the London Street Tramways Company which has already been purchased by the Council and leased to that company, has been postponed. The arrangement made, subject to the approval of the Council, is that the companies shall sell their tramways to the Council at £10 000 per mile for double and £5,000 per mile for single lines, and at this rate the purchase-money would amount to £437,000. To this sum, however, for the purposes of arriving at a conclusion as to whether the offer was such as the Council could accept, the committee state that there must be added the £101,798 paid for the portion (about 4¾ miles of line, with two depôts) of the London Street Company's undertaking already purchased by the Council and leased to that company. The total amount of capital expenditure for lines and the two depôts would therefore be about £540,000. Provision has also been made for the purchase by the Council of the companies' freehold and leasehold buildings used in connection with the lines to be purchased and for the leasing company to pay by way of rent during the term of the lease (which is to be for 14 years) a sum equivalent to 5 per cent. on the amount to be paid for the freehold depôts and stables, and 6 per cent. on that to be paid for the leasehold, and, as regards the latter, that the ground and other rents which are now paid by the company shall continue so to be paid. No agreement has been come to as to the price to be paid for the buildings, but arrangements have been made for that matter to be settled by arbitration. The committee point out that the proposed arrangement is such as in their opinion the Council should accept, and that it was fair both to the Council and the company. The committee further state that they have considered the question of the advisability of the adoption of some system of electrical or other mechanical traction in substitution for horse traction and have arranged with the company that if at any time during the continuance of the lease the Council should consider it desirable that some form of electrical or other mechanical traction should be adopted the leasing company will be prepared either to carry out the necessary works on terms to be arranged with the Council, or, should the Council itself execute the works, to pay a fixed rent and a share of the extra profits which may be derived from the use of such traction. They were unable to give the Council information of a reliable character as to the probable profit to the ratepayers on the basis of electric traction, as they had as yet been unable to obtain trustworthy data on the subject. In the opinion of the engineer the conditions are so different in London, and in different parts of London, from those which obtained in any other city where electric traction was in use, that it was impossible to estimate with any approach to reliability, what might be the results of its adoption. The only really satisfactory course appeared to them to be that they should institute an exhaustive enquiry into the several systems; and, when convinced that any one possessed merits sufficient to justify the belief that it would be more economical as well as more convenient than the present system, to make a practical trial of it for a sufficient period over a typical portion of the London streets.

Blackburn.—The approaching introduction of electric tramways into the town marks the first step towards the adoption of methods that must exercise a great influence upon municipal enterprise; for the local authority proposes, not only to furnish current for operating the two electric lines from the municipal electricity works, but will also take in hand the erection of all overhead wires, poles, and other structures, as well as the bonding of rails, laying of feeders, etc. The tramway company will provide its own rolling-stock and motor equipments, receiving from the Corporation an extended lease of the lines. The important questions of maintenance—as regards the circuits (outgoing and return) and the rolling-stock—are, however, not yet settled, being matters that fall for treatment in the agreement now, we understand, in process of drafting between the Corporation and the tramway company. Considerable interest will be felt in the final arrangements made for electric traction in this town between the Corporation and tramway company, as conditions of a similar nature have not yet arisen anywhere else; indeed, Blackburn will for that matter occupy the position of being the first town in the country to operate tramways from the municipal lighting works. Mr. J. G. W. Aldridge (with whom is Mr. Frank B. Lea, lately resident engineer on the Rouen electric tramways) is advising the tramway company, whilst Mr. E. M. Lacey acts as consulting engineer to the Corporation. Colonel W. Langton Coke, M.I.C.E., an inspector of the Local Government Board, held an enquiry last week into the application of the Town Council for sanction to borrow £28,000 for electric light purposes and £10,000 for electric traction. The Town Clerk observed that in February last year the electric station at the No. 1 gasworks was opened, and application was made to the Local Government Board for permission to borrow £32,000. Prior to making the present application, the Corporation had spent £27,659 of the original borrowing powers. In April last it was decided to apply for further borrowing powers. Since the application was made the Corporation had let some contracts, otherwise they would not have been able to go on with the works this winter. Of the £28,000, £3,000 would not be spent at present, but would be reserved for further extensions. The existing buildings used now for the gasworks shops will be used for the electric light extensions. The following figures showing the increase in consumption of electricity were submitted by the town clerk: commencement of supply, February 18, 1895—number of lamps connected, 3,129; maximum load, kilowatts, 32. Ten months ending December, 1895—number of lamps connected, 5,915; maximum load, kilowatts, 121; percentage of increase, 266. Year ending December, 1896—number of lamps connected, 13,000 (estimated); maximum load, kilowatts, 325 (estimated); percentage of increase, 168. Year ending December, 1897—number of lamps connected, 20,000; maximum load, kilowatts, 754; percentage of increase, 132. In the course of the second enquiry it was stated by the town clerk that it was a matter which had been very carefully considered by the Corporation and the tramways company. The tramways had been laid by the Corporation, under the powers of the Blackburn Improvement Act, 1882, and were leased by the Corporation to the company under an indenture of lease dated June 1, 1891, for a term of 21 years. The proposition was to supersede the two horse sections only with electric traction, the overhead system being proposed. They had made arrangements with the tramways company to pay the Corporation a certain price per unit, whilst the basis of cost to the company was 3d. per car mile for power only.

Telephones in Scotland.—At the statutory meeting of the Fife County Council, Mr. H. V. Haig, in moving the approval of the minutes of the Road Board, said they had arranged with the Telephone Company that the county should get the use of five instruments, as at present, on the same terms for the next three months, and they would be able to communicate along the trunk lines at 3d. per message. The Telephone Committee had come to the conclusion that the judicious thing for the county was to have a telephone system of their own. They reluctantly felt that they were obliged to ask the County Council to move in this matter, because, to begin with, the facilities that the Post Office gave were so inferior that they were practically of no use to the police, who were the principal people to use them. If the county put up this system, they would have thoroughly efficient communication with each of the police stations in connection with Cupar. It would be thoroughly private and in no way public. They had two estimates of about £1,300 each for the instruments, and they would require a skilled man at 25s. or 28s a week to attend to them. The total cost, estimated at about £2 000, could be borrowed at 6 per cent., and paid off at about £220 a year. This would give them a telephone system over 82 miles, and connecting 17 stations, for £200 a year. For that sum they would have a most efficient telephone system all over the county. They might have communication with Dundee over the Tay Bridge and with Edinburgh over the Forth Bridge. He moved that the committee be empowered to get the fullest information as to cost, etc., of a telephone system. Mr. M'Gavin Greig asked if he might be permitted to speak to a point of order. The County Council were now meeting as the Road Board, and he could take no part in their discussions, Tayport having their own roads, and not contributing to the road assessment, but the adopting a telephone system was a question for the County Council, and police burghs would be assessed, and it should be discussed at a County Council meeting, where he might, if he wished, express his view of the proposal. The Chairman said that at present they were merely considering the question generally, and no step was being taken which would commit the county to expenditure. The whole question would come up at another meeting of the County Council. Mr. W. Meiklejohn seconded the motion. Mr. Haig stated that he had calculated the expense of maintenance and renewal. The Chairman said he was now in favour of the scheme, although he was distinctly opposed to it at first. Even yet if the Post Office would treat them in a fair way he would be inclined to stand by them. If the proposed system had great advantages inside of the county, it had great disadvantages outside. The Government had distinctly refused to be reasonable in the matter, and he was now a convert to the system. Mr. Prentice asked if Mr. Haig had any idea whether or not such a proposal would be considered by neighbouring counties. Mr. Haig replied that Captain Bremner had informed him that Kinross would also join with them, and he saw no reason why they should not get communication with Dundee. Mr. Glass wanted them to be sure that they had the right to erect a telephone system before they incurred any expense. The Chairman said there was no doubt they had the right, so long as they did not charge for messages. He was advised that there was no doubt about their right. In reply to Mr. Prentice, Mr. Haig stated that the rate of way-leave for the Telephone Company's branch lines had not been fixed, but the committee were of opinion they were entitled to something substantial considering what they charged their subscribers. Mr. Glass remarked that if the system were to be a success there was no doubt that other counties would do the same. He understood it would represent a saving of £300 or £400 per year. The Chairman thought that they might save a couple of hundred per year. The motion was unanimously agreed to. At the meeting of the Glasgow Chamber of Commerce Mr D. M. Stevenson moved: "(1) That a committee be appointed to wait upon the Town Council and press upon them the urgent need of securing the telephone license for which the Corporation have applied to the Postmaster-General, with a view to the establishment of an improved service; and (2) that a memorial be sent to the Postmaster-General supporting the Corporation's application for a license, and urging a revision of the present exorbitant trunk-line tariff." After a rather warm discussion Bailie Alexander said that if Mr. Stevenson would confine his motion to the part which advocated the sending of a memorial to the Postmaster General in support of the Corporation's application for a license, he would agree. The Corporation, he pointed out, applied for a license three years ago, and no reply had been received from Government. He believed that if the twin-wire system were adopted there would be three times the number of subscribers there were at present, and the charge would be reduced to half. Mr. Stevenson said he would accept Bailie Alexander's amendment. Bailie Alexander then seconded the motion in its altered form. On a division 10 voted for the motion and 11 for the previous question.

PROVISIONAL PATENTS, 1896.

OCTOBER 12.

22571. **Incandescent elect·ic light decorations.** Alexander Abercrombie Po'lock, 70, Wellington-street, Glasgow.

22584. **Improvements in wall sockets for electric lighting and like fittings.** Gustav Byng, 73, St. Stephen's-road, Upton Park, London.

22585 **Improvements in fittings for electric light and like purposes.** Gustav Byng, 73, St. Stephen's-road, Upton Park, London.

22595. **Improvements in electric accumulators.** Anthony George New, Palace-chambers Westminster, London.

22599. **Improvements in dynamo-electric machines.** Valere Alfred Fynn, 47, Lincoln's-inn-fields, London.

22600. **Improved method of and means for electrically connecting railway rails.** George Haskell Scott, 55, Chancery-lane, London

22633. **A high-speed dynamo.** Hans Carl Madsen, 1. Queen Victoria-street, London. (Complete specification.)

OCTOBER 13.

22661. **Improvements in electrical bell pushes or their equivalents.** Robert Bell and William Thomas Hall, Fleet-street, London.

22691. **Improved high-insulation cord grip ceiling rose.** Frederick William Heaton and Harry Smith, Salford Switch Works, Sidney-street, Salford, Manchester.

22703. **Improvements relating to the generation of gas and electricity and to apparatus therefor and the application thereof to motive power purposes.** Sidney Howe Short, 45 Southampton-buildings, Chancery lane, London. (Complete specification.)

22704. **Improvements in electric brakes.** Henry Harris Lake, 45 Southampton-buildings Chancery-lane, London. (Elmer Ambrose Sperry, United States) (Complete specification.)

22744. **Improvements in or relating to switches for electric batteries.** William Turner, 111, Hatton-garden, London.

22746. **Improvements in or connected with automatic switches for controlling electric lamps.** William James Davy, 40, Chancery lane, London.

OCTOBER 14.

22783. **Improvements in electric locking and block apparatus on railways.** Frederick Thomas Hollins, Saltley House, Forest Drive, Leytonstone, Essex.

22796. **Improvements in and relating to electrical indicators.** Mervyn Walter Stikeman and Reginald Page Wilson, 70, Chancery-lane, London.

22820. **Improved method of constructing, mounting, and arranging the underframe and driving appliances of electric and other motorcars, and in means or apparatus for reducing vibrations and oscillations and to facilitate ease of action in starting such cars.** Hazelwood Carmont, 166, Fleet-street, London.

22833. **Improved means or appliances connected with electric arc lamps.** John Henry Rose, 166, Fleet street, London.

OCTOBER 15.

22844. **Improvements in electric arc lamps for projection.** Eugen Kiupathy 3, Fleet-street, London.

22886. **Improvements in electric railways.** Nigel Harrington Balfour and Edward Wythe Smith, 66, College street, Chelsea, London.

22893. **High-voltage electric incandescent lamp.** Frederick James Satchwell, 4, Crescent-villas, Crescent-road, South Woodford Essex.

22926. **Improvements in electrical devices and in insulating supports for same.** Reginald William James 1, Queen Victoria-street, London. (William White and John Hubert Davies, South African Republic.)

22947. **An improved electrical joint.** Alfred Francis Bilderbeck Gomess, 9, Warwick-court, Gray's-inn, London.

OCTOBER 16.

22967. **An improved method of connecting electric wires.** William Henry Dorman, The Green Hall, Stafford.

22979. **Improvements in machines for covering electric or other wires or cables.** William Alfred Phillips, Market-place, Huddersfield.

22980. **A new or improved method and means for fireproofing insulated wires and cables.** William Alfred Phillips, Market-place, Huddersfield.

22990. **Improvements in appliances for the intercommunication of telephones.** Joseph Devonport Finny Andrews, 45, Fulham Park-gardens, London.

23003. **Improvements in or relating to cooking or similar stoves applicable for the production of steam for use in the generation of electricity.** Alfred Julius Boult, 111, Hatton-garden, London. (Joseph Plantard, Louis Rault, and Guillard-Dupard, France.)

OCTOBER 17.

23071. **Improvements in switches for electric currents.** John Joseph Rawlings and William Robert Rawlings, 82, Gloucester-road, South Kensington, London. (Complete specification.)

23040. **Improvements in the construction of electrical accumulators and primary cells.** Andrew George Adamson, 154, St. Vincent-street, Glasgow

23084. **An improved cell for controlling the direction of flow of electric currents or retarding such flow and for like purposes.** William Phillips Thompson, 6, Lord-street, Liverpool. (Leo Grä'z, Germany.)

SPECIFICATIONS PUBLISHED.

1895.

17745. **Electrolytic or galvanic processes or cells.** Lake. (Hoepfner)

17788. **Electromotors.** Clerk. (Lacy, Johnson, and Slacke.)

17790. **Electromagnets and method of winding the same.** Clerk. (Lacy, Johnson, and Slacke.)

17791. **Dynamos.** Clerk. (Lacy, Johnson, and Slacke.)

18440. **Arc lamps.** Hill.

19934. **Process and apparatus for the electrolytic production of metallic zinc and metallic copper from zinc ores containing copper, and oxygen gas as a by-product.** Burghardt and Rigg.

19989. **Electrical "tell-tale" or watchman's recorder.** Fletcher.

20843. **Electric batteries.** Shrewsbury, Marshall, and Dobell.

21137. **Electrical tramway and railway conductors.** Nisbett.

22207. **Electrodes suitable for electrolytic apparatus.** Kellner.

22246. **Insulators and insulating conduits or tubing for electrical purposes.** Treharne.

22519. **Electric railways or electric transport.** Esmond. (Date applied for under International Convention, April 26, 1895.)

1896.

3151. **Arc lamps.** Schmidt and Schmidt.

10788. **Electric arc lamps.** Bagnall.

15013. **Electrical selectors and answer-backs.** McKenna. (Drysdale.)

15622. **Alternating-current dynamo-electric machines.** Little.

19303. **Electromagnets.** McKenna. (Electric Selector and Signal Company)

19304. **Ele tric selectors and adaptations thereof and transmitters suitable therefor.** McKenna. (Electric Selector and Signal Company.)

19305. **Electrical selecting instruments.** McKenna. (Drysdale.)

NOTES.

One More Objection.—Mr. Diatto, who we believe to be an Italian, and know to be an advocate of conduit traction systems, says that to the French the overhead system carries its own condemnation. Apparently they do not distinguish between *trolley* and *trop-laid.*

Berlin Exhibition.—The *Berliner Tageblatt* estimates the deficit on the exhibition to amount to something like £390,000, and this in spite of the fact that, according to the *Local Anzeiger*, the exhibition before it closed on the 15th inst. was visited by 3,500,000 paying visitors.

Mayor of Cambridge.—Mr. Horace Darwin, a son of the late Charles Darwin, has consented to take the office of Mayor of Cambridge. It is to be presumed that this is part of the healing of the immemorial feud of town and gown which is supposed to have been in progress lately.

Italian Electrical Engineers.—Some details are given in *L'Elettricità* of the new Association of Italian Electrical Engineers. The society is to be a federation of branches in the principal towns, the head-quarters being the branch to which the president for the time being belongs. Prof. Ferraris, of Turin, is suggested for the first president.

The Turbines at Niagara.—According to a note in the *Engineer*, the friction of the 5,000-h.p. turbines at Niagara is said to be so small that when once started they will run light with a gate opening of $\frac{1}{16}$in. only. Careful experiments have shown the wheels to have an efficiency of 80 per cent., which is 5 per cent. in excess of the guarantee.

Cobalt and Nickel.—It would appear from *Wiedemann's Annalen* that it has been discovered by G. S. Mayer that in cobalt and nickel tension produces an E.M.F. identical in direction with that produced by longitudinal magnetisation. So far as permeability is concerned, the behaviour of cobalt under stress appears to be similar to that of iron.

Dundee Architects.—We have received the annual report of the Dundee Institute of Architecture, Science, and Art, and a circular in which the council of the institute announce that preliminary arrangements have been made for the opening meeting of the session to be held on or about November 5 next. The probable dates of other meetings of the session will be December 17 and March 18.

The Behr Railway.—The ceremony of turning the first sod of the single-line electric railway at Tervueren, adjoining the grounds of the Brussels Exhibition, has taken place. This is a "single rail" system on trestles, of which the inventor and patentee is Mr. F. Behr. It was fully described and illustrated in our columns some time ago, and the Brussels line will be the first occasion of it being tried on a practical scale.

Liverpool Engineering Society.—The following is the list of papers to be read up to Christmas: November 11, 1896, Mr. G. L. Burton, A.M.I.C.E., "Water-Tube Boilers"; November 25, 1896, Mr. Ernest S. Wilcox, M.I.C.E., "Some Notes on Railway Construction"; December 9, 1896, Mr. James Glover, jun., M.A., A.M.I.C.E., "Some Notes on Current Specifications and Tenders for Public Works." There is to be a paper by Mr. T. M. Bigley on "Electric Tramways" in February.

Meteorological Congress.—There has been an international congress of meteorologists at Paris. It appears to have been mostly confined to French and Germans. The subjects of atmospheric electricity and terrestrial magnetism were discussed, but nothing very important was brought out. It was stated that the instruments for measuring the atmospheric potential at the top of the Eiffel Tower had been working most satisfactorily in spite of the fact that the difference of potentials measured (between the air and earth) might amount to several thousand volts.

Magnetic Elements. — An abstract is given in *L'Elettricità* (Milan) of the communication made by Dr. G. Folgheraiter to the Reale Accademia dei Lincei on the possibility of obtaining a knowledge of the direction of terrestrial magnetism in classical or even earlier times. It depends upon the fact that with many kinds of clay there are traces of magnetism which are permanent, and depend on the direction of the object (a vase or brick) with regard to the earth's field at the time of firing. But it is just in the difficulty of determining this that the trouble comes in.

Some Coming Events.—There is an Electro-Harmonic Concert to-night (Friday); we gave the programme last week.—The Brush Company's meeting (confirmatory to reduce capital) will be held at the Cannon-street Hotel on Monday, November 2, at 12 o'clock.—The Society of Engineers meet on Monday next, the Civil Engineers on Tuesday, the Mechanical Engineers on Wednesday and Thursday, and the Junior Engineers on Friday. The business to be done is given in another note. The Crystal Palace Wednesday lecture is by Mr. Fletcher (once of the *Daily Chronicle*) on "The Newspaper Press."

Lucium.—It is stated that yet another "rare" metal has been discovered in monazite sand. At one time this would have been of no importance whatever to practical people. But the new element is said to make excellent incandescent mantles, and on the principle that it is impossible to specify the nameless or describe the undiscovered, it has been suggested as possible that the new metal may prove a means of circumventing the Welsbach patents. The name of the new element is lucium, and its atomic weight is put at 104. That figure is almost certainly wrong, but there is room for an element at about 99 or 100.

High-Velocity Motors.—According to the *American Engineer*, at least one large firm manufacturing dynamos and motors in the States is at work upon a motor that will run at a speed of 10,000 revolutions per minute, and if constructed is to be used by the United States Government on men-of-war to start the propelling machinery of Howell torpedoes just before they are fired from their tubes. This torpedo is propelled by the energy stored in a small flywheel inside of it, made to revolve at a speed of 10,000 revolutions, and at present a steam-turbine is the only motor of simple form that is available to rotate the flywheel at that speed.

City and Guilds Institute.—The following are the scholarships awarded in connection with the present session 1896-97 of the Central Technical College, Exhibition-road, S.W.: Clothworkers' Scholarship, £60 a year, with free education for two years, L. P. Wilson; Mitchell Scholarship, £40 a year, with free education for two years, R. S. Potter; Clothworkers' Technical Scholarship, £30 a year, with free education for two years, E. W. Cook; David Salomons Scholarship, £50, E. W. Marchant; John Samuel Scholarship, £30, H. W. Hanbury; Institute's Scholarships, free education for three years: F. S. Miller, J. I. Hunter, and F. W. Fawdry.

The Fritsche Dynamo.—In the *Elektrotechnische Anzeiger* there is a description of the bell armature dynamo which has been patented by Fritsche and Pischon, of Berlin. The machine is intended to run either as a motor or a dynamo. It is a three-pole machine, the field magnets taking the form of a double bell with slots. The armature revolves between the two slotted bells, and the commutator naturally is placed on the side of the machine corresponding to the top of the armature or the mouth of the field magnets. This form of dynamo is said to be constructed

Digitized by Google

for outputs of between 1 and 55 kilowatts, and wound for voltages of from 65 to 240.

Self-Propelled Traffic Association. — At the inaugural meeting of the Liverpool centre of the Self-Propelled Traffic Association Lord Derby (Lord Mayor of Liverpool) presided, and Sir David Salomons delivered an interesting address. Sir David thought the immediate future of motorcarts would be in connection with trade. He did not think oil motorcarts would be popular in the long run; steam was better. "I can picture to myself," Sir David said, "that in the next 10 or perhaps five years the whole of the heavy traffic as well as the public conveyances of this country will be propelled by motors, probably steam, instead of by living horse power."

Electrolytic Gold Winning.—At the annual meeting of the shareholders of the Rand Central Ore Reduction Company, held at Johannesburg, Mr. C. S. Goldmann, the chairman, in the course of his speech, remarked that the company had been the first to practically demonstrate that slimes which had hitherto been considered unworkable could be profitably treated with the aid of the Siemens-Halske process, and much of their success was due to it. This process did not depend or rely upon chemical reaction. It was not necessary to add further chemicals to the solutions in order to get correct precipitation or better results. The simple application of the electric current was all that was necessary.

Lightning Conductors.—More attention appears to be given to the proper arrangement of lightning conductors on the Continent than in this country, possibly because thunderstorms are a little more severe there. There has been published in the *Centralblatt der Bauverwaltung* an account of a large body of observations on the subject. In the conclusions arrived at, however, there is nothing very new. They amount to this: that care should be taken to secure good and deep earths, that neighbouring masses of metal should be connected to earth but not to the lightning conductor, and that when all is said and done the best ordinary lightning conductor seems to afford no certain protection against induction strokes.

Glow-Lamp Tests.—The *Elektrotechnische Zeitschrift* in its "Review" refers to Mr. Preece's method of testing incandescent electric lamps and the results set forth in his paper at the British Association. Our Berlin contemporary is at present disinclined to accept the test as absolutely reliable until it has had a more prolonged trial. "It is, however, an unpardonable mistake that such experiments should be made without the co-operation of the makers of incandescent lamps." At least so says the *Elektrotechnische Zeitschrift*; but if a quarter of what is said about German lamps is true, that can be understood without assuming anything worse than a fear that good makes may get confounded with the general run of bad ones.

Velocity of Electric Waves.—Mr. Clarence A. Saunders's researches on the velocity of electric waves are published in the *Physical Review.* A novelty in his method is to check the velocity of the rotating mirror by a motor accurately regulated by a synchronous alternating motor on the same axle instead of the old method of a tuning-fork. Mr. Saunders's average values are 29,820 and 29,970 × 10^6 cm./sec., the larger number resulting from using a longer circuit. If the wires were perfect conductors, the velocity of propagation should be the same as that of a wave in the dielectric—*i.e.*, to the velocity of light—and theory indicates that in the present case the error due to the resistance of the copper wires would be too small to be taken into account.

Pacific Cable Conference.—The Canadian Government has asked that the reassembling of the Pacific Cable Conference may be postponed until the second week in December. The Canadian delegates will be Sir Donald Smith and Mr. Sandford Fleming, the latter having been nominated the second Canadian commissioner in place of Sir Mackenzie Bowell, who has retired. Neither Mr. Laurier, the Premier, nor Sir Richard Cartwright, the Minister of Trade and Commerce, is now expected to visit England this year, but they may come to London after the next session. A later telegram states that Canada will appoint three representatives, as by this means the desire of Queensland to nominate a third delegate from Australasia will be met.

The Remuneration of Instructors.—The Egyptian Government in its *Journal Officiel* gives notice that there are a number of vacancies for teachers of English, of mathematics, and of art and drawing in the Government schools. It is sometimes complained that technical teaching is inadequately remunerated in England, and, therefore, to save the Egyptian Government from a rush of foreign candidates, it may be as well to add that the time of application for these posts expired on the day the *Journal Officiel* reached our shores. Also that the maximum salary asked must be something less than £72 per annum, and, in addition, £3 has to be paid to the Revenue Department of the Egyptian Government for the privilege of making application for one of these vacant posts.

Carborundum.—Silicon carbide, for use as a grinding material, is a crystalline substance, and must therefore have presumably undergone fusion. It is not impossible that a substance of similar composition though not crystallised may be formed at a temperature lower than that necessary to melt it and cause it to crystallise. As the product of an electric furnace is always highly heterogeneous, it is reasonable to suppose that amorphous SiC, unfitted for abrading purposes, may be found there, and the *Zeitschrift für Electrochemie* suggests that it might prove a profitable by-product as a carburetting and siliciding agent. Carbides, silicides, nitrides and borides of manganese, magnesium, and aluminium are suggested as possible products for the common profit of the steel-maker and the electro-metallurgist.

Electric Lighting at the Law Courts.—There have been some considerable alterations in the electric lighting arrangements at the Law Courts during the Long Vacation, and, if report is to be trusted, everything necessary was done to make the new arrangement a shining success—except to switch the light on. As the tale goes, on entering the building their lordships (the Queen's Justices) were ceremoniously conducted to a lightless robing-room, there to form themselves into the order of precedence in which they were to proceed through the Grand Hall. The next thing was a voice speaking in the telephone, "Turn on the electric light in the robing-room instantly!" If the tale is untrue, it is not we but the London correspondent of the *East Anglian Daily Times* on whom rests the responsibility.

Tramways and Telephones.—The report of Mr. P. van Vloten, of Brussels, on the subject of the disturbances produced in telephones by the working of electric tramlines is published in the *Bulletin* of Belgian Société d'Electriciens. The report was made to the International Tramways Union at its meeting at Stockholm this year. The report recommends the use of a large number of sections in the commutators of the motors and care to secure good rail and trolley contacts, and as little vibration as possible. It is, however, held that the telephone also should do what is possible to protect itself. "A telephonic system with earth return is incomplete and defective." Much attention is devoted to English

Digitized by Google

practice, and in reference to the danger of electrolysis the prescription of the Board of Trade limiting the potential drop for an uninsulated return to seven volts is looked upon as unnecessarily severe for long lines.

The Clydebank Cell.—A Glasgow contemporary says: "About two years ago a stir was caused in engineering circles [presumably local circles] by an announcement that two Clydebank young men named Macdonald had made a discovery which would revolutionise the application of electricity for motive purposes. The features of their invention were said to be the smallness and lightness of the battery and the simplicity of the ingredients—salt water and coal ashes. Experts were sceptical [naturally, it is a way they have], but it is stated that a syndicate has now been formed with the object of testing the value of and exploiting the invention. It is said that the vessel 'Medusa,' which was employed by Dr. John Murray, of the Challenger Expedition, for marine investigations, has been purchased for experimental purposes." The last paragraph fairly beats us. A cell of that size would be unexampled even in the annals of primary batteries.

Manchester Association of Engineers.—At a meeting of the members of this association last Saturday, Mr. G. T. Pardoe read a paper on "Water Power and its Development." He thought water power might be used effectively for electric lighting purposes in a number of small towns in the North of England and in Wales. The inhabitants of those towns, however, did not appear inclined, or did not have sufficient money, to embark on what was for them a new enterprise, and outside capital was necessary for the working of that field. People seemed to think they could have water power for nothing. Apparently they forgot that the much-maligned capitalist required a return for his money, and that the works needed repairs and renewals. Whether power of that kind could be rendered available at a lower cost than power derived from coal was a question only to be solved after close consideration of each individual case.

Obituary.—Mr. James Henry Greathead, the engineer, died at his residence, Streatham, last week. He was a member of the council of the Institution of Civil Engineers, and had carried out many extensive engineering works; but he will be chiefly remembered as the pioneer in that system of tunnelling which bears his name, has revolutionised the method of tunnelling hitherto adopted in large cities, and has practically solved the problem of rapid transit in London. The City and South London Railway was one of the first to be constructed by Mr. Greathead, the Central London and the Waterloo and City Railways are in course of construction, and others are authorised. These tunnels would not have been practicable had it not been for the device known as the Greathead shield, which enables tunnels to be driven with safety and economy underneath buildings of all kinds without disturbance, and under rivers without danger to the workmen.—The death is announced of Mr. William Allen, head of the firm of Bessemer and Sons, at Sheffield at the age of 72.

A French Opinion.—The *Revue Industrielle* in its "Chronique" refers to the report of the British Consul at Naples made some time ago, in which the absurdity of English manufacturers forwarding to Italy for circulation catalogues printed in English, and with all quantities in English weights and measures, was strongly insisted on. Our Paris contemporary says plainly that even when a textual translation of the catalogue is made the addition of figures in English weights and measures does more harm than good in countries that use metres, kilogrammes, and litres or their equivalents under native names. In conclusion, it is urged that the remarks of our consul are worth consideration, not only in England, but in France, and in particular by French "consuls, who are rarely as ready as the English consul at Naples to exert themselves to push the introduction of the products of their country's trade and industry." It is believed that the Naples consul's report was not pleasing to everybody in this country. Apparently the French wish they had some like him.

Boiler Incrustation.—In a communication originally appearing in the *Oesterreiche Zeitschrift für Berg- und Hüttenwesen*, Rubricius, an Austrian chemist, recommends yet another anti-incrustation compound for boilers, which is stated to have furnished remarkably good results during the year that it has been in use at Anina and other localities in Austria-Hungary. To the feed-water there is added a mixture consisting of 90 per cent. of soluble chromates and 10 per cent. of soda. These salts transform the more or less soluble carbonates contained by the water into soluble chromates, which settle in the shape of slime without adhering to the walls of the boiler, and the latter can easily be cleaned by washing. The beneficial effect of the process will be felt even in the case of boilers which are already lined with thick layers of incrustation, for these will be gradually reduced and transformed into slime. On an average, $\frac{1}{10}$oz. of the mixture should be added to 35 cubic feet of water. For an ordinary boiler 3oz. to 4oz. per day would be sufficient. Where water with very high lime contents is being used, the dose should be increased a little; the exact quantity needed can be determined by a preliminary test.

Crystal Palace.—We have received from the manager the prospectus of the Victorian Loan Exhibition, which it is intended to open on May 24, the anniversary of her Majesty's birthday, and which will illustrate, by historical and modern specimens, original models and practical examples—(1) the famous inventions in the arts and industries of the last 60 years; (2) the naval and military services, 1837-1897; (3) the fine arts of the Queen's reign; (4) the national sports, pastimes, and recreations of the Victorian era; (5) the colonies and dependencies. As to Section 1 ("famous inventions"), it is stated that "the available space for this section of the exhibition being limited, the exhibits will be restricted to those inventions that have been most conducive to the development of the commerce, wealth, and prosperity of the nation, those, for instance, connected with electricity and telegraphy, heating and lighting, hygiene, labour-saving machinery, locomotion, photography and its applications, printing machinery, textile industries, utilisation of natural forces, utilisation of waste products, etc." We have also received the programme of the Wednesday winter lectures and next year's Handel festival.

Electric Locomotive in New York.—Reference has before been made to a trial to be made of an electric locomotive on the Manhattan elevated railroad in New York. The trial took place on October 5, the experiment being made on the Thirty-Fourth-street branch between the Long Island Ferry and Third-avenue. A third rail laid on the outside of, and 10in. higher than, the regular rails carries the current. Contact is made by means of two sliding steel shoes. The motorcar carries, when fully equipped, a storage battery of 256 cells, which may be used in case of emergency, and which serves to keep the load on the line and on the station fairly uniform. The battery alone, it is said, will operate a train for 19 miles at a speed of 35 miles per hour. The motorcar is 18ft. long, and slopes from a height of 8ft. in the centre to 3ft. at the ends. The electric current is also used to light the cars. The loco-

Digitized by Google

motive has two motors of 125 h.p., and weighs 10 tons. An overhead railway of the New York type is the sort of thing that would not be looked upon with favour in this country. But if electric locomotives get used upon it, it will remove one source of anxiety to ordinary people in the street—namely, there will be no possibility of bits of coal or ashes, cold or hot, coming down on their heads.

A New Use for Steam-Rellers.—The following from a weekly contemporary, contains a most amusing amount of misinformation. The initial difficulty of finding Mauritius in the West Indies is unfortunately slurred over. "A new use for a steam-roller has been found. The Governor of Her Majesty's Crown Colony of Mauritius recently purchased one and had it shipped out to the West Indies for macadamising the roads. When it arrived, unforeseen difficulties in the way of making roads with it arose, and as its cost had been something like £500, it looked as though the colony would be considerably out of pocket by the transaction. The authorities, however, determined that it was a pity to waste it, so they fixed it up with wooden sprockets till the wheels and rollers could revolve clear off the ground, and then they geared it on to an electric dynamo. In this capacity it works splendidly; the roller acts as a heavy flywheel, and with the motive power thus supplied the electric light works better than it ever did before." Other "interesting items about the Mauritius" are added, but they relate to bicycles, golf, cricket, dominoes, and such frivolous matters, and they are doubtless equally authentic. Yet the colonies complain that the mother country knows little about them and cares less.

Engineering Societies.—The Institution of Civil Engineers meets on Tuesday, November 3, at 8 p.m., for the opening of the seventy-eighth session, when Mr. J. Wolfe Barry, C.B., F.R.S., will deliver an inaugural address on taking the chair as president.—The Institution of Mechanical Engineers meets Wednesday, November 4, and Thursday, November 5, at 7.30 p.m. The papers to be read and discussed are: "Research Committee on the Value of the Steam Jacket; Experiment on a Locomotive Engine," by Prof. T. Hudson Beare, F.R.S.E,, and Mr. Bryan Donkin (Wednesday); "Transmission of Heat from Surface Condensation through Metal Cylinders," by Lieut.-Colonel English and Mr. Bryan Donkin (Wednesday); "Break-downs of Stationary Steam-Engines," by Mr. Michael Longridge, of Manchester (Thursday).—The Institution of Junior Engineers has its inaugural meeting on Friday, November 6, at the Westminster Palace Hotel. The presidential address will be delivered by Mr. A. R. Binnie, M.I.C.E., and the chair to be taken at 8 p.m. by the retiring president, Mr. A. Denny, M.I.N.A.—The Society of Engineers meet on Monday, November 2, for Mr. D. B. Butler's paper on "The Effect of Admixtures of Kentish Ragstone, etc., upon Portland Cement." The meeting is at the Royal United Service Institution, Whitehall, at 7.30.

Technical Education.—In an address to students delivered in connection with the opening of the session of the Department of Science, Technology, and Arts of the Yorkshire College, Leeds, Mr. Asquith said from the gigantic sum raised by taxation in this country the comparatively moderate pittance which university colleges demanded might well, he thought, be sanctioned by the Chancellor of the Exchequer, and it would not be the least usefully expended of the money that passed through his hands. However, he advised them not to rely upon Governments alone. Mr. Asquith also remarked that the grammar schools which exist all over the country had been awakened to new life. If it means to the proper treatment of science teaching the writer had not yet observed it. Mr. Chamberlain at Birmingham has a plea for debating societies. "I am afraid that the true meaning is too often lost in the jangle of the bell; therefore there is the more reason in these days of technical education that there should be, among other things, a school of debate, where young men may be taught to concentrate their thoughts and express them in appropriate and in forcible language." But does a school of rhetoric do this? The advice of the Duchess was: "Take care of the sense and the sounds will take care of themselves." Mr. Roberts Beaumont has also written to the *Times*, but says little new.

Electric Light and Plant Growth.—Some particulars of recent experiments in the application of electricity to farming and horticulture have been given in the *North American Review*. At Cornell University it has been found that plants receiving the bright electric rays at night and the sunshine in the daytime were found to grow much faster than those not thus supplied with the artificial stimulant (similar results are produced by the almost continuous daylight of the sub-Arctic regions). Lettuces, spinach, radishes, and similar vegetables were brought to maturity in almost half the time ordinarily required. The effect upon flowering plants was almost as startling. The plants were made to shoot up rapidly, and under forced stimulation the stalks grew up tall, slender, and weak. The blooms were hastened in their growth, and in the case of the petunias they produced more flowers than by the old system. Verbenas, on the other hand, were uniformly injured when placed near the electric lamp. Both the leaves and the flowers were hastened in their growth, but they were small and insignificant, while many of the lower clusters died before they had reached their full expansion. The effect of the electric light upon colours was even more interesting than upon the growth of the plants. The colours of the tulips were deepened and made more brilliant, while most of the scarlet, dark red, blue, and pink flowers were turned to a greyish white; but nearly all of the flowers artificially stimulated into beauty by the electric light soon lost their brilliancy and faded much more quickly than those raised by Nature's methods.

The Light Railways Act.—We have received from Messrs. Reeves and Turner, 100, Chancery-lane, "The Light Railways Act, 1896." This is a book compiled by Mr. Evans Austin, M.A., LL.D., of the Middle Temple (barrister-at-law), treating, as its title denotes, with the Light Railways Act, 1896 (59 and 60 Vict., c. 48). The aim of the author is to give, as far as possible, all the information likely to be required by local authorities and others, and therefore he has appended sections of the various Acts relating to the subject, such as the Lands Clauses Consolidation Act, 1845; the Board of Trade Arbitrations Act, 1874; the Arbitration Act, 1889; a list of the enactments relating to safety, etc.; a table of the principal general enactments relating to railways; and the rules made by the Board of Trade with respect to applications to the Light Railway Commissioners for orders authorising light railways. The book is, of course, practically a reprint of the whole and portions of Acts of Parliament, but the usefulness of it lies in the fact that the whole of the laws which have any direct influence on the question of light railways have been selected with great care and put together in one volume. The author, in his preface, calls attention to the fact that no definition of a light railway is attempted by the Act It leaves to the Commissioners a very wide discretion in this respect. Indeed, no definition is possible, the circumstances in every part of the country being so various that do definition would suit them at all. A clear and concise general summary of the Act at the beginning of the

Digitized by Google

book and a copious index at the end considerably add to its value.

Antitoxins and Electrolysis.—Some time ago reference was made to the experiments conducted in France on the effect of alternating currents of high frequency on bacteria and bacterial toxines. Physiologists do not always keep their physics up to date, and therefore it is less surprising than would seem at first sight that in some quarters it should have been imagined that "antitoxin" was in some way manufactured by the alternating current. On the very good authority of an article in the *Lancet*, it appears, however, to have been the case. It would, however, seem to be indicated by the investigation of Mr. Marmier, that the action of the high-frequency current on bacteria differs little in principle from that of a continuous one. Mr. Marmier, in a contribution to the *Annales de l'Institut Pasteur*, gives a series of experiments made with continuous currents similar to those carried on by Smirnow and Krüger and with currents alternating at high frequency such as were used by D'Arsonval and Charrin. He finds that with venin and with diphtheritic toxins he is able to obtain no attenuating effect with alternating currents of high frequency, but that with continuous currents there is a distinct attenuation of the virus to be noted. He finds, moreover, that continuous or alternating currents of low frequency destroy bacterial toxins simply because they have the power of producing hypochlorites and chlorine from the chloride of sodium dissolved in the solution of toxins, this substance in a nascent condition exerting a considerable effect upon the toxins. He considers, in fact, that the Hermite process is the one that is brought into play in the attenuation of the toxins that are in the fluid. In fact, the fluid after electrolysis is perfectly different as regards its antiseptic power from the fluid before electrolysis is commenced.

Motorcart Regulations.—The draft regulations proposed to be issued by the Local Government Board under the powers conferred on them by the Locomotives on Highways Act, 1896, were considered at a meeting held at the London Chamber of Commerce on Monday last, with Major Flood Page in the chair. It was considered best that the proceedings should be considered private, since the meeting was practically an answer to an invitation of the Board to make suggestions to it for consideration. It is, however, no secret that the Board is doing its honest best to produce a set of rules which, while providing for the public safety and the public fear of anything novel, will leave the new industry free to take its natural course of development. If that were not so, it would hardly have been possible for the proceedings to have been over well within the hour at a meeting at which, not only the societies, but the interests of electricity, oil, and steam motors, as well as engineering in general, were represented. In fact, very few suggestions were made, and if there is no adverse influence from other quarters, and the rules go through in anything like their present form, they will be found to be as satisfactory both to the general public and the manufacturers as is possible under the circumstances. Of course the whole difficulty lies in providing a set of regulations which shall be short and comprehensible and yet shall cover the necessities of everything from a light traction engine down to an automatic cycle. Then, again, independent of size, there is a cross division as to motive power. Take, for instance, a regulation that a motor vehicle must not be left unattended. A light electric tricycle or car, with its wheels braked and its switch locked, would be about as dangerous as a crate of the same size. It is, in fact, absolutely safe. On the other hand a steamcar, perhaps burning petroleum, if not absolutely unsafe, is at least one of those things of which it cannot be said for certain that there is no possibility of mischief if it happens to be left too long—that is to say, if the owner does not want to find himself without steam when he comes back to it. The difficulty is not lessened by the fact that the type of vehicle to be legislated for is at present certainly untried, probably unconstructed, and indeed possibly as yet uninvented. But so long as a considerable section of the public takes *omne ignotum pro terrifico* it would be eminently undesirable to have no special rules. Moreover, whatever form they take, the Board's regulations will not have the rigid character of an Act of Parliament. They can be changed, and even if they could not such a very uncertain piece of mechanism as the horse and cart manages to get along all right within the unalterable provisions of the Highways Act.

The Heilmann Locomotive.—The *Iron and Coal Trades Review* is responsible for the statement that "Railway engineers, both in Europe and in the United States, have of late been greatly exercised over the prospect of finding the electric locomotive superseding the ordinary steam locomotive engine which has played so important a part in transportation during the last 60 years," and adds that "up to the present time the interest of the electrical world has chiefly been centred in the Heilmann locomotive, which has been constructed in France, and operated on two of the most important railway lines in that country. M. Heilmann is a manufacturer of electrical plant and a locomotive builder, who carries on extensive works at Havre and who is well known in Paris as an original and enterprising engineer. His locomotive, which was originally looked upon as something of a curiosity, has forced its way into such prominent notice that negotiations are said to have been concluded for building several others on the same lines, but of 2,000 h.p. for Russian railways, and a company which has been formed in Russia proposes to pay, if it has not already paid, £500,000 for the patent rights for that country." So far as it is known to the writer, the opinion both of the electrical and engineering world has been that the use of dynamos and motors as a kind of speed gear between the steam-engine and the driving wheels—for that is what the Heilmann engine comes to—does not hold out a very hopeful prospect. The double conversion of energy into current and back again is not altogether a proceeding that makes for economy, and the platform and tender of a locomotive is rather a cramped domain into which to pack the mechanism of a power-transmission line. Moreover, the ship-shape end, presumably adopted as a precaution against wind pressure at high speeds, is taken as an indication that the inventor has not really grasped the relative importance of the various factors which limit the rate of speed of a locomotive, or, for the matter of that, the proper way of treating them. Outside the shops at Rugby and Thames Ditton most of the information as to the Heilmann locomotive current in this country has been obtained from the proceedings of the Société des Ingenieurs Civils, at Paris. The Société has discussed the subject pretty fully from time to time, and, as these columns have testified, the Heilmann locomotive has come in for some pretty sharp criticism there. It is now suggested that the Willans type of engine will not do—in fact, that the reciprocating type of engine must be abandoned altogether and steam-turbines adopted. Now, the steam-turbine is a very pretty thing, and valuable enough where space is small and speed is great. But no one has yet accused it of economy, and, after all, that is the point; for it is not a question of doing a thing, but of doing it better than other engines.

THE PRINCIPLES OF ALTERNATE-CURRENT WORKING.*

BY ALFRED HAY, B.Sc.(EDIN.), A.I.E.E.

(Continued from page 456.)

89. We are now in a position to study the behaviour of a condenser when placed on an alternating-current circuit. We shall first of all consider the simple case in which the circuit is made up of a condenser whose terminals are connected to a source of alternating E.M.F., and we shall suppose the resistance and inductance of this source to be negligible. We shall also assume that the impressed E.M.F. varies according to the simple harmonic law. From the first assumption it follows that the P.D. at the terminals of the condenser is at every instant equal to the impressed E.M.F.

Let e stand for the instantaneous value of the E.M.F., q for the instantaneous quantity, and C for the capacity of the condenser. Then we have the relation (Art. 85)

$$q = C e,$$

and since we suppose e to vary according to the simple harmonic law, it follows that q will vary according to the same law, and be in phase with e.

Let E stand for the maximum value of e, and Q for the maximum value of q. Then $Q = C E$. The E.M.F. may be represented by an alternating vector (Art. 15) derived from the rotating vector O A (Fig. 63), of length E. The quantity of electricity in the condenser may be represented by another alternating vector, which is in phase with the first, but whose maximum value is C E. Next, since the current is measured by the rate of change of the quantity

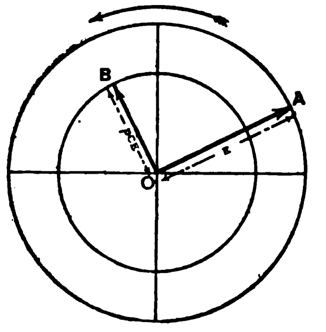

FIG. 63.

(Art. 87), and since the latter is represented by an alternating vector, it follows that the current itself will also be represented by an alternating vector, of amplitude $p C E$ (Art. 22), this vector being $\frac{\pi}{2}$ in advance of the quantity vector as regards phase. The letter p stands, as usual, for 2π times the periodicity.

If, therefore, in Fig. 63 we draw $O B = p C E$ at right angles to O A, and if we suppose the whole diagram to revolve round O with constant angular velocity p, then the projections of the rotating vectors O A and O B on the vertical axis will give us the instantaneous values of the E.M.F. and current respectively. We thus arrive at the following important result:

If a simple harmonic P.D. of amplitude E be applied to a condenser of capacity C, then the current through the condenser will be of amplitude p C E, and will be $\frac{\pi}{2}$—i.e., a quarter-period—in advance of the P.D. as regards phase.

90. It may be well, perhaps, at this point to anticipate a paradox which might possibly occur to the student and cause some difficulty. According to the result just established the current has its maximum value when the E.M.F. passes through the zero value. Let us suppose that there is a switch in the circuit and that the switch is closed at the instant of zero value of the E.M.F. Now, since the E.M.F. is just passing through its zero value it does not matter whether, at the instant considered, the switch is closed or not. From this it would appear to follow that there is a current through the condenser before the closing of the switch. What really happens is this. When the switch is closed the current starts from a zero value, but the first few waves are of an abnormal type; the current gradually gains on the E.M.F. as regards phase, and ultimately reaches a phase difference of $\frac{\pi}{2}$. Our investigations are concerned with the steady periodic state, and not with the abnormal waves which make their appearance on first closing the circuit.

A similar difficulty occurs in the case of an inductive circuit, and is similarly met.

91. The result established for a simple harmonic E.M.F. wave may, by the principles of Arts. 43-45, be extended to waves of any shape whatever. The method is the same as that used in working out the numerical example of Art. 46. We shall take the same E.M.F. as that used in Art. 46—viz.:

$$e = 2{,}000 \sin p\,t - 600 \sin 3\,p\,t,$$

and, assuming a periodicity of 100 ∿ per second, suppose that this E.M.F. is applied to a condenser of capacity $= 15{\cdot}9$ microfarads. We then have

$$p = 2\,\pi\,n = 200\,\pi\,;\ 3\,p = 600\,\pi.$$

$$p\,C = 200\,\pi \times 15{\cdot}9 \times 10^{-6} = {\cdot}01 \text{ approximately,}$$

and $$3\,p\,C = {\cdot}03.$$

Hence, taking the first term in the expression for the

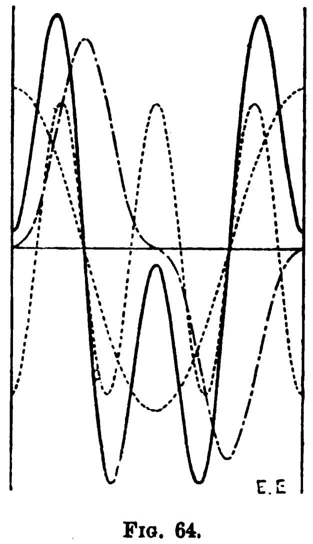

FIG. 64.

E.M.F.—*i.e.*, 2,000 $\sin p\,t$—we find that the corresponding current is represented by $20 \sin\left(p\,t + \frac{\pi}{2}\right)$; while the current corresponding to the second term, $-600 \sin 3\,p\,t$, is given by $-18 \sin\left(3\,p\,t + \frac{\pi}{2}\right)$. The total current through the condenser is therefore represented by

$$20 \sin\left(p\,t + \frac{\pi}{2}\right) - 18 \sin\left(3\,p\,t + \frac{\pi}{2}\right).$$

In Fig. 64 the chain-dotted curve is the E.M.F. curve (the harmonic components of which are shown in Fig. 37). The full-line curve is the current curve, whose harmonic components are shown dotted. The student will at once observe that the current curve departs much more widely from the simple sine form than does the E.M.F. curve; so that the effect of a condenser on the current curve is to produce still greater distortion than that which is already present in the E.M.F. curve. In this respect the effect of a condenser is the reverse of that produced by an inductance, as the student will readily see by referring to Art. 46. An inductance may be said to have a smoothing effect on the current wave, and a capacity a distorting effect. The reason for this is not far to seek. In the case of an inductance, the current, for a harmonic E.M.F. of

* Based on a series of evening lectures delivered at the University College, Liverpool.

Digitized by Google

given amplitude, varies inversely as the periodicity $\left(I = \frac{E}{Lp}\right)$; but in the case of a capacity, it varies directly as the periodicity ($I = pCE$). Hence an inductance will tend to suppress the higher harmonics in the current wave, whereas a capacity will tend to bring them into greater prominence.

92. Returning to the case of a simple harmonic E.M.F., we see that, by the result established in Art. 88, the relation between the P.D. at the terminals of a condenser and the current through it is given by the equation

$$I = pCE \quad . \quad . \quad . \quad . \quad . \quad . \quad (25)$$

where I and E may stand for either the maxima or the R.M.S. values of the current and P.D. respectively. It will be instructive to compare and contrast the behaviour

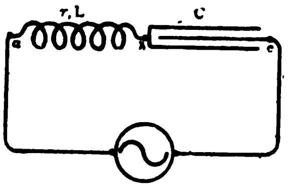

FIG. 65.

of a simple inductance with that of a simple capacity when the impressed E.M.F. follows the simple harmonic law. This is done in the following table:

Simple inductance.	*Simple capacity.*
The current is $\frac{\pi}{2}$ *behind* the E.M.F. as regards phase.	The current is $\frac{\pi}{2}$ *in advance* of the E.M.F. as regards phase.
The current varies *inversely* as the product of the inductance and periodicity.	The current varies *directly* as the product of the capacity and periodicity.

Since the effects produced by an inductance are thus seen to be the very reverse of those produced by a capacity, the idea at once suggests itself that a capacity may be used to neutralise the effects of an inductance. As we shall see presently, this may be accomplished when the E.M.F. obeys the simple harmonic law.

93. Let us suppose that a circuit consists of an inductive resistance connected in series with a condenser, as shown in Fig. 65. Let r and L be the resistance and inductance of the circuit respectively and C the capacity of the condenser. Let us suppose that the current obeys the simple harmonic law, and that its amplitude is I. The problem is to find the impressed E.M.F. We may regard the latter as made up of three components: (1) the $r\,i$ component; (2) the $L\,i'$ component (Art. 37); (3) the P.D. at the condenser terminals.

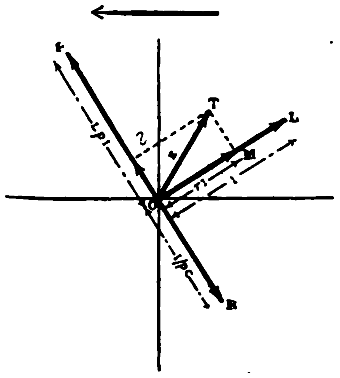

FIG. 66.

In Fig. 66, O L is a rotating vector of length I. The alternating vector derived from this by projecting it on the vertical axis gives the current. O M is a rotating vector of length r I, and coincident in direction with O L; the projection of this vector at any instant on the vertical axis gives the $r\,i$ component of the E.M.F. at that instant. The $L\,i'$ component is represented by the projection on the vertical axis of a rotating vector O P, of length LpI drawn at right angles to O L (Art. 37). Lastly, the condenser P.D., which by the results established in Art. 89 is $\frac{\pi}{2}$ behind the current as regards phase, is represented by the projection of a rotating vector O R, of length I/Cp, drawn at right angles to O L, but in a direction opposite to that of O P.

The whole diagram is, of course, supposed to revolve in a counter-clockwise direction (as shown by the arrow) round O, the angular velocity being p (where $p = 2\pi n$).

The instantaneous impressed E.M.F. is the sum of the projections of the rotating vectors O M, O P, and O R on the vertical axis. But this sum is (Art. 12) the same as the projection of the resultant of the three rotating vectors. In order to find this resultant, we may first of all find the resultant of O P and O R. If we assume that O P > O R, then the resultant of these two vectors will be represented by a vector O S, of length $LpI - I/Cp$, and having the same direction as O P. By compounding the vectors O S and O M (Art. 11), we find the required resultant O T of the three vectors.

We thus see that the impressed E.M.F. is represented by the projection on the vertical axis of the rotating vector O T, and from the geometry of the figure we can at once determine the maximum value of the impressed E.M.F. and the angle of phase difference T O L between it and the current. Noticing that $OM = rI$, and $MT = OS = \left(Lp - \frac{1}{Cp}\right)I$, we get

$$OT = \sqrt{OM^2 + MT^2}$$
$$I = \sqrt{r^2 + \left(Lp - \frac{1}{Cp}\right)^2}.$$

Hence, denoting by E the maximum value of the impressed E.M.F., we see that

$$I = \frac{E}{\sqrt{r^2 + \left(Lp - \frac{1}{Cp}\right)^2}} \quad . \quad . \quad . \quad (26)$$

Again, if θ stand for the angle of lag T O L of the current behind the impressed E.M.F., we have

$$\tan\theta = \frac{MT}{OM} = \frac{Lp - \frac{1}{Cp}}{r} \quad . \quad . \quad . \quad . \quad (27)$$

94. Several important results follow at once from the relations just established. If $Lp = \frac{1}{Cp}$, then we get $I = \frac{E}{r}$, and $\theta = 0$. In other words, by choosing the capacity so that it is equal to $\frac{1}{Lp^2}$, we cause the current to come into phase with the impressed E.M.F., and to assume a value which is simply equal to the quotient of the E.M.F. by the resistance of the circuit. The effect of the inductance is thus completely annulled by the capacity.

Again, a glance at Fig. 66 shows that the current may lag, be in phase with the E.M.F., or lead, according as Lp is greater than, equal to, or less than $\frac{1}{Cp}$.

Further, we have the important result that under certain conditions *the P.D. at the condenser terminals may considerably exceed the impressed E.M.F.* in the circuit, so that a voltmeter connected across the points b and c (Fig. 65) will give a higher reading than one connected across a and c. This is evident from the fact that for certain values of the resistance, inductance, and capacity the vector O R may exceed O T.

Similarly, *it may happen that the P.D. across the inductive resistance exceeds the impressed E.M.F.* For the vector O P may under certain conditions exceed O T. If this is the case, a voltmeter connected across $a\,b$ will give a higher reading than one connected across $a\,c$ (Fig. 65).

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 457.)

Single-Line Working.

The principles under which single-line block working is carried on differ in no way from those adopted for ordinary double-line work, the section limit being imposed upon trains passing between any two adjoining cabins. Inasmuch, however, as trains passing in either direction have necessarily to pass over the same line of rails, it is obvious that some other precaution than that afforded by the ordinary form of block is necessary to ensure that two trains shall not, through negligence in any way, enter the section from opposite ends at the same time. This is generally accomplished by the "staff," or "staff and ticket," system of working single lines, to which block working is often merely supplementary.

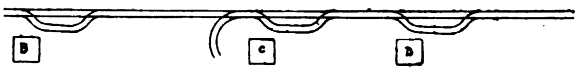

Fig. 83.—Staff Sections, B—C, C—D.

In single-line working the line is divided into a convenient number of parts, at the junctions between which passing places are provided for trains proceeding in opposite directions; and the driver of any train passing through any such section, as B C (Fig. 83), must obtain from the signalman at the entrance to the section some visible authority other than, and supplementary to, that given by the usual mechanical outdoor signals, and must deliver the same to the signalman at the exit end on his arrival there. In the case of the simpler single lines this authority to proceed is given by the signalman handing the train staff (Fig. 84) to the driver of the train about to enter the section. As there is only one staff to each section, and as no train may enter a section without the staff accompanying it, the driver, on receiving the staff, knows that no train will be sent from the opposite end, and he may therefore proceed as far as the next staff station. It will be noticed that the signalman at intermediate staff stations will have two staffs to deal with, whilst the signalmen at the ends of the single line will have only one to handle. In order to prevent interchange of staffs, each is in some way made distinct from the others, either by difference in form or colour, or by being appropriately lettered

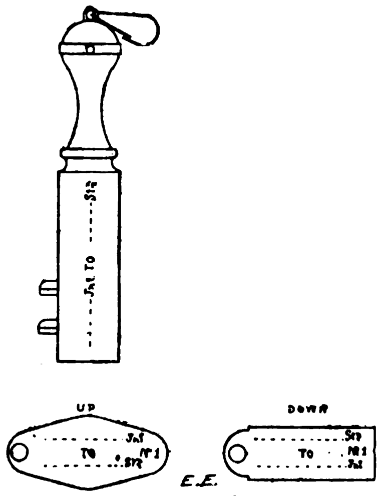

Fig. 84.—Staff and Tickets.

Trains on single lines worked by "staff" alone are liable to considerable delay, more especially where the line is fed with traffic at one or more points, such as at C (Fig. 83). If a train is sent from "B" to "C," say, and takes the staff, no train can pass between these points in the same direction until the staff has been returned to "B." This may be done by a train passing from "C" to "B" in the ordinary course, or a special engine may be sent with the staff to B; or, in the event of an engine not being available, the staff may be sent by a messenger on foot, or horseback, if the circumstances are sufficiently urgent. In any case, considerable delay to traffic results from any deviation from the ordinary or prearranged working of the line, and special traffic must be carefully arranged to fit in with the ordinary, and special advice of additional trains must be given to the officials concerned in the working of the line, or that portion affected.

In order that trains may pass over any staff section in the same direction in succession, the modification known as the "staff and ticket" is introduced, the "ticket" being a supplementary authority for the driver to proceed, which is understood to be available for use *only* when the staff for the section to be entered is in the possession of the signalman at the *entrance* to the section.

The staff usually takes the form of a cylinder of brass or hard wood of distinctive shape, and has engraved upon its surface the names of the points constituting the staff section for which it is available. The "ticket" is usually a flat iron plate of oval or rectangular form (Fig. 84), and is similarly lettered. In addition, the very necessary information respecting the direction in which it is to be used—*i.e.*, for "up" or "down" journeys—and its number are marked upon it. By these means the "ticket" affords a check upon the signalman, and ensures the use of the proper ticket, and also affords information to the driver, by its number, of the condition of the line through which he is to proceed. Each cabin is provided with a small lock-up box, in which a certain number of "tickets" are kept for use as required. The key for this box forms part of the staff, and the ticket-box, therefore, can only be opened by the signalman who has possession of the staff. If a train is to be sent away from the staff station, and it is certain that another will require to follow it before the staff could be returned under ordinary working conditions, a "ticket" is given to the driver, and the staff is retained by the signalman until such time as it becomes necessary for the staff to be sent to be available for trains in the opposite direction, tickets, in their proper numerical order, being delivered to drivers of all successive trains except the last, to whom the staff is given. This method constitutes a great advance on simple staff working and enables traffic to be handled with much greater facility. Even with this modification, however, the schedule of arrangements of trains must be closely adhered to, and if any deviation from it is made, or trains are sent unexpectedly, it is a mere matter of chance if delay does not ensue.

Fig. 83 shows a single line divided into staff stations with passing places for trains proceeding in opposite directions. The number of staff sections for any line will depend upon its length, the amount of traffic passing over it, and the number of points at which traffic is lifted or delivered. For busy lines it is, of course, of advantage for the staff sections to be short, in order to lessen the delay to trains waiting for others to clear the section. On the other hand, cutting the line into numerous staff sections involves expense in providing passing places, staff cabins, and signalmen; and delays to through traffic in consequence of the frequent slackening of speed to exchange staffs or "tickets."

Where the "staff and ticket" system is in use, and trains proceeding in the same direction may follow each other, a combination of the block system with the staff is found to be advantageous. In Fig. 85 a portion of the staff section, B-C, is shown as split into three block sections,

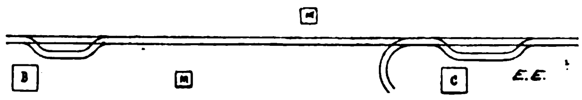

Fig 85.—Staff Section B—C, with Intermediate Block Sections, B—M, M—M', M'—C.

B-M, M M¹, and M¹ C. Block apparatus of any suitable kind is provided in B, M, M¹, and C, and the usual complement of mechanical signals is provided at each place. A train leaving B, say, with a ticket for C would be signalled on the block instrument in the usual way, and would be cleared back to B when it passed M and was proceeding to M¹. A second train might then be sent away from B in the same direction either with a second ticket, or the staff, as might be desirable. Between B and C the trains are worked under block rules only, and they are not required to stop or slow down for

Digitized by Google

the exchange of staffs at M or M[1], but may run straight through so long as the proper mechanical signals are exhibited. At the same time there is nothing to prevent the ordinary work of lifting or leaving traffic being performed at either M or M[1]. In this way, as will be evident, a glut of traffic passing in one direction can be much more readily dealt with than by the simple staff or staff and ticket systems alone. Although the fact that between B and C there may be three trains would seem a violation of the principle underlying the staff system, yet on closer examination it will be evident that the primary object of the staff is to prevent trains entering a section from opposite ends at or about the same time, and the trains in the case considered are all passing in the same direction. Further examination will show that the staff section space has been replaced by a shorter block section space, and so long as no irregularities occur the system is perfectly safe.

There is nothing special in the instruments used for single-line block working where nothing more than the mere indication of the condition of the line is required. Any form of instrument in use on double lines may be easily adapted to single lines. The single-needle instruments described in connection with double-line working only require to be provided with a pin at each end for pegging the needle, instead of at one end only, there being, of course, only one indicator

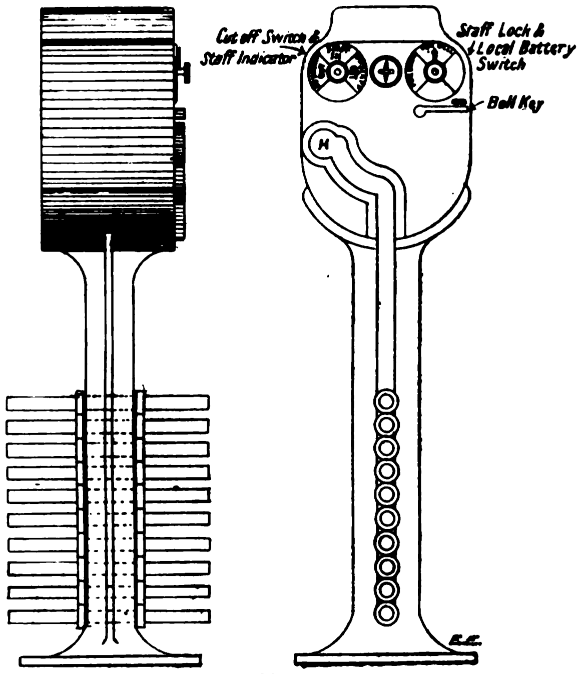

FIG. 86.—Webb and Thompson's Electrical Train Staff Instrument.

for each section and only two wires required. Winter's block instrument (Fig. 51) simply requires Z of the line battery to be connected to the terminal, S *p*, to enable it to be used for single lines. In this case one instrument serves for the two sections which are controlled from the cabin. Block instruments in the design of which some attempt has been made to secure a degree of automatic control have some claim to be considered as capable of being used on single lines without the aid of the staff system, but such adaptations have made no progress in this country. Other instruments, such as Walker's, Harper's, Fletcher's, and the single-needle instruments can only be used to facilitate traffic over the lines, and are subordinate to the staff as a *safety* appliance.

The want of flexibility in the staff system, and the delay consequent upon any deviation from the ordinary or prearranged working, has led to modifications, and instruments have been devised by means of which safety is ensured and much of the delay to the traffic is obviated. The principal alteration consists in the abolition of the single staff governing the passage of traffic in both directions, and the substitution of a number of staffs at each end of the section. The staffs for any one section are all similar, and are of equal value; and these are contained in instruments, placed in the cabins, which are so constructed that only one staff can be withdrawn from the instrument for any section at a time. Whilst such an arrangement enables traffic to be more readily handled, and releases the rigidity of the simpler system, it is obvious that the precautions to be observed in such a method are necessarily more elaborate, and the control of the instruments containing the staffs must be absolute.

An interesting instrument, from an electrical point of view, for this purpose is Webb and Thompson's electrical train staff instrument which is shown by Figs. 86-88.

Fig. 86 shows front and side views of the exterior of the instrument with a number of staffs in position, together with the two switches, indicator, and bell key. Staffs can only be inserted or withdrawn from the instrument at the opening, H. Staffs may be *inserted* at any time, but can only be *withdrawn* under prearranged conditions.

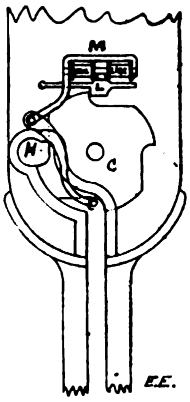

FIG. 87.

Fig. 87 represents the arrangement by which the staffs are locked in the staff pillar. The cam-wheel, C, turns on its centre. When a staff is raised with the object of withdrawing it, it must lift the bent lever, *l*, before entering the passage to H. The compound electromagnet, M, is lifted by the movement of *l*, and if it is energised *properly* it lifts the lock, L, with it. Otherwise L remains in the position shown. If L is raised with M the motion of the staff, under the movements of the signalman, towards H causes the cam-wheel, C, to turn, and allows the staff to pass to H, and be withdrawn there. In the event of M not being properly energised, L will remain as shown, and

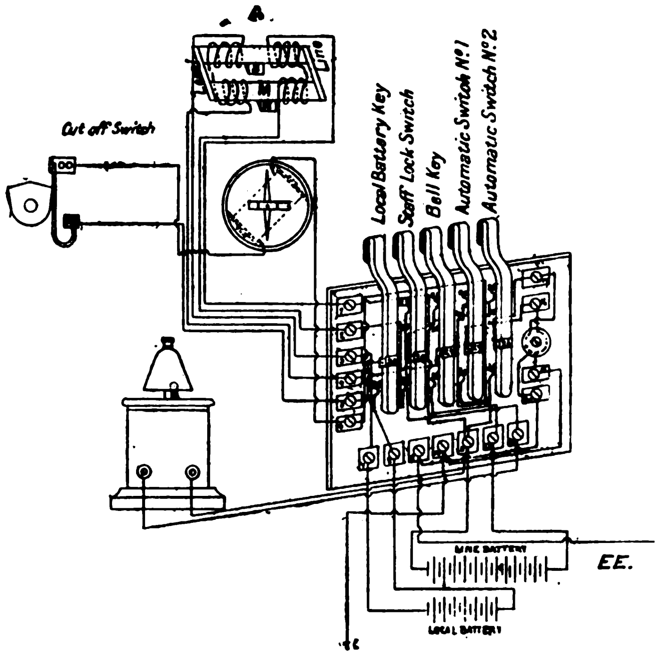

FIG. 88.—Webb and Thompson's Electrical Train Staff Diagram of Connections for One Section of Single Line.

the cam-wheel being locked against turning in the necessary direction, it will be impossible to withdraw the staff under the conditions. Obviously, therefore, the withdrawal of a staff depends upon the excitation of the magnet, M, whilst a glance at Fig. 87 will show that staffs may be put into the pillar at any time.

The instrument is provided with a switchboard (Fig. 88) of five switches, four of which are two-way switches,

Digitized by Google

whilst the fifth has only one contact. The switches marked No. 1 and No. 2 are actuated by the movement of the cam-wheel (C, Fig. 87), and change the positions of contact every quarter revolution of C.

The switch marked "bell key" is actuated by the depression of the lever similarly lettered in Fig. 86. Normally the bell key (Fig. 88) makes contact at "23"; when the lever is depressed, contact is made at "33." The "local battery key" and "staff lock switch" bars (Fig. 88) are operated by the switch on the right hand of Fig. 86. When the handle is as shown by Fig. 86, the "staff lock" bar makes contact at "22" and the "local battery" bar is disconnected. When the handle is placed to "For staff" the "staff lock" bar makes contact at "32" and the "local battery" bar at "31." The cut-off switch (Fig. 88) is operated by the left-hand switch, shown in Fig. 86. When the indicator attached to the handle is in the position shown it does not affect the "cut-off" switch, shown in Fig. 88, but when held *hard* down in the position shown the spring is displaced from the upper stud, and the circuit broken. The indications "Staff in," "Up staff out," "Down staff out," of the left-hand switch do not depend in any way upon the actual conditions being similar to the indication exhibited. They are merely reminders which the signalman may or may not place in accordance with the actual state of affairs, without affecting the working of the apparatus. The staff lock electromagnet, M (Fig. 87), is shown diagrammatically in Fig. 88, and the construction of the indicating magnetic needle is shown in the same figure.

All train distinguishing and other signals passing between the signalmen at opposite ends of the staff section, are given by a bell code; the bell being rung by depressing the key shown on the front of instrument in Fig. 86.

(To be continued.)

MEASUREMENT OF POWER IN TWO AND THREE PHASE CIRCUITS BY MEANS OF WATTMETERS.*

BY DUGALD C. JACKSON.

The principles underlying the methods of measuring power in polyphase circuits differ in no essential respect from those relating to single-phase circuits, but it is desirable to apply them in such a way as to reduce the number of necessary readings to a minimum. For satisfactory measurements, non-inductive wattmeters are of essential importance, and very satisfactory commercial portable wattmeters are now to be had for a reasonable price. In the following *résumé* of the various ways in which wattmeters may be applied to the measurement of the power in polyphase circuits it has not seemed necessary to insert mathematical proofs of the soundness of the methods, as these have been fully set forth by such eminent men as Blondel, Gerard, etc.

Two-Phase Systems.

Independent Circuits.—In a two-phase system with separate circuits independent wattmeter readings are taken in each circuit, and the total power is the sum of the readings. One wattmeter placed in each circuit (illustrated in Fig. 1), from which simultaneous readings are taken, is the best arrangement; but if two wattmeters are not to be had one may be inserted successively in the two circuits, and the sum of the readings is equal to the power in the system provided the load does not vary while the readings are being taken. If the circuit is perfectly balanced, twice the reading of a wattmeter in one circuit is equal to the power, but this is a condition which cannot be relied upon.

Circuits with Common Return.—Two wattmeters may here be used, one for each circuit, connected in the way shown in Fig. 2, and the power in the system is equal to the sum of the readings. When the system is in exact balance the wattmeters may be connected as in Fig. 3, or one wattmeter may be used in the way illustrated in Fig. 4, but the condition of exact balance, as has already been remarked, is not to be relied upon, so that the arrangements shown in Figs. 3 and 4 cannot be safely used, except under exceptional conditions. When a single wattmeter is used in a balanced system, as illustrated in Fig. 4, the current coil is placed in the common wire, and a reading is taken with the free end of the pressure coil connected to one outside wire. The pressure coil terminal is then quickly transferred to the other outside wire and a new reading taken. The sum of the readings is then equal to the power sought.

* From the *Electrical World*, New York.

Three-Phase Systems.

Three Wattmeters.—(*a*) If the power delivered by a generator or absorbed by a motor or other device which is connected in star or Y fashion is to be measured, three wattmeters may be used, connected as shown in Fig. 5, provided the common or neutral point is accessible. It is

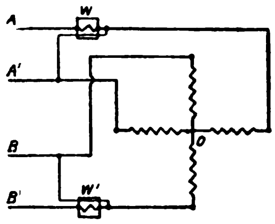

Fig. 1.

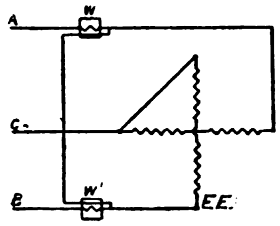

Fig. 2.

evident that each wattmeter measures the power in one coil, so that the sum of the readings gives the power in the system. If the system is exactly balanced three times, the reading of one wattmeter gives the power. (*b*) If the devices are connected mesh or Δ fashion three wattmeters can still be used, provided the current coils of the wattmeters can be inserted directly into the coil circuits, as shown in Fig. 6. The power in the circuit is equal to the sum of the three wattmeter readings, and if the circuit is

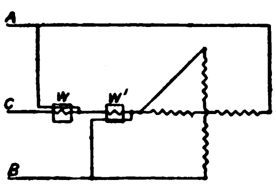

Fig. 3.

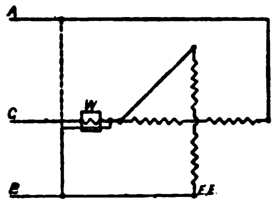

Fig. 4.

exactly balanced three times the reading of one wattmeter gives the power. (*c*) When it is impossible to insert the wattmeters in the coil circuits of a device with mesh connection, the three-wattmeter method may still be used by the creation of an artificial neutral point, as shown in Fig. 7. For this purpose one end from each of three equal non-reactive resistances are connected together, and the other ends are connected to the respective corners of the mesh circuit. If the system is balanced, the pressure

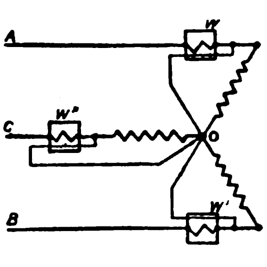

Fig. 5.

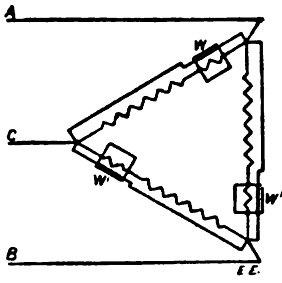

Fig. 6.

between the neutral point and either corner is equal to $\frac{E}{\sqrt{3}}$, where E is the pressure of one coil, and the phase of this pressure is ϕ degrees in advance of the current entering the corner. A wattmeter with its current coil inserted in the circuit wire leading to the corner carries a current equal to $\sqrt{3}$ C, and if the free end of the pressure coil is connected to the neutral point, the power reading of the wattmeter is

$$\frac{\sqrt{3}\, C\, E \cos\phi}{\sqrt{3}} = C\, E \cos\phi,$$

which is the power in the coil. This holds equally true for an unbalanced system. Care must be taken that the resistances of the wattmeter pressure coils are so large compared with the three auxiliary resistances that connecting them

Digitized by Google

in circuit does not disturb the pressure of the neutral point. If the resistances of the wattmeter pressure coils are exactly equal, auxiliary resistances are unnecessary, and the measurement may be made by joining the free ends of the three pressure coils. The equality in the resistances of the pressure coils may be gained by inserting proper non-inductive resistances in series with them, as shown at r_1, r_1^2, r'' in Fig. 8. These methods are independent of the condition of balance in the system.

Two Wattmeters.—The algebraic sum of the readings of two wattmeters inserted in a three-phase circuit as shown in Figs. 9 and 10 gives the power in the system with entire

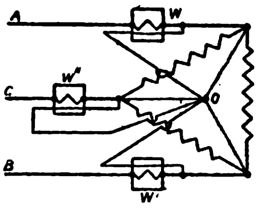

Fig. 7.

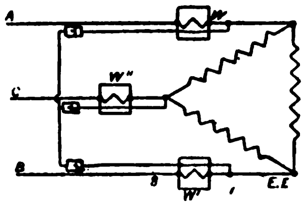

Fig. 8.

independence of the balance of the system or current lag; the only conditions affecting the soundness of this method are (1) when the devices are connected in mesh fashion, as in Fig. 9, the algebraic summation of the instantaneous pressures between the three lines, A, B, and C, must always be equal to zero, or

$$e_{AB} + e_{BC} + e_{CA} = 0;$$

(2) when the devices are connected in star fashion, as in

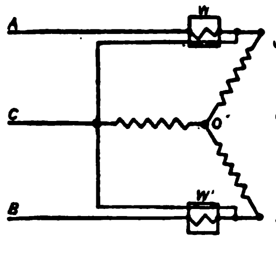

Fig. 10.

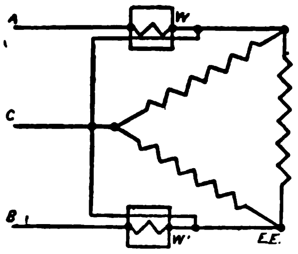

Fig. 9.

Fig. 10, the algebraic summation of the instantaneous currents in the three-line wires, A, B, and C, must always be equal to zero, or

$$C_A + C_B + C_C = 0.$$

When two wattmeters are used as here proposed, and the equivalent current lag in the circuit is less than 60 deg.—*i.e.*, the power is greater than ·50—the arithmetical sum of the readings of the two instruments is equal to the power in the circuit; but if the lag is greater than 60deg.—*i.e.*, the power factor is less than ·50—the relation of the currents

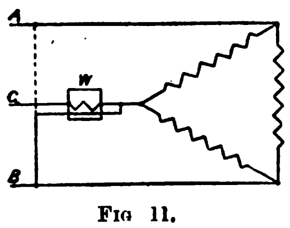

Fig. 11.

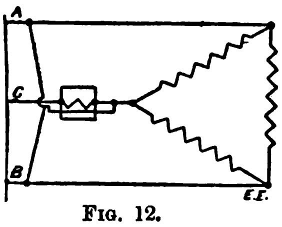

Fig. 12.

in the current and pressure coils of one of the wattmeters causes it to have a negative reading, and the arithmetical difference of the readings of the two instruments gives the power. There is some difficulty in distinguishing which condition exists in many cases, especially when the power absorbed by partially loaded induction motors (in which the power factor is low) is under measurement. As a general rule, if the conditions do not make the case evident, the truth may be discovered by interchanging the positions of the instruments without altering the relative connections of their current and pressure coils. If the deflections of both needles are reversed, the difference of the original readings represents the power; but if the deflections are in the same direction as before, the sum of the readings is correct. A double wattmeter, consisting of two fixed coils and two movable coils on one spindle, can be used in measuring power by the two-wattmeter method. Such an instrument of itself sums up the double reading algebraically, and a single reading gives the power. Recording wattmeters based upon this principle can be made very useful in the commercial sale of power from three-phase circuits.

One Wattmeter.—In a balanced circuit, one wattmeter may be very conveniently used by connecting the current coil in one wire and connecting the free terminal of the pressure coil alternately to the other two leads (Fig. 11), when the sum of the readings gives the power. For, the power reading of the wattmeter in its first position is $\sqrt{3}$ C E cos (ϕ + 30°), and in its second position, $\sqrt{3}$ C E cos (ϕ − 30°), and the sum of the readings,

$$\sqrt{3}\ C E \{\cos(\phi + 30°) + \cos(\phi - 30°)\} = C E\ 3 \cos\phi,$$

where C E and ϕ are the current, pressure, and lag in a coil; but C E cos ϕ is the power in one coil and 3 C E cos ϕ is the total power of the three coils, hence the one wattmeter gives correct indications *provided ϕ is the same for all the coils and the load is uniformly distributed.* A wattmeter having two independent pressure coils could be used as a direct-reading instrument for this purpose. A similar wattmeter could also be used in one-wattmeter measurements of power in two-phase circuit. An ordinary wattmeter with one pressure coil may be used for the double measurement at one observation by connecting the free end of the pressure coil to the middle of a high non-inductive resistance which is connected between the two lines opposite to the one in which the current coil is inserted (Fig. 12). This reading is evidently equal to the sum of the readings with the other arrangement, but the wattmeter constant must be determined with one-half the high resistances in series with it.

The conditions italicised above is ideal rather than practical, so that this arrangement cannot be relied upon, and either three or two wattmeters must be used according to the arrangements illustrated in Figs. 5, 6, 7, 8, 9, and 10, for the purpose of measuring the power in a three-phase circuit under operating conditions. The two-instrument arrangement is correct in nearly all cases, and, of course, is the most convenient.

PRESENT STATUS OF THE DISTRIBUTION AND TRANSMISSION OF ELECTRICAL ENERGY.*

BY DR. LOUIS DUNCAN.

It is my purpose to take up the different methods of transmission and distribution and to consider the limits that are actually fixed by the present status of electrical development. The question is a commercial one, each problem presenting different conditions which must be considered, but certain general principles govern each case, and our knowledge and experience makes it possible to judge the practicability of each particular transmission.

Generating Plants.—At the present time practically all of the electrical energy distributed is generated in plants operated either by steam or water power, and it is important to consider the conditions of maximum economy in large generating plants, as this bears directly on the subject of transmission and distribution.

Some of the latest steam plants have machinery of the highest possible efficiency, and yet if we consider the price per horse-power of the power generated we will find that it is greater than we expect. This is partly due to the fact that for both lighting and power purposes the load on the station is, as a rule, not uniform and the apparatus is not working under the best conditions for economy. If we take the load diagram of such stations in large towns, we will find that the average output is not greater than 30 to 40 per cent. of the maximum output. We have therefore to supply a large amount of machinery corresponding to the maximum demand on the station, while for distribution a large amount of copper is required that is only being used at its maximum capacity for a comparatively short period of the time. In stations supplying power for traction

* Presidential inaugural address read before the American Institute of Electrical Engineers, September 23, 1896.

Digitized by Google

purposes we find a variation of load, but the variation is a different kind from that found in a lighting station. In the latter the load varies at different hours in the day, but for any particular instant it is practically constant. In the former the average load for different hours during which the station is operated will be practically constant, but there will be momentary variations depending upon the size of the station and the type of traffic. Taking, for instance, a 2,000-h.p. station in Baltimore, I find that the average load is 48 per cent. of the momentary maximum load. This difference in the kind of variation for the two types of stations necessitates employment of different apparatus to obtain the maximum economy for each type. For lighting stations triple-expansion engines may be used, while for traction work, where the variation in the load is sudden and may occur after the steam is cut off from the high-pressure cylinder, it is not well in general to go beyond compound engines, and there is even a question as to whether simple engines are not more economical when condensing water cannot be obtained. In any case, however, it is of the utmost importance as regards economy of operation that the load should be made as constant as possible.

Two distinct types of distribution are used for incandescent lighting in this country — the single-phase alternating current and the direct-current three-wire system. At the present time the former does not permit the supplying of power.

With the alternating system it seems impossible to provide even a moderately steady output, but with the continuous-current system the motor load during the day gives an average output greater in proportion to the maximum. Some years ago the question of the relative values of the alternating and direct current systems was discussed, and for a while most of the stations installed were of the alternating type. At present the tendency seems rather in the direction of continuous-current stations, especially in towns where there is a large demand for current within a comparatively small area. There is a great advantage of direct currents in that they allow the employment of storage batteries, which equalises the load on the station. The efficiency of batteries in lighting stations is comparatively high, while the depreciation has been greatly reduced, and is not now over 5 or 6 per cent. per annum. In most systems, however, the full benefit of the storage batteries is not realised, as the batteries are placed in the station, and while the advantage of an approximately constant load is obtained, yet the further advantage offered in distribution is not secured. I will take this question up later.

As far as traction stations are concerned, their efficiency and output would be increased by the use of batteries, both because the machinery would be steadily loaded and because the most efficient type of apparatus could be used, as is the case in lighting stations.

If storage batteries are used, the two types of variable load belonging to lighting and power stations demand different types of battery. For lighting stations a considerable capacity is required, while the momentary variations of power stations do not require any great capacity, but demand as great a maximum output as battery manufacturers can obtain.

In water-power plants the conditions of economy are different. The location of the plant is, of course, definitely fixed, and the advisability of obtaining a uniform load by means of batteries depends upon the local conditions.

We may conclude that while the practice in large lighting and traction systems is to multiply stations near centres of consumption, yet the economy of a single large station makes it important to consider whether it is not possible to concentrate our power at some point where the expenses will be a minimum, and distribute by some of the methods which have in the last few years proved successful and economical. It is important to make the station load steady, and this may be done for continuous-current lighting and traction plants by means of storage batteries.

Electrical Distribution.—I shall first consider the condition of affairs in a traction system in a large city where a number of suburban lines are operated. If direct distribution is attempted from a single station, it will be found that when the distance exceeds five or six miles a large amount of copper must be employed to prevent both excessive loss and excessive variation of potential on the lines. On suburban lines it is the latter consideration that usually determines the amount of copper used, and this is especially true on lines where there is a considerable excursion traffic. Even in the city itself the supplying of sections at distances three or four miles from the station may require so much copper that it would be less expensive to operate separate stations. Several methods other than the direct method may be employed to remedy these difficulties. For outlying lines where the traffic is mainly of the excursion order, being variable both during the day and for different seasons, boosters may be advantageously used. It is perhaps best from reasons of economy to run the boosting dynamos from motors. If the average station potential is 600 volts, and it is boosted 300 volts, then the copper for a given loss would be decreased in the ratio of 36 to 81. The booster system has the advantage of the direct system when the cost of the additional apparatus together with the increased loss on the line, capitalised, is less than the increased cost of the copper necessary to produce the same result by the direct system. Whether the balance is in favour of one or the other depends on the distance and the variation of the load, and it is indifferent whether the variation in the latter occurs often or not.

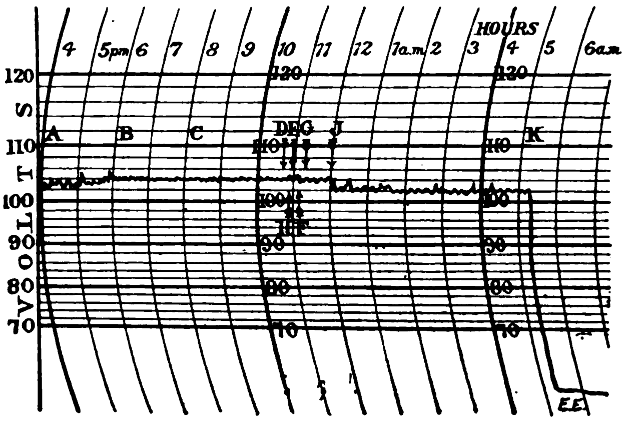
If any transforming device is employed to feed a distant section of the line, it must be remembered that the capacity of the device must be great enough to look out for the maximum demand on this section. Suppose now that we wish to feed some suburban line where the load has considerable momentary fluctuations, but where the traffic is moderately constant during the year. In this case the booster could be used with a storage battery at the end of its feeder, the battery supplying the line. The advantages of this combination are greater than with the simple booster, and in many cases they will compensate for the interest and depreciation on the battery and the loss in it. If the arrangement is properly made, the load on the booster and line wire will be practically constant, thus decreasing the capacity of the booster to that required for the average load, while less copper will be required for a given loss. As to the latter point, suppose a given amount of power is to be distributed in 24 hours, say 200 amperes at 600 volts; if the load is uniform, the loss will be proportional to $200^2 \times 24$ hours. If it is all distributed in 12 hours, the loss will be proportional to $400^2 \times 12$ hours, or twice as much. So in the case of the steady load the same power could be transmitted with the same loss with half the copper. It makes no difference whether the variation extends over 12 hours in 24 or it occurs every other minute, the result will be the same. It is apparent, then, that it is of the utmost importance to keep the line steadily loaded, as well as the station, and this points to the location of the battery near the points of consumption and not in the station. By this system—a booster with storage batteries—it is possible, assuming the same loss, to transmit power to a distance of 10 miles with approximately the same amount of copper that would be required for a five-mile transmission on the direct system. It would increase the economical radius of distribution twice and the area of distribution four times. A single station could economically supply lines within distances up to 10 or 12 miles. If it is desired to still further increase the radius of distribution, it is possible to do this by employing some of the alternating-current methods that have come into use. I will discuss these methods later, but at this point I may remark that the use of stationary and rotary transformers permits the energy to be transmitted in the form of alternating currents, and to be changed again into continuous currents of any required voltage. These rotary transformers supplied by an alternating current which is transmitted from the station at a high voltage may be used to feed the line directly, or they may be used to supply storage batteries which are connected to the line. In the latter case we have the advantage of decreased size of apparatus, of steady load on the station, and of a minimum cost of copper on the line; which system it would be best to employ would depend upon the distances and the character of the line and load.

Digitized by Google

Of the systems that I have proposed for city and suburban distribution from a single station, three have been successfully employed—namely, the booster system, the booster system with batteries, and rotary transformers operating directly on the line. When we consider the advantages of a single station and a steady load it seems evident to me that many of the large traction systems would do well to concentrate their stations into one, and to use the booster system with batteries for their outlying lines, and if necessary use rotary transformers for lines beyond the limit of ordinary suburban work.

THE HASTINGS SWITCH GEAR.

We have received from Mr. L. Andrews the accompanying record of station voltage at Hastings. It shows the regularity of the supply, which is largely due to the use of the synchronising switch gear described in our issue of the 9th inst. The sudden fluctuations so often seen in these curves are, of course, primarily due to variation in the supply, but the magnitude of the recorded variation can be largely influenced by the recording apparatus. Inertia in the moving parts always magnifies sudden alterations of pressure, and, on the other hand, a too strongly damped needle may err in the opposite direction. The curve before us had evidently been inked in by hand before being photographed, and in this way the sharp character of the peaks is lost. Certain points, as G and F, do not in our reproduction show fluctuation, but in the print sent us faint



indications of three to four volt kick can be seen. Mr. Andrews informs us that the unsteadiness between A and B and J and K was caused by a faulty governor on the small engine. Then working 52 15-ampere arc lamps were switched on to the 'bus bars at B, and the regulating resistances were not touched during this operation. Between B and C two 100-unit machines working in parallel were doing between them 214 kilowatts. Between C and D the regulating resistances were never once touched. At 10.30 p.m., D, and again at 11 p.m., E, a machine was switched on to the 'bus bars, which are now always paralleled when the synchroniser lamps are pulsating very quickly. The fall in volts at 11.20 p.m., G, shows the effect of synchronising in the old way—viz., waiting for a long and steady phase. At 10·50 p.m., H, the field of one of the 100-unit plants connected to the 'bus bars was open-circuited. At 11.10 p.m., F, the automatic switch was made to cut out by shutting the stop valve of the engine driving the plant to which it was connected. It is now the usual practice at Hastings, when taking an alternator out of parallel, to shut down the engine and let the automatic switch cut out when the return current passes. We also received an interesting curve showing how soon the switch acts if a bad parallel is made. In the record we see that 3½ seconds after the connection was made the circuit was automatically interrupted owing to a return current, but unfortunately the recording curve does not show the magnitude of the current in question. If another curve given us is to the same scale the value would be about 50 amperes. These curves were taken by throwing a spot of light from an arc lamp on to a mirror attached to the spindle of a Shallenberger meter, the turning torque of which was opposed by a fine spring. The light was reflected from the mirror on to a sheet of rapid bromide paper, moved at a uniform rate by clockwork.

REVIEWS.

Examples in Electrical Engineering. By SAMUEL JOYCE, A.I.E.E. Longmans, Green, and Co. (Price, 5s.)

This is one of a class of books which, well done, possess great value. The mere reader or hearer is apt to be somewhat of a dreamer, and unable to apply his knowledge with exactitude. We are of opinion that although most teachers make much of written answers to questions, their much is far too little. There should be for every branch of industrial work requiring calculations books containing thousands of simple questions upon the subject. The greater the number of simple questions the better, and the more gradual the change made to more and more difficult the better. Practice makes perfect holds good here as elsewhere, and the student's practice ought to be so large and so diversified that when a new problem presents itself little time should have to be wasted in its solution. The making of the large number of examples for practice is no easy task. The writer thinks this or that so simple as to require but one or two questions. It is to him, but not to the learner. Further, there are thousands of students who have to "grind" out the work for themselves without the aid of a teacher, and to them specimen solutions are of the greatest value. To reason correctly is a gift not given to everybody, but many can follow in the same direction their guide leads them. Mr. Joyce, then, is a guide, and, so far as we have examined the book, a good guide. He solves a very large number of problems which may be taken as representative problems, and the knowledge of the way to solve them enables the student to solve similar problems when the terms do not vary too much. Mr. Joyce commences with the consideration of simple circuits, but he is careful to vary the conditions so that the problems cover most of the ground in practice. He then considers distribution and multiple-wire circuits, concluding this part of the subject with Chapter III., which discusses circuits containing more than one E.M.F. A running commentary, or explanation, leads up to each problem, and we must say that, not only in this section, but throughout the book, the problems solved are well chosen. It will not be necessary to deal at length with the chapters or sections, but simply to say that, following the circuits, we have chapters upon dynamos and motors, in which fields, armatures, magnetic circuits, efficiencies, etc., are illustrated. Here we would make a mild criticism. Is it altogether impossible for English writers to avoid using German or Old-English text letters in formulæ? Was it not De Morgan who made much of the right kind of paper and type to avoid eye-tiredness? It would, we think, be far better in these days of hurry to avoid everything that adds to the labour of the physical part of the student, and we think these letters used in formulæ are not distinct enough to avoid trying the eye. Then, again, it would be a boon and a blessing to men if letters were universally used to indicate the same thing, and not that every author followed his own sweet will. What we have said with regard to the unsuitable kind of letters in formulæ may be taken also to apply to the writing on diagrams. Unfortunately, far too many authors like writing with a flourish, which when reproduced and reduced in size photographically becomes almost, or quite, illegible. But to resume. Mr. Joyce considers questions of traction, alternate currents, transformers, capacity, resistances, etc.; altogether giving specimen solutions to some 63 problems, and then gives a list of over 150 more for the student to try and solve. The arithmetical answers to the latter, together with a number of useful tables, complete the book. We have, as stated above, examined a number of the problems solved, and must state that these solutions taken together with the explanatory matter ought to make the book a valuable one in the hands of all students.

TO CORRESPONDENTS.

All Rights Reserved. *Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.*

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	4s. 11d.	9s. 9d.	19s. 6d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVI. of new series of "The Electrical Engineer" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

CITY AND GUILDS.

This institution is assuming larger and larger proportions and becoming the principal centre from which practical technical education is radiated. The Science and Art Department occupies a sphere in education which is not well defined; it was in existence before the City and Guilds, hence the latter had to make a programme which took into account existing work. Such a programme would necessarily differ considerably from one constructed under absolute freedom of action. Thus, we have to consider the work of the City and Guilds Institute as it was possible to make it, rather than as ideally perfect. The report of the examinations department, which has just reached us, presents some curious reading, and suggests that the system possible is not so good as it might be. Take the following passages for comparison: "Since the issue of the last report the number of new teachers whose qualifications have been provisionally or permanently approved has been one hundred and forty-eight." Of course, we assume that all teachers have thus been approved. Now, turning to the report of the examiners on electric lighting and power we read: "The conclusion seems inevitable that in many cases the teachers who are conducting the classes are not engineers at all, but possess a book knowledge only of electrical work." Here, then, in the first place, all teachers are approved; in the second place, some of them are said to be incompetent. Whose is the fault? Surely not with the teachers, but with the men who have approved the teachers, or it may be with the examiners. In the first place, "teachers" as a rule cannot be practical men. They never have been and never can be. Their objective is "teaching," not practice. The examiners are teachers, not practical men. That is conclusively shown by their questions, some of which go far to make us believe that the examiners are just as unpractical in examining as they say the teachers are in teaching. The best teacher savours much of the interpreter. He is not expected, or ought not to be expected, to teach his students how to mix cement, to grind the valve of a gas-engine, to apply insulating material to wires, and so on, but to teach the principles involved in practical work. The actual doing of the thing is learnt in the shops, not in the schools. We could name many a professor, many a teacher, whose lectures and writings are most intensely practical, but who could no more compete with an ordinary mechanic in the management of a lathe than he could fly. We have said the best teacher is an interpreter: he sees the progress of practice, he sees how old principles are newly applied, and the latter knowledge forms the basis of his teaching. The difference between the later school of teachers and examiners and the older school is simply that the former teach principles with a view of their application; the latter taught principles with never a thought to their application. Analysis is probably the basis of most of the teaching of to-day; synthesis was probably the basis of the older teaching. But we are travelling somewhat wide of the report before us. We say it

Digitized by Google

condemns its own actions in that it condemns some of the very teachers it has approved. Reference is made to the similarity of answers with "consecutive numbering." This seems small game for a weighty report. It is what we should and ought to expect, be the teacher good, bad, or indifferent. It will be seen that our idea of what constitutes a good teacher and the institute's idea are not the same. The institute says: "It is desirable that they should have spent sufficient time at their trade to have become skilful workmen; they must have some knowledge of scientific method—whatever that may mean — besides having received a fairly good general education." What would the great educationalists say to this view? Here and there you may find a workman born to be a teacher, but not frequently. The good teacher requires training and apprenticeship just as much as the good workman, and life is not long enough to undergo two apprenticeships. One great mistake of the City and Guilds Institute is that at the Central Institution, where good teachers are supposed to be framed and moulded, there is, so far as we know, no attempt to show the embryo teachers how to teach. The notion that any man or woman who is filled up with technical information or that has passed certain examinations is competent to teach, is an exploded fallacy, although it still seems to be the view of the institute. Lastly, no ordinary student can properly assimilate in one session any one of the three branches in the syllabus of "Electric Light and Power." The student may be crammed to pass—he cannot be taught; and this, again, is not the fault of the teacher: it is the fault of the organisation.

RECORDS.

The advance of the electrical industry is fast weeding out imperfect types in all departments. In the old days of dynamo design, for instance, every maker had his own shape of dynamo field, and often prided himself on the striking contrast between his machines and other dynamos. Experience and extended knowledge has tended to abolish these monstrosities of the early days of electric lighting. Still, these false steps on the road to success are worthy of record, and a museum containing examples of these early types of machinery would be of great interest and value. The men who can from first principles determine *de novo* what is right and what is wrong are few, and the great majority of engineers rule their course by practical experience. The faults and failings of old classes of machinery have from experience been found out, and the inspection of such discarded plant would keep the causes of such failings to the fore. The student or the practical man would in such a museum be able to study the steps in the perfection of any apparatus for a specific purpose. In this way the time expended by some in reinventing old types or in perfecting new apparatus on the trial and error system would be saved, and could be put to more remunerative purposes. Our readers will notice a letter from Mr. Clement E. Stretton on the formation of a museum for railway signalling apparatus. We agree with him as to the advantages to be derived from such an institution, but think that it might be a branch of the present Patent Office Museum at South Kensington. In the galleries of this museum several electrical exhibits are to be seen, and in some cases prominent electrical engineers have presented series of apparatus showing developments of the type now manufactured. The successive exhibits are clearly labelled with dates and short descriptions. These gifts to the nation are to be highly commended, and we hope to see the example largely followed.

HONOUR WHERE DUE.

The news that the King of Servia has created Prof. D. E. Hughes a Knight of the Royal Order of Takovo will be welcomed by all. The history of this eminent scientist is one of great successes followed by well-deserved honours. His inventions in telegraphy have been almost universally adopted, and it is most pleasing to find that this fact has been acknowledged by most of the ruling powers in Europe. The no less valuable invention of the microphone can also be claimed by Prof. Hughes, and in this case the discovery was given to the public gratis. We are able, through the courtesy of the newly-created knight, to give the contents of the letter from the Servian Ambassador which accompanied the Grand Officer's Star and Collar. The letter reads as follows:

Dear Professor Hughes,—It has been brought to the knowledge of his Majesty the King of Servia that not only the Servian State Telegraphs are employing the type-printer—the invention of which has so justly established your fame throughout the civilised world—but that at a certain period of your brilliant career you honoured the capital of Servia with a short sojourn, and were kind enough to explain the principles and mechanism of your invention to the Telegraph Department of State there. His Majesty, who takes great personal interest in the progress of physical science, was further informed of the important services which you have rendered to science and the world by your other inventions and discoveries. His Majesty thought that Servia owed you a public recognition of the services done her, as well as an expression of appreciation and admiration of services which you have done the whole world. Influenced by such sentiments, and believing that it would be an honour for the knights of the Servian royal orders to number you among them, his Majesty has been pleased to confer on you the Grand Officer's Star and Collar of his Royal Order of Takovo.

I congratulate myself on my good fortune in having been instructed by his Majesty, my august master, to convey to you his high appreciation of the services you have rendered the world at large, and in some measure also to Servia.—I have the honour, dear Professor Hughes, to be your most obedient, humble servant, (Signed) Ched. Mijatovich.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

HONOURS TO PROF. D. E. HUGHES, F.R.S.

Sir,—I am directed by his Excellency the Servian Minister to inform you that his Majesty King Alexander of Servia has conferred upon Prof. David Edward Hughes, F.R.S, the Grand Officer's Star and Collar of the Royal Order of Takovo.

His Excellency desires you will kindly state the reasons actuating his Majesty in conferring this honour upon the distinguished electrician—viz., that his Majesty, who takes great personal interest in the progress of physical science, has been especially interested in the type-printer which is employed by the Servian State telegraphs service, the

Digitized by Google

invention of which has so justly established Prof. Hughes's fame as a great inventor; and, further, that his Majesty has informed himself as to other important inventions and discoveries of the learned professor, in particular the microphone, and his Majesty considered that Servia owed Prof. Hughes a public recognition of his efforts as well as appreciation and admiration of services which are of great advantage to the whole civilised world.—Yours, etc.,

H. W. CHRISTMAS,
Consul-General for Servia in London.

The Royal Servian Consulate-General in London, 42A, Bloomsbury-square, London, W.C., Oct. 29, 1896.

THE BLOCK SYSTEM.

SIR,—Having read with great interest the articles of Mr. J. Pigg (p. 456), I beg to ask that gentlemen to have the goodness to state when the block system was first introduced?

Every few years a person claims in all the papers that he invented the block system in 1865; but, of course, all railway engineers know that it was in use in its present form in 1853, and in other forms in 1839.—Yours, etc., CLEMENT E. STRETTON.

Leicester, October 26.

[We shall be glad if Mr. J. Pigg can give us any early history of the subject. Mr. Stretton's letter, however, appears to answer itself, and a copy of his collection of early records of the block system would be of great interest.—ED. *E. E.*]

A NATIONAL RAILWAY MUSEUM.

SIR,—Electric apparatus is such a very important part of railway working, that I beg to call your attention to the very great necessity which exists for the formation of a national railway museum in which all details of block systems, telegraph, interlocking, etc., could be preserved.

For ten and a half years I have urged the importance of such a museum, but at the present time there is every reason to believe that the required result will be attained, and as soon as it be formed it is my intention to present the whole of my large railway collection thereto.—Yours, etc., CLEMENT E. STRETTON.

Leicester, October 26.

RE INDIARUBBER INSULATION.

SIR,—From various quarters signs of restlessness arise as regards the present practice in wiring for electric light. Some authorities differ, and all of them—apparently with one accord—suppress their dogmatic wrath wherever they meet with bold, bad men who ignore or defy the Phœnix or minor "rules" which a year or two since none but the very elect dare run counter to. New rules are expected; and as it is the *un*-expected that is likeliest to happen, the electric lighting world is in a feeble state of agitation concerning the outcome. No better time can come for a review of the canons of authority on insulating materials. The best judges may be most surprised at what I wish to emphasise, but when I have placed a few pregnant facts in their natural order I have no doubt one or other of the few fit, fair, and fearless experts will take up the parable and point the moral.

Thirty years ago I found indiarubber condemned and out of use as an insulator, whilst guttapercha was everywhere in supreme favour. Secondary materials—such as Stockholm pitch, tar, paraffin wax, marine glue, and Chatterton's compound—had their uses and kept their places; indeed, they hold their own even now under ever-varying *aliases*, especially "Chatterton's compound," whose strongest mark of distinction is that it never was "Chatterton's," and that its component parts are not found in Chatterton's specification. Such is business. But the significance of this bald relation of facts consists in the ignominious confusion in which the whole question is involved. Practically and broadly speaking, after 30 years ringing the changes on the above materials we are "no forrader." This is no doubt owing chiefly to the manner and conditions under which electric lighting has occupied—almost monopolised—the stage. How does indiarubber stand in this connection? Thirty years ago I found the very reasons why indiarubber was put aside were the very reasons why it should have front rank in all but submarine insulation. All demand for it had ceased, and Silvertown had distinctly and emphatically thrown it over in favour of its great rival—guttapercha. Even the most strenuous resort to vulcanising did not save it. But having intimate acquaintance with the article in all its states, qualities, and conditions, I set up wire-covering machines and kept an old Silvertown wire coverer doing nothing but rubber-covered wire for all my electric bell work, and in 1873 Silvertown had to buy rubber-covered wire of me to supply importunate customers. I do not state this as any discredit to them or credit to me. I simply relate the facts to show that indiarubber, after being condemned and crushed by vast guttapercha interests, rose again by its own virtue under fair trial, and now, after figuring very largely in the electric lighting world, would die out "unhonoured and unsung" in a very similar way to that of 30 odd years ago. For look how it poses now. The same stage is arrived at as was reached in 1862. Wherever insulation of importance was wanted the sophisticated article was covered and "protected" with vulcanised rubber. The short respite soon ended, for who does not know that after three or four years' exposure to varying temperatures vulcanised rubber rots, and injures rather than protects its more tender though more durable *protégé*? Whilst waiting the next move it may be interesting to enquire if any of the consumers of the manufacture are aware that, although it is quite easy to obtain natural rubber covering in its pure unsophisticated state, there is not a bit in the market. In 1880, writing in the electrical Press, I said, after enforcing the superior claims of indiarubber over its rivals, "pure rubber, not the article which passes under the name, but which has all its virtue masticated out of it." I have specimens of elastic rubber, which have been in my possession 38 years, as sound as ever, and others—including some dentist's "dam" rubber only three years old—rotten as tinder. Whereas the natural rubber, cut into tape direct from the "bottle" or other crude form, is practically everlasting. Nor let anyone be led by the nose by the knowing ones, who would have you believe that it is impracticable *now* because of the wicked natives, who, in spite of Manchester and other morality teachers, do persist in loading the bottles with so much dirty grit that if the knives would cut the tape the tape would not be sound, and therefore worthless for the purpose. It is not true. The truth, is there is a *possible* saving of not more than 10 per cent., and a loss of efficiency about 30 per cent., and of durability about 99 per cent. As no one professes to use anything but best Para rubber for wire insulation, it may be as well, in anticipation of the objections currently bandied about, to refer to the well-known description of the Para rubber district, published under the title of "Fifteen Thousand Miles on the Amazon and its Tributaries," by Brown and Lidstone. The professional survey of the district by the authors, occupying several years, gave them an unparalleled opportunity for witnessing innumerable instances of rubber collecting and smoking, and I have the most positive assurance from one of the authors that there is no inducement for the collectors to let any grit or other foreign substance mix with the rubber, but rather the other way, for very practical reasons. This is further corroborated by the manager of one of the large rubber-manufacturing companies, who from 40 years ago down to the present time has known no difficulty in getting virgin rubber sound and solid, fit for cutting tape direct from the crude bottle.

Now, to save a possible 10 per cent.—really an unnecessary allowance if wire-coverers would only look to the credit of their craft—a loss of more than half its value and nine-tenths of its natural life is submitted to by using rubber that has been through the "masticating machine," and still further ruined by a chemical solvent.

This matter is of such paramount importance that many well-informed lay members in the electrical world are looking for a little scientific accuracy to be applied to it. Perhaps the society will move in the matter.

At first sight it may seem strange that if there is so

Digitized by Google

much difference in the insulation value between the rubber cut direct from the bottle and that which passes current amongst experts as pure Para rubber no one should have made a stir about it. It may be as well to review the points involved in this strange situation. The electric lighting boom, which culminated in 1882, got no impetus from any great invention or discovery in the insulation of wires. The experts in lamps and dynamos were content to take to indiarubber insulation as a tried servant with a good character, and the assurance of wire-coverers that they used none but best pure Para rubber was probably quite *bonâ fide*, and no one on examination would be likely to dispute it.

It need not be surprising that the article known everywhere in the trade as the purest and best should pass muster. Yet all along the fact remains that no indiarubber that has gone through the masticating process, or has been dissolved in any liquid, can be truly said to be pure in any sense worth placing in the category of scientific accuracy. The moment the question is raised in a critical spirit, which is the proper spirit for such a question, it will be seen how caution is suggested by the first step in the departure from nature. It sounds very rough and ready to hear that when the Zeringa juice is tapped from the tree it is collected on a mould and smoked layer after layer. Yes, smoked! But what smoke; and why will not *any* smoke do? Surely here is a case where caution is indicated if only one kind of smoke is found to suit. From this stage forward scientific accuracy is cast to the winds—the only scientific accuracy observed being the formula laid down by the South American Indians of past centuries. It may not seem practicable to stick to the Indian formula only for wire covering, else the obvious plan would be to let the wire serve as the mould, and get the Indians to run the wire through the milk and smoke in a running line. It would be much simpler than the present plan and more economical, for the smoke "sets" the milk quickly enough for a raw Indian to do about three miles of wire a day, and a uniform thickness at that. The only item that does not work out right is, who is likely to have pluck enough to believe in such a simple solution, and no patent rights in the way, too? Meanwhile, the question here at home is, what is to be done? For supposing it is true that the only way to get long-lived rubber covering is to cut the tape direct from the bottle. Are there no contingencies to count on, such as frost, etc.? My reply is *no* to all the idle queries all down the line. And here is the reason for raising the question now. Every electrical catalogue gives chief position to indiarubber as a wire insulator, and every week in one or the other of the electrical journals there are accounts of breakdowns from faulty insulation. Yet no distinctive pronouncement as to whether we have or have not a safe material for long-lived insulation. If not indiarubber, what other material is there to take its place? Time has been required to confirm or confute the claims of the numerous new nostrums that have been and gone quicker than leap years. Leaving this as the outcome—viz., guttapercha a good second, indiarubber only a good first, when qualified by a vulcanised outer, and only that because the time trial is not over. The outsiders are still taking care of the favourites, and by their aid "hope" still "tells a flattering tale" and makes good business. Even with them the trouble is to tell where and when their turn comes; fancy is so free, and system so carefully avoided. But would it not be feasible to borrow a little science from the turf and try to handicap the well-known public performers—to wit, Stockholm tar, linseed oil, resin, paraffin wax, gum Damara. Mixtures of these, without mentioning members of any other allied gums, may be varied in so many plausible ways that the first attempt to give proper weight to their respective merits would need severe trials to prove them. Probably the only combination that offers any present opportunity for the requisite "sacredness of accuracy" to have "a look in" is that which passes under the name of "marine glue," but even in this case great care at the outset is needed, for there have been several variations always in use to suit various purposes. And when all that could be hoped for could be attained, a thorough realisation of how evanescent the spirit that binds these matters together would strongly emphasise the importance of making sure whether we have or have not in indiarubber a unique, simple, and truly natural material that contains within itself all the qualities which the smartest efforts would desiderate. As for vulcanising it to save it there are numbers of good trustworthy judges accessible to any man of business in a serious mood who will accentuate the futility of expecting *that* to preserve its homogeneity. The purest and in every sense the most perfect specimen of vulcanised rubber—probably unmatched for carefulness in its production—is a book with thin creamy flexible leaves, bound in carved ebonite, that was got up for presentation to her Majesty the Queen by Charles Goodyear, the inventor and perfecter of the process. This was done and accepted by the Queen in 1856, and the leaves will prove which lasts longest—the natural or the manufactured article, for in the same collection are specimens of the raw material. This is a practical court of appeal, if other facts are too evasive. But all difficulty will probably disappear if the parties most interested in the matter will only bend to the occasion and look carefully into it.

Meanwhile, the only alternative resort is in metal sheathing or concentric wiring (line inside and outer for return), for that is a protection that will greatly lengthen many short-lived materials. As the electrical world has had this plan before it since I first specified it in 1873, it presents another instance of hope deferred and the slow growth of sound practice. At its best, however, it must leave so much branch wiring to be done with more pliable conductors that the opening problem will need solution. I conclude with the modest challenge that my solution holds the field; and I can refer to buildings wired 30 years ago with miles in each of single, double, and treble rubber coverings that will bear out the claim.

Since all these considerations ought to have some more or less definite relation to the "rules," "Phœnix" or "Institute," I refer with perhaps pardonable satisfaction to my criticism of them in 1882, as not only have my forecasts proved true, but there still remain vexing dicta with little apparent help over difficulties, emphasised, but not elucidated, as "rules" should in some measure indicate.

The final query that will crop up may as well be met at once. It will be asked, can a simple test be applied to prove whether one really gets the natural, unsophisticated article when insisted upon? The answer is emphatically *yes*, for if it deceived the eye it would not deceive the touch or the handling when its differential characteristics were once pointed out.—Yours, etc.,

Camberwell. WALKER MOSELEY.

PURE OR APPLIED SCIENCE.

SIR,—The "Catalogue of Scientific Papers" compiled and published by the Royal Society of London was intended to serve as an index to the titles and dates of scientific papers contained in the *Transactions* of societies, *Journals*, and other periodical works. This catalogue is highly valuable to all technical enquirers, and it is a matter of deep regret that the international conference held under the auspices of the Royal Society of London has decided that the international catalogue of scientific literature, which is to begin with 1900, is to relate to pure science only, applied science being strictly excluded. It is possibly too late to remedy the position, which is probably due to absence of representatives of technical societies at the international conference.

It would seem desirable, further, that there should be a conference of technical societies to discuss the publication of a subject-matter index to technical and scientific periodicals. This institution has had for some time before it the question of the publication of such an index of subjects of interest to mining and metallurgical engineers; and probably a comprehensive index to engineering and other technical papers would prove more valuable.

This suggested conference of technical societies might also consider other questions which interest technical societies individually, but which they are unable to obtain owing to want of concerted action. Thus, such an association might approach the Government on such questions

Digitized by Google

as the excessive cost of postage of *Transactions*, as there can be no valid reason why they should not be placed in the same position, although their *Transactions* are issued at varying intervals of time, by a short Act of Parliament as an ordinary weekly newspaper.

And there are many other matters which no doubt crop up in connection with the carrying out of the objects of individual societies in which concerted action would produce valuable results.—Yours, etc.,

M. WALTON BROWN, Secretary.

The Federated Institution of Mining Engineers, Newcastle-on-Tyne, October 21, 1896.

A DISCLAIMER.

SIR,—It has come to my knowledge that reports have been circulated that I am acting as consulting engineer to the Mile End Guardians. I shall be obliged if you will allow me to state that such is not the case, as my appointment with Messrs. Crompton and Co., Limited, prevents my acting in such a capacity.—Yours, etc.,

B. H. JENKINSON.

TECHNOLOGICAL EXAMINATIONS.

We have received an advance copy of the report on the work of the examination department of the City and Guilds of London Institute. The general features of the educational scheme are referred to in our leader, but the following abstracts of the examiners' reports on electric subjects will be of interest to our young subscribers:

Telegraphy and Telephony.—A noticeable feature of the examination is the still further advance made in the number of candidates who have entered for the telephony paper, this total being 53 against 31 for last year, or an increase of 21. The increase, however, it may be mentioned, has not been entirely at the expense of the telegraphy paper, as the number of candidates who attempted the latter was 80, against 89 last year, or a diminution of nine only. The interest in telephony has doubtless been very largely due to the fact that the telephone system of the United Kingdom is gradually passing entirely into the hands of the Postal Telegraph Department, the members of the staff of which presumably form a very large proportion of the total number of candidates examined. In the honours grade in telegraphy the percentage of failures has not materially changed, being 26·2 per cent. against 27·0 per cent. for 1895. The telephony results are not quite so good as regards percentages, though the actual number of candidates who passed first class is actually greater than in 1895, being 26 against 23; and this also applies to the second class, the numbers being 17 and 6 respectively for 1896 and 1895. Taking the examination as a whole, I think the results are not unsatisfactory, though there are indications that the training of the candidates who attempted the ordinary or pass grade leaves something to be desired. Take, for example, Question 2, which is definitely laid down in the syllabus as a subject for examination; very few indeed of the candidates had any idea of what is meant by an "absolute galvanometer." Question 6, which was attempted by many, and which was set as a test of general education, was answered incorrectly in almost every case. Question 15 produced a group of curious answers, very few indeed of the latter even approaching correctness. This question at least, it might have been expected, would not have been beyond the knowledge of the majority of the candidates.

Electric Lighting and Power.—The examiners have been struck with the exceedingly bad quality of the sketches and diagrams in the answers both to the preliminary and to the ordinary papers. Candidates do not seem to have had any proper training in making dimensioned hand sketches, nor in the correct methods of drawing electric circuits. The examiners also note that a very large proportion of the failures arise from the unreal nature of the information possessed by the candidates, and from the parrot knowledge which so largely does duty for an acquaintance with the subject. Candidates who cannot give simple answers to quite elementary questions in the technics of the subject, and waste their energies in calculating to many places of decimals numerical deductions from data having only three significant figures, cannot be regarded as qualified to receive certificates of efficiency in this branch of engineering. The conclusion seems inevitable that in many cases the teachers who are conducting the classes are not engineers at all, but possess only a book knowledge of electrical work. Such an inference is confirmed by the occurrence amongst the answers of batches of answers of which the consecutive numbering shows that they come from the same school or centre, wherein, in spite of the wide choice given to candidates from which to select, there is a lamentable failure to attain even a second-class pass. The percentage of passes in the honour grade is much higher than in the ordinary grade, and of the honours passes more than half are of first-class quality, whereas in the ordinary grade not only more than half the candidates totally failed, but of those that passed the greater part only succeed in obtaining a second class; the number of answers that are good enough to qualify for a first-class ordinary certificate being relatively very few. In this respect there is a distinct falling off in the answers as compared with previous years. In Branch III. of honours, dealing with central-station work and electric traction, there is a decided improvement both in the number and quality of the answers; but in Branch II., dealing with dynamo construction and allied subjects, the answering is poor and the number of papers small.

Electro-Metallurgy.—The high standard of last year has not been maintained, but the papers show a fair average of knowledge, and a large proportion of those who pass are in the first class.

The fact that instructors without practical experience cannot impart real technical knowledge must be evident to all, and the institute has this matter in their own hands to remedy.

LOCOMOTIVES ON HIGHWAYS ACT.

The motorcart regulations of the Local Government Board have not yet been issued, but as the Board has forwarded draft copies to all the county councils of England and Wales, the metropolitan vestries, and all other highway authorities, the nature of the regulations is a very open secret. A motorcar, or "light locomotive," is defined as a "vehicle propelled by mechanical power which is under three tons in weight unladen, and is not used for the purpose of drawing more than one vehicle (such vehicle, with its locomotive, not exceeding in weight, unladen, four tons), and so constructed that no smoke or visible vapour is emitted therefrom, except in temporary or exceptional circumstances. If a car exceed 3cwt. in weight, it shall be capable of being so worked that it may travel either forward or backward, and whatever its weight it must not exceed 7½ft. in width, measured between its extreme projecting points. As to tyres, the order says that if a car weighs between three-quarters and one ton, the tyres must be not less than 2½in. wide; if between one and two tons, 3in.; and if between two and three tons, 4in. There must be no bosses or projections, except in the case of pneumatic tyres. Every car must be provided with two independent brakes in good working order, and so powerful that if the car is travelling at the rate of 14 miles an hour it can be stopped within a distance of 50ft. As in the case of ordinary vehicles, the name and address of the owner must be written upon the side of the car, which must be driven by a person competent to control it. Lamps must be carried at night, and it is required that the driver shall, whenever necessary, give audible warning of the approach of the car. The driver must also, on the request of any police-constable, or of any person having charge of a restive horse, cause the car to stop, and to remain stationary so long as may be reasonably necessary. On the subject of speed the Local Government Board, after reminding the highway authorities that the Act provides that motorcars

Digitized by Google

shall not be driven at a greater speed than 14 miles an hour, states that it proposes to make no order regarding the question of speed until the general regulations have come into operation.

INTERNATIONAL SUBMARINE TELEGRAPHY.

With the sub-title of "A Protest," the following appeared in the *Pall Mall Gazette* on Wednesday:

"The proposed international memorial 'To the Inception and Extension of Submarine Telegraphy' appears to have created some stir, and a good deal of correspondence in the *Times* concerning the justice of especially associating with it the names of the late Sir John Pender, Sir James Anderson, or Mr. Cyrus Field. The official letter from the secretary—said to be 'authorised,' but certainly not by his committee generally—sounded very much like dropping a hot poker. We shall be exceedingly surprised if the scientific men whose names have been made use of (on the committee) in connection with this scheme consider it an honour to have their departed chiefs and fellow-workers 'tacked on' to the above three names in any secondary position. It would seem that, if any three names are set up as the pioneers of submarine telegraphy, they should be those of men who have rendered it an accomplished fact by engineering skill and electrical devices rather than three financiers of this branch of scientific enterprise; the more so when we remember that submarine telegraphy could not possibly be financed until there was something practicable to finance. Lord Kelvin, the late Sir Charles Bright, Sir Samuel Canning, the late Mr. T. R. Crampton, the late Dr. Werner von Siemens, the late Mr. Cromwell Varley, Mr. Latimer Clark, and Mr. F. C. Webb are all pioneers of this work in a strictly professional sense, though none of them has made the large fortunes out of it that the financiers have been able to. We are of opinion that a memorial to such as these would be infinitely more suitable, for it is their early accomplishments which have enabled the capitalists to amass these very fortunes.

"In the event of a memorial being erected to the sister branch of engineering, we find it hard to imagine that Lord Stalbridge, Lord Emlyn, or Lord Tweedmouth—as chairmen of the three largest railway companies—would put themselves in a false light by posing as the pioneers of our railways. And yet there would be just as much sense in this (or in that of immortalising Hudson, the 'railway king') as in putting forward the names of Sir John Pender, Sir James Anderson, and Mr. Cyrus Field as representatives of the inception and extension of submarine telegraphy. Just now, civil engineers seem to be having a bad time of it. On the one hand they are constantly elbowed by the Royal Engineers out of work that distinctly pertains to the civilian; and, on the other, commercial men show signs of laying claim to glory and honour that certainly belongs to the civil engineer."

APPLIED ELECTRO-CHEMISTRY.*

BY JAMES SWINBURNE.

LECTURE IV.

(Continued from page 468.)

Again, if hypochlorites or chlorate get to the cathode they will be reduced wastefully. But these are conditions that would not occur in a rationally conducted works. If you put salt into a vat and stir it round during the electrolysis, the result will obviously be that very soon hypochlorite will be formed in large proportions at the anode to be reduced again at the cathode. But then nobody tries to make soda and chlorine that way. Suppose, however, that the liquid is still, and there is a porous partition. Start with all chloride. Chlorine comes off at the anode and hydrogen at the cathode, and caustic appears at the cathode. We now have, in the anode compartment, chlorine moving towards the anode, and sodium towards the cathode. In the immediate neighbourhood of the cathode we have both caustic and chloride. We thus have the current there borne by the sodium moving towards the cathode, and also by hydroxyl ions moving towards the anode, and chlorine ions moving towards the anode. Eventually the hydroxyl ions will reach the porous partition, and they will finally go on into the anode chamber, and we shall there have caustic which will take up chlorine and make hypochlorite. This, I take it, is Dr. Hurter's difficulty. If the current were borne entirely by the sodium and chlorine, all the chlorine would eventually move into the anode chamber, and all the sodium would move into the cathode compartment. In practice, however, we have to run brine into the vats continuously, and run off caustic solution. The ionisation of the caustic and salt depend on the strength of the solution with regard to both. I need not take actual figures, as it will serve my purpose to suppose for the moment that all the current is borne by the hydroxyl, the chlorine and both lots of sodium ions being idle and not migrating at all. Of course in the anode chamber, where I assume no caustic for the moment, the current must be borne by the chlorine. Then we have a sort of army of hydroxyl ions marching from the cathode towards the anode at a certain rate. We admit the brine to the anode compartment, and we draw off caustic liquor from the cathode chamber. Then all we have to do is to feed the brine at such a rate that the whole of the liquid moves at the migration velocity of the hydroxyl. The hydroxyl then really stands still and never gets to the anode. What is drawn off is really a mixture of salt and caustic. The vat has full efficiency, as hydrogen comes off at the cathode and chlorine at the anode. The current being borne by the hydroxyl makes no difference in the current efficiency of the vat, as the current borne by the hydroxyl is just as effective as that borne by the sodium or chlorine ions. The real difference is in the amount of salt it is necessary to draw off with the caustic. If the current were all borne by the chlorine, we could get pure caustic solution off. The relative ionisation of the salt and caustic affect the proportion of salt and caustic drawn off, and thus influence the cost of finishing; but they do not affect the current efficiency. I hope I have not misrepresented Dr. Hurter in any way.

In the case of making chlorate, all that is necessary is to feed the potassium chloride in at the cathode end, and draw off the chlorate at the anode. The same vat gives either product, according to the direction of the fluid current. Of course the chlorate vat must be hot, and as the anode liquid is not acid, platinum anodes are available. I tried small chlorate vats on this principle some years ago, but have made very few and imperfect experiments on caustic soda.

COPPER REFINING.

There is but little to be said about copper refining or the electrolytic extraction of the metal from its ores. A great deal has been published about refining, and still more about various schemes for extraction, and there would be little use in repeating such accounts here. At the same time, there is a great deal—as Badt points out—that is not published. Copper refiners seem to think they are working a magic secret process, and that if they keep all the details to themselves no others will be able to compete with them. Such ideas are commonly to be found among workmen, but are seldom encountered among educated people; and the probability is that the various copper refiners are working their processes as badly as they can be worked, and understand very little about electrolytic work. The unfathomable secret guarded by copper refiners seems to be the use of anodes and cathodes of copper in a solution of copper sulphate. As regards details of management or of processes, such as the best temperature to work at, or the best method of circulating the liquid, there can be very little to learn. It would be much better, however, for electrolytic copper refiners to publish results and compare notes, as if they are competing with one another any knowledge shared equally among them makes no difference, but it puts them all in a better position as competitors in the race with refiners who use ordinary metallurgical methods. The same sort of thing went on in early days among incandescent lamp makers, and, in fact, it still goes on. Fortunately, workmen are migratory, and wander from factory to factory, so that each factory knew what the others were doing, but thought its own processes were profound and valuable secrets. The more insignificant the works, and the more idiotic the process, the greater was the secrecy observed.

The main difference between two classes of copper refining processes consists in the series or parallel coupling of the plates. From a purely electrical point of view, this looks like a distinction without a difference, but there is more in it than appears at first sight. It makes little difference in the energy used per ton of copper refined, the only source of divergence being the numerous contacts in the parallel system. When a vat only takes a fraction of a volt, a large proportion of the power may be wasted on imperfect contacts.

The series arrangement, however, saves a good deal of money in the leads, and greatly simplifies the connections. It is often supposed to have some magic efficacy in giving a greater output of copper for a given power, but that is absurd. Its great

* Cantor lectures delivered before the Society of Arts.

Digitized by Google

advantage really lies in its needing less copper in the vats for a given output. This may seem a small matter, but if prices are worked out it may mean a very important saving. Take an example. Suppose copper is deposited at, say, five amperes per square foot; and suppose the anodes are cast, say, ⅝in. thick, and are eaten off both sides. Roughly, the anodes will take two months to be deposited on the cathodes. Take the case of a refinery dealing with a thousand tons of copper per month. This means that 2,000 tons are in the vats. As a matter of fact there will be a little more, but we can take 2,000 tons as a good round figure. The value of this copper at £60 per ton is £120,000. Now the question is, what value is capital to the owners of the refinery? They might perhaps be able to borrow money partly on the security of the copper at a low interest; but it is more likely that money is worth 6 per cent. to them, or, in other words, that their works give 6 per cent. on the capital sunk, and would give at least that interest on any further money sunk safely in enlargement. The interest on the copper in the vats is thus £7,200 a year, or £600 a month. As the output is 1,000 tons a month, this means that the price of refining copper is increased no less than 12s. a ton for interest on the metal in the vats. It is then of great importance to keep down the amount of copper going through the works—that is to say, to make it go through quicker. A little can be done by removing the cathodes when they are ⅜in. thick instead of ⅝in. and putting new ones. This reduces the 12s., not to 6s., but to something above 9s.; how much above 9s. depends on the cost of the initial cathodes. Many people may say there are such quantities of copper all about a copper refinery that it makes no real difference whether it is in the vats or in the stores. This argument is fallacious, for the copper in the vats is not available to fill orders like the finished copper in the stores. The stock of crude copper is merely a kind of buffer or regulator to take up the variations in supply, and give a constant feeder to the refinery: the stock of finished copper is to enable a slow and steady production to cope with sudden and irregular demands. The copper in the vats cannot act in either way, and is quite independent of the stocks held, and it cannot be drawn upon. It therefore represents capital lying idle. It is still an open question whether the series arrangement, as series arangement, saves money. At the Bridgeport works in Connecticut, which are I think the largest electrolytic copper-refining concern in the United States, the system worked out by Hayden is used. The anodes are rolled and are quite thin. I forget the dimensions just now, but think they were about ⅛in. when I saw them. They were arranged in wooden vats taking something like 120 volts, connection being made to one at one end, and to a special cathode at the other. Each of the intermediate plates then becomes both cathode and anode, as one side of it is eaten away, while the other has copper deposited on it. As the plates are rolled they are eaten and deposited very evenly, and the process is carried on till very nearly the whole of the copper is transferred. As the deposited copper never sticks tight to the plates, the remains of the original anodes can be picked off the refined copper. There is, of course, a certain amount of scrap anode which has to be remelted and rolled again, but as no leads have to be connected to the anodes, and as they are finally supported by the deposited copper, they can be consumed much more completely than in the case of thick cast anodes. The saving is thus essentially in the use of thinner plates, and in the cost of doing away with the necessity for making electrical connection to each plate with its attendant loss of power, due to inferior contacts. The saving in leads about the vat-house is also considerable. The most important of these points is undoubtedly the thinness of the plates in the vats. There seems no reason, however, why equally thin plates should not be used in the parallel system. There is no reason why the parallel system should be tied down to cast anodes, which must be fairly thick to allow of casting. It might be possible to cast the anodes thinner by adding a little extra silver. I have heard that a very little silver allows copper to be cast well, but do not know if that is correct. The silver would practically all come out again in the refining. Whether a trace of aluminium would do is another matter. It would, of course, be lost, and would gradually accumulate in the bath. These are merely crude suggestions. The series arrangement has been worked out, no doubt independently, by Smith, Hayden, and Stalmann. Who invented it, I do not know. It is described in a pamphlet by Hugon, dated 1885, but I do not know that any copy came into England or America until several years later. Hugon discusses the question of economy of capital sunk in copper going through the process; in fact, it is his main point, and he makes out that the series arrangement is cheaper, but it is difficult to see why, unless the series arrangement alone allows thin anodes and cathodes to be used. Hugon also discusses the use of cuprous chloride. Cuprous chloride gives twice as much copper as cupric sulphate with a given current; but that is not everything, and unless the resistance of the vat is so low that twice the pressure is not necessary, this does not pay. It might be said that a specially low current density might be used, but that means sunk capital again. I do not know at all how far the chloride would do, as it might carry over impurities that remain in the slimes in a sulphate solution. Copper nitrate gives good deposits of copper with enormous current densities, but it is probable that silver and, perhaps, gold are carried over. Swan has made numerous experiments on rapid deposition from the nitrate, but has, I think, published nothing as to its use in refining argentiferous copper. The presence of a very little chloride might prevent silver coming over, but it would hardly stop gold.

Stalmann, who was for some time manager, and who designed the Anaconda electrolytic copper refining works, uses a very ingenious series arrangement. Each plate has paper stuck to one side. A few copper rivets are put through, and the paper is blackleaded. This gives a paper cathode, which separates the deposited copper from the crude, and gives no trouble in separating the scrap anodes from the good deposited cathodes.

It is often supposed that everything electrolytic is pure. Unfortunately, this is not necessarily the case. Electrolytic copper is nearly pure, but it is generally, if not always, contaminated with antimony. It is probable this small trace of antimony does harm, as it most likely reduces the conductivity appreciably, and may alter the non-electrical physical properties of the metal. Antimony can be separated from copper by electrolytic analysis. What is wanted is a method which is possible on a commercial scale.

By the way, there is no space here for a discussion of electrochemical analysis, but there is just room for an urgent appeal to analysts not to measure electrical quantity in terms of bang-gas. Until quite lately, electroplaters and writers on electrolysis used the Smee cell as the unit of everything. When they told you they had passed the current of 57 Smee cells through anything, they thought they had given you information. The Smee cell, as a fundamental unit of everything, still lives in the somewhat muddled minds of many writers on electrolysis and electroplating of the old school. But in electrochemical analysis—which is a new branch of science—surely we might expect chemists to work with volt and ampere meters, and to use the methods of other scientific men.

Calcium Carbide.

This compound has created an enormous sensation in the financial world, or at least in the speculative part of it, during the last year or so. As far as its discovery in America goes, it appears to have been a mere matter of chance, an invention in the literal meaning of the word. The formation of calcium carbide from carbon and lime seems to be a mere question of temperature, and to have nothing to do with electrolysis. It may be that lime and carbon do not react until the lime is fused or the carbon volatilised, and that the temperature of the electric furnace is needed to bring this result about. It is probable, however, that the very high temperature is necessary to bring about the reaction, apart altogether from getting the lime and carbon into contact. I have tried some experiments with an oxygen furnace, and have not succeeded in making calcium carbide even when I used a solvent for the lime, so that there was no doubt that it came into contact with the carbon. These experiments were not tried thoroughly enough to be conclusive, but they tend to show that an exceedingly high temperature is needed. It is hardly necessary to say that an oxygen furnace—that is to say, an ejector furnace fed with an oxygen and coal-gas blow-pipe—gives a pretty high temperature.

The future of calcium carbide depends very largely on its cost of manufacture. It is, of course, very absurd to take the cost of coal, lime, and energy, and calling that the cost of the carbide, to compare the cost of a candle-power hour with that of gas as charged to the consumer. The prime cost of gas as delivered into the "hydraulic main" would be the right thing to compare in such a case, and would tell a very different story.

(To be continued.)

THE RATHMINES TRAMWAYS.

The question of the proposed purchase of the tramways by the Township Commissioners is exciting a good deal of discussion in this large suburb of Dublin. The Commissioners have held several meetings in connection with the subject, and a long letter has appeared in the *Freeman's Journal* from Mr. W. M. Murphy. At the last meeting of the Commissioners a lengthy report by the Parliamentary Committee was adopted, and a resolution to promote a Bill in Parliament authorising the Board to raise funds to purchase the tramways was carried with only three dissentients. The report was as follows:

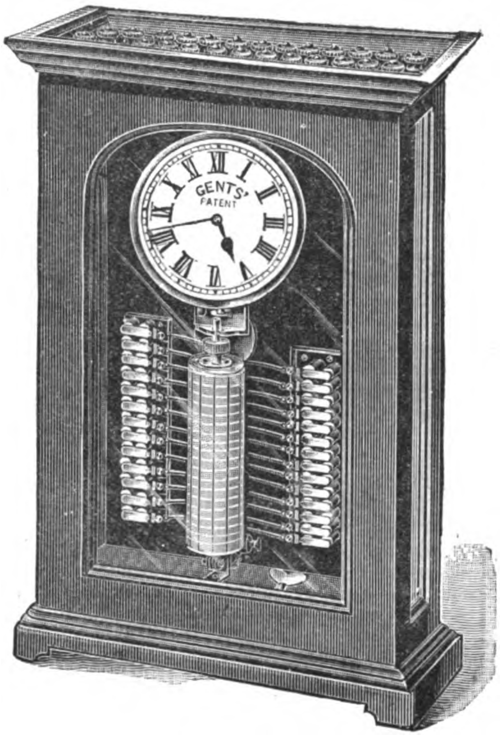
Referring to the meeting of the Rathmines Commissioners on the 13th inst., when the question of the purchase of the tramways

Digitized by Google

in the township was considered, it appears to us that the question as a whole is misunderstood. We, therefore, feel it to be our duty to lay the matter clearly before you. By the action of the Legislature, the tramway company were granted the user of certain of the roads within the township for their undertaking for a period of 21 years, free of charge, which period expires in the year 1899, and the Commissioners will then become entitled to purchase the tramways by merely paying to the company the then value, "exclusive of any allowance for past or future profits of the undertaking, or any compensation for compulsory sale, or other considerations whatever." Seeing the very large amount that the present company and the late Dublin Southern District Tramway Company were prepared to offer the city and this township for even the right of user of the roads, would the Commissioners be discharging their duties to the ratepayers if they allowed to slip their rights to obtain such a valuable property? The true way to look at the matter is to see what was done elsewhere. Take the instance of Glasgow, where the Corporation took over the tramways. The accounts for the year ended May 31, 1896, show a profit of £70,000, after paying all working expenses and interest on capital, and after the reduction of fares to ½d. per half-mile. Take, again, Belfast, where the Corporation took advantage of the powers placed in their hands, and, as a result, were able to re-lease the system to the old company for a further period of 14 years at a rent of £5,000 per annum for the first seven years and £7,000 for the second period of seven years. There is nothing whatever to prevent the Commissioners dealing with the tramways the same way. It would be altogether a matter for the future consideration of the Board whether they would work the trams themselves or re-lease them. With these facts before us, we say most emphatically that the Commissioners would be wholly neglecting their duties as custodians or trustees of the ratepayers' property if they allowed such a certain means of deriving a revenue to the relief of the rates to fall through. We are perfectly confident that the township would derive a very considerable advantage by taking over the tramways. The tramway company have never shown the slightest consideration to the township, the control of the roads by the company is very embarrassing, the Commissioners have found it very hard to get on with the company, and the Commissioners have incurred losses on account of the action of the company—for instance, the Commissioners some years ago purchased a piece of ground at the request of and for the convenience of the company, on the promise that the company would take it up and pay for it. The transaction cost the Commissioners something like £800, but the company repudiated their obligation to pay, and, in fact, have not paid a penny on account of this sum. Again, the Commissioners have had to appear before Parliament on two or three occasions consequent on the action of the company, at a considerable expense, and one penny on account of this has never been paid. If the Commissioners purchase the tramways, this would prevent the repetition of any such expense, and they would then have complete control of the roads. In 1895, when the company was before Parliament for a Bill for electric power, the company refused the slightest concession to the Commissioners or to the Corporation of Dublin, or to Pembroke Commissioners, though these bodies were willing to treat with the company at the time, but no concession would be made by the company. That Parliament believed that the local authority were to purchase the tramways is made clear by the fact that for the protection of the mortgagees it was enacted that "every mortgage granted by the company under this Act shall be endorsed with a notice that such mortgage will not be a charge upon the tramway in the event of its being purchased by the local authority under the forty-third section of the Tramways Act, 1870." If this provision has not been complied with it is not the fault of the Commissioners. We also fear that the question as to the waterworks is not fully understood. It does not need the skill of an actuary to prove that it is a profitable investment. The estimate for the works was £100,000; the actual cost of constructing the works was £165,000 (not three times the amount of the estimate of £100,000, as stated by a member of the Water Committee); £165,000 at 4 per cent., including sinking fund and interest, would amount to an annual charge of £6,600 for a supply of water equal to 3,000,000 gallons per diem. Had the Commissioners accepted the offer of the Corporation for equal supply of Vartry water, made in the year 1877, the township would be paying at the rate of over £9 000 per annum, which sum would increase annually as the township enlarged, which it is rapidly doing, and without reaping any advantage from the revenue derived by the township from outside supplies. Subsequently in the year 1879, when the Commissioners had determined to promote a Bill in Parliament for their own supply, the Corporation made an amended offer, but even this would entail an annual increasing payment of £7,562. 10s., whereas, the Commissioners having their own supply, every additional house that is built in the township, instead of increasing lowers the contribution towards the expense of the water supply on all other property; that with the increased revenue derived from outside supplies (at present bringing in about £750 per annum), so that now the waterworks are, as the Lord Chairman of the House of Lords (when allowing Section 57 into the 1893 Act) expressed his opinion that money authorised for waterworks should not be considered as a debt, but as a profitable investment. Thus it will be seen on the one hand, if the Commissioners had accepted the Corporation supply, they would be paying a perpetually increasing revenue to the Corporation, whilst, on the other hand, the Commissioners having their own water supply, the charge at the end of 20 years would be almost nil. It must always be borne in mind how fortunate it was, not alone for the inhabitants of this township, but also for the city and surrounding townships, that Rathmines had its own supply in the water famine year of 1893. If the Commissioners had their supply from the Corporation it would have fallen short early in the summer, and the result would have been an awful water famine all round. In our opinion it is for the advantage of the township to proceed with the Bill, and we recommend the Commissioners and ratepayers to do so."

TELL-TALES.

We publish an illustration of an improved dry ink marking tell-tale manufactured by Messrs. Gent and Co., Faraday Works, Leicester, for checking the movements of night-watchmen in warehouses, factories, mills, hotels, etc., and also ensuring the attention of night-nurses and attendants in asylums, hospitals, workhouses, and other institutions. Underneath the cylinder and running parallel with its axis are the markers, the number of these, also the length of the cylinder depending upon how many stations it is desired to communicate from. Each marker is operated by an electromagnet, so connected that when a comparatively weak current is sent through its coils the marker jumps up and strikes at the record sheet on cylinder. Between the markers and the cylinder is an ink-ribbon which is so fixed that every time a marker strikes a clear indication is printed on the record sheet opposite the



name of station which controls the marker and in the hour space corresponding with the time the movement is made. After each night's work the printed record is removed and a clean one put on.

COMPANIES' MEETINGS AND REPORTS.

BRAZILIAN SUBMARINE TELEGRAPH COMPANY, LIMITED.

The half-yearly meeting of this Company was held on Wednesday at Winchester House, E.C., Mr. J. Denison Pender presiding.

The **Chairman**, after a reference to the late Sir J. Pender, moved the adoption of the report, a summary of which appeared in our columns last week. Mr. Pender said that the strong position of the Company was clearly shown, and he saw nothing in the future to diminish its prosperity. The receipts from messages, £92,071, showed a decrease of £14,097, as compared with the previous year; but this decrease was due chiefly to unavoidable and, he hoped, temporary causes. Among these might be mentioned the fall in exchange in Brazil, the dulness of trade, and keen competition in the River Plate district, causing fewer messages to be transmitted; while Press messages had increased, entailing much work, but not much additional revenue. Most of the commercial messages averaged only a little over nine or ten words. Above all, the decrease in revenue was due to a reduction of 6d. per word having been made in the messages to South America last year. On the other hand, their expenses were £19,210, a decrease of £2,413, due to the absence of any expenditure for the repair of cables, which in the previous year cost

£2,770. The dividend and bonus to be paid out of profit equalled 7 per cent.—the same as in the preceding year, and their reserve fund now stood at £832,000.

Mr. Youle seconded the motion, which was agreed to.

EASTERN EXTENSION TELEGRAPH COMPANY.

The half-yearly ordinary general meeting of the shareholders in the Eastern Extension, Australasia, and China Telegraph Company was held at Winchester House, E.C., on Wednesday, Lord Tweeddale presiding.

The **Chairman**, in moving the adoption of the report, a summary of which has been already given, referred with regret to the loss which the Company had sustained by the death of their late chairman (Sir John Pender), and pointed out that the gross revenue for the half-year under review amounted to £313 914, showing an increase over the corresponding period of 1895 of £49,776. This was undoubtedly due in a great measure to the gold-mining industry of Western Australia The working expenses were £87,256, showing a decrease of nearly £8,000 on the corresponding period of the previous year. Two quarterly interim dividends of 1¼ per cent. each, amounting to £62,500, had been paid for the half-year, leaving £108,235, of which £75,000 had been transferred to the general reserve fund, and the balance of £33,235 was carried forward.

The report was adopted.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Karlsruhe.—The Granducal Railway authorities will receive tenders on November 9 for the supply of a quantity of telegraph posts.

Bressoux-lez-Liege (Belgium).—The Municipal Authorities are prepared to receive propositions for public lighting by (coal) gas, electricity, or acetylene.

Bucharest.—Tenders will be received at the Mairie, Bucharest, on November 16 for two stand-by steam-engines for a water-power electric generating station at Grozavesti.

Malines (Belgium).—Tenders will be wanted for the supply at Malines of about six tons of special lubricating oil for dynamos and gas-engines. Particulars at the Brussels Bourse, where tenders will have to be sent.

Schneidemuhl (Germany).—Tenders are advertised for the supply of iron telegraph poles for the State Railways. Particulars for 50 marks (6d.) from die Königliche Eisenbahn Betriebsinspection, Schneidemühl, Germany. Tenders must be in by Nov. 5.

Ayr.—The Electric Lighting Committee invite tenders for the supply and erection of boiler and engine house plant. Specifications (price £2. 2s , returnable on receipt of bona fide tender) can be obtained of Mr. Robert Hammond, Ormond House, Great Trinity-lane, London, E.C., on and after November 10. Tenders to be delivered by November 25.

Cologne.—Tenders are required by the Municipal Authorities for the construction and working of electric tramways in the city of Cologne to an aggregate length of 20·3 kilometres (12½ miles). Specifications, plans, and particulars are obtainable for 10 marks (10s.) from der Registrateur B, des Oberbürgermeisteramt, Köln, Germany, and tenders must be in by November 6.

Paris.—Tenders will be received by the Post and Telegraph Authorities at Rue de Grenelle 103, on November 10, for the supply of Baudot telegraphic instruments (five lots), also messengers' wallets (three lots). Application for permission to tender must be made before October 30. On November 20 tenders will be received for the supply of various parts of telegraphic instruments for the next five years. Application must be made before November 10.

Warrington.—The Cheshire Lines Committee are prepared to receive tenders for the supply during the year 1897 of telegraph materials, instruments, wire, etc. Patterns can be seen and specifications with forms of tender obtained on and after November 2, 1896, upon application to Mr. S. Saxon Barton, storekeeper, Cheshire Lines, Warrington. Tenders, sealed and endorsed, to be sent to Mr. Glegge Thomas, secretary, addressed Cheshire Lines Stores Department, Warrington, not later than 10 a.m. on November 28 next.

Glasgow.—The Police Department of the Corporation invite tenders for the construction and erection of fans and motors for the new sanitary chambers, Cochrane-street, Glasgow. Specifications and forms of tender may be had and drawings seen on application at the office of Mr. William Arnot, electrical engineer of the Corporation, 75, Waterloo-street, Glasgow, and tenders, properly sealed and marked outside "Tenders for Fans and Motors," must be lodged with Mr. J. Lang, clerk, City Chambers, Glasgow, by 10 a.m. on November 9.

Monmouth.—The Town Council invite tenders for (1) machinery (consisting of turbines, alternators, steam-engines, boilers, electric motors, sewage pumps, etc); (3) cast-iron pumping main ; and (4) electric lighting mains. Plans may be seen on application to Messrs. Bramwell and Harris, engineers, 5, Great George-street, Westminster, S.W., or to the Town Clerk, Monmouth, from either of whom may be obtained, on deposit of £2 2s. (to be returned on receipt of a bona fide tender), a printed form of specification and tender for either contract. Tenders, on the prescribed form, must be delivered with the specification attached (enclosed in a sealed envelope), endorsed "Sewage-Disposal, Tender for Contract No. —," and addressed to Mr. T. R. Oakley, town clerk, Monmouth, by 12 noon on November 2.

Torquay.—The Town Council require tenders for the supply and erection of the following plant: (Section A) boiler-house plant—boilers and fittings, forced-draught apparatus, feed storage, etc ; (B) engine house plant — steam alternators, condensers, pumps, steam and exhaust pipes, etc., ; (C) switchboard, etc ; (D) underground mains, lamp-posts, etc. ; (E) transformers, etc ; (F) meters ; (G) accumulators, etc. ; (H) crane, etc.; (I) builder. Tenderers are at liberty to tender for any section or sections, but not for part of a section. Specification, with terms and conditions of tender and contract, may be obtained of Mr. W. H. Trentham, consulting engineer to the Council, 39, Victoria-street, Westminster, S.W., or of Mr. Fredk. S. Hex, town clerk, Town Hall, Torquay, on payment of £3. 3s., which sum will be returned on receipt of a bona fide tender. Tenders must be addressed to the Town Clerk, sealed and marked "Tender for Electricity Works," and delivered by 3 p.m. on November 3.

West Ham.—The Town Council require tenders for the supply of the following: four steam alternators and exciters; surface condenser and pumps; station switchboard, etc.; high and low tension mains, etc.; transformers, sub-stations, etc.; instruments; arc lamps, posts, etc.; crane. Plans of the suggested arrangements, specification, form of tender, and further particulars may be obtained at the office of Mr. John J. Steinitz, borough electrical engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a bona fide tender. Tenders, endorsed "Tender for Machinery, etc.," to be sent to Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham, by 4 p.m. on November 24. The contractor will be required to enter into a bond, with two sureties, for the performance of contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

RESULTS OF TENDERS.

Barnstaple.—The Town Council have instructed Mr. W. J. Ridd to connect the police station and waterworks by the telephone.

Cork.—For the electric lighting of the Palace Theatre of Varieties the tender of Messrs. Handley and Shanks has been accepted.

Armagh.—The Asylums Board have accepted the tender of Messrs. Cox and Walker for providing the electric light to the County Armagh Lunatic Asylum, at £1,070.

Birkenhead.—The Town Council have accepted the tender of Messrs. J. Gordon, Allison, and Co., Limited, for the electric installation of the Central Free Library, at £89.

Stettin.—The lowest tenders for telegraph posts for the Prussian State Railways were those of Messrs. Cornin, Vallentin, and Marckwold, and the Berliner Holzcomptoir for various sizes of posts.

Antwerp.—The first firm on the published list of tenderers for the supply of electric lighting carbons to the Belgian State Railways at Antwerp, and to whom the contract will probably be given, is Bierordt, of Rotterdam.

Brussels.—The following were the lowest tenders for telegraphic supplies to the Belgian Government on October 21: galvanised iron wire, Dekoning and Co., Brussels, 17,085fr.; cables, Felten and Guilleaume, 19,674fr.; copper wire, E. Yung, St. Josse Ten Noode, 16,841fr. There were no tenders from English firms.

BUSINESS NOTES.

Sheffield.—The electric lighting is being taken up very extensively in High-street and the centre of the city.

Scotter.—There is a proposal to extend telegraphic communication to this town and also to the adjacent town of Messingham.

Brentford.—An offer to the District Council by Mr. Druce of an electric lighting scheme has been referred to the Works Committee.

Callender's Cable and Construction Company.—The Company have declared an interim dividend of 4s. per share, equal to 8 per cent. per annum.

Kettering.—In the Urban Council estimate for the half-year appears the item: electric lighting (balance of cost of provisional order), £70. 5s. 6d.

Dublin.—The Corporation are going to take the Pigeon House Fort, on the edge of the river, as an electric station, from which to light the whole city.

City of Birmingham Tramways Company.—Letters of allotment for the issue of first mortgage debentures and preference shares have been posted.

Shafton.—The clerk to the Parish Council has been instructed to make enquiries as to whether it is advisable to apply for telegraphic communication.

Digitized by Google

Morecambe.—The District Council have decided to apply for an electric lighting provisional order, in case the one obtained by the company will not suffice.

Somerset.—It was reported at the meeting of the County Council that a contract had been entered into for lighting with electricity the Cotford Asylum at a cost of £3,000.

Dundee.—The directors of the Royal Lunatic Asylum have decided to introduce the electric light into the institution and the farm buildings attached thereto at a cost of £3 000.

Egypt.—Lord C. Beresford, in a speech at the Constitutional Club on Wednesday, remarked on the improvements in railways and telegraphs in Egypt since the British occupation.

Bath.—A Local Government Board enquiry is to be held to-day (Friday) in respect to the application of the Urban Authority to borrow £58,000 for the purchase and extension of the electric light works.

Chile.—According to *El Mercurio*, it is proposed to utilise the Maipo River as a motive power for electrical purposes and the propulsion of the Santiago tramways by electricity at a cost of £800,000.

Bury St. Edmunds.—Judging by the candidates nominated, the endeavour of the Ratepayers' Association to fight the municipal elections on the question of electric lighting has completely collapsed.

Russia.—It has been decided, says Reuter's St. Petersburg correspondent, to lay a telephone line between that city and Moscow. The cost of construction is estimated at 400,000 roubles (about £50,000).

Derry.—Mr. Christie, electrical engineer, has reported to the Lighting Committee as to the question of keeping the electric lamps alight all night. He says that it would cost over £400 a year if they adopted such a plan.

British Thomson-Houston Company.—The head office will for the future be at 83, Cannon-street, E.C. The Company's London workshops, testing-rooms, and stores are now situate at Rose's Wharf, 63, Bankside, S.E.

Gorleston.—It is stated that the Gorleston and Southtown Tramway Company are seeking corporate sanction to extend their line from Pier-walk to the vicinity of the south pier, and to apply electricity as a motive power.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ending October 25 amounted to £1,092, as compared with £1,075 in the corresponding week of the previous year, being an increase of £17.

British Pure Acetylene Gas Syndicate, Limited.—This Company has been registered, with a capital of £50,000 in £1 shares, to acquire all patents, concessions, etc., for the manufacture and supply of gas, to supply electricity, etc.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ending October 23 were £1,988. 5s. 4d., compared with £2,045 14s. 10d. for the corresponding period of last year, being a decrease of £57. 9s. 6d.

Watford.—In our last issue we stated that the electric lighting proposal was deferred for 12 months, but, as a matter of fact, the amendment to this effect was lost, and the report of Mr. Hawtayne on the scheme, which is likely to cost about £20,000, was adopted by 11 votes to 2.

Hartlepool.—At a special meeting of the Town Council the Lighting Committee recommended that a provisional order be obtained, at a probable cost of £300 or £400, for the electric lighting of the borough. After some discussion, the matter was deferred until next year.

Leeds.—A plan has just been issued from the city engineer's office showing the existing tramways in the city, the routes of the proposed new tramways, and the roads along which the Corporation have obtained parliamentary powers to lay down lines but have not yet decided to do so.

City and South London Railway.—The returns for the week ended October 25 were £1,003, compared with £977 for the corresponding period of last year, being an increase of £26. The total receipts for the half-year 1896 were £15,696, compared with £14,678 last year, being an increase of £1,018.

Bournemouth.—The Lighting Committee having considered the question of lighting the main roads with incandescent gas lamps, recommended that the surveyor be instructed to report as to the cost of lighting the principal thoroughfares, the Lower Pleasure Gardens, and pier with electric light. The Town Council have adopted the suggestion.

Scandinavian Art and Industrial Exhibition.—The preparations are being made for the Scandinavian exhibition, to be opened at Stockholm on May 15, 1897, in connection with the twenty-fifth anniversary of King Oscar's reign. The object is to represent the artistic and industrial products of the Scandinavian countries and of Russia.

Acton.—At the District Council meeting a letter was read from the secretary of a motorcar manufacturing company stating that they had commenced to make scavenging carts fitted with motors. He would be pleased to quote prices for such vehicles, with full particulars, to the Council in a short time. The communication was allowed to lie on the table.

The Transvaal.—Application has been made by the Rand Central Ore Reduction Company to the Government for a site on which to erect chlorination works in the Barberton district, where they should prove of the utmost value, as the concentrates and complex ores produced cannot be treated in the district, and in many cases are not rich enough for shipment.

Southwark.—The clerk reported at the Vestry that he had had an interview with a representative of the Telephone Company, who had pointed out that the Vestry's proposal as to rent for the underground wires was really prohibitive. It was agreed that the matter should go back to committee for reconsideration.

Amsterdam.—The Dutch Government has decided to operate the large locks at Ymuiden, the outer port of Amsterdam, by electricity, and has placed the contract for the supply and erection, with the necessary plant, with Messrs. Schuckert and Co., of Nuremburg, Germany. It is stated that altogether 36 electromotors will be required, ranging from 17 h.p. up to 45 h.p. each.

Tonge.—At the meeting of the Parish Council a letter was read from the town clerk of Bolton with reference to the extension of tramways into the district by the Bolton Corporation, and a resolution was ultimately passed that the Council are in favour of the borough of Bolton promoting a Bill in the next session of Parliament to include the extension of the tramway through their township.

Personal.—Mr. C. A. Gibson, of 74, Hadley-street, Kentish Town, having been nominated by the London Trades Council, has been appointed by the London County Council a member of the Technical Education Board, in the place of Mr. Morgan.—Mr. J. H. C. Brooking has joined the staff of Messrs. W. T. Glover and Co., and is now superintending the laying of their cable in Shoreditch.

Calcutta.—A consignment of special small plants for jute press lighting has just been received by the Oriental Telephone and Electric Company, of 89, Clive-street. Each plant consists of one of their Norwich dynamos to run 22 16-c.p. lamps, 22 16-c.p. Edison-Swan lamps in special enamelled iron shades with special brass dust-proof holders, wire and cable dust-proof switches and safety cut-outs.

Coventry.—The Coventry Electric Tramways Company propose to apply for parliamentary powers next session to extend their present system by about 6¼ miles. At the last meeting of the company it was decided to approach the Corporation with a view of making arrangements that will enable the company to commence the proposed extensions as early as possible after parliamentary sanction is obtained.

Middlesbrough.—At the meeting of the Streets Committee of the Corporation, the proposal of the Imperial Tramways Company to introduce the electric tram system in Middlesbrough was referred to, and the Town Clerk said he had received from the tram company a statement of the alterations they proposed to make in Middlesbrough. After some discussion it was decided to hold a special meeting to consider the matter.

Why Trade Goes to Germany.—At the Blackburn Chamber of Commerce, a letter was read from a leading Lancashire firm of chemical manufacturers, stating that crude materials are conveyed from England to Germany for less than half the rates charged for carriage to Lancashire, and that while it costs 30s. to carry a ton of manufactured chemicals from Lancashire to London, the same goods are brought from German works on the Rhine for 12s. 6d.

Ayr.—The additions to the electric lighting works are likely to take a more extended form than was at first contemplated. In view of the liberal way in which the electric light is being adopted, it is thought that plant should be laid down to fill up the whole available space in the engine-house. Mr. Robert Hammond, the consulting electrical engineer of the burgh, has prepared specifications for two sets of plant, each capable of generating current for 6,600 lights.

St. Pancras.—At the Vestry meeting it was reported that owing to increased and increasing demands for the electric current it was necessary to provide a separate main, extending from Cleveland-street to Gower-street, Euston-road, and a new main was also requisite along the north side from Tottenham Court-road to Gower-street. Among recent applications for current was the London and North-Western Railway Company, who required additional lamps for Euston Station.

The London Tramways Scheme.—At the London County Council meeting the Highways Committee again brought up their report, the particulars of which were given in these columns last week. The committee recommended the Council to purchase the lines of the North Metropolitan and London Street Tramways Companies, and to lease them to the former company for 14 years. The consideration of the report was adjourned until next week for consideration by the Finance Committee.

Stoke-on-Trent.—The town clerk reported at the Town Council meeting that he had received a notice from Messrs. Milward and Co., solicitors, of an intended application to the Board of Trade for the transfer of the undertaking authorised by the Potteries Extension Tramways Order, 1896, from the promoters to the British Electric Traction Pioneer Company, Limited. He was instructed to communicate with the neighbouring authorities with a view, if possible, of some combined action being taken.

Wimbledon.—At the Urban District Council meeting it was agreed that certain negotiations suggested by the County of London Electric Lighting Company should be declined, and a draft provisional order in relation to the electric lighting scheme was approved. If this district is to be satisfactorily lighted, there seems no alternative but to adopt electric lighting. The gas has been so bad as to be of little use, and when meeting on the 21st inst. the District Council had to have the Council-room lit with candles.

Llandudno.—A letter was read at the District Council meeting from Messrs. Dickenson and Co., Birmingham, asking for the support of the Council to their scheme to construct an electric

Digitized by Google

tramway connecting Colwyn Bay, Llandudno, and Conway, and intimating that Colwyn Bay had approved of that scheme. Several members opposed it, but on the casting vote of the chairman it was decided to consider the plans when submitted. It is proposed to erect a disinfector in connection with the projected electric light station.

Bolton.—During the past week the four new arc lamp pillars at the corner of the Town Hall-square have been placed in position. Each of the new lamps will have an illuminating power of 3,000 candles. The Gas Committee have decided to improve the lighting arrangements in a number of thoroughfares by erecting new lamps and rearranging others. A letter was read from the Board of Trade intimating that they would accept the accounts relating to the electric lighting department made up to March 31 instead of December 31.

Burton-upon-Trent.—At the annual meeting of the Staffordshire Institute of Mining and Mechanical Engineers, Mr. J. Settle, in his presidential address, referred to the recent application of electricity for relighting miners' safety lamps by electricity without opening them, which removed the risk of the lamps being unlocked in the mine and the possibility of one not being properly put together after relighting. Under proper regulations the system seemed commendable on the ground of economy and safety.

Messrs. O. Berend and Co.—Messrs. Berend have registered their business as a company under the title of O. Berend and Co., Limited. The management will remain in the hands of the hitherto partners of the old firm, who will become sole managing directors, while the business will be carried on as heretofore, and all debts due to and owing by the old firm will be received and paid by the new company.

St. Olave, Southwark.—At the meeting of the Board of Works, Mr. Smith moved: "That the Board accept the terms of the London Electric Supply Corporation, Limited, to make the necessary connections from their main for the purpose of lighting the Board's offices with electric light at a cost of £25, and that the clerk enter into the agreement for the supply of electrical energy at the rate of 6d. per Board of Trade unit, and for payment of the necessary meter rent." The matter was referred back to the Works and Finance Committee.

Western and Brazilian Telegraph Company.—At a meeting of the Board of directors it was decided that after placing £5,000 to the debenture redemption fund and £3,000 to the reserve fund, the directors would, subject to audit, recommend at the forthcoming meeting a dividend at the rate of 2 per cent. per annum, free of income tax, for the six months ended June 30 last, carrying forward £3,530. 5s. 7d. The receipts for the week ending October 23, after deducting 17 per cent. payable to the London Platino-Brazilian Company, were £2,432.

Telephonic Facilities.—The Postmaster-General has addressed a letter to the Liverpool Chamber of Commerce in continuance of correspondence on the subject of telephonic facilities for trunk lines. The Postmaster-General intimates that arrangements have been made by which subscribers may use a trunk wire for a second period of three minutes with giving previous notice. This concession is in response to complaints from mercantile men that the three minutes originally allowed for communications—including the time occupied in "ringing up"—was inadequate.

University College, London.—Evening classes in electrical engineering will be held on Tuesday evenings, 7-9 30, and in mechanical engineering on Monday evenings, 7-9.30. A course of about 20 advanced demonstrations is now being given in the electrical engineering laboratory at University College, Gower-street, W.C. Applications for admission to the class should be made to Prof. J. A. Fleming, F.R.S. A course of mechanical engineering is being given in the same college by Prof. T. Hudson Beare, B.Sc., M.I.C.E., on Monday evenings at the same fee. Full particulars are given in an advertisement in another column.

Belfast.—At the meeting of the Corporation the application of the Street Tramways Company for leave to establish a system of overhead electric traction was considered in committee. The following amendment to the original resolution was moved by Councillor John M'Cormick and seconded by Alderman Henderson: "That the further consideration of electrical traction be deferred for the purpose of the Law and Improvement Committees appointing an expert on tramways to report on the question generally, financially, and otherwise." The amendment was carried by 14 votes to 9, and the committee rose.

Stirling.—By invitation of the Police Commissioners, Prof. Kennedy has visited Stirling, accompanied by Mr. Mackenzie, convener of the Lighting Committee of Edinburgh Town Council. In company of the Electric Lighting Committee of the Commissioners, they made a tour of the town and suburbs, and in the afternoon met the Commissioners in a body. The proceedings were private, but it is stated on good authority that the professor's opinion was that Stirling, from its situation near the coalfields, and its other advantages, was peculiarly well adapted for the introduction of the electric light, with a good prospect of success.

Brighton.—The Works Committee recommend that the National Telephone Company be permitted to place their wires underground in several streets on payment of £1 per annum for the concession. The work of extending the electric light supply still goes on, and it is now recommended that additional mains be laid in Stanford-avenue, St. Andrew's-road, Preston Park-avenue, and Albion-hill It is considered inexpedient to put arc lamps in Beaconsfield-road or the upper part of Stanford-avenue. The Town Council have received notification that the rate of insurance on the Corporation generating station is to be raised to 10s. 6d. per cent. per annum, but the insurance company have undertaken to reconsider the proposed increase.

Halifax.—Mr. Walter Emmott, consulting electrical engineer, has been carrying out a series of experiments in the application of electric arc lighting for interior illumination, more particularly with respect to the most suitable globe for passing and diffusing the light, and at the same time having an attractive appearance. The Tramways Bill promoted by the Corporation will shortly be lodged with the parliamentary officials. The Corporation Tramways Committee have arranged for the plans to show a double line from the bottom of Horton-street to Commercial-street, and single lines to King Cross and Highroad Well. The gauge adopted is 3ft. 6in.

Lancaster.—At the Town Council meeting the Electricity Committee reported that the engineer, acting on the instructions of the chairman, had submitted a report upon the question of the Corporation supplying electric motors, and guaranteeing them to do the work required, and arranging easy terms of payment therefor, with a view to increasing the consumption of electric current during the daytime. Mr. Hall, in moving the confirmation of the minutes, stated that the committee were anxious to encourage the use of electric motors, and would be glad to give any information to those requiring motive power both as to cost and efficiency of electric motors. Mr. Heald seconded, and the minutes were agreed to.

Hampstead.—At the meeting of the Vestry the Finance Committee reported that they had carefully considered the letter of Mr. J. Thwaites, jun., agent for the Norwich Union Fire Insurance Office, stating that certain of the rates for the building and contents of the electric lighting station would be increased from 5s. to 10s. 6d. per cent.; that they found that the increased rates were decided upon by the Fire Offices Committee, and were therefore the same as those quoted by other offices; that there was apparently nothing unusual in the short notice given of the increase; that insurances could be effected direct with the head offices of the companies without the intervention of agents, and that, whether ensured direct or through agents, the rates would be the same. The report was adopted.

Windsor.—The Windsor and Eton Electrical Installation Company is making satisfactory progress with the new works in Peascod-street. The chimney shaft has reached to a height of 60ft., and the boiler-house is almost ready for the reception of the boilers. The work of laying the cables is being rapidly proceeded with. The main is being laid direct in the earth with earthenware pipes alongside for the purpose of laying additional wires when needed. In Eton the mains will extend to the Eton Wick-road and Common-lane. A considerable number of houses and business establishments are being wired, about 50 in number, and including the Eton Supply Stores and Burge and Co.'s Victoria Brewery. The work of laying the mains is being superintended by Mr. Schiasse, engineer to Messrs. Callender.

Walsall.—In the course of an address upon "The Last Six Years' Work of the Town Council," Councillor Walter Hughes said that the consent of the Corporation for the adoption of the electric overhead system for trams was justified by the results, and he hoped the question of the electric tramways in the borough would end in Walsall either acquiring them or having some control, an important matter which was now under consideration. The electric generating station had now replaced the old gasworks, and the electric lighting scheme had cost £19,000, this being a necessary outlay in view of keeping out of the town competitors who would have been only too glad to have secured the electric light monopoly, and so, perhaps, jeopardise the hitherto prosperous gas undertaking.

Long Eaton.—A letter was read at the District Council meeting from the District Councillors' Association, stating that Long Eaton did not seem to be included in the list of places having obtained orders for electric lighting powers. He (the clerk) did not know it was necessary to take action now. Mr. Winfield was afraid they had committed themselves—or, rather, the old Local Board did so. He believed the power was given to a private company. The Clerk said he would look up and see if anything had been put on the minutes. Mr. Widfield said he had a conversation the other day with Mr. Whiteley, who was of opinion that they had compromised their position. Mr. Orchard and Mr. Marriott both thought the Board simply decided no action be taken. The matter will be looked into.

Lighting Improvements in London.—The repaving of Piccadilly and Piccadilly-circus has now been completed, and in a short time the electric light will be installed. The scheme adopted by the St. James's Vestry includes the whole of Regent-street, Piccadilly-circus, Piccadilly (as far as St. James's street, where the parish of St. George's begins), St. James's-street from Park-place, Pall-mall, Lower Regent-street, and Waterloo-place, Coventry-street, and Shaftesbury-avenue as far as Wardour-street. The columns, 18ft. high, will be placed on the refuges in the middle of the street, and will be fitted with 10-ampere Crompton-Pochin lamps. There will probably be seven or eight lamps in Piccadilly-circus. Current will be supplied by the St. James and Pall Mall Company. Oxford-street and Marylebone will be added to the scheme later on.

Bray.—A public meeting of the ratepayers has been held for the purpose of considering whether the proposed promenade pier and electric tram schemes would be beneficial to the township. The Chairman stated that they had got a consensus of opinion from the frontagers where the trams were proposed to be run, whose total valuation amounted to £11,296. They had got a memorial in favour of the schemes from ratepayers representing a valuation of £4,500, and a memorial against them from ratepayers

Digitized by Google

representing a valuation of £651. A resolution was passed asking the Town Commissioners to sanction the schemes, which, if carried out, will mean an expenditure of about £35,000 in the town. As a result of the interview of the deputation with the Commissioners that body have decided to ask Mr. Molloy to supply them with all plans in reference to both schemes.

Edinburgh.—At the Town Council meeting notice of motion was given by Messrs. Scott and Mallinson to remit to the Cleaning and Lighting Committee to consider and report as to the electric lighting of Haymarket-terrace as far west as Magdala-crescent. Both Mr. Cranston (convener of the committee named) and Treasurer M'Crae protested against bringing up a question like the further extension of the electric light in the middle of the financial year. The estimates were all framed, and this insidious method of procedure would have a disturbing effect upon them. The Lord Provost said they had a sort of understanding that they should endeavour to introduce the electric light wherever there were tramways. Ultimately, however, the motion was withdrawn on the understanding that a scheme for extension would be brought up at the beginning of the next financial year.

Glasgow.—The *Glasgow Herald* publishes the following: "We are hearing a great deal in these days of German competition and of the need for the people of this country being alive to the growing enterprise of the sons of the Fatherland. The following example of that 'enterprise' could hardly be excelled. It is the text of a postcard forwarded by a Hamburg firm of dynamo and motor manufacturers to merchants in this city with whom they never had business associations: 'Sir,—I shall esteem it a great favour if you will kindly oblige by letting me know whether you use dynamos or motors, either for producing electric light or for generating power, and whose make the machines are. At the same time I should thank you to give me, on the annexed card, the names of those firms and individuals in your neighbourhood possessing either dynamos or motors. It will afford me pleasure to reciprocate your kindness when an opportunity occurs. Thanking you in anticipation of a reply.—I am, etc.'"

Rotherhithe.—At the meeting of the Vestry a letter was received from Mr. S. Morse, on behalf of the County of London and Brush Provincial Electric Lighting Company, Limited, asking for the formal consent of the Vestry to the application of the company for a provisional order to supply electrical energy to the parish of Rotherhithe. The compulsory streets scheduled are Union-road, Albion-street, and Rotherhithe street. Mr. Stokes (the clerk) pointed out that the Vestry gave their sanction eight years ago to the granting of a provisional order to the London Electric Supply Corporation, who were supposed to carry out their works within two years from that date. They had, however, only laid mains in Rotherhithe New-road. The matter was referred to committee, and the clerk was instructed to write to the company who already possess powers to supply electricity within the parish asking whether they intended to proceed with their order, and pointing out that they were liable to penalties for the delay.

Kingswood.—A meeting of the Lighting Committee of Kingswood Urban Council has been held to consider whether the plant, etc., used for the electric lighting of the district should be purchased. The sum first asked by Messrs. Parfitt was £3,500, but this was subsequently reduced to £3.200. The present agreement with the electricians for supplying the light is optional for seven, 14, or 21 years, and as yet less than one-third of the time limit has expired. In the event of the installation being acquired by the Council it would be requisite to have a loan covering a period of 20 years. Mr. Parfitt explained that the purchase would not cost the ratepayers very much more than at present if a loan was acquired. A discussion followed, in which the lighting of the district by gas was incidentally referred to. The question of having the plant valued by an expert electrician was also mooted. Finally, it was resolved to recommend that an expert be requisitioned to value the plant with a view to purchase or otherwise.

Bermondsey.—The Electric Lighting Committee of the Vestry recommended at the last meeting that Messrs. Kincaid, Waller, and Manville be engaged, at a fee of 50 guineas, to report upon the following points—namely, (1) whether the supply of electricity could be advantageously undertaken by the Vestry, and at what preliminary loss; (2) what would be the best system of supply for the Vestry to adopt, and the best site for a generating station, and the capital required; (3) as to the advisability of combining a dust destructor with the station for the utilisation of heat; and (4) generally on the best means of putting the scheme into operation. This was agreed to, and it was referred to committee to appoint a deputation to wait upon the Board of Trade with a view to ascertaining whether there was any probability of the Vestry obtaining a provisional order should they decide to undertake the supply of electrical energy to the parish. The firm of electrical experts will not be engaged unless a favourable reply is received from the Board of Trade.

Liverpool.—A section of the members of the Liverpool Engineering Society paid a visit last week to the exchange of the National Telephone Company in Exchange-buildings. The gathering was a numerous one, the gentlemen being met by the district manager, Mr. Arthur Martin. Small groups were conducted by Mr. Martin and his assistants over the extensive premises comprising the telephone exchange, and had explained to them the process of "ringing-up" and switching on of subscribers. Besides the switch-rooms, the battery and test rooms were also inspected. Before separating, Mr. Martin was very cordially thanked, on the proposition of the president (Mr. A J. Magginnis), for the courtesy he had extended to the society's members. The City Council have decided to promote a Bill in Parliament to acquire the undertakings of the Liverpool Tramway Company. It is stated that the amount required would be from three-quarters of a million to a million. The Council propose to substitute some form of mechanical traction for the present system of horses.

Birmingham.—After holding 11 meetings and fully considering the whole question of tramway municipalisation, the Public Works Committee of the Corporation have come to the following conclusions, which have been ratified by the Council: "(1) That the committee have not sufficient experience of the working of tramways by municipalities to guide them as to the probability of the Corporation desiring to take the tramways into their own hands at the expiration of the existing leases; (2) that the experiments being made in methods of traction, autocars, etc., render it desirable that for the present the tramways should continue to be worked by lessees, under such covenants for ensuring cheap and quick transit, and safety, comfort, and convenience of the public as may be thought necessary; (3) that the Corporation would not be justified in rejecting the immediate and prospective advantages which they and the public would derive from the acceptance of the offer (that of a syndicate which offered a rent of £185 per mile per annum for renewal and extension of lease—the estimated clear rental being £5,000 a year).

Cambridge.—The Paving, Drainage, and Lighting Committee reported at the Town Council meeting that of late when it had become necessary for the Cambridge Electric Supply Company, Limited, to break up any of the streets or parts of streets for the purposes of the Cambridge Electric Lighting Order, 1890, the company had carried out the work through its own workmen, instead as formerly, when any repairs or alterations became necessary, of calling on the Corporation to do the work and paying the necessary costs incurred. The committee were of opinion that, as the Corporation were responsible for the repair of the streets, it was inconvenient and undesirable that the company should have power to interfere with them, and recommended that notice be given in accordance with Section 12 of the order to the effect that the Corporation desire to exercise or discharge all the powers and duties of the undertakers in relation to the breaking up, filling in, reinstating, or making good any streets, bridges, sewers, drains, tunnels, or other works vested in or under the control or management of the Corporation. The report was adopted.

Motorcars.—In view of the presence in Liverpool of Sir David Salomons, Bart., president of the Self-Propelled Traffic Association, the vice-president of the Liverpool centre of that association (Mr. A. L Jones) gave a luncheon this week to Sir David and some 40 gentlemen prominent in Liverpool commercial and engineering circles. In proposing the health of Sir David Salomons, Mr. Jones spoke in pointed terms of the future which he anticipated for motorcars for the conveyance of cargo from the ship's side to warehouses, whether in Liverpool, Manchester, or other portions of Lancashire. In connection with motorcars it was proposed to form a company—the Liverpool and Lancashire Road Carrying Company—which would make use of existing highways, and by means of which the cost of carrying cargo to places within 40 miles would not exceed 3s. 6d. a ton, whilst the delays of going into stations and of unnecessary handling of goods would be done away with. The conveyance of goods would thus be done at one-third of the present railway charge—a tremendous advantage to traders. Sir David Salomons responded, and other speeches were made.

Vestries and Electric Light.—At the Newington Reform Club, Walworth, last week, an address was delivered by Mr. Alderman N. W. Hubbard, L.C.C., upon "Should vestries provide electric light for their respective districts?" In the course of an exhaustive address the lecturer referred to many municipalities which had introduced electric light at the cost of the local rates and maintained such installation with profitable results. Many provincial towns were far ahead of London in several matters, and more particularly in electric lighting, and this was due to the fact that those governing authorities were not afraid of spending money which they felt would prove a benefit to the ratepayers. If provincial towns could make a success of such an undertaking, why could not the Vestry of Newington and other vestries of London? He did not believe there was a parish in London which could not adopt the electric light system with advantage to the ratepayers. He hoped the people of Newington would put their shoulders to the wheel and make a success of the electric light, for then in future years their children would be thankful to them for having fought their battle.

Huddersfield.—At the meeting of the Town Council the Central Wards Committee recommended the adoption of a scheme for the lighting of the streets in a certain area of the central wards by electricity instead of gas. It was stated that the present cost of lighting the area was £806. 14s., and that the new scheme would effect a saving of £130. 13s. In the course of discussion frequent complaints were made of the present inefficient lighting of the streets by gas, and several members of the Central Wards Committee said that the alteration was being made as much on the ground of efficiency as of economy. The recommendation was approved by a large majority, over an amendment moved by Alderman Stocks, the chairman of the Gas Committee. Alderman Calvert, chairman of the Electric Lighting Committee, whilst denying that the electric lighting department had been subsidised by £6,000 since its establishment three years ago, said that the actual subsidy was not greater than would have to be paid at the commencement of any such undertaking. The electric lighting department had had a satisfactory year; and it was confidently hoped that there would be a balance in hand at the end of the present

Digitized by Google

financial year. Aldermen Joseph Brooke and Stocks and Mr. B. Broadbent were appointed as a sub-committee to act in conjunction with representatives of the local technical instruction institutions to formulate a uniform scheme of technical instruction in the town.

Manchester.—A syndicate composed of Manchester men has been formed to further a scheme for the establishment of a new Mutual Telephone Company, Limited. In a circular which has been issued it is stated that "for some time past the service in this city has been exceedingly unsatisfactory, and there is a widespread discontent amongst the subscribers to the telephone, both on this ground and also because the charges in connection therewith are considered to be excessive. With a view of remedying these evils, a number of gentlemen have formed a syndicate to float a new telephone company, which will offer to subscribers the benefit of an improved system at reduced rates. The gentlemen forming the syndicate feel, however, that it would be useless to incur the expense of floating this company unless they can rely upon the support both of the present users of the telephone and those intending to use it in the future." The object of this circular is to ascertain the extent to which the required support will be given. The Corporation have decided to put up arc lamps in Albert-square, St. Ann's-square, and Piccadilly, and the charge for the current is to be 2d. per unit. They have also resolved to insert a clause or clauses in the omnibus Bill about to be applied for by the Corporation to enable them to supply electricity beyond the limits of the city by agreement with adjoining local authorities, and further to extend the powers of the Corporation in reference to the supply of electricity. The Gas Committee having reason to believe that several local authorities are willing to make arrangements with the Corporation to supply them with electricity in their districts, they have been authorised to make suitable arrangements with them.

Tunbridge Wells.—The *Tunbridge Wells Courier* publishes the following statement: "Electric lighting.—An experiment has been tried this week of placing two 8 c.p. incandescent electric lamps in an ordinary gas lamp, with the addition of a reflector, which is the clever invention of the borough electrical engineer (Mr. H. P. Boot), and has just been patented by him. One of the darkest thoroughfares in the town—London road—was selected for the trial, which is remarkably successful, and should lead to the extension of the system in all thoroughfares where arc lamps are not used. The light, thanks to the ingenious arrangement of the reflectors at varying angles, gives about six times the illumination of a gas lamp, and the committee will be able to supply them at the same annual cost as the gas lamps. The lamp, which is just below the Castle Hotel is well worth inspection. A number of new customers are still recorded. This week the Kent Drug Stores, which recently put in incandescent gas, have now substituted the electric light; and the articles of virtu in Mrs. Smither's old curiosity shop have been simply transformed under the new illuminant. The revenue earned at the central station has lately been as much as £25 per day. A good deal of attention has been attracted to the incandescent gas 'arc' lamp outside Mr. Pelton's, over which an electric arc lamp has been placed from the office and showroom of the Electrical and General Engineering Company. This affords an excellent test of the two illuminants, and the 2,000-c.p. electric lamp practically extinguishes the 160 c.p. of the triple incandescent burner, although we are assured on good authority that the cost of the two lamps is practically equal, but the illuminant of the arc lamp is infinitely superior."

Leyton.—At a special meeting of the Urban District Council Prof. Robinson (electrical engineer to the Council) reported that owing to the rapidity with which the householders had connected up and the number of applications that had been received it was necessary for the Council to at once extend the plant at the central station, otherwise it would be impossible to supply the current, and much profitable business would be lost this winter. He recommended the Council to put down another gas producer, and two more engines and dynamos, for which space was provided in the existing buildings. He also advised an extra set of batteries with a battery-room to contain them. The total cost of this work would be rather more than £3,000, and it would provide them with 2½ times as much power as they had available at the present moment. He had been making arrangements for supplying the light to the Temple Mills goods-yard of the Great Eastern Railway Company, which alone would absorb a great part of the output from the additional plant. The Highways and Lighting Committee recommended that these additions be made and be treated as an extra to the current contracts. Mr. Trumble moved as an amendment that the recommendation be referred back. Rumours he said, had got abroad that the electric light cost 200 per cent. more than gas. Captain Macey and Mr. Pittam said it was ridiculous to think of more plant before they had a lamp in the street. The latter said they were spending or had spent £21,000 in putting up works and in lighting only four miles of their roads Mr. Bishop stated that the number of lights used by private consumers was approximately 300 16 c.p., and 100 more 16 c.p. had been applied for. Mr. Trumble ultimately withdrew his amendment, and the report was adopted with only two dissentients.

Cardiff.—At the Borough Council meeting Councillor Waring proposed that permission be granted to a Queen-street draper to fix three arc light standards on the kerb in front of his shop, subject to his entering into an agreement that the lamps should be kept lit every evening from the time the public street lamps were lighted until the closing of his business. This was seconded, and in the course of some discussion considerable objection was taken to the proposal on the ground that the street, which is well enough lighted, would be obstructed at that part by putting more lamps there. The motion was ultimately rejected by 13 to 10 votes. Councillor Morgan Morgan, in the absence through illness of Alderman Carey, moved that a resolution passed last year appointing Mr. Neville Applebee to take charge of the lighting station under the supervision of the borough engineer at a salary of £200 be rescinded, and "that Mr. Applebee be appointed electrical engineer at a salary of £200, to take entire charge and control of the electric light undertaking, and of the apparatus, plant, and other property in connection therewith, and also the staff, and that he be directly responsible to the Lighting and Electrical Committee for the due performance of all duties appertaining to his position or in relation thereto; the appointment to be determined by one month's notice on either side;" the question of salary to be paid in connection with the above post to be reconsidered at a future date. He pointed out that the borough engineer was himself desirous of being relieved of the responsibility owing to the great amount of other work he had to do. Councillor Munn seconded. Councillor Jacobs remarked that the relations existing between Mr. Applebee and the borough engineer were of the most amicable character. The resolution was adopted, and the minutes of the Electrical and Lighting Committee were also passed.

Lighting a Yacht by Electricity.—In the City of London Court on October 28, before Mr. Commissioner Kerr, an action was brought by Froggatts Electric Lighting Company, Limited, Lorrimore-street, Walworth, to recover the sum of £32. 13s. 8d., the balance of £115 against Mr. Cecil Quentin, a retired engineer, 23, St. Swithins-lane, E.C., for work done and materials supplied in equipping the defendant's yacht with electricity. Mr. Mallinson appeared for the plaintiff and Mr. Kerby for the defendant. The plaintiffs' case was that the defendant instructed them to fit up his yacht with electric light. The vessel was lying at Burnham Crouch. The plaintiffs did the work, and after some trouble they received a cheque for £50 on account, but the defendant would not pay the balance. Mr. Kerby said that the plaintiffs were not suing for the whole amount of the original price agreed upon. The reason the defendant would not pay the amount now claimed was because he said that the accumulators were no good, and that instead of lasting for 80 to 100 hours, as the plaintiffs said they would do, they went out after burning for only about five hours. The £50 was paid on the express condition that the plaintiffs would make the accumulators work properly, which they had never done yet. Mr. Mallinson said the accumulators were ready for the defendant. They were in thorough working order. They told the defendant that it would be necessary to renew the accumulators three or four times before they could be relied upon. The defendant said that he went on a cruise to France and Belgium, and the lights went out soon after he had started. Mr. Commissioner Kerr said he thought the defendant had behaved very liberally in the matter. The lights did not work properly, and all the defendant had asked the plaintiffs to do was to put them right. That they had never done. The consideration for which the defendant had paid his £50 having failed, there must be judgment for the defendant, who might bring an action for damages against the plaintiffs if he was so inclined.

Southport.—A meeting has been held, under the presidency of Mr. J. H. Wilkinson, of London, to take steps to form a company to carry out the scheme for an electric tramway between Southport and Blackpool, embracing Lytham and St. Annes. Plans have been prepared by Mr. Stewart Speedy, architect, of Southport, and he estimates the requisite capital at £400,000. The tramway, if constructed, will commence near the end of the north lake on the Southport foreshore, where an entertainment pavilion will be erected, and will include a carriageway and pathway for pedestrians. The structure will cross the mouth of the Ribble in its course to Lytham, but by the provision at this point of a swing-bridge Mr. Speedy has got rid of all danger of interference with shipping. Liverpool passengers by taking this route to Blackpool would cut off no less than 26 miles from the journey, while the saving between Southport and Blackpool would be something like 30 miles. It is also proposed to erect in connection with the scheme pavilions for various entertainments at Lytham and Blackpool The Chairman said that for over 20 years that scheme had, in one phase or other, been under consideration, but to Mr. Speedy was due the credit of having formulated a scheme upon business lines. He had no hesitation in saying that any scheme formed on such lines was sure of financial support. Southport and Blackpool were the favourite holiday resorts of Lancashire people, and the bringing of these two places into closer association was a question which had been much thought of. He though that if the proposal were carried into effect it would induce a large number of people who visited Blackpool to come to Southport, and *vice versâ*, and the natural result would be that the tradespeople of both places would be benefited. As they were doubtless aware, something like £450,000 was required, but all financial people would know that it was easier to raise half a million upon a properly organised scheme than £10,000 upon a scheme which had no basis and no solidity. He thought they would have no difficulty in the raising of the capital if they were able to show people with money that the scheme had a revenue-producing power, irrespective of capital value. It was decided to form a provisional committee, with Mr. W. King as secretary, to take the necessary steps for the formation of an influential committee, and to hold a further meeting this week.

New Company.—Messrs. B. Verity and Sons, of London, Birmingham, and Manchester, have converted their firm into a private limited company, under the title of "Veritys Limited." This has been done in order to cope with the increase of their business, with a view of interesting certain of their managers in

Digitized by Google

the active working of their businesses. No shares in the new company will be offered to the public, and the management will continue in the same hands. The chief feature in the new concern will be the inclusion among the directors of three of the more prominent employés of the old firm. Ultimately others engaged by the company will have opportunities of becoming financially interested. The firm was established in the early part of the century by Mr. B. Verity, the grandfather of the present owners and, although some of the earlier ledgers and books were destroyed in 1851, wages books and ledgers dating from 1837 are still in existence. In these many accounts with leading English families can be traced through three and four generations In the early days many small gasworks and gasmaking apparatus were erected by the firm, who also, it may be mentioned, fitted gas-pipes throughout Blenheim Palace in the fifties. It is noteworthy that the firm has thus taken a prominent part in the development of both gas and electric light. On the death of the founder in 1861 the business was partially divided, and the firm of Messrs. Verity Bros. started by two of his sons. This business was, however, again absorbed by Mr. John Verity on their deaths, and Veritys Limited thus take over these two old-established businesses with the more recently founded businesses of Veritys carried on by the firm in Birmingham and Manchester. The number of employés of the firm when taken over by the company was 644, but in view of the large new works now being erected at Aston this number will soon be very largely added to. The new works, which will provide accommodation for from 700 to 800 men, are to be employed chiefly in the manufacture of accessories, such as switches, fuses, lampholders, switchboards, etc., but some new departures will also be made. Thus it is proposed to manufacture small motors on a large scale, and at a price to successfully compete with the foreigners. It is pleasing to note that in artistic fittings we export into Germany. Thus Messrs. Veritys Limited have now in hand a large order for fittings from the noted firm of Krupp, and we have heard of large export orders from other firms. We wish the newly-constructed firm every success.

Tonbridge.—A special meeting of the Urban District Council has been held for the purpose of receiving a report from Mr. B. Hastings Medhurst, electrical engineer, on a scheme for the supply of the electric light. The clerk stated that a meeting of the Electric Lighting Committee took place that afternoon, when the report from Mr. Medhurst was read, and he (Mr. Neve) had since prepared the following summary and abstract of Mr. Medhurst's report: Estimate: that at least 2,000 lamps of 16 c.p. in use at expiration of first completed year's working. Site recommended: the garden in rear of 83, High-street. Compulsory area: from bottom of Brook-street, Quarry Hill-road, Station Bridge, High-street, and Dry Hill Park. Optional area: the whole of the district. System to be adopted: the three-wire low-tension. Capital expenditure: for 2,000 lamps, inclusive of buildings, machinery, mains, etc., between £10,200 and £10,400—say, £10,300. Revenue: the estimated income from 200 lamps at 6d. per unit would produce about £1,800 a year. Working expenses: not more than £1,100 per annum. To this must be added a sum of £566. 10s. for repayment of loans. Public lighting: The street gas lamps in the compulsory area to be replaced with incandescent electric lamps of various candle-powers The capital outlay to secure this will be £700. Present annual cost of of gas lighting in this area is £193 5s. 3d. The increased working expenses rendered necessary by street-lighting, including lamp renewals, attendances, extra coal, etc., would not be more than £100, and the additional loan would necessitate repayment of £38. 10s. a year. This would show a profit of over £50 per annum, and the lighting itself would be about twice as good as at present. Motive power: much of the plant at the sewage works is antiquated, and some is so old and worn out as to be almost useless. The present yearly working expenses at the sewage works are £417. 18s. 4d., including wages, coal, gas, repairs, and sundries. If the present steam-engine and gas engines were removed and replaced by electric motors, a supply of current could be obtained from the central station, and an estimated saving of at least £200 per annum in working expenses would be secured. Additional capital expenditure about £1,500 necessitating interest and sinking fund about £82 10s., thus showing a saving of £110 per year. Mr Medhurst strongly advises the Council to apply for a provisional order and to carry out the entire scheme above indicated. Summary of figures: Working expenses, £1,100; repayment of loans, £566; public lighting—working expenses, £100; loans, £39; sewage works loans, £83—£1,888; estimated profit, £305—total, £2,193. Revenue from 2,000 private lights, £1,800; saving in public lighting, £193; saving in labour and sewage works, £200—total, £2,193. Councillor Race, chairman of the Electric Lighting Committee, moved that application be forthwith made to the Board of Trade for a provisional order, and Councillor Jones seconded. In reply to various questions Mr. Medhurst said experience proved that works had been laid down in country towns, which had turned out much too small for the demand which had originally arisen, and the result of this was that local authorities had had to spend more money at the end of five or six years than they would have done if a more reasonable estimate had been made in the first instance of the demand which would accrue. Thus the reason that he had estimated for at least 2,000 lamps in use at the expiration of the first completed year's working. He proposed to use steam power, for it was preferable to gas. Gas-engines did not run with that steadiness which was required for electric lighting purposes. It would be best to use accumulators for such a town as Tonbridge, and they would be able to work with two shifts instead of three.

Swansea.—At the meeting of the Corporation, the Tramways and Electric Lighting Committee reported the terms of the agreement scheduled to the Bill to enable the Corporation to acquire the tramways undertaking were discussed. Mr. Kincaid informed the committee of the readiness of the directors of the tramways company to now meet the requirements of the Corporation, and it was arranged that a new agreement should be drafted accordingly for the approval of the Corporation and the company, upon the same terms as that set forth in the schedule to the Bill intended to be promoted in the last session of Parliament. The town clerk submitted the draft agreement relative to the purchase of the tramways undertaking, and suggested to the committee certain alterations therein, and it is recommended that the settlement of the agreement upon the terms indicated be referred to the chairman and the town clerk. Mr. Ruck and Mr. Kincaid attended, and certain of the provisions of the proposed agreement with the company for the purchase by the Corporation of the tramways undertaking were discussed, and it was agreed that the amount (if any) to be paid on account of the redemption of debentures should be a capital charge on the sum of £2,000 intended to be provided by the Corporation. The committee approve of the terms of the agreement, and recommend that a Bill be promoted in the next session of Parliament to empower the Corporation to acquire the tramways undertaking upon the terms contained in such agreement. Mr. Richard Martin moved the minutes of the Tramways and Electric Lighting Committee. It would be in the recollection of the Council, he said, that this subject was last before them on February 14 last, when the minutes of February 10 were confirmed. There was a letter received that morning from the solicitors of the company which admitted of differences of interpretation. The Council gave the tramway company an opportunity of saying "aye" or "nay" to those minutes, but the only reply they had was a letter from the solicitor, that he could not add to the letter of February 13. Then the matter dropped. On April 3 the town clerk received a letter from the engineer of the company, stating that he was strongly of opinion that the negotiations fell through rather from misunderstanding than on account of any serious points of difference. That letter pointed out the start of the renewal of the negotiations. The town clerk saw him (Mr. Martin) about the letter, and he replied to Mr. Kincaid on April 9: "I shall be glad to know whether the directors of the company are now prepared to accept the terms submitted in my letter of February 10 last, and if so will they call a meeting of the shareholders to confirm their action. I may at once say that nothing short of this would justify the Corporation in reopening the negotiations." There was another letter that passed between them on April 22 from Mr. Kincaid, who wrote: "I have a letter from the directors authorising me to conclude the agreement." That was the point they came to when they called the committee together on May 18 to meet Mr. Kincaid. The result of that meeting was the drawing up of a draft agreement upon the terms as submitted by the committee on February 10 and as confirmed on February 14. There was a meeting held on July 7 to consider the amended draft sent back by Mr. Kincaid, and on October 6 there was a meeting held to allow the directors of the tramway company to appeal to the Corporation to make some alteration in the Bill. The meeting spoke for itself as to the result. The great point of difference that occurred between the Corporation and the company, when the negotiations collapsed, was the spending of the £32,000. That was the point to which he personally attached most importance. With the Mayor and town clerk they felt that the Corporation ought to have absolute control over that money, that it should not be possible for the company to take it away and spend it in any shape or form, but upon what was agreed between the Corporation and the committee. That, the Council would see, had been secured. The agreement itself mentioned the purposes of the spending of the £32,000. Every penny of the money was to be spent directly or indirectly in the matter of the equipping of the tramways for use. The other points that they were not at all agreed on were now included in the present agreement. The Corporation on February 13 submitted that they were prepared to allow the money required for widening streets to be repaid on a 30 years' basis; also that the cost of the Bill be on the same terms. The Corporation further offered to pay for the accumulators if the company paid for the transformers. The company now agreed to pay for the transformers. The Corporation now agreed to take over at the end of the term all the rolling-stock of the company on the basis of a valuation. Those points were all contained in the present draft of the agreement, and he (Mr. Martin) knew of nothing that the Corporation demanded from the company in February that was not contained in the present agreement. Mr. R. S. Lindley seconded. An amendment was proposed to refer the minutes back to the General Purposes Committee for full discussion, but after some discussion the amendment was lost by 11 votes to 16, and the minutes were adopted. The tenders for the electric lighting of the market have been forwarded to Messrs. Kincaid, Waller, and Manville for examination and report.

PROVISIONAL PATENTS, 1896.

October 19.

23178. Apparatus for varying the speed of electromotors. Charles Denton Abel, 28, Southampton-buildings, Chancery-lane, London. (Berliner Maschinenbau-Actien Gesellschaft vormals L. Schwartz Kopff, Germany.)

Digitized by Google

23127. Improvements in or in connection with arc lamps. Frank Michael Lewis, 30, Park-row, Leeds. (Complete specification.)

23161. Improved electric lamp advertisement attachment. Edward Augustus Ingold, 66, Wandsworth Bridge-road, Walham Green, London.

23189. Improvements in or connected with means or apparatus for producing light by electricity. Charles Henry Stearn, 47, Lincoln's-inn-fields, London.

23194. Improvements in nitrated fabrics for electrical and other purposes. Carl Hoepfner 45, Southampton buildings Chancery lane, London.

23195. Improvements in machines for weaving insulating coverings on electrical conductors. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London (Augustus T. Clark, United States.) (Complete specification.)

OCTOBER 20.

23242. Improvements in and relating to electric incandescence lamps. Forest William Dunlap and John Robert Quain, 60, Queen Victoria-street, London.

23249. An improved insulator. James Houghton Cottingham, 91, Sharkhouse, Crawlington, Northumberland.

23256. Improvements in electric lighting for velocipedes, cabs, broughams, omnibuses, tramcars, or any other vehicle, and in the method of generating and storing electrical energy therefor by the utilisation of the motive power of the said velocipedes, cabs, broughams, omnibuses, tramcars, or any other vehicle. Albert Montague Armstrong, 59, Derby-road, Croydon

23258. Improvements in primary electric batteries. John Edward Preston and Cuthbert Simkin, 7, Southampton-row, London.

23282. An improved method of and arrangements for illumination by means of incandescent electric lamps. Pierre Charles Eugène Champion, 45, Southampton-buildings, Chancery lane, London.

23291. Improvements in or relating to trolleys for overhead systems of electric traction. The British Thomson-Houston Company, Limited, 70, Chancery-lane, London. (Norman C. Bassett, United States.) (Complete specification.)

23315. Improvements in electrical apparatus for controlling traffic on single lines of railways. John Patrick O'Donnell, 70, Palace-chambers, Westminster, London. (John Wells Wainwright Hopkins, Argentine Republic.) (Complete specification.)

OCTOBER 21.

23335. Displaying prices and the like in shop windows and other places by electric illumination. John Richardson Craig, jun., 115, St. Vincent-street, Glasgow.

23339. Phil Phillips's electric mat and cushion. Phil Phillips, 24, St. Mary street, Cardiff.

23352. Improvements in electric sparking apparatus for ignition purposes in oil and gas motors and the like. Edward William Lancaster, Church-road, Moseley, Worcestershire.

23393. Improved portable telephone apparatus. Joseph Kandt, 322, High Holborn, London. (The firm of Töpffer and Schädel, Germany.) (Complete specification.)

23399. Improvements in electric switches. Hans Friedrich Kleinschmidt, 45, Southampton-buildings, Chancery-lane, London.

OCTOBER 22.

23474. A new or improved method of and apparatus for electrically lighting cycles and other vehicles. Henry Torkington, 76, Chancery lane, London.

23497. Improvements in means or appliances for facilitating the drawing of electric conductors through tubes or conduits. Henry Edmunds, 47, Lincoln's-inn-fields, London.

23512. Improvements in electricity meters for alternating currents George Hookham, 18, Southampton-buildings, Chancery-lane, London.

23519. Improvements in bonds for electrical railways. John Henry Beardsmore, Hucknall Torkard, near Nottingham. (Frederick T. Newbury, United States.)

OCTOBER 23.

23531. A combined reflector and fastener for electric lamps. Frederick Williams Allen, 17, St. Ann's-square, Manchester.

23545. Apparatus for controlling incandescence electric lamps when connected in series. John Dugdill, Firs House, Failsworth, near Manchester.

23556. An improved electrical wire joint or connection. John Bremridge Melhuish, 77, Colmore row, Birmingham.

23587. An improved electric alternating-current machine Johan Josef Andreas Minder and Simon Apfel, 6, Lord-street, Liverpool.

OCTOBER 24.

23765. An improved form of contact blades for switches for electrical purposes. Frederick William Heaton and Harry Smith, Salford Switch Works, Sidney-street, Salford, Manchester.

23663. New and useful improvements in the apparatus for the production of oxygen and hydrogen by electrolysis (system Garuti). Pompeo Garuti and Ricardo Pompili, 77, Colmore row, Birmingham. (Complete specification.)

23665. Improvement in telephone transmitter. William Andrew Moore, 52, Chancery-lane, London. (Date applied for under Patents, etc., Act, 1883 Sec. 103, March 25, 1896, being date of application in United States) (Complete specification)

23698. Improvements in and relating to electrical governors Percy Wilbraham Northey, 124, Chancery-lane, London.

23766. Improved high-insulation tumbler switch. Frederick William Heaton and Harry Smith, Salford Switch Works, Sidney street, Salford, Manchester.

SPECIFICATIONS PUBLISHED.

1895.

18698. Electric railways or electric transport. Lorrain. (Esmond.)

18699. Electric railways or electric transport. Lorrain. (Esmond.)

18868. Electric velocipedes. Libbey.

19973. Electric arc lamps. Davy.

21367. Electrical indicating and recording meters. Wood and Mayes.

21752. System of using electric lights and other means of illumination. Cuthbert.

22939. Electrical sounding apparatus. Griffith.

23653. Electric tram or railway systems Allen and Peard.

24296. Rotary electric transformers. Blackburn and Spence.

24594. Electric lifts. Stevens and Major.

1896.

17818. Dynamo-electric machines. The British Thomson-Houston Company, Limited. (Thompson and Armstrong.)

18628. Incandescence body for electrical glow lamps and process of manufacture of the said body. Bachmann, Vogt, Weiner, Kirchner, and Konig.

18651. Commutator brush-holders for dynamo-electric machines or electric motors. Lake. (Lundell)

NOTES.

The Marine Engineers.—The sixth annual dinner of the Bristol Channel centre of the Institute of Marine Engineers took place on Saturday at Cardiff. The chair was occupied by Prof. Elliott, D.Sc., president of the centre.

France and Russia.—In connection with the visit of the Tzar to Paris, the French Society of Civil Engineers and the Imperial Technical Society of Russia and the Russian Institute of Engineers have been exchanging congratulatory letters.

The Heilmann Locomotive. — According to the *Bulletin* of the Société Belge d'Electriciens a six-cylinder type of engine devised by Mr. Mazen, of the Chemin de fer de l'Ouest, is to be tried for the Heilmann locomotive. The object, of course, is to avoid vibration at the high speed used.

Mont Blanc.—An electric railway for passengers is proposed for Mont Blanc. Up to a certain altitude it would be upon an inclined plane, and the ascent would be completed by a vertical shaft of a depth of 2,539 metres, through which powerful electrical lifts would convey the passenger to the observatory on the summit. The question is, would it pay ?

Science at St. Andrews.—The new marine laboratory in connection with the University of St. Andrews, founded through the generosity of Dr. Charles Henry Gatty, of East Grinstead, has been inaugurated by Lord Reay, who remarked in his speech that the great alarm felt for our industries was due to the fact that science had not been sufficiently recognised.

Brussels Lighting.—From *L'Electricien* it appears that the tariff of the municipal electric supply at Brussels is a little under 7d. a unit. There are three generating stations, and the system is a continuous-current three-wire one at 110 volts. Of 285 customers last January, 106 were business houses and 51 private; 34 were hotels, cafés, etc. There are five theatres. There is very little public lighting.

Lord Kelvin.—There was a report that Lord Kelvin was seriously ill, and another that he had come to London to consult a specialist as to his eyesight. We are pleased to find that both these reports are wrong. As a matter of fact, it appears that Lord Kelvin has been suffering for some time past from severe neuralgia in the head, but last Saturday was so much better as to be able to attend at the Royal Society, Burlington House, for an hour.

Motorcarts.—Motorcarts have been putting themselves in evidence in the usual ways during the last week, and the London County Council seems to have changed its mind about them, and to be now afraid of what it has hitherto advocated. Many other people have been showing a similar inability to comprehend that a maximum speed limit has nothing to do with the question of "furious driving." Apart from the latter, there is no limit to the speed of a horse.

The North Pole.—Mr. Warrington Baden-Powell, elder brother of Sir George Baden-Powell, M.P., has a scheme for reaching the North Pole. According to a contemporary, he suggests that a discarded double-bottomed ironclad, "with enough coal and electric power to plough a way through the ice," should be utilised, and that a syndicate should be formed to carry out the project. He is confident that the plan could be successfully carried out; but probably other people will not share his confidence.

Submarine Telegraph Memorial.—At a meeting of the committee last Monday it was decided to put off the memorial of the establishment of submarine telegraphy till 1901, and to establish a memorial to the late Sir John Pender. In connection with the subject, Mr. C. Bright has written to the *Times*, remarking that "it may be of interest to note that the exact date on which the first submarine cable was open to the public for telegraphic despatches was November 13, 1851." The year 1901 will therefore be the "jubilee."

Weather.—The "depression" which the Meteorological Office said last week was to come over Great Britain took a bend to the south and went to Sweden *viâ* France. The result of it is that they have had a bad time in the latter country, and at Lyons, the electric light works being flooded, the city had to revert to gas. There appears to be something seriously wrong in the weather this year all over the northern hemisphere, or else the monsoon would not have broken off short and produced the "diffused want" which the Indian Government objects to have called by the name of famine.

The Preece Cable.—The *Elektrotechnische Zeitung*, which did not greatly like Mr. Preece's endurance tests of incandescent lamps, appears, on the other hand, to think highly of his new cable. The "Preece telegraph cable," it says, "must be looked upon as a noteworthy advance in submarine telegraph work." The Lowestoft-Nordeney cable of 1866 and the Bacton-Borkum cable of 1896 are compared in the course of the article. The mileage is almost the same, but the KR factor is reduced from 198,100 to 126,000, although the capacity is increased in the proportion of 73 to 84.

Institution of Civil Engineers.—The seventy-eighth session of the institution was inaugurated on Tuesday, Mr. J. Wolfe Barry, C.B., F.R.S., the president, being in the chair. Dr. W. Pole, F.R.S., who recently retired from the post of honorary secretary, was elected an honorary member, and the president then delivered to a large audience an inaugural address. He dwelt forcibly upon the necessity for improved scientific and practical training for students of engineering. He thought that the time had arrived for the adoption of some definite test by examination of candidates for the profession; and, speaking as an individual, he saw no proper way of ensuring the desired result except through the instrumentality of the institution, which was the acknowledged head of the engineering profession of Great Britain and of Greater Britain.

Grants for Science Teaching.—The Lord President of the Council has appointed a committee, consisting of the Vice-President of the Committee of Council on Education (chairman); Mrs. Sidgwick, member of the late Royal Commission on Secondary Education; Sir John F. D. Donnelly, K.C.B., secretary of the Science and Art Department; Sir H. Roscoe, F.R.S., member of the late Royal Commission on Secondary Education; Mr. G. L. Ryder, C.B., H.M. Treasury; Prof. R. C. Jebb, M.P., member of the late Royal Commission on Secondary Education; Mr. W. Armstrong, director of the National Gallery, Dublin; Captain W. de W. Abney, C.B., F.R.S., Science and Art Department (secretary), to consider the mode in which the grants in aid to science and art schools are distributed, and to report if it is desirable to make any alteration therein.

Telephones in Guernsey.—A curious state of things appears to have been brought about by the conflict of laws in Guernsey. The islanders want a local telephone, and, having governed themselves since the time their brother Normans conquered the larger island of Britain, do not see why they should not have it. But it appears that, though most Acts of Parliament have no force in Guernsey, the Telegraph Act has, and consequently a public telephone system cannot be established without the consent of the

Digitized by Google

English Post Office. On the other hand, that does not in any way prevent the local Legislature from forbidding the Telephone Company erecting lines even when armed with the license of the Post Office, and, as a matter of fact, the local officials have at least once cut down the wires. The whole affair raises high constitutional points which would be important if Guernsey were not so small and France so near.

Asbestos.—Last Saturday the *Financial Times* announced to all and sundry that a "mountain of asbestos" had been discovered in Canada, and the price of the fibre was to come down to £2 per ton. A "commission" has gone to look at the mountain, and a company is to be formed to work it. This produced a letter from Mr. H. W. Bell, managing director to Bell's Asbestos Company, Limited, who said plainly that the affair was an "impudent attempt to extract money from the British public for a valueless property." Messrs. Ashurst, Morris, Crisp, and Co. replied to this, saying: "A party of our clients, accompanied by experts, left for Canada on the 24th ult., to satisfy themselves on the merit of the undertaking," and "we have already sent out to Canada a copy of Mr. Bell's letter, and have directed special attention to the points he raises—which, however, are not likely to have escaped the experts." There have been other letters. When the experts come home we shall know more about it. It does not appear that the outside public are to be asked for any money until this has taken place.

The District Low-Level.—A meeting has been held between the syndicate and the Board of the District Railway in regard to the electric low-level scheme. Mr. Forbes was away ill. It is stated that only one director is opposed to the scheme, and that pressure is being exerted to induce the syndicate to provide a station for the Imperial Institute and Albert Hall. Victoria is surely more important. It is understood that Sir Benjamin Baker, in his report, suggests that the originally proposed capital of £1,000,000 is insufficient, and proposes that a little over £1,400,000 should be provided to include the expenses of sidings and a gradient from Gloucester-road to Earl's Court, Sir Benjamin being of opinion that trains must be run through without passengers having to change. Meanwhile there has been a project started of an electric railway of the City and South London type from Cannon-street to Hammersmith. This is to depend on local traffic, and is apparently laid out to tap as many theatres as possible. If carried out, with the addition of a few subways, it looks a bad prospect for cabs and omnibuses.

Cable Interruptions.—The month's cable interruptions, as given in the list of the *Journal Télégraphique* to October 25, comprise the following in which communication was not reported as restored at that date: Puerto Plata and Martinique, December 19; African Transcontinental, beyond Mazoe, March 11; Amazon Company's cable, May 4; Columbian (New Granada) land lines, July 4; Salisbury and Umtali line, July 11; Parà and Maranham, August 6. There was a repair of this on September 21, but it failed again on October 8. Communication was restored on October 3 over the Ecuadorian land lines (failure August 11), so that in this case South America has beaten South Africa. The Bahia and Rio de Janeiro cable was restored on October 2, after a month's failure. The restoration of communications on the Penang and Medan, the Loanda and Benguela, and the Zanzibar and Mombassa cables belong to the end of September, but could not be reported in time for that month's list. Other short interruptions were on the Florida land lines, and the Siberian, the Saigon and Bangkok, and the Bolindo and Manilla lines.

Electric Lighting in Spain.—A considerable amount of space is devoted by *Electron* (Madrid) to the remarks made recently in the *Electrical Engineer* on the subject of electric lighting business in the Peninsula. On the whole, our Spanish contemporary appears not to disagree greatly with the views expressed, but is apparently not at all pleased with the reference made to the light and flimsy character of the buildings of some of the central stations in the North of Spain considering the valuable machinery they have to protect. After admitting that it has not visited the stations in question, our contemporary says that they are only temporary, and hopes that the writer of the article in the *Electrical Engineer* may live as long as Methuselah, "and then he will see in time central stations projected of a splendour to suit his taste." "For the rest," *Electron* continues, "we recognise willingly that the productions of English industry are excellent, and that it is proverbial in Spain that every English article is of first quality. But many merchants have taken advantage of that belief to sell us as English goods manufactured in some other country." But a suggestion is further thrown out that the Englishman, as a rule, is too dear.

Stoppages.—It is satisfactory to see that electrical fires, in the rare cases in which they do occur, are easily dealt with. On Friday, at the Prince of Wales's Theatre, Coventry-street, Haymarket, during the performance of the second act of "The White Silk Dress," it was noticed that something was wrong with the electric lights, and suddenly those who were behind the scenes on the "prompt" side discovered that flames were running up from behind the switchboard. This board is situated only a few yards from the visible portion of the stage, and it is supposed the wires fused and ignited the wooden casing arrangements behind. The immediate result was that the electric lights all over the theatre became extinguished. There was no panic. The fireman in charge of the fire-extinguishing apparatus at the theatre got one of the private hydrants with which the theatre is fitted into play, and "in a space of time to be measured by seconds the danger was over." With but little delay the piece was proceeded with, the gas, and a considerable portion of the electric lights, being still utilisable. According to one of the daily papers a momentary stoppage in a private installation in the City the other day had a very curious origin. A cat jumped on to the dynamo.

Skinburn by Rontgen Radiations.—A demon strator of the Röntgen rays at the Earl's Court Exhibition has written to *Nature* describing the result of the continued exposure of his hand to the rays. He says the effect is like sunburn, but ever so much worse, so that the skin comes off, and he has even lost some of his nails. The hand used in manipulating the fluorescent screen is, of course, the one affected. There is nothing in the letter, which is a long one, to show whether it is the Röntgen rays proper that produce the result—*i.e.*, those that affect the fluorescent screen or ultra-violet light generated at the same time, unless that gloves did not stop it. It is curious, considering the severity and evidently painful character of the skinburn produced, that nothing in the way of a covering of thin metal foil, or even metallic powder, which would be very nearly opaque to the rays, appears to have been tried. It is just possible that the constant handling of platino-cyanide may also not be good for the finger tips in all cases. It should be clearly understood that it is only very prolonged exposure—for instance, several hours a day for a period of six months—that is considered likely to produce the skinburn. It would be interesting to know how far other operators have experienced anything similar.

Digitized by Google

Some Forthcoming Meetings.—The first meeting of the Institution of Electrical Engineers takes place next Thursday, November 12, at the usual time and place. A paper on "Telephone Trunk Lines" will be read by Mr. John Gavey.—The Institution of Civil Engineers meet on Tuesday, November 10, for papers on the Tower Bridge by Mr. G. Crutwell and Mr. Sam. G. Homfray.—The Physical Society meets on Friday, November 13, for papers "On Röntgen Rays," by Prof. Threlfall and Mr. Pollock," and "On the Absorption of Electric Waves along Wires by a Terminal Bridge," by Dr. Barton and Mr. Bryan. The Northern Society of Electrical Engineers meet at Manchester on Tuesday, November 10, for a paper on "Cheap Steam Power" by Mr. John S. Raworth.—The North-East Coast Engineers meet at Sunderland on November 11 for the discussion of various papers.—November 9 is the opening of the winter course of lectures at the Imperial Institute by Prof. Wyndham Dunstan on "The Work of the Scientific and Technical Research Department of the Institute."—The shareholders' meeting of the Western Brazilian Telegraph Company is fixed for Thursday week; and the Motorcar Club meet for Saturday week.—The Institution of Junior Engineers has its inaugural meeting to-night (Friday, November 6), at the Westminster Palace Hotel for the presidential address of Mr. A. R. Binnie, M.I.C.E.

Royal Institution.—A general monthly meeting of the members of the Royal Institution was held on Monday, the 2nd inst., Sir James Crichton-Browne, M.D., LL.D., F.R.S., treasurer and vice-president, presiding. The following were elected members: Mr. George Cawston, Mr. J. Broughton Dugdale, J.P., D.L., Mr. Henry Harben, J.P., and Mr. John H. Usmar. The special thanks of the members were returned to the proprietors of the *Times*, to Dr. Ludwig Mond, F.R.S., Prof. Dewar, and Sir Andrew Noble for their donations to the fund for the promotion of experimental research at low temperatures. At the meeting it was announced that the Christmas lectures to children will this year be given by Prof. Silvanus P. Thompson, F.R.S., his subject being "Visible and Invisible Light"; and it was reported that the managers had elected Prof. Augustus D. Waller, M.D., F.R.S., Fullerian professor of physiology for three years, the appointment to date from January 13, 1897, and also that the managers had appointed Dr. Alexander Scott, M.A., D.Sc., to be superintendent of the Davy Faraday Research Laboratory of the Royal Institution, the directors already appointed by the managers being Lord Rayleigh and Prof. Dewar. After the meeting the members inspected the new rooms which have lately been added to the library of the Royal Institution through the munificence of Dr. Ludwig Mond, F.R.S. These rooms will provide increased accommodation for the members on the occasion of the Friday evening meetings.

Technical Education.—Sir Philip Magnus has been again insisting at Bolton on the need for keeping up with the Germans in the matter of technical education. "What the Germans have done to apply chemical science to industry they are now endeavouring to do in the applications of electricity, and hence their large outlay on electrotechnic laboratories, which they have good reason to believe will prove a productive expenditure. Fifteen years ago there was no teaching of electric technology in any part of Germany to compare with that given in the Cowper-street Schools under the direction of the City and Guilds Institute. And now England has no laboratories as complete nor attended by as many students as those recently erected in Darmstadt. The results of this teaching are shown in the general application of electricity to locomotion to the transmission of power in mills and factories, to illumination, and other purposes." Mr. Bryce has been saying ditto to Sir Philip Magnus at Cripplegate, and adding some nasty remarks of his own on English young men, whom he apparently considers much inferior to Germans or Scotchmen. It is not the young man's fault if, after being taught to admire classics and athletics, he thinks little of the science of which he is left in absolute ignorance. Young Englishmen will work hard enough, especially in competitive work, if they are properly encouraged. The fault rests with older men, like Mr. Bryce, who might have altered things and did not.

Royal Society of Edinburgh.—The last issue of the *Proceedings* of the Royal Society of Edinburgh contains a note on "Centrobaric Shells" by Prof. Tait, which will be interesting to those people who work with electric images. The note points out that with a spherical shell whose surface density is inversely as the cube of the distance from an internal point, its "potential" is the same as if its mass were condensed at the internal point. The proof is similar to the Newtonian proof that a uniform spherical shell exerts no gravitating force on an internal particle. Lord Kelvin's paper on the motion of a heterogeneous liquid resulting from a given motion of its boundary, is interesting from the way in which such familiar matters as cups of tea and half-filled corked bottles are brought to bear on illustrating what at first appear the decidedly paradoxical results of mathematical investigation. In a second paper, Prof. Tait defends Clerk Maxwell's exposition of the kinetic theory of gases from the criticisms of Mr. Bertrand and Prof. Boltzmann. The fact is—though Prof. Tait does not say so—Maxwell has occasionally been superstitiously followed rather than thoroughly understood. Not all men could draw the bow of Ulysses, and Maxwell, were he alive, would probably be the first to repudiate the rigour with which it is now customary to push the results of his theory. More directly connected with electrical matters is Dr. Beattie's investigations in the relation of the Hall effect and thermo-electricity in bismuth and various alloys. The subject has been referred to before, and definite conclusions on the matter have by no means yet been attained. From a note of Dr. Macintyre's it would appear that amateurs in making cryptoscope screens for Röntgen ray work are liable to put the fluorescent salt on too thinly.

Low-Temperature Work.—It has perhaps appeared rather a puzzle to some why oxygen and nitrogen, although possessing different boiling points, come down at almost exactly the same temperature when air is cooled, and therefore are not separated in the process of liquefaction. Prof. J. Dewar explained this, as well as several points in connection with low-temperature research, at Liverpool. It is owing to the relative pressures of oxygen and nitrogen in the air that the result occurs. The method employed for measuring low temperatures is stated to consist in using a system of five thermo-junctions, so arranged that three of them are kept at 0deg., whilst the other two are of the same metals but in the inverse order, so that when one of them is cooled the other must be heated in order to preserve equilibrium. The low temperature to be observed is thus balanced by a high temperature which can easily be read off. Hydrogen and helium remain yet to be liquefied, and of the two it seems as though helium were the less easily condensible. Moreover, it seems to have an abnormally low refractivity and molecular volume. Fluorine, in these respects, would appear to resemble helium. The ratio of the refractivity of hydrogen to that of chlorine is almost the same as that of helium to that of argon, and hence it has been suggested that a substance may yet be discovered which will be intermediate between these two elements

Digitized by Google

just as fluorine is intermediate between hydrogen and chlorine. As to this, it has been pointed out in Germany that a periodic function can change from positive to negative by passing through ∞ as well as 0. If this is admitted, Mendeleieff's series can be rearranged, so that both argon and helium would fall into place as "transition" elements with unpredictable properties. But the conclusion that their molecule is monatomic at the temperature of measurement would have to be given up.

The Imperial Institute.—The extended organisation of the experimental branch of the scientific and technical research department of the Imperial Institute is now nearly complete, and the whole of the west corridor of the second floor is occupied by well-equipped laboratories, instrument-rooms, and sample examination rooms. The winter course of lectures will be opened on Monday, November 9, at 8.30 p.m., with a discourse by Prof. Wyndham Dunstan, F.R.S., the recently appointed director of the scientific department, the subject of which will be "Illustrations of Some of the Work of the Scientific and Technical Research Department of the Imperial Institute." After the lecture the research laboratories of the department will be open for the inspection of visitors, and a number of interesting exhibits will be on view. On November 16 Mr. William Crookes, F.R.S., will deliver the first of two illustrated lectures on the "Diamond Mines of Kimberley," in connection with which a number of specimens and experiments of great interest will be shown. Among other topics Mr. Crookes will discuss the nature and probable origin of the diamond, and will give an account of recent researches of his own. On the occasion of the first lecture Lord Loch will preside. On the two remaining Monday evenings in November illustrated lectures will be given by Prof. J. W. Judd, C.B., F.R.S., the dean of the Royal College of Science, on "Rubies, Natural and Artificial, with Special Reference to their Occurrence in the British Empire" (November 23), and by Dr. J. H. Bryan, F.R S., on "Flight, Natural and Artificial" (November 30). Among succeeding lectures, the dates of which will be duly announced, is one by Prof. W. E. Ayrton, F.R.S., on "Sixty Years of Submarine Telegraphy." These lectures are open to Fellows of the institute and to persons introduced by them.

Lightning Conductors at St. Paul's.—"For about 60 years after Wren's cathedral was completed," says the *City Press*, "there were no lightning conductors of any sort." The reason of this is exceedingly obvious. It was in 1769 that under the recommendation of a committee of the Royal Society the metal work of the lantern was connected to the lead of the dome by means of strips of lead and 1¼in. square iron bars, the lower portion of the lead roof of the dome being connected to the downspouts on the stone gallery, and so to the downspouts of the roof of the nave, and ultimately with the ground, into which the lead downspouts pierced for 3ft. The pineapples on the summits of the western towers were similarly connected to the ground by way of the nave roof. Considering what was known at the time—the great dispute as to ball or pointed ends was yet to come—the arrangement appears to have been a good one, and as a matter of fact proved effective. The danger that subsequently arose was not, as it happened, owing to the necessary ignorance of the designers of the system of protection, but to want of care in the upkeep, for when in 1873 these arrangements were examined it was found that not only had the iron rods rusted so as to be in themselves a positive source of danger, but that in many cases the old iron hoods of the rain-pipes, which hoods had originally acted as the connection between the rods and the pipes themselves, had been exchanged for granite hoods 6in. or 8in. thick. Upon this state of affairs becoming known, the Dean and Chapter appointed Mr. Faulkner to provide efficient protection against lightning, with the result that the top of the cross surmounting the dome and the tops of the pineapples on the western towers were then connected with the sewers in a manner believed to be capable of thoroughly protecting the cathedral from any peril by lightning whatsoever. It is believed that St. Paul's was the first building in London which was protected against lightning.

Liverpool Engineering Society.—At the opening meeting of this society the president-elect, Mr. S. B. Cottrell, M.I.C.E., M.I.M.E., delivered his inaugural address. Having sketched the general expansion of railways, Mr. Cottrell came to the main point of his address—electricity as applied to traction. Electromotive power, Mr. Cottrell said, began in earnest with the opening of the first electric railway in Berlin in 1879. The subsequent growth of electric rails and tramways in this country, on the Continent, and in the United States and Canada, where 90 per cent. of the street railways are worked by electromotive power, was referred to, and the special value of electric traction for the purpose of inter-communication in cities. In London the worst deficiencies in this respect were about to be remedied by new underground electric railways now authorised or in course of construction. By the application of electricity, the notorious discomforts of the London Underground would doubtless before long become a mere record. Discussing the application of electricity to main lines of railway, Mr. Cottrell said that the application would mean a different class of electric traction to that now employed. The present system of 500-volt continuous current had to be limited to a distance within 12 miles with any degree of economy, but by doubling the present working voltage the cost of transmission would be enormously lightened. A 1,000-volt current would not be impracticable under proper conditions as to safety. It would reduce the cost of conductors to one-fourth the present amount, and the problem would be enormously simplified by operating roads 30 or 40 miles in length from a single power station, while these stations, if placed where coal and water were abundant and worked by latest labour-saving appliances, would reduce the cost of output to a minimum, and enable power to be economically transmitted at high voltage to transferring sub-stations on branch lines up to 150 miles away. If the suggested speed of 100 to 120 miles an hour was ever to be attained, it would be by the electric locomotive. There was practically no limit to the rotary motion of an electric motor, while, unlike the steam locomotive, where the speed was increased by increasing the size of the driving wheels, and thus reducing the tractive power, the wheels might be of small diameter, which reduced the wheel base and gave the highest efficiency of tractive power. The Heilmann locomotive made a great stride in advancing electric traction, since it did not involve the use of power stations. This locomotive generated its own electricity, which was conveyed to motors fixed on the wheels. The whole weight of the locomotive was utilised for tractive purposes, and was unlike the steam locomotive in this respect, since in the latter only a small part of the weight was so made use of. Another advance was the discovery (ascribed to Mr. Tesla) of the rotating magnetic field and the construction of a motor which dispensed with commutators and brushes, always a source of trouble and expense. These improvements pointed to others, and showed that the record of railway development, one of the most interesting chapters of practical science, was far from closed.

BURY ELECTRICITY WORKS.

Bury is supposed to have been a Roman station, and is a place of considerable antiquity. The town stands on the east bank of the River Irwell, and is about two miles from the confluence of the Irwell with the Roach—nine miles north of Manchester. It was incorporated by Royal charter dated September, 1876. The greater portion of the population, numbering some 60,000, are engaged in the cotton trade, though woollen manufacture still employs a large number of hands. The town hall and assembly rooms, situated in Market-street, were erected at the expense of the Earl of Derby, K.G. The police office and the magistrates' room, in which the petty sessions and courts are held, form part of the town hall buildings.

COUNCILLOR ASHWORTH, CHAIRMAN OF ELECTRIC LIGHT COMMITTEE.

MR. JOHN HASLAM, TOWN CLERK.

MR. JOHN HALL, MAYOR OF BURY.

The question of adopting electric lighting in the town was first mooted in 1882, but the decision was eventually arrived at that electric lighting for practical purposes was in too experimental a stage to justify the Council in spending ratepayers' money. However, in 1890 notice was given by a private company of their intention to apply to the Local Government Board for a provisional order authorising the supply of electricity within the borough. This move decided the Corporation to again consider the whole question, and a committee was accordingly formed to deal with the matter. The deliberations of this committee resulted in a provisional order being applied for on behalf of the Corporation to prevent private companies getting in. The order was duly granted in 1890, and Dr. John Hopkinson was soon afterwards called in to prepare a report and to advise the Corporation as to the best method to adopt in lighting the town. In his report, duly submitted in the following year, Dr. John Hopkinson recommended the adoption of a low-pressure system as being best suited to the configuration of the town. But the matter hung fire, no decision being arrived at to carry out the scheme. It was not until it was evident that the gasworks, which, by-the-bye, are in the hands of the Corporation, were becoming too small to cope with the town's demand for gas that the question of electric lighting was really seriously gone into.

MR. E. M. LACEY, A.M.I.C.E., CONSULTING ELECTRICAL ENGINEER.

MR. J. CARTWRIGHT, M.I.C.E., BOROUGH ENGINEER.

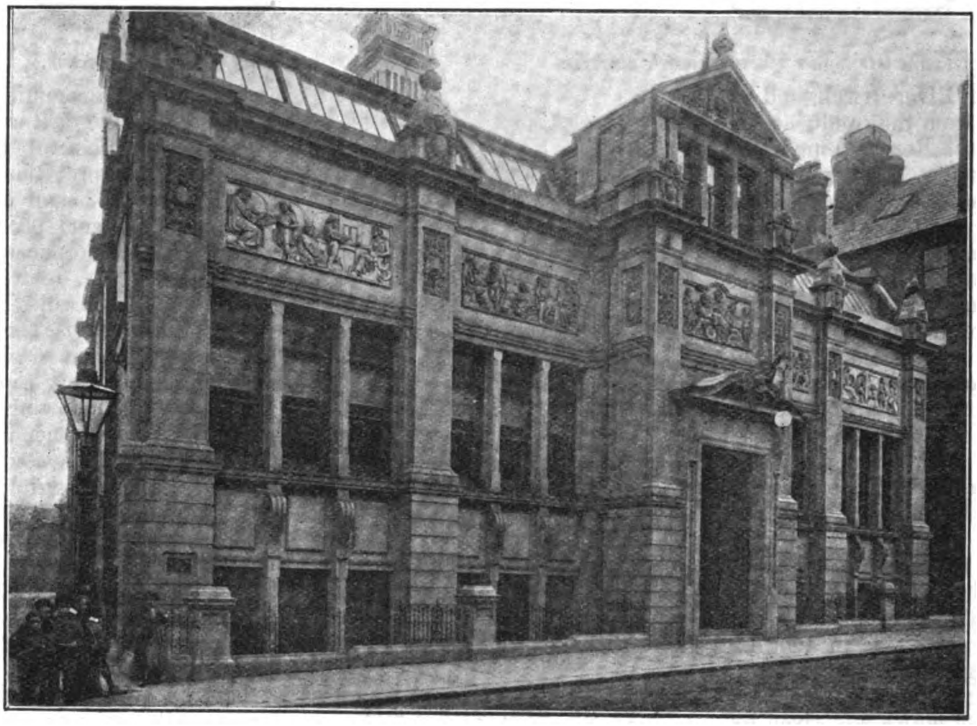
Early in 1893 the Electric Lighting Committee paid a series of visits to different towns which had taken up the

Digitized by Google

supply. They inspected the electricity works at Oxford, London, Eastbourne, Woolwich, and Cambridge. In their report they stated that they considered "the Corporation to be bound to do something at an early date to carry out the electric lighting order they had obtained." The chief difficulty which troubled the committee was the choice between the continuous and alternating systems. They recommended that a number of preliminary tenders should be obtained, leaving the tenderers full liberty to adopt and recommend such systems and types of motive power and dynamos as they may deem best suited. The matter was placed in the hands of the able borough engineer, Mr. J. Cartwright, M.I.C.E., who gave the competitors all the leading data to be fulfilled in tendering. The result of the above course was that 12 firms sent in tenders, which varied so largely in detail and in the design of the plant offered that Mr. Cartwright advised the Council to obtain expert advice on them.

In consequence, a borough electrical engineer was appointed to work with Mr. Cartwright in the matter. Mr. Wynne was chosen for this work, and reports from both these gentlemen were considered by the Corporation early in 1894. It was decided to adopt a low-tension three-wire system with accumulators, and that new tenders on this basis should be invited. Mr. Wynne shortly afterwards resigned his position, and the new specification was prepared by Mr. J. Cartwright. Mr. E. M. Lacey, A.M.I.C.E., consulting engineer, of 10, Delahay-street, Westminster, was, however, retained to co-operate with the borough engineer in electrical matters. In March, 1895, powers to borrow £30,000 were granted after an enquiry, and from that time the work has not been checked. It will be gathered from the above that the brunt of the work has fallen on the shoulders of Mr. J. Cartwright, and he is to be congratulated on the successful completion of the station opened yesterday. His coloborator, Mr. Lacey, has had an extensive experience in electrical work. He held appointments on the staffs of the Health, Inventions, and Colonial Exhibitions. Since 1892 Mr. Lacey has practised on his own account in the profession of consulting engineer, and during this period has, amongst other public bodies, advised the Corporations of Bournemouth, Bury, Darwen, and Blackburn. Mr. Lacey at the present has in hand several important works, and amongst these may be mentioned the extension of the Blackburn Corporation electricity works, the electric traction scheme for the Blackburn tramways, and the electrical installation at the Blackpool Winter Gardens, where a plant of upwards of 1,200 h p. is being put down.

The area to be supplied at Bury is a fairly good district, and although no canvass or attempt whatever has been made to secure customers, yet the equivalent of about 800 8-c.p. lamps has already been wired. The work of adding to this number is still going on merrily. The tradespeople and private residents are likely to be the largest consumers, as although there are many large factories in the town the principal ones have their own installations, spare power being utilised. The municipal buildings have not yet been wired, but the work is to be proceeded with shortly. Of the other public buildings perhaps the principal is the technical school, a photograph of which we reproduce. This truly magnificent structure was designed by Mr. J. Cartwright also, and has only been completed about a year. It at present has its own installation of electric light, the number of lights installed being equivalent to 300 16 c.p., but it is probable that the institute will shortly be connected on to the Corporation mains, the present system of running by means of a gas-engine being found to be none too satisfactory. Altogether, although the number of lamps connected at present to the mains is small, there is every promise that the number will rapidly be augmented. Gas is supplied in the district at about 2s. 1d. net, and the price per unit for electrical energy has been fixed at 6d. with a rental for meters according to capacity. As mentioned above, the sum of £30,000 was borrowed to cover the cost of the electric light undertaking, but of this amount only about £15,000 has been actually expended, £5,000 of which represents the cost of the buildings. The contract for the erection of the requisite buildings was given to Messrs. Storrs and Sons, of Stalybridge, in September, 1894. The order for the necessary plant and supply mains was awarded to Messrs. Siemens Bros. in November, 1895.



THE ART SCHOOLS, BURY, DESIGNED BY MR. J. CARTWRIGHT.

Buildings.

The site of the station buildings is conveniently situated almost in the centre of the district to be supplied, and is Corporation property, there being room for unlimited extension. The buildings (designed by Mr. J. Cartwright), the general arrangements of which can be gathered from Figs. 1, 2, and 3, are of red brickwork with stone dressings, and comprise offices, storerooms, workshops, accumulator-house, boiler-house, engine and dynamo room. The area covered is 10,000 square feet. At present the approach is from Back Derby-street, but the principal entrance will ultimately be from Rochdale-road. The accumulator-house has a floor space of 1,550 square feet; the walls are lined with salt-glazed bricks of a brown colour, while the floor is paved with Staffordshire chequered blue bricks laid on 6in.

Digitized by Google

of concrete. The accumulator cells are supported on low walls of salt-glazed bricks running parallel with each other down the length of the room, and ample light is obtained

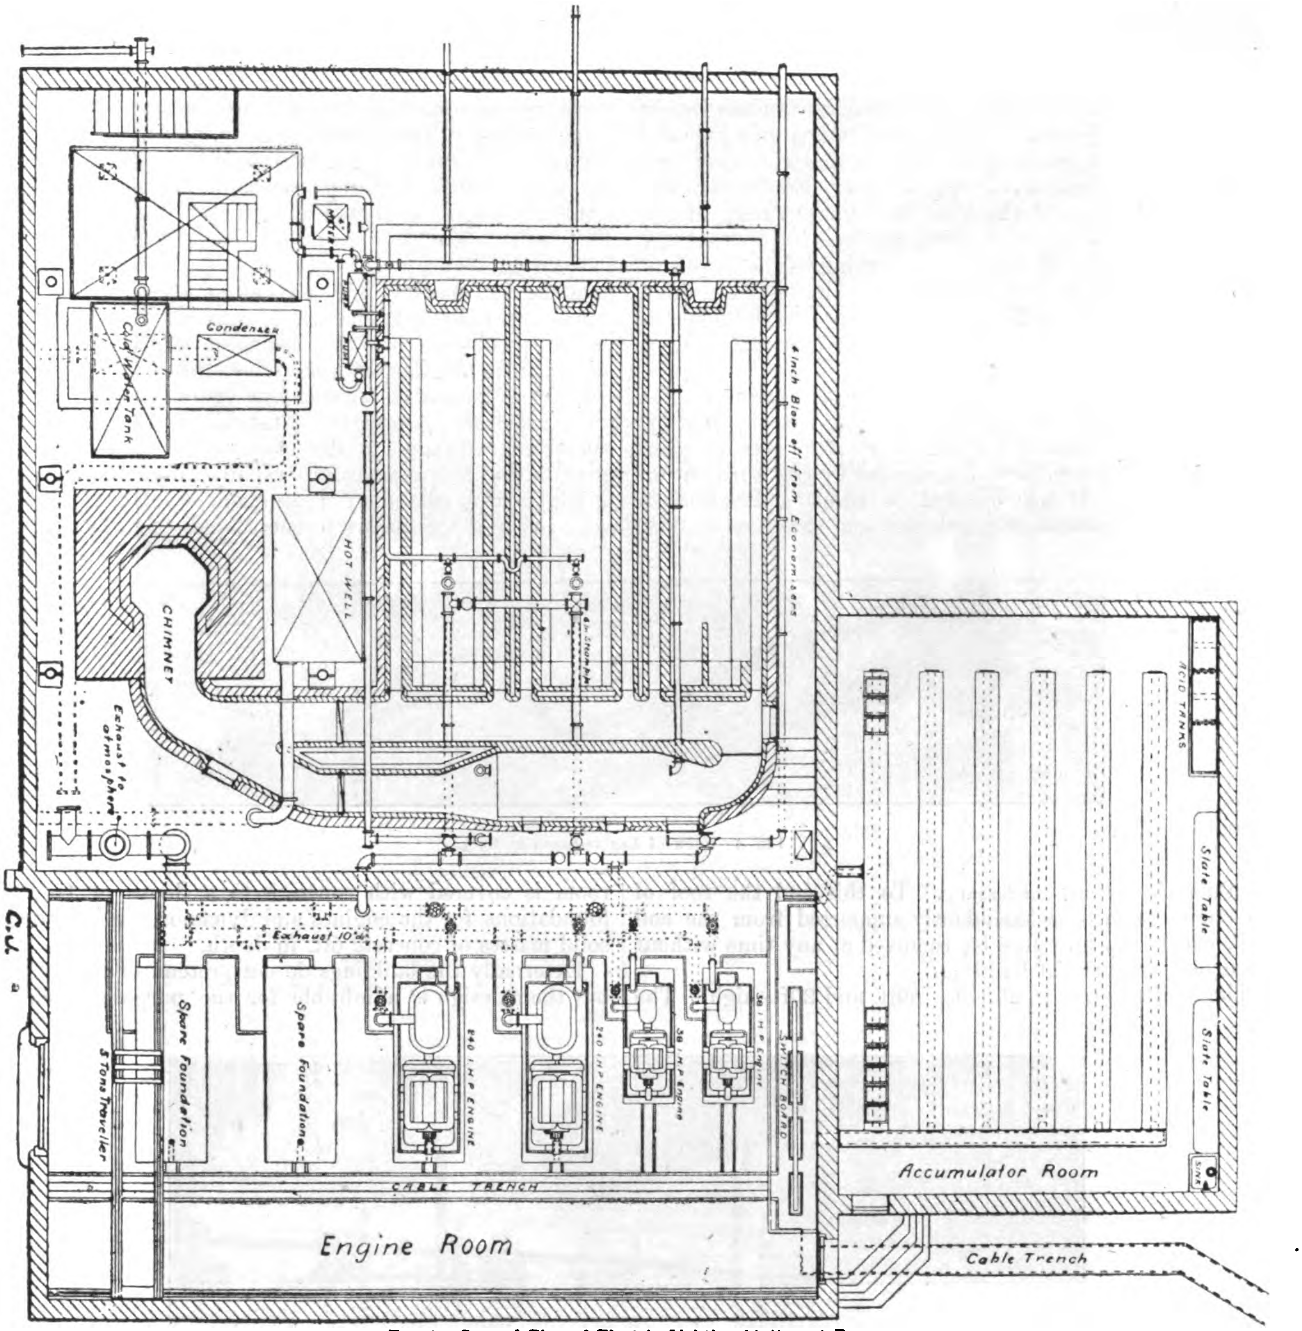


Fig. 1.—General Plan of Electric Lighting Station at Bury.

through windows along the south wall. Ventilation is provided for by means of a continuous open ventilator running the entire length of the roof, which, by the way, is of deal.

The engine-room is 60ft. by 30ft., height 36ft. to ridge, and the walls to dado height are lined with brown and

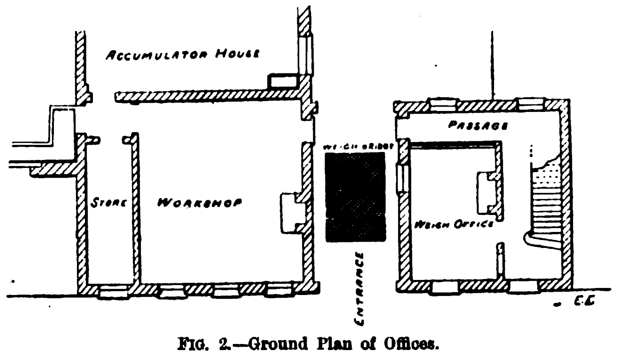

Fig. 2.—Ground Plan of Offices.

cream coloured glazed bricks, as can be seen in Fig. 4. The upper portion of this work is done with Aston Hall bricks. The floor is paved with encaustic tiles, with pattern border, and the roof is of iron, boarded with 1½in. boards on the angle. Lighting is effected from the westerly side by windows of fair proportions, by a lantern light in the roof, which also serves the purpose of a ventilator, and by skylights in the roof, also used as ventilators, which can

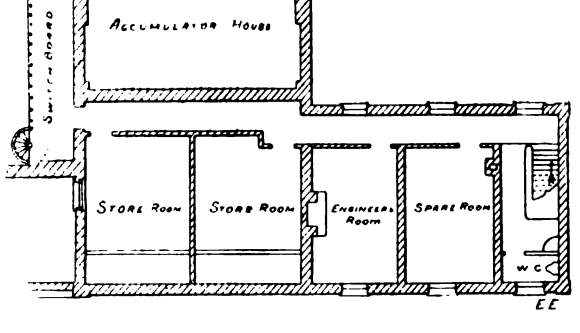

Fig. 3.—First Floor Plan of Offices.

be opened from the floor level. A travelling crane to lift 10 tons, worked by means of hand power, supplied by Messrs. Carrick and Ritchie, of Edinburgh, runs the entire

Digitized by Google

length of the room, being supported on moulded stone corbels 20ft. from the ground level. The floor space is amply sufficient to allow of plant double the present capacity being installed without any extensions. Provision is also made for extensive additions to the present building should such become necessary. To this end the roof of the engine-room is independently supported from the end wall, which can therefore be removed at any time without disturbing the present building.

The boiler-house is 60ft. by 60ft. and 20ft. high. The roof is of iron in two spans, supported by girders and columns, and has louvre ventilators. Three large doorways, fitted with revolving steel shutters, are provided through which to tip coal. Accommodation is provided for another boiler when extensions become necessary. The chimney shaft rises through the roof of the boiler-house; it is 14ft. square for a height of 48ft., the remaining portion being octagonal in form and surmounted with a terra-cotta top. The shaft is lined with firebricks for a height of 60ft., the total height being 150ft. No difficulty has been experienced in obtaining good foundations. The floor of the engine-room is covered with concrete to a depth of 1ft., while foundations for the engines and dynamos are provided by solid masses of concrete 6ft. in depth.

Externally the buildings do not pretend to much beauty, but their design is admirable for the purpose which they serve, and forethought has been shown for future extensions. It is quite probable that extensions may be necessary at an early date, for we understand that the tramway company is negotiating with the Corporation for the supply of current necessary to work a portion of their extensive system electrically on the overhead trolley system. In the

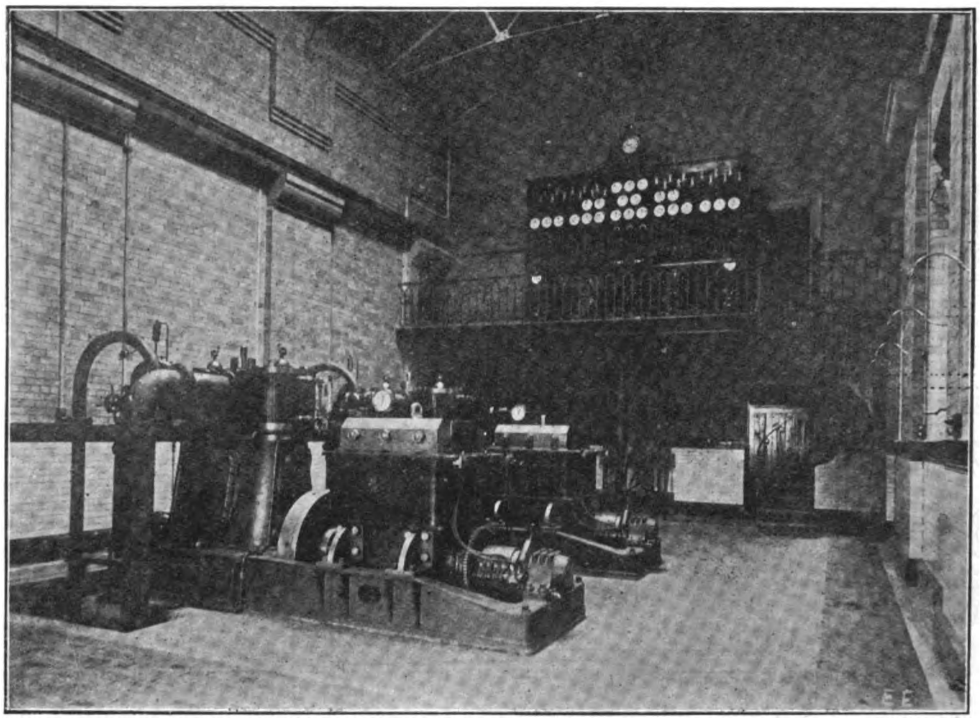

FIG. 4.—View of Engine-Room at Bury.

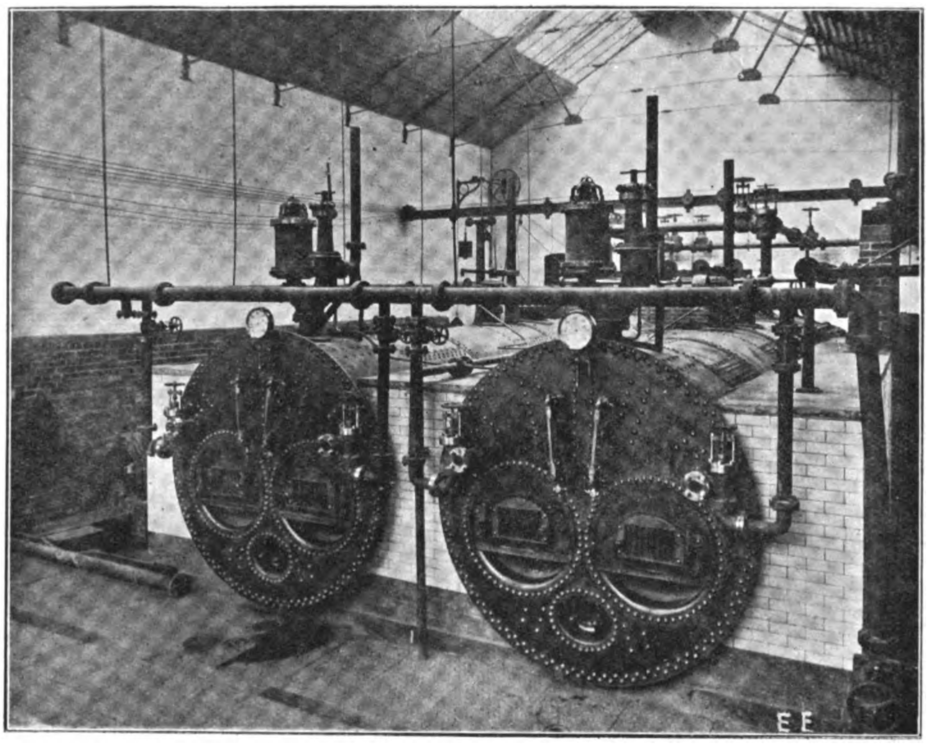

FIG. 5.—View of Boiler-House.

Digitized by Google

event of the successful issue of these negotiations, Bury will be able to boast of its electrically-driven tramcars, and will also gain a useful power load for its electricity works. The two large dynamos in series would give the voltage required, so that new plant interchangeable with the old

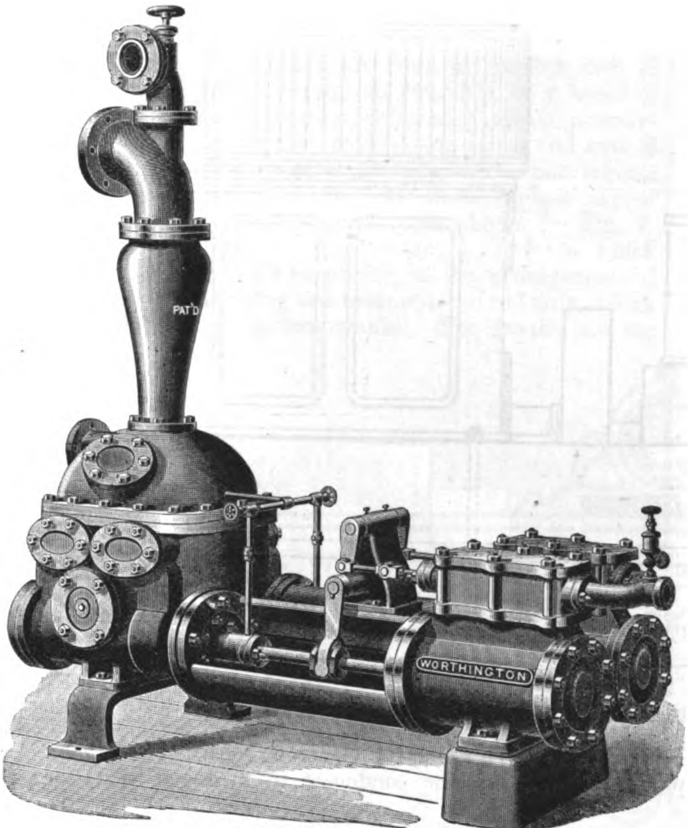

FIG. 6.—Worthington Jet Condenser.

could be added. A weighbridge (Fig. 2) is provided at the Back Derby-street entrance to the generating station for weighing all coal or other material that may enter the yard. The offices are spacious, and very conveniently arranged; the testroom adjoins the offices. A separate contract was entered into by the Corporation with Messrs. J. H. Heywood, of Manchester, for wiring the whole of the premises. For lighting the engine-room, yard, and approaches, this firm have used arc lamps manufactured by Messrs. Crompton and Co. We may add here that a few arc lamps will be put up by the Corporation for experiment, but no street-lighting on an extensive scale has yet been decided upon.

Steam Generating Plant.

As mentioned above, Messrs. Siemens Bros. are the contractors directly responsible to the Corporation for the whole of the machinery and mains; but sub-contracts were entered into by them. Thus, the boilers were supplied by Mr. W. Lord, of Bury. Two of the Lancashire type of boilers were required, and a general view of these in their seatings is shown in Fig. 5. Each boiler is 30ft. long and 7ft. diameter. The two tubes taper in diameter from 2ft. 9in. at the furnace end to 2ft. 3in. at the other end. The shell plates are of $\frac{11}{16}$in. mild steel. The first ring of the main tubes is of $\frac{5}{8}$in. steel, the rest being $\frac{1}{2}$in. There are no cross tubes. These boilers were designed for a working pressure of 150lb. per square inch, and were tested under a hydraulic pressure of 300lb. per square inch. All the usual boiler mountings are supplied, and the Hopkinson type of fitting and valve has been used throughout. These boilers are fed by two Worthington pumps, each of which is capable of keeping the full load in the station going. Each of these pumps has cylinders $4\frac{1}{2}$in. diameter, plungers $2\frac{3}{4}$in. diameter, with a 4ft. stroke. These pumps are so arranged that water may be pumped to the boilers direct from a cold-water tank (of 8,000 gallons capacity, replenished from the town mains), from the hot-well through the Green's economiser which has been provided, or direct from the hot-well to boilers. This fuel economiser has 120 heating tubes, each $4\frac{9}{16}$in. diameter and 9ft. long, and was made by E. Green and Son, Limited, of Manchester and Wakefield. It is placed in the flue between the boilers and chimney stack. This apparatus has been constructed from strengthened patterns throughout, and is of Messrs. Green's high-pressure type. It is arranged in rows six tubes wide, with a passage along the back for inspection and cleaning purposes. The test pressure applied before the economiser was passed was 350lb. on the square inch. The scrapers in this economiser are actuated by a $\frac{1}{2}$-h.p. electric motor placed in the boiler-house.

Steam and Exhaust Pipes.

These, together with the tanks, were supplied by John Abbott and Co., of Gateshead-on-Tyne. The pipes are of lap-welded mild steel with flanges welded on, with copper bends and cast-iron T-pieces The steam-pipes are arranged on the ring system, and the steam for the engines may be taken either way round the ring. Valves are placed between each engine and between the boilers, so that any section can be cut off independently of the others for repairs, etc. A feature which strikes one on entering the engine-room is the absence of unsightly steam-pipes (Fig. 4). The reason of this is that these, together with the

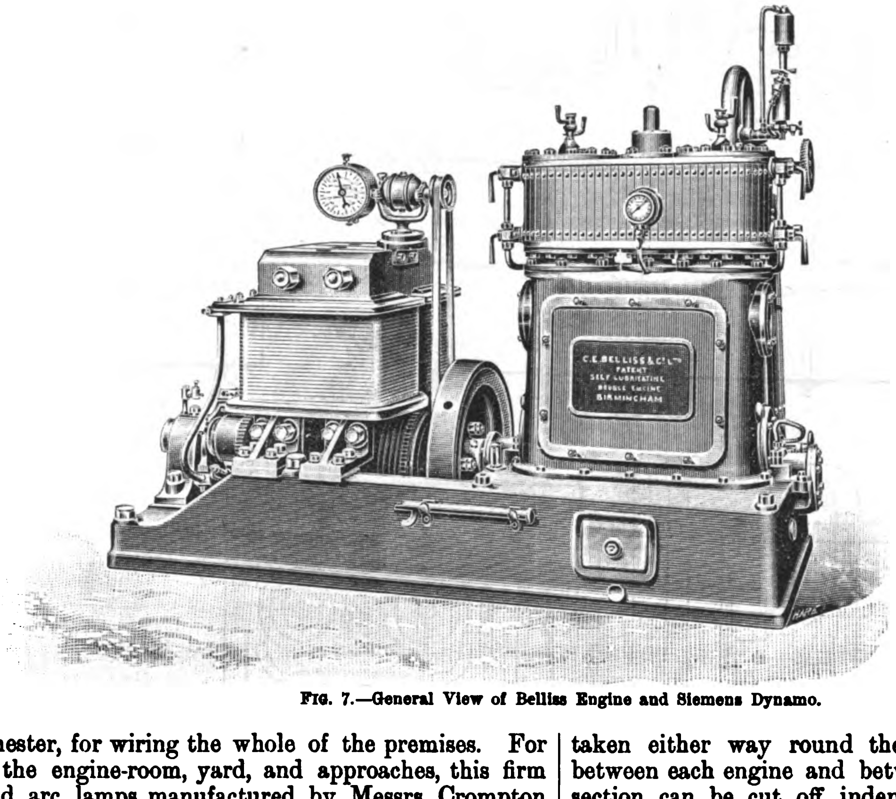

FIG. 7.—General View of Belliss Engine and Siemens Dynamo.

Digitized by Google

exhaust steam-pipes, etc., are laid in brick trenches below the floor, at the back of the engines, and covered with neat iron gratings. This trench is approachable from the boiler-house and affords ample room for inspection and repairs. The exhaust-pipes are of cast iron, varying in diameter up to 14in., and are supported in the same way. The exhaust is at present carried into the atmosphere, the pipes going

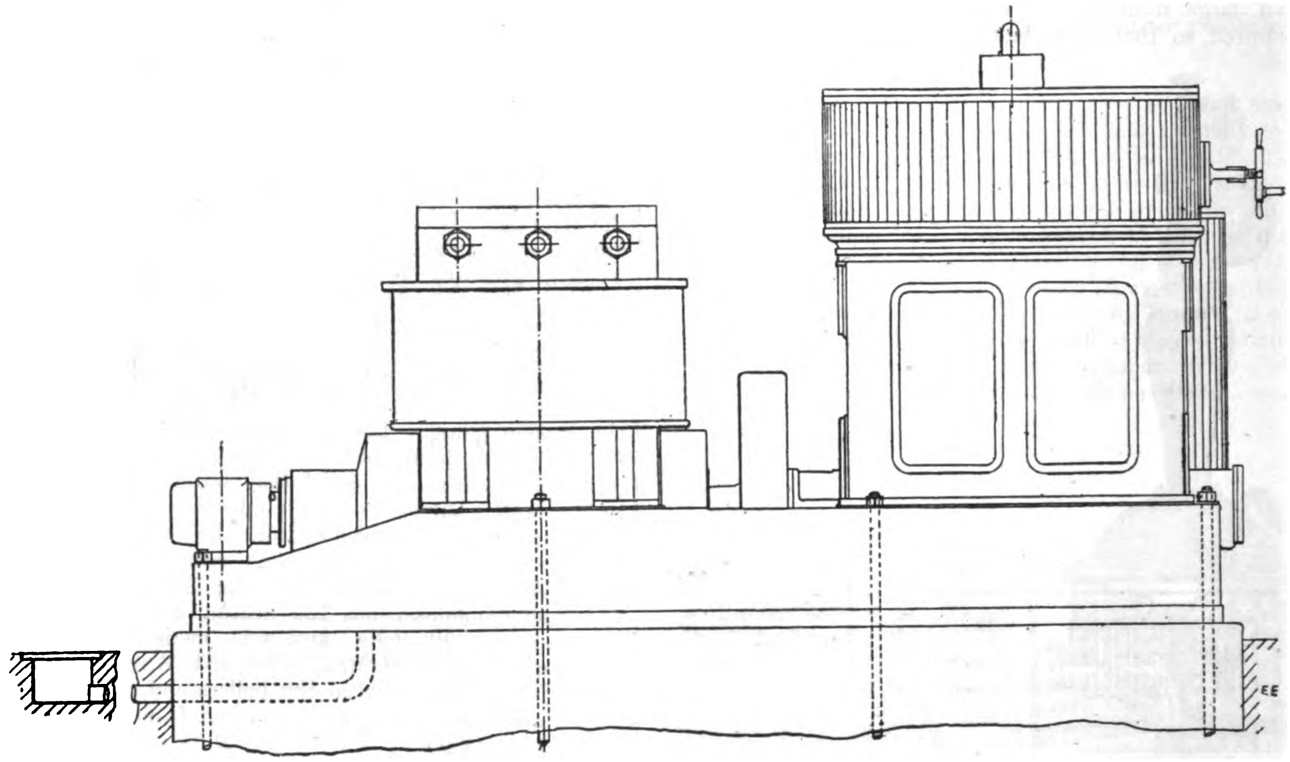

FIG. 8.—Elevation of 240-i.h.p. Belliss Engine Coupled to Siemens Dynamo.

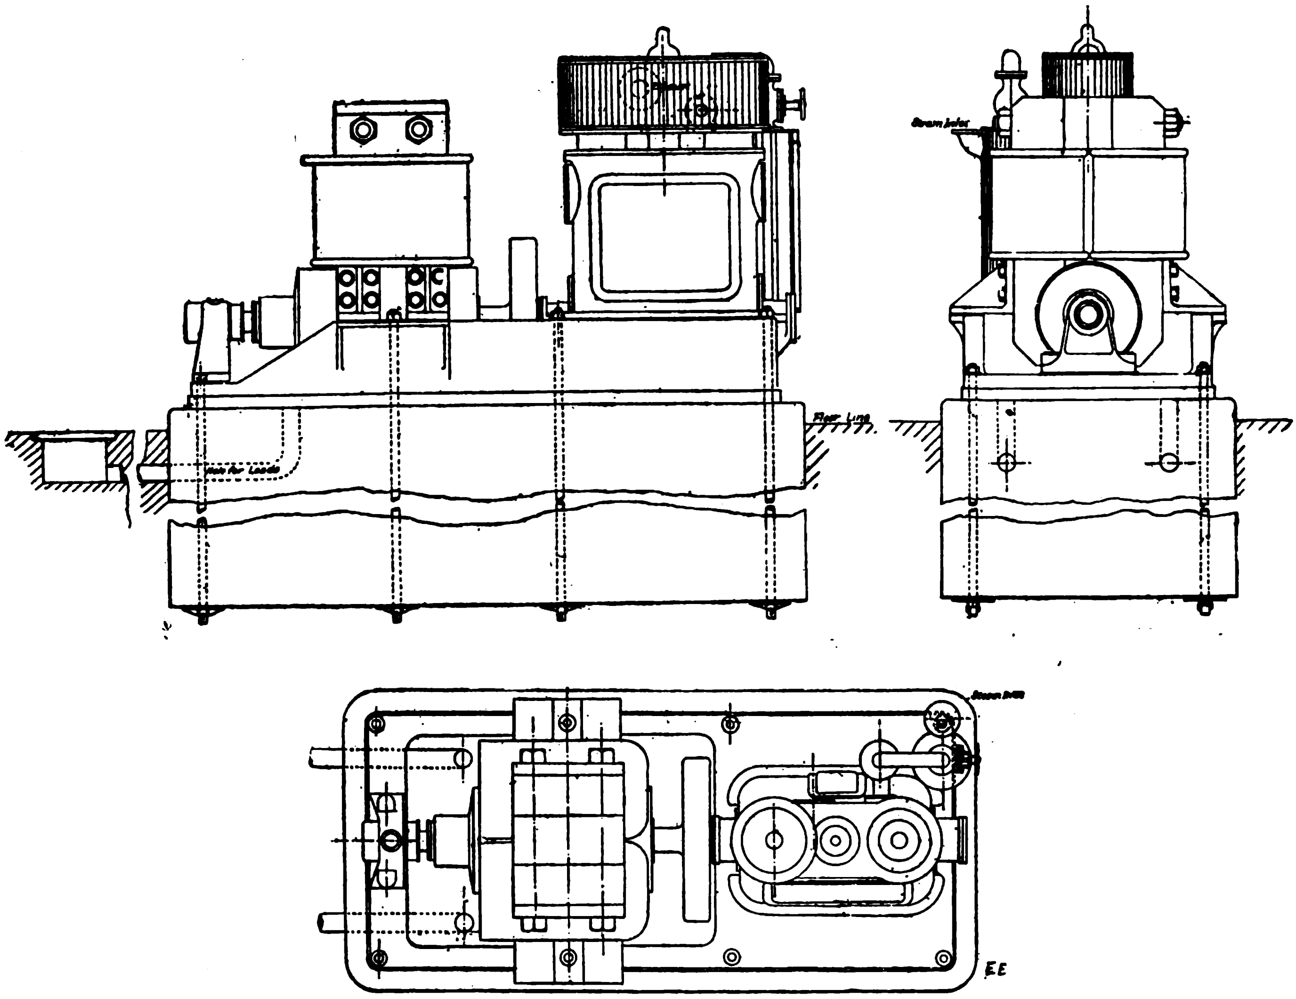
through the boiler-house roof independent of the chimney shaft (Fig. 1). A Worthington jet condenser is, however, being erected. This apparatus (Fig. 6) consists of a duplex pump and an injector condenser so arranged that the momentum of the incoming injection water and exhaust steam is employed to assist the pump in maintaining the vacuum in the condenser. The diameter of the steam-



FIGS. 9, 10, and 11.—Plan and Elevations of 88-i.h.p. Belliss Engines Coupled to Siemens Dynamo.

Digitized by Google

cylinders is 9in., while that of the pump plungers is 12in., the length of stroke being 10in. The necessary condensing water will be obtained from the Barnbrook stream, which runs in close proximity to the station.

Engines.

These have been supplied by Messrs. G. E. Belliss and Co., of Birmingham. They are four in number, two of them designed for an output of 240 i.h.p. at a speed of 350 revolutions per minute, working at a steam pressure of 140lb. per square inch at engine stop-valve, and two of 38 i.h.p. working at a speed of 560 revolutions per minute with the same steam pressure. All these engines are of the Belliss two-crank compound type, shown in Fig. 7. A special feature of this type of engine, and one which contributes largely to its simplicity, is the arrangement of the slide valves, requiring one eccentric and rod only, which is placed in between the two cranks. The cranks are set opposite to each other, the steam being admitted simultaneously to the top of one cylinder and the bottom of the other, by which arrangement the reciprocating parts are to a great extent balanced and the strain on the bearings much reduced. The engine is fitted with a centrifugal governor, carried on the crankshaft, and connected to an equilibrium throttle-valve. The governor gear is arranged so that the speed of the engine is capable of being adjusted through a wide range of variation whilst running. Forced lubrication is provided throughout, and the makers claim that their double-acting engine is capable of exceptional efficient lubrication.

Dynamos.

All the dynamos were, of course, manufactured by Messrs. Siemens Bros. and Co. The two large dynamos, of the H.B. $^{24}/_{36}$ type, are coupled to the 240-h.p. engines (Fig. 8), and were specified to give 500 amperes at 260 volts. They are shunt-wound, the shunt regulation to be sufficient to allow of an output of 500 amperes at from 220 to 250 volts, while the remaining 10 volts may be obtained by raising the speed to 350 revolutions per minute. The smaller pair of dynamos (Figs. 9, 10, and 11) are of the H.B. $^{15}/_{16}$ type, capable of giving 144 amperes at from 110 to 145 volts, with a speed of 500 revolutions, but a rise of speed to 560 revolutions will allow of the voltage being raised to 160 volts. At the lower voltage the machines can give 200 amperes. All the armatures are drum-wound, and the bearings are provided with ring lubrication, and a tachometer is supplied with each set. Combination bed-plates, extending under both engine and dynamo, are used for both the sizes above mentioned.

These engines and dynamos were tested at Messrs. Belliss and Co.'s works before being delivered. All the sets were run on full load for some 10 hours. We have been kindly allowed to see a copy of these official tests, and gather from them that the two large sets were put through the 10-hour trial at the same time. From the figures as to boiler pressure and pressure in the valve chest, it is seen that the small section of the steam-pipes used caused a considerable fall of pressure. Hence the efficiency figures suffered. The tests we give were made when one set only was running at varying loads.

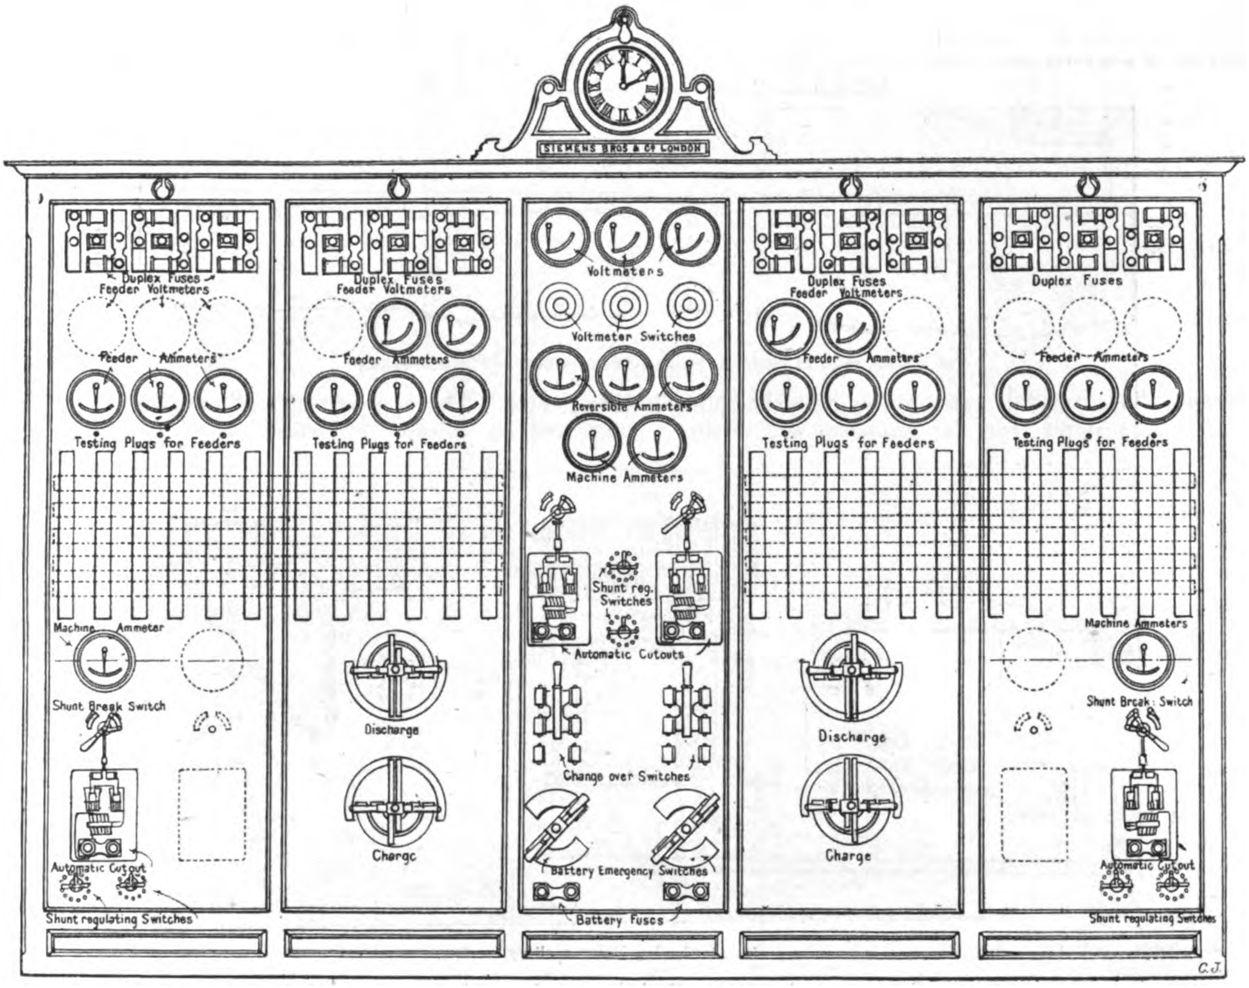


Fig. 12.—The Switchboards, Bury.

Belliss Engine No. 421 Coupled to Siemens H.B. $^{24}/_{36}$ Shunt Dynamo—Test when Exhausting into Condenser.

	Full load.	Half load.
Boiler pressure, pounds per square inch	145	145
Vacuum in inches	27·5	27·5
Pressure in steam-chest, pounds per square inch	95	49
Revolutions per minute	352	350
Amperes	490	238
Volts	262	253·5
Electrical horse-power	172 2	81
Indicated " "	203	96·8
Efficiency $\frac{\text{E.H.P.}}{\text{I.H.P.}}$	84·8	83·6
Pounds of water per hour	3,216	1,854
" " " I.H.P.	15·84	19·15
" " " E.H.P.	18·67	22 88

The engine No. 420, which is similar in every respect to that tested above, was then run at full load, exhausting into the atmosphere. The average of three tests for water consumption gave the following figures: Boiler pressure, 143lb.; pressure in steam-chest, 135lb.; speed, 349·5 revo-

Digitized by Google

lutions; E.H.P. = 177·8; I.H.P. = 212·6; efficiency, 83·6 per cent.; pounds of water per hour, 4,249; pounds of water per I.H.P. = 19·98; ditto per E.H.P. = 23·86. A set of friction cards taken on the same engine showed 22 i.h.p. at no load. Assuming that this friction loss is constant at all loads, as we are justified in doing, this will give a ratio of $\frac{\text{B.H.P.}}{\text{I.H.P.}}$ = 89·65 per cent.

The governor trials of these two engines gave the following results. The full load was switched off suddenly to test the regulation of the governors:

	Revolutions per minute. No. 420		No. 421
Load on	349	362	350
Load off	367	367	365
Momentary increase	410	395	415

The following are the temperature rises after the 10-hour run at full load:

Temperature of test-house, 95deg. F.	No. 420	No. 421
Temperature of field magnets	154	150
Temperature of armature engine end	122	125
Temperature of armature commutator end	113	120

The temperatures of the various parts of the dynamos after the 10-hour full load run were as follows:

Temperature of test-house, 95deg. F.	No. 222	No. 223
Temperature of field magnets	110	112
Temperature of armature	111	112

Governor trials made by throwing the full load suddenly off:

	Revs. per min. No. 222.	No. 223.
Load on condensing	550	500
Load off condensing	560	512
Momentary increase condensing	600	590
Load on non-condensing	—	500
Load off non-condensing	—	513
Momentary increase	—	575

Switchboard.

The switchboard (Fig. 12) has been supplied by the contractors for the whole of the plant and mains (Messrs. Siemens Bros.), and consists of five panels of enamelled slate supported on an iron framework. It is essentially a plug switchboard of Messrs. Siemens Bros.' latest design. All the instruments, switches, etc., are of the firm's make. Two panels contain the battery charging and

FIG. 13.—Laying Mains at Bury.

discharging switches—one for each side of the three-way system—with the usual arrangements for throwing-in additional cells to keep pressure constant or to take them out, as the case may be. The connection and plugging switches are so arranged that any one dynamo and circuit can be isolated from the 'bus bars and run independently. Duplex fuses are provided for the feeders. Space is left on the board for two more machines and four more feeders. As will be gathered from the illustration, each three-wire feeder is provided on the board with two ammeters, two pilot voltmeters, but no switch, so that only a failure of the fuses can cut off the supply. The two smaller dynamos are used to charge the accumulators, and the change-over switches on the centre panel allow either machine to charge either set. The large dynamos, on the other hand, are always connected to the two outside wires of the network. All the machines are protected against excessive or return current by automatic cut-outs.

The switchboard is erected at the south end of the engine-room on a gallery which is reached by a circular iron staircase.

Thus the maximum rise on the field was only 59deg. F., while that of the armature never exceeded 30deg. This shows that the dynamos are capable of giving considerably more than their rated output.

The two smaller sets of engines and dynamos were put through similar trials, with the results given below:

ENGINE No. 222—EXHAUSTING INTO CONDENSER.

	Full load.	Three-quarter load.	Half load.	Quarter load.
Boiler pressure	146·5	140	143·3	146·3
Pressure in steam-chest	131·5	—	—	—
Vacuum	23·5	24	24	24
Revolutions per minute	500	505	503	503
Amperes	203	137	100	53·3
Volts	114	110	109	112
Electrical horse-power	31	20·2	14·6	8
Pounds of water per hour	796	504	389	238·5
„ „ „ „ E.H.P. hour	25·67	24 9	26·5	29·75

In the combined condensing trials for 10 hours of these two engines and dynamos at full load better consumption figures than the above were obtained. The water per electrical horse-power hour came out at only 24·4lb. The friction cards on one of these sets indicated 3·77 h.p. at no load, which shows a commercial efficiency of 89·6 per cent. at full load.

Accumulators.

These are of the E.P.S. type, and the 130 of the K-54 type

Digitized by Google

cells are arranged in two batteries in series, each containing 65 cells. The plates are placed in lead boxes and equipped with all the usual accessories, including hydrometers and sheet-glass spray catcher. Spare acid is contained in an ebonite cistern at one end of the room. This cistern is provided with an ebonite valve and indiarubber hose pipe, so that acid can be easily put into any battery requiring it. The whole of the cells are connected in series, the centre cell and those at each end being connected to the switchboard.

Mains.

The whole of this work was placed in the hands of Messrs. Siemens Bros., but the trenching and making good the footpaths was done by the Corporation under Mr. Cartwright's supervision. A three-wire system of distributing mains with three-wire feeders is provided, the voltage of supply between two adjacent wires being 110. A few consumers have, however, been connected across the outside wire, taking their supply at 220 volts. The cables used for distributing mains consist of a strand of 37 wires ·071in. diameter for the outside wire and 19 ·064in. wires for the inner conductor. About 3,000 yards of this distributing system have been supplied and laid. This network is fed at two points—one in Fleet-street, near the corner of Union-street, and the other at the junction of Princes-street with Market-street. Both these feeders are about 700 yards long. All the mains and feeders are insulated with vulcanised rubber tape and braided, and these are drawn into 4in. cast-iron pipes. The method of laying the mains, etc., is shown in Fig. 13, while Fig. 14 shows a section of a street box. The station is at one end of the area supplied, and the streets now provided with mains include, besides those mentioned, Moss-street, Silver-street, Broad-street, King-street, Rock-street, Clough-street, and Rochdale-road. The house connections are drawn into 2in. wrought-iron pipes from house service boxes placed every 20 yards or so along the street. These boxes are usually of glazed brick, but concrete is used in some places.

The resident electrical engineer is Mr. S. J. Watson, who has been recently appointed. The charge authorised for the supply will be 6d. per Board of Trade unit, and meter rents will also be adopted. The whole of the meters

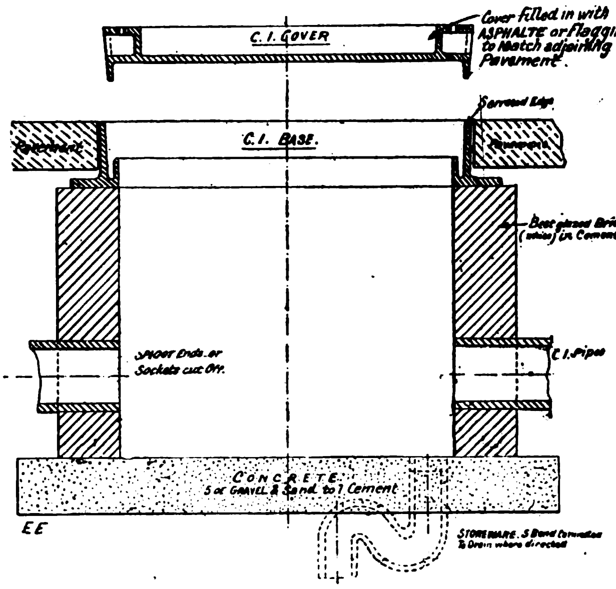

FIG. 14.—Section of Street Box.

for consumers have been supplied by Messrs. Chamberlain and Hookham, while the station meters are of the Elihu Thomson type.

CROYDON ELECTRICITY WORKS.

The scattered town of Croydon, although only recently incorporated, has a history extending back into Lanfranc's time. This eminent bishop built the archiepiscopal palace, which fell into disuse in 1757, and now is in ruins. The town has grown rapidly of late, and now has a population of over 100,000. Its corporate spirit is shown by the splendid municipal buildings it has erected, which were recently opened by the Prince of Wales.

The electric light has been the cause of much agitation in Croydon, and a perusal of our back volumes will repay for turning up references under the heading of "Croydon." Thus, we find that in November, 1889, no less than three companies gave notice that they were applying for a provisional order to light the town by electricity. The municipal fathers took counsel as to which of the three would offer best terms if the granting of their order was not opposed, but in the end could find "no best." This was about the time when the numerous House-to-House companies were projected, but the Croydon House-to-House Electric Lighting Company did not get a footing in the town. Finally, the Corporation applied for an order in self-protection, and were granted the necessary powers in 1891. Even then the companies tried to get transfers, and as a result tenders were asked for. The chief condition laid down to the persons offering to take over the order was that good repurchasing clauses should be given. No less than six offers were submitted to the Council early in October, 1892. The terms of these offers are given on page 367 of vol. x. of the *Electrical Engineer*. In the report on these it is noted that "under either of the offers, if the Corporation should desire to repurchase the undertaking, they will have to pay a substantial profit upon the sums actually expended by the contractors, and they may find themselves in the position of having to take over a considerable amount of plant which at the time of purchase may be out of date and of little value, but which the Corporation will have to acquire, not at its then value, but at a considerable premium on its original cost." Taking all these considerations into account the committee recommended "that the Council should carry out the powers of the provisional order itself, either then or at a future date."

Mr. W. H. Preece was then called in to report on the advisability of placing a central station under the new municipal buildings, and presented his report early in 1893. The conclusions arrived at have now practically been carried out. The inconvenience of running a large number of private lights from an electric lighting plant in the basement of the town hall was pointed out, and the establishment of a central station elsewhere in the town was recommended. On the matter coming before the Council it was referred back by the casting vote of the Mayor. The matter was then shelved for a time, till in November, 1894, a resolution was passed to the effect: "That the Corporation should arrange with some company of undoubted stability to establish an installation for a compulsory area at such contract price as the consulting engineer of the Corporation may approve; that the Corporation should find the necessary capital for the above purpose; that the company should undertake to work the undertaking for a term of years to be agreed upon and to maintain the plant in thorough working order, taking the revenue to be derived from the undertaking and satisfactorily guaranteeing to pay the Corporation interest and sinking fund upon the capital expended; and that powers should be reserved to the Corporation to take over the undertaking from the company upon terms to be agreed at an earlier date than the expiry of the period stipulated in the first instance." From this it will be seen that a new departure in the methods of supplying a town with electric light plant was proposed, and the subsequent records show that the British Thomson-Houston assisted in the new venture. Thus in April, 1895, it was agreed: "That the Electric Lighting Sub-Committee be authorised to instruct the town clerk to make application to the Local Government Board for permission to borrow a sum not

Digitized by Google

exceeding £27,500 for the purpose of electric lighting; that the sub-committee be authorised to instruct Prof. Kennedy to arrange with the British Thomson-Houston Company a detailed specification of such works as in the judgment of Prof. Kennedy will satisfactorily supply electricity to the central area, together with all necessary accessories at such contract price as Prof. Kennedy may approve. Provision to be made, as far as buildings and laying pipes to carry

ALDERMAN EDRIDGE, MAYOR OF CROYDON.

extra mains are concerned, for a considerable future extension of the system. That the sub-committee be authorised to order the corporate seal to be affixed to a contract with the British Thomson-Houston Company, Limited, subject to the sanction of the Local Government Board to a loan for the purpose of providing the necessary expenditure, and that the sub-committee be authorised to engage Prof. Kennedy to watch the interests of the Corporation in the matter and to see that the contract is efficiently carried out."

The full details of the arrangements between the British Thomson-Houston Company and the Corporation are too

ALDERMAN MILLER, CHAIRMAN OF ELECTRIC LIGHT COMMITTEE.

lengthy to publish, but the gist of the arrangements is as follows: The Corporation find all the capital required, and the contractors to work the station for a period of not more than 10 years, and to pay during that time the interest and sinking funds of the borrowed capital. The contractors, of course, take all the income, and have to provide for keeping the station in repair. When the station is taken over by the Corporation some payment has to be made for goodwill if the 10 years have not expired.

Buildings.

The station buildings at Croydon were designed by Mr. E. Haslehurst and erected by S. Page, of Borough-hill, Croydon. The station is situated near the Corporation's dust depôt at Brimstone Barn, which is a convenient site both for coal and water. It is expected that a siding to the works will be provided as the demand increases. The front view of the buildings, which include all the usual offices,

ALDERMAN MOSS, MAYOR ELECT, CHAIRMAN GENERAL PURPOSES COMMITTEE.

is shown in Fig. 1. The buildings are of substantial design, and in every way are a credit to the architect. The engine-room and boiler-rooms have a dado of glazed brickwork, and the ventilation has been especially looked after.

System of Supply.

The system of supply, although not altogether new, has many features worthy of special notice. The alternators in the station supply by independent feeders some four sub-stations. The high-pressure supply is at 2,000 volts, and is transformed down to 200 volts in the sub-stations. These sub-stations have also high-pressure links between

MR. E. MAWDESLEY, B.A., LL.B., TOWN CLERK.

them, so that in the case of a failure of one feeder the light need not be interrupted for any length of time. The low-tension mains provided can, if desired, be connected up as a network, but at present the links will be left out and each section fed independently. Thus each sub-station feeds some three or four sections of low-tension mains through fuses in the sub-station. No fuses are at present placed anywhere on the mains themselves. The higher voltage on the low-

Digitized by Google

tension side—*i.e.*, 200 volts—is here applied for the first time for alternate-current work. This pressure makes the two-wire system as valuable as the three-wire system with the pressure of 100 volts, and also gives greater simplicity. The other novelties in the station itself will be referred to later on.

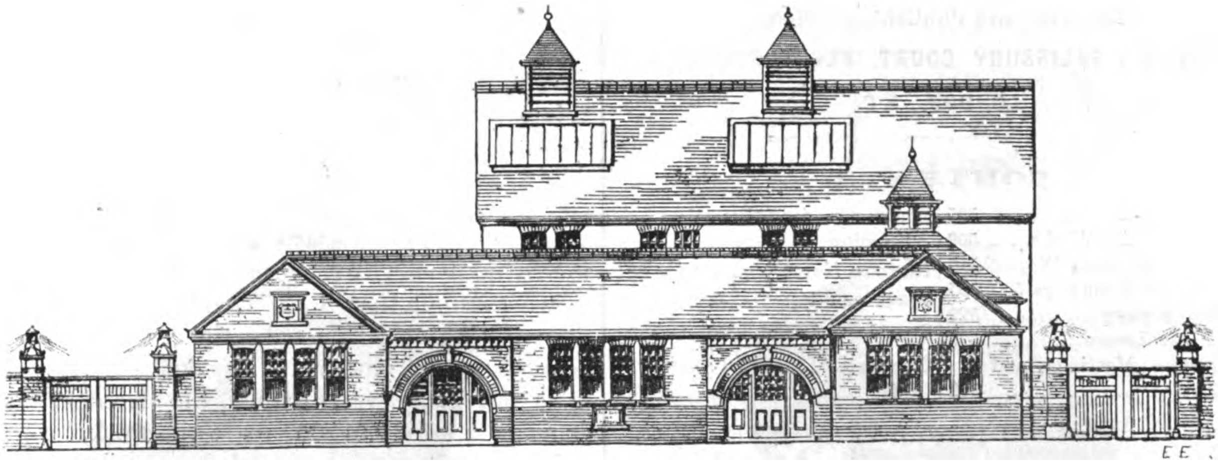

FIG. 1.—Front Elevation of Central Station at Croydon.

Steam Generating Plant.

The sub-contractors for this part of the work were Messrs. Davey, Paxman, and Co., of Colchester. They have supplied three of their steel "Economic" boilers. The position of these in their seatings can be seen in Figs. 2 and 3, while Fig. 4 shows a general view of the boiler-room. Both boilers are 14ft. long and 8ft. 7¼in. in diameter, and are fitted with 104 3in. diameter smoke-tubes. Each boiler has two main flues, 2ft. 10in. in diameter, and there are two circulating tubes in each flue. The total heating surface of the boiler is 1,316 square feet, and the working pressure is 160lb. per square inch. Each boiler is provided with Paxman's patent expansion boiler flue (see Fig. 5), the form of which gives it such strength that thinner plates can be used in its construction than it would be safe to use in the plain flue. This is a great advantage, as it is a well-known fact that the heat passes more rapidly through thin plates, which are thus rendered more durable because they do not overheat. In this way the full excellence of the material is retained for a great length of time. It is also well known that the strength and durability of a boiler depend greatly on there being proper provision made in its design for the inevitable expansion and contraction. Where this is not provided for, furrowing and ripped seams are the result. The flues, as illustrated above, provide for this without injuring the efficiency of the flue as a stay. The flue is made up of a series of short lengths of soft and exceedingly tough steel as shown. The plates are bent in such a way as to be perfectly cylindrical, thus adding to the strength of the flue. They are then carefully welded, and then the ends are heated in a furnace and enlarged in a powerful flanging machine in such a way that the end of one plate exactly fits within that of the next. The holes are then drilled through both, and riveting completes the work.

L. C. C. AND TRAMWAYS.

We do not remember having advocated the municipalisation of tramways, nor do we see any more reason for such a course than for municipalising bakeries, booteries, and groceries. History and experience tend to cause hesitation in returning to the pre-civilised state, when a fatherly chief dictated to the tribe the position of each individual member. But whether we like it or not, whether we argue against it or not, the hard fact remains that some municipal authorities have obtained control of tramways and others are seeking to obtain such control. The London County Council has entered upon this course, and seems inclined to continue therein. It was Pope, in his "Essay on Man," who assisted to indoctrinate us with the idea that "what is, is right"; so we presume that if the London County Council does this thing it must be right. The ratepayers acquiesce, and there is an end of the matter. It is not many years since the London County Council started to do its own work, organised a Works Department, and was going to show the world at large, and the London ratepayers in particular, how cheaply work could be done and how well. Lately funny rumours have been heard that in this direction "all is not well," and sanguine individuals go so far as to prophesy that the Works Department will gradually dwindle into insignificance. But the ratepayers will have to pay the piper all the same. All that we can say will not stop the London County Council scheme, because that scheme is based, not upon financial or business considerations, but upon the popularising of its members and the securing of votes. Men are but human, and if desirous of place, power, and pelf do not look too closely into money matters which appeal most closely to other folk's pockets. Assuming, however, that municipalisation of tramways is the correct course to follow, there remains subsidiary questions to be decided. So far as we are concerned, one only is of interest—Is it advantageous to work tramways electrically? We have no hesitation in answering this question in the affirmative. Elsewhere we give a letter of Mr. J. A. Baker, a member of the Highways Committee of the London County Council, to the chairman, dealing more particularly with the question of electric traction. Mr. Baker is altogether in favour of such working, although his conclusions are derived from sources that are under somewhat different conditions to those which rule in the Metropolis. We have often pointed out that the so-called American tramlines are in reality light railways, and must be classified as such in all comparisons. Just as it is more economical to generate steam with a large plant than with a small plant, so we should imagine it must always be more economical to run an ordinary railway than a light railway, and a light railway than a tramway. We cannot therefore accept all figures put before us in favour of substituting one system over another. The figures are not fair, and we have no desire to carry our contention by means of incorrect figures. The London County Council, as Mr. Baker points out, has considered one part of the question only, and has come to a conclusion upon "what is" without con-

Digitized by Google

sidering what may be or what ought to be. That increased traffic always comes with better service and better accommodation is certain, though that increase may not be 100 per cent., as Lord Mountmorres stated, unless a large part is due to increase of population upon the route. We certainly have a decided opinion that the dual system with accumulators on the car so successfully tried in Germany ought to be thoroughly investigated here. The car is then run from the trolley in the suburbs and is self-propelling in the more crowded streets. The charge is given to the accumulators when running on the trolley. This question of electrical traction has not yet been fairly considered—that is, almost all the information is derived either from expressed opponents or from those engaged in promoting schemes. The real truth is somewhere between the views such men express, and we think lies nearer to the claims of those engaged on the work than to those of the opponents.

CROYDON ELECTRICITY WORKS.

(Continued from page 519.)

It will be seen that both the laps, as well as the rivet heads, are removed from the line of draught, and consequently escape the scouring action and intense heat of the gases as they pass along the flue. This type of boiler (shown out of its seating in Fig. 6) was introduced by Mr. James Paxman some 35 years ago, and is of the internally-fired type. The furnace terminates in a brick combustion chamber, which becomes very greatly heated, more uniform temperature, and the result is an absence of leakage set up from undue expansion and contraction in the flue, shell, or tubes. The tubes are made $\frac{1}{4}$in. larger at the smoke-box end, so that they can be easily removed. The cleaning of tubes and flues is entirely effected from the front of the boiler.

We are informed by the makers that these boilers are best worked with a draught equal to not less than $\frac{5}{8}$in. of water (though $\frac{3}{4}$in. is preferable), and they are most economical when being worked at about 5lb. evaporation per square foot of heating surface, and for this purpose the draught should be not less than above stated. In actual daily work these boilers have been found to evaporate 12·2lb. of water per pound of best Welsh coal from feed at 212deg. F.

Feeding Arrangement.

The boiler can be fed by two Worthington feed-pumps, either of which are capable of supplying feed for the full load of the present plant. These pumps are arranged to feed either direct from the supply tank or by passing the feed-water through the economiser. A Kennedy water-meter is provided to check the quantity of feed-water used. The Green's economiser supplied to Croydon is one of this firm's most improved design, consisting of 128 pipes, arranged in two groups, each being connected together by copper expansion elbows. The economiser is made for high pressure, and fitted with Green's patent internal lids. All the most modern improvements that have so far been devised are also included in this apparatus. The scraper gearing is driven at present by a small horizontal high-speed engine, which is attached to the gearing frame of the economiser, but we understand that an electric motor will shortly be substituted.

Steam and Exhaust Pipes.

The arrangements of this part of the work can be seen in Figs. 2 and 3. The steam-pipes generally are of lap-welded mild steel, with cast-iron T-pieces and copper bends.

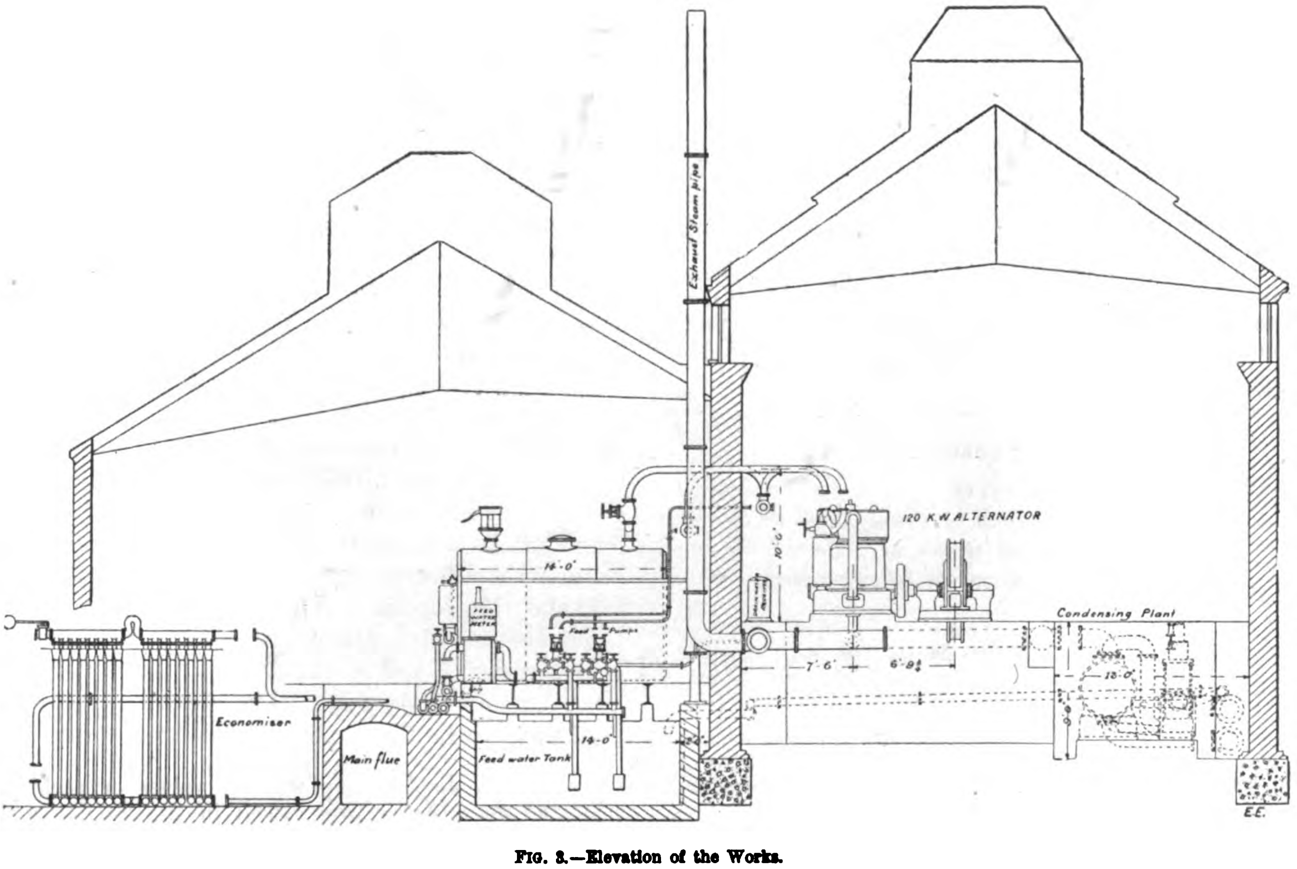

FIG. 3.—Elevation of the Works.

and tends to a perfect combustion. There is an absence of smoke which enables the surfaces to be kept clean, and they are able to absorb the heat, which is cut up in a similar way to that passing through the tubes of locomotive boilers. In addition to this the gases pass into a smoke-box, and are directed round the external surface of the boiler. This is a great advantage, as the boiler is kept at a Two steam-mains are provided, one in the boiler-room and one in the engine-room. These mains are 6in. diameter. Connections are made from each boiler and engine into each main. There are no valves in the mains themselves, but only in the junctions to the boilers and engines respectively. The Y-piece on the boilers, with two valves, can be seen in Fig. 4, and those on the engines in Fig. 7

Digitized by Google

With this arrangement one half of the engines can be supplied by steam from each main if desired, and the number of valves usually found in the steam-ring is avoided. It will also be noticed that all the valves are used regularly, and hence are more likely to keep in good order than those which are only closed in cases of emergency. The connections from the boilers to the mains are 5in. diameter, while the copper bends to the engines are 4in. diameter. as shown in the ground plan and elevation of the station. The circulating water will be obtained from the Wandle Park Lake. The 16in. cast-iron circulating pipes for conveying the water have been fixed by the Corporation.

The Engines.

Messrs. G. E. Belliss and Co., of Birmingham, were the contractors for the engines, and have supplied and fixed

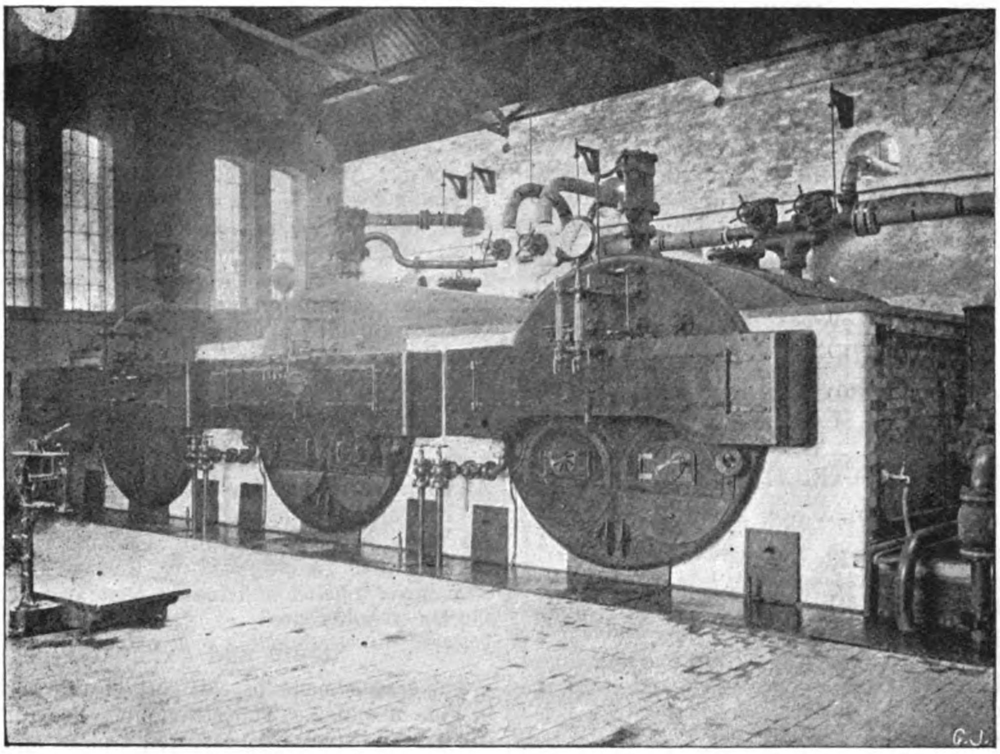

FIG. 4.—General View of Boiler-House at Croydon.

three of their two-crank compound self-lubricating type. In this station the engine and alternator are placed independently of each other on the concrete foundation, and are rigidly coupled together. Thus it is the stability of the concrete foundations on which they depend for the correct alignment of the engine and dynamo shafts. The engines are of the standard E.C. 10 size, the cylinders being 12in. and 20in. diameter respectively, with 9½in. stroke. They are designed to give off 240 i.h.p. when running at a speed of 360 revolutions with steam pressure at the engine steam stop valve under 150lb. per square inch, and with the vacuum equivalent to 25in. of mercury. The lubrication is a special feature in these engines. The oil is supplied

The steam-pipes are supported by rods from brackets fixed to the walls (Fig. 7), the joints in these rods allowing of small lateral movement in either direction.

The exhaust-pipes are carried in channels left round the foundations. The exhaust-main is of cast iron 12in. diameter, with 7in. connections to the engines. The arrangement of these pipes can be seen in the general plan. The exhaust to atmosphere is taken up in the corner of the boiler-house, and rises in four sections to a height of 40ft. The whole of this work was erected by the British Thomson-Houston Company. The surface condenser was supplied by Messrs. Browett, Lindley, and Co., of Patricroft, Manchester. It consists of a vertical tandem compound engine coupled by

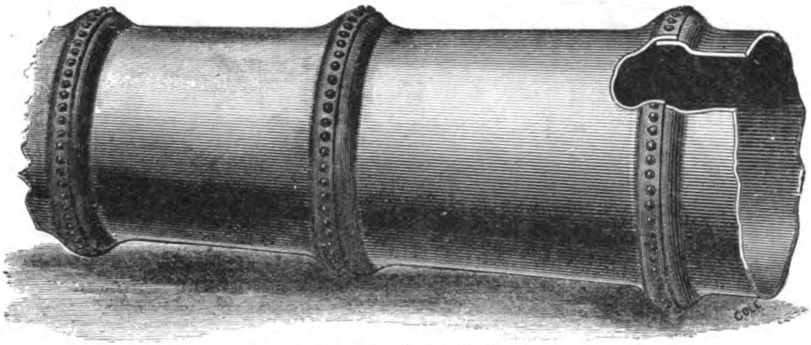

FIG. 5.—Tube of Economic Boiler.

spur gearing to air and circulating pumps, and working in connection with a surface condenser. The principal dimensions of this plant are as follows: steam-cylinders, 5½in. and 9½in. diameter by 8in. stroke; air-pump cylinders, 9½in. diameter by 10in. stroke; circulating-pump cylinders, 17in. diameter by 10in. stroke; the ratio of the gearing between engine and pump shaft is 2¼ to 1; the cooling surface in the condenser, comprising some 800 square feet, consists of solid-drawn brass tubes ¾in. external diameter, the circulating water being arranged to pass through the tubes. This plant is placed below the engine-room floor, by means of a simple pump, without valves or packing, working off the eccentric from a well in the framing, and discharging under pressure through oil channels into all working parts. The makers claim that the double action of the engine permits the film of oil at this pressure to get thoroughly between the working journals and brasses, keeping them apart and preventing any wear or chance of knocking with any load. The engines were tested at the makers' works to their full load on a water brake under the specification conditions, the trial being supervised by Prof. Kennedy. The water discharged from the condenser

Digitized by Google

was weighed, with a result that at full load the consumption was found to be 17·9lb. per brake horse-power, a result well within the guarantee. The engines were also

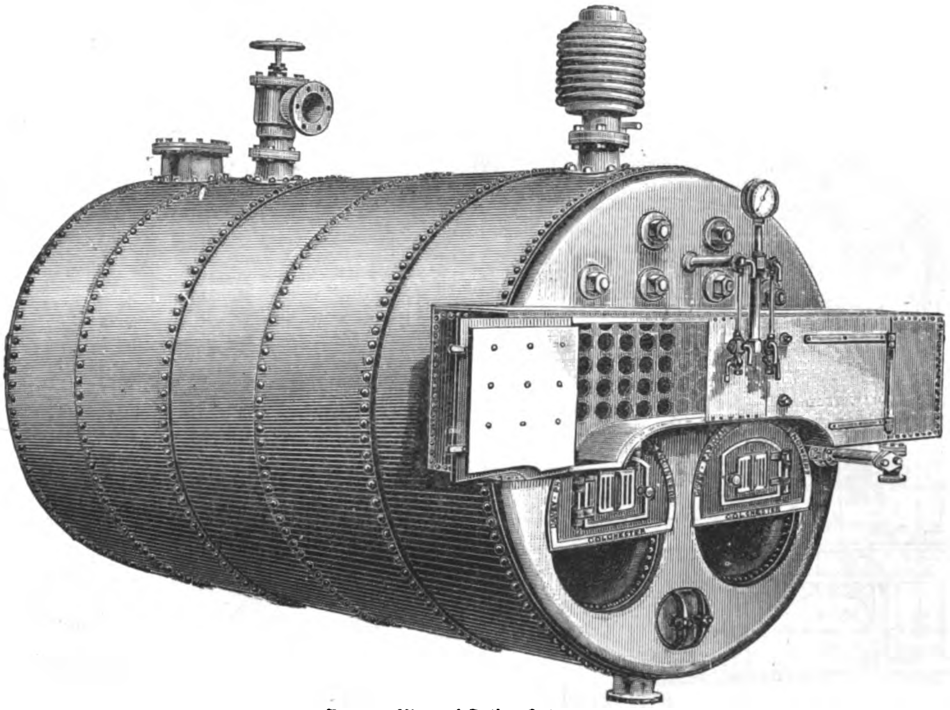

FIG. 6.—View of Boiler Out of Seating.

run for a period of six hours continuously at the full power to the inspecting engineer's satisfaction.

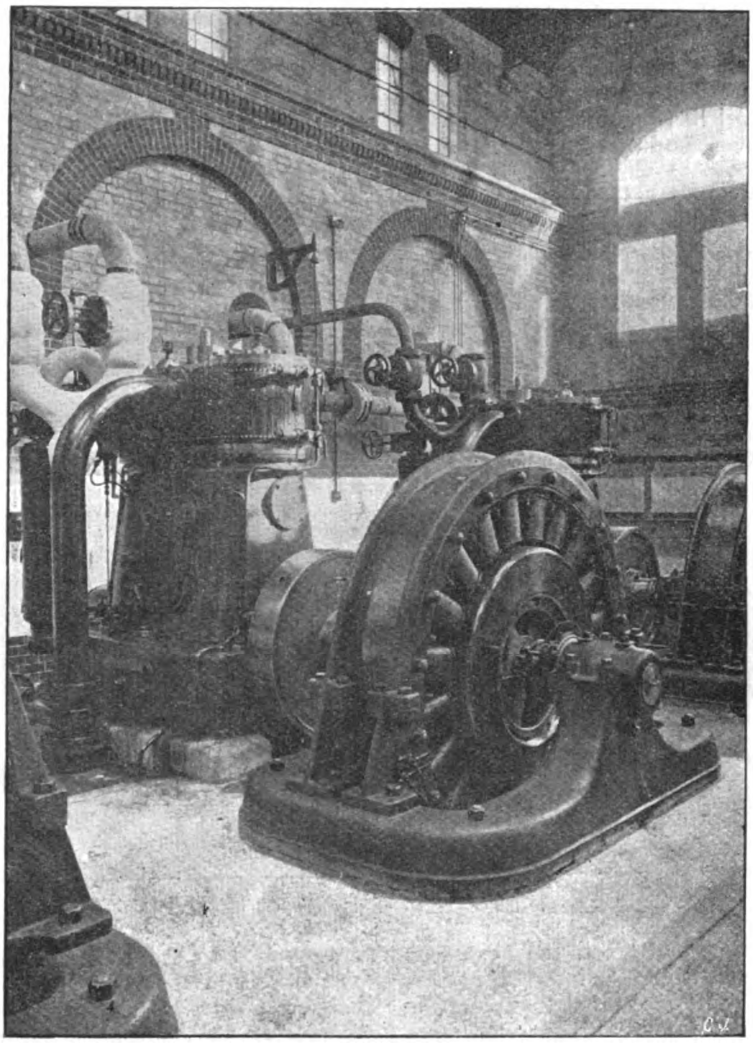

FIG. 7.—View of Steam Alternator.

Alternators.

The alternators coupled to the above engines were supplied by the British Thomson - Houston Company themselves. They are of American manufacture, and are each capable of giving an output of 120 kilowatts at 360 revolutions per minute. The voltage can be varied between 2,000 and 2,200 volts. The frequency of these machines is about 60 per second. A general view of one of these alternators is given in Fig. 7, and an elevation in Fig. 8. They have 20 poles each. The field-magnet cores and yokes are built up of laminated stampings clamped between

Digitized by Google

heavy cast-iron rings. The field coils are wound on formers, and after being slipped on are held in position by two bolts, one at either side. The armature core is also built up of laminated plates grooved to receive the coils. These grooves or slots are not placed symmetrically round the armature. Each pair of grooves, holding one complete coil, have their edges parallel to each other and to the radius through the centre of the coil. This allows of the coil, which is fully insulated, and thus complete in itself, to be easily slipped into position. As the sections at the bottom of adjacent teeth formed by grooves thus made must be equal, it follows that the surface of the core is not divided symmetrically. The distance between the inner edges of the two grooves holding one armature coil is less than that between the other edges of the grooves and the next slots on either sides. When the coils have been inserted, wooden wedges are driven in, keying into recesses at the top of the slots, and securely holding the coils. Brass end rings prevent the wedges from being displaced. The lubrication of these alternators is effected on the ring system, but the rings are split and screwed together, which greatly facilitates erection or removal.

The excitation of these alternators is supplied in a somewhat novel way, as there are no direct-driven exciters in the station. A motor generator (Fig. 9) is used to convert from alternating into direct current and to charge the accumulators, which will always be used for excitation at times of heavy load. The capacity of these cells is sufficient to keep the station going for at least two full working days. The alternating motor is an eight-pole one, running at a speed of 900 revolutions per minute. It is capable of taking some 30 kilowatts without undue heating. The field-magnet cores are laminated, and are cast into the yokes. The direct-current machine is one of the American four-pole toothed-core type with carbon brushes. This dynamo charges the accumulators, which were supplied by the Electrical Power Storage Company. Some 60 cells of the 31-L type are provided in lead boxes. These are capable of discharging at 100 amperes for five hours, or at 250 amperes for half an hour. The requirement for excitation is, however, of the nature of a small discharge for a still longer period. The cells are placed on substantial wood shelves attached to cast-iron supports. Every convenience is supplied for examining the cells and

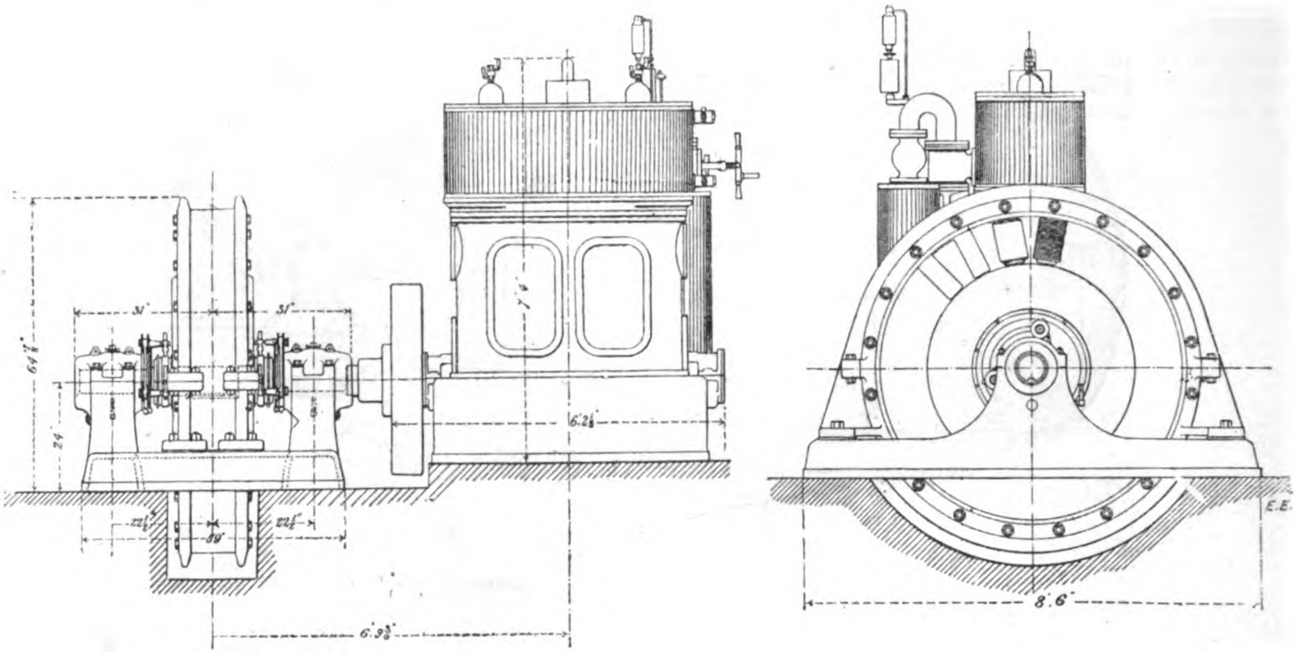

FIG. 8.—Elevation of 240-I.H.P. Engine and Alternator.

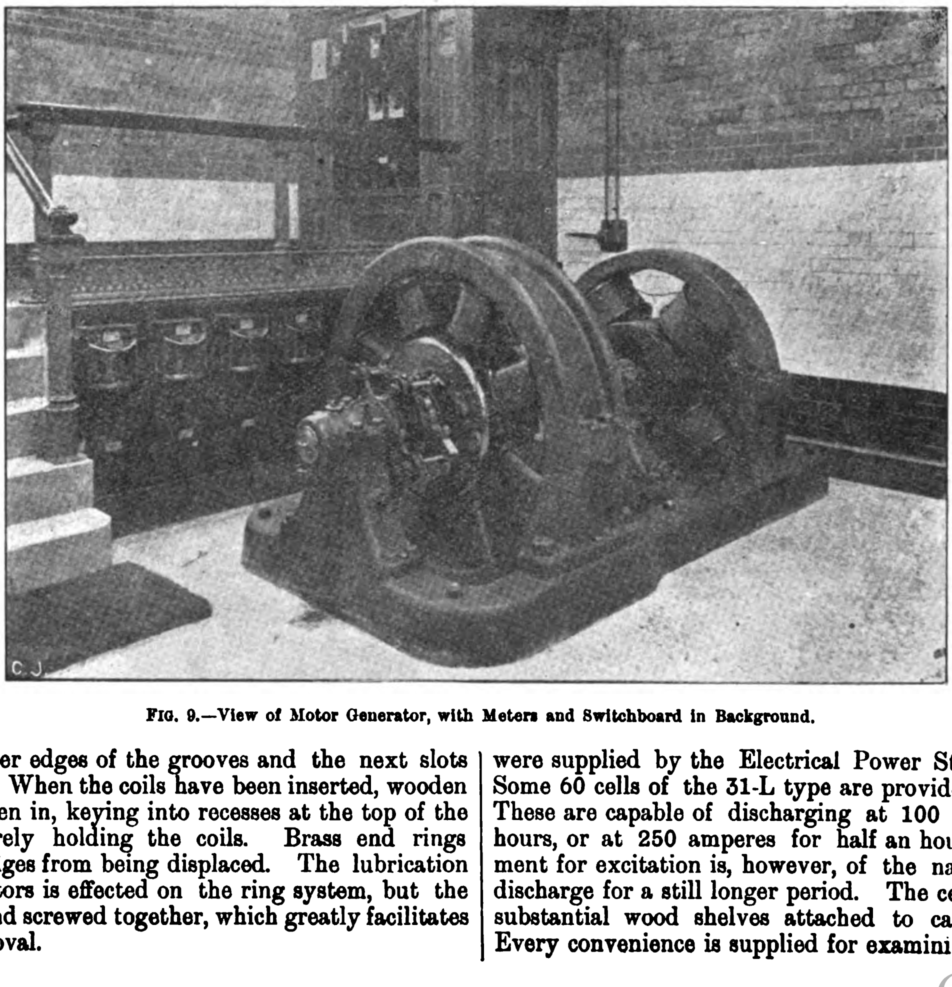

FIG. 9.—View of Motor Generator, with Meters and Switchboard in Background.

take records of density, voltage, etc. The whole of the switch gear for the batteries, and also a small motor generator for milking-up weak cells, were supplied by Messrs. J. H. Holmes and Co., of Newcastle-on-Tyne. This motor generator (Fig. 10) transforms down to about three volts, giving 80 amperes to any cell that may require special charging. The leads for this purposes are encased in rubber hose pipe to prevent the acid fumes from injuring the insulation. A special feature on the switchboards is the Holmes starting and stopping switch. These are made on the ratchet principle, the handle of the switch acting as the pawl. The forward movement of the handle shifts the contact

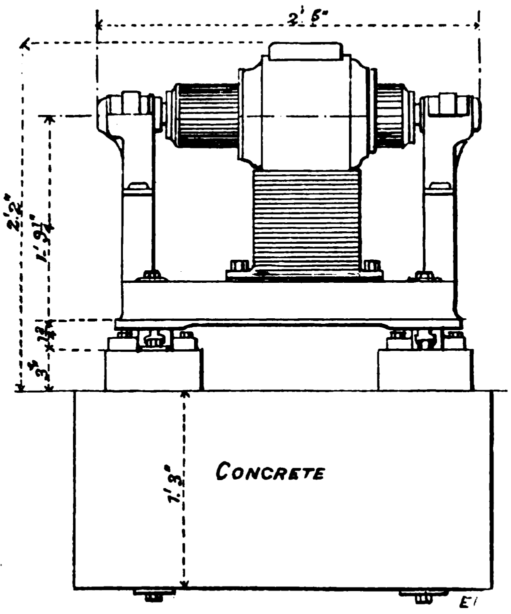

FIG. 10.—Elevation of Holmes' Motor Generator.

bar forward by one step, and the handle has to return to its position of rest before the contact bar can be again moved. In this way the switching on is effected by a kind of pumping process, and the motor resistance cannot be thrown out of circuit rapidly. The connections to this switch are such that on breaking the connection with the main, the shunt circuit remains connected to the armature and discharges its extra current through it. On starting up again, the first movement of the lever disconnects from the armature, the next connects the shunt to the main, and the third movement connects the armature to the main through

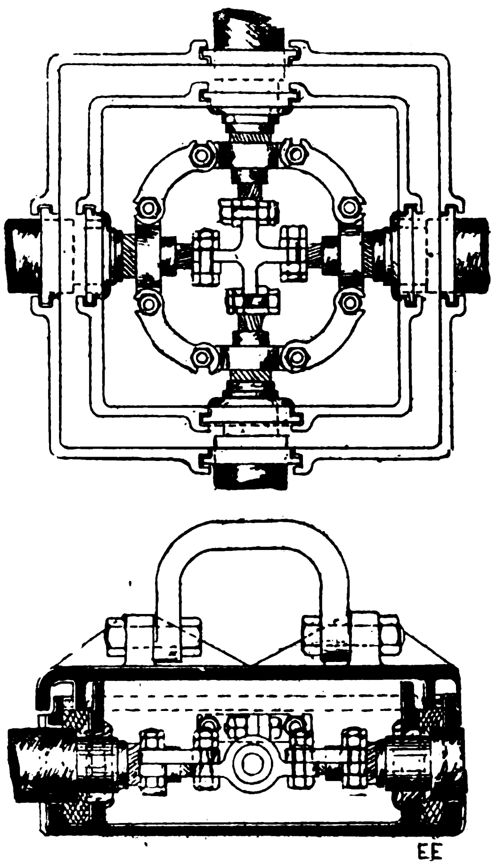

FIG. 12.—Four-Way Network Box.

resistance, which is cut out step by step. These switches will be a most valuable adjunct to all motor equipment where unskilled labour is employed, as they will protect the motor from excessive currents.

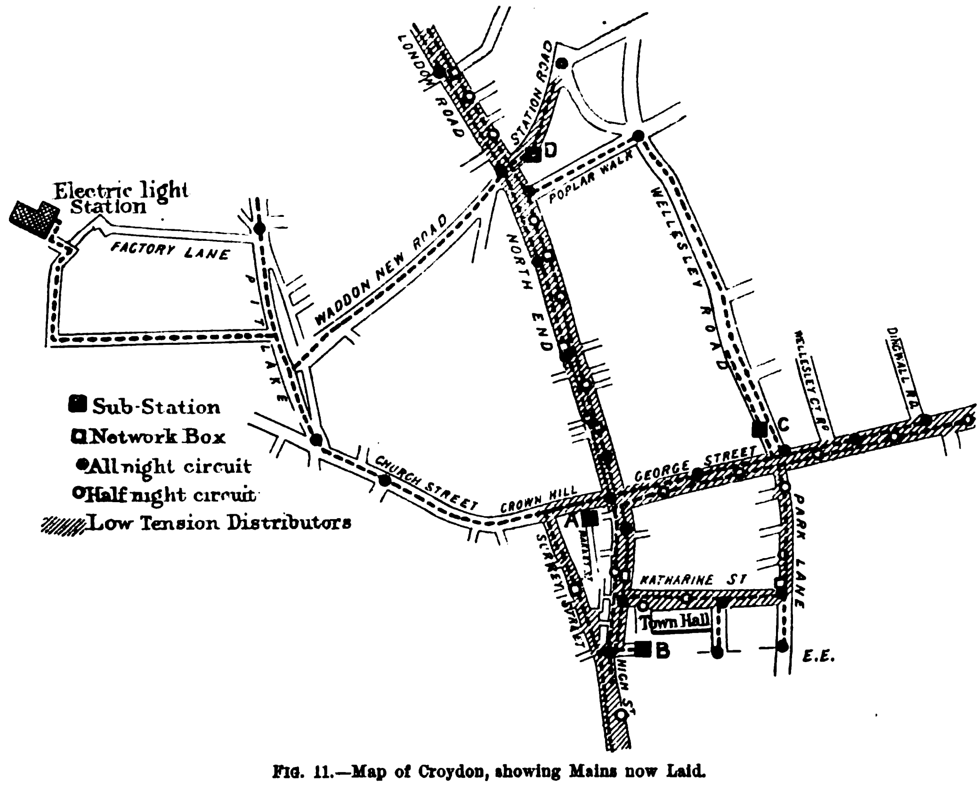

FIG. 11.—Map of Croydon, showing Mains now Laid.

The main switchboard, the rectifiers, and the rectifier switchboard were supplied by Messrs. S. Z. de Ferranti and Co. The main switchboard is of their standard single-pole type, but two omnibus bars are provided. Any alternator or feeder can be switched on to either bar, so that if required

Digitized by Google

the load can be supplied in two sections. The rectifiers were not in place when we visited the station, but we understand that the supply of the street-lighting will be commenced from the opening ceremony to-day. The arc lamps for this work are of the usual Thomson-Houston type.

Mains.

The whole of the contract for the underground mains has been carried out by Callender's Cable and Construction Company, Limited, of 90, Cannon-street, London, E.C., who have both supplied and laid the cables, and have carried

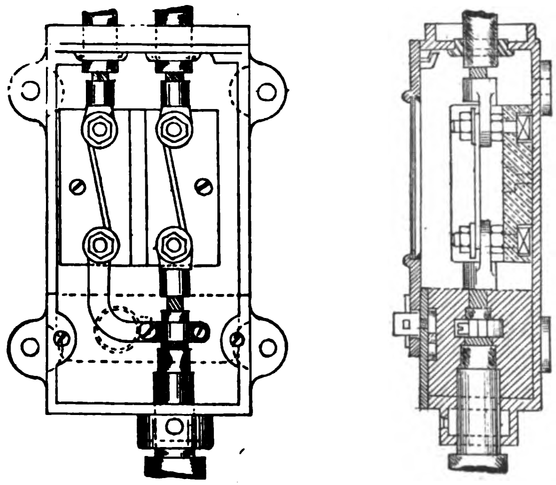

Fig. 13.—Reid House-Connection Box.

out all the excavation of the necessary trenches. As mentioned above, the supply is on the high-tension alternating-current system, being supplied to the feeders at a pressure of 2,000 volts, and then transformed down at the various sub-stations to a distributing pressure of 200 volts.

From the generating station (Fig. 11) three main feeders, of the concentric lead-covered, iron-armoured type, are run. The first is of ·09 square inch sectional area, and goes to

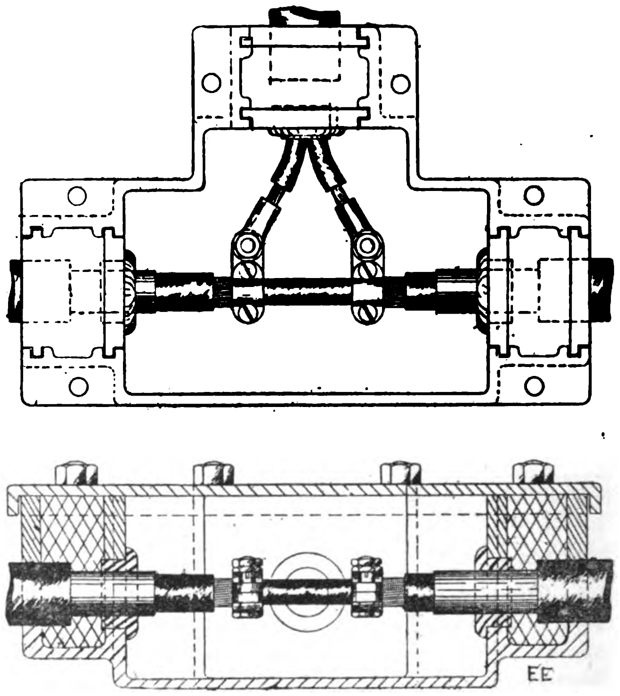

Fig. 14.—Arc Lighting Street Junction Box.

the sub-station A, in Market-street, a distance, of 1,200 yards. The second is ·08 square inch in section and connects to the sub-station D in Station-road, a distance of 1,100 yards. The third is ·07 square inch in section, and goes to the sub-station B in Mint-walk, a distance of

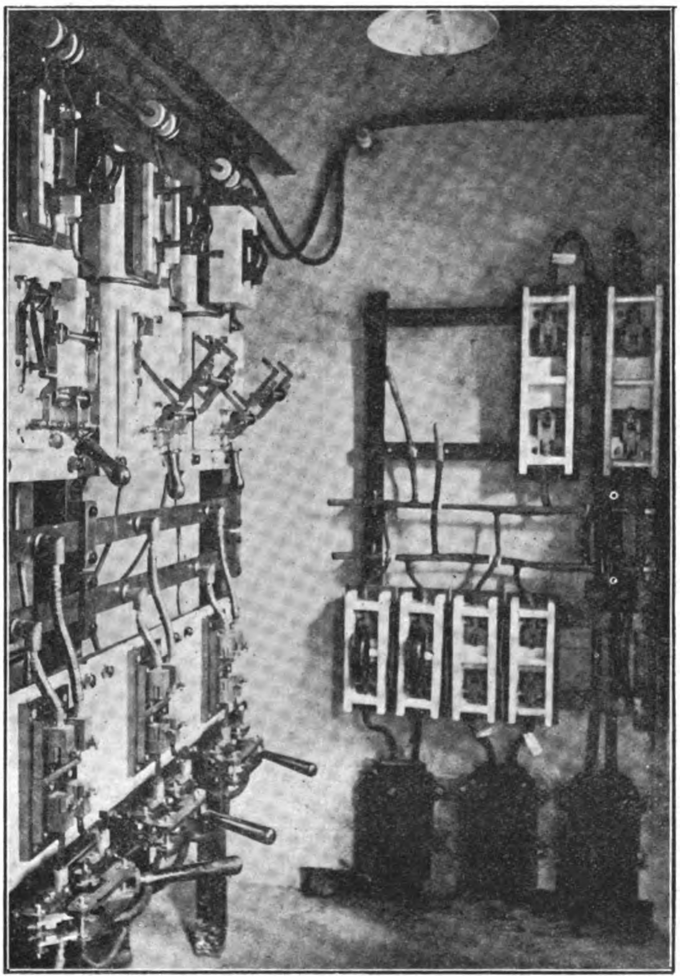

Fig. 15.—Sub-station Switch Gear.

Digitized by Google

1,550 yards. A branch feeder of ·04 square inch section is run from sub-station A to sub-station C in Wellesley-road, 360 yards in length. In addition to these feeders, the sub-stations are inter-connected by means of a ring main ·025 square inch, running thus: D to A, A to B, B to C, and it is proposed shortly to connect C and D *viâ* Wellesley-road, St. James-road, and Oakfield-road, taking in a new sub-station, E, in St. James-road. At present 2,500 yards of this cable have been laid. Under ordinary working conditions these inter-connecting ring mains will not be used, but they will be convenient as a stand-by. In the sub-stations the concentric cables are led into dividing boxes bolted on to the wall (Fig. 14), and from these dividing boxes two single conductor cables of vulcanised bitumen are led to the station high-tension fuses. The dividing boxes are filled up with compound, specially prepared by the Callender Company, so as to effectually seal the cable ends.

The high-tension feeder cables are all of Callender's well-known concentric type. Each of the conductors is insulated with a dielectric of bitumenised fibre, and the outer dielectric is encased in a solid lead tube, the lead being put on under great hydraulic pressure. The cable is then served with yarn thoroughly compounded, and finally protected by an armouring of two steel tapes or ribbons of carefully selected mild steel. The cable is finally served with an outer covering of jute yarn and finished with hard compound. These cables are laid direct on the ground, and about 3in. over them are placed tarred boards, 6in. by ⅝in., so as to give an indication of the presence of the mains to anyone opening the streets at a future date. From the sub-stations a network of low-pressure concentric cables, similar in type to but less heavily insulated than the feeders, is carried through the principal streets of the town, and distribution is made on the two-wire system at 200 volts. The section of the low-tension cables is ·10 square inch, with the exception of two short lengths of ·25 square inch leading from sub-station A to the junction of North End and High-street.

In ordinary working the different sections of the network leading from the various sub-stations will not be connected together, each sub-station distributing current to its own separate section of the network. Network boxes, however (Fig. 12), are provided at various points marked on the plan so that the separate sections can be connected together. About 600 yards of distributing main have at present been laid. These network boxes, placed in brick pits measuring 24in. by 24in. inside, are set in cement, and provided with cast-iron frames and surface covers. The network boxes themselves are placed on brick piers inside the pit, the piers being 1ft. high. The brick pit is drained by a 2in. pipe. The service cables used are of a similar type to that of the distributors, the sectional areas being ·022 square inch and ·064 square inch. These run from the mains direct to the consumers' premises, where they terminate in Reid's patent cut-out boxes (Fig. 13). This type of box acts not only as a cut-out, but as a permanent seal for the cable ends, preventing any injury to the cable even in damp cellars.

In addition to the supply for private lighting cables, two arc lighting circuits for public lighting have been run from the generating station through the busy thoroughfares of the town. These cables are manufactured in precisely the same way as those for the feeders, and are laid direct in the ground, then covered with tarred boards similar to the feeders. In all 7,500 yards of arc cables have been laid. The arc lamp services consist of a twin cable of vulcanised bitumen, lead sheathed and armoured, tapped off the outer conductor of the concentric main by means of a special branch box designed by the Callenders Company (Fig. 14), and leading to the switch terminals in the base of the lamp-post. At present there are 40 lamps on the two circuits, and it is intended that one circuit shall be run all night and that the other shall be shut down at midnight. The positions of the arc lamp-posts are shown on the accompanying plan.

Sub-Station Equipment.

Of the four sub-stations now built, two are below ground and two above. The view of the switch gear shown in Fig. 15 was taken in sub-station B. From it the general connections can be followed. The concentric feeders enter the station at the floor level, and in this case there is one main feeder and two smaller feeders linked from other sub-stations. From the Reid's junction box the wires are led through high-tension fuses to the high-tension omnibus cables. The connections are made from these to the transformers by means of the double shutter switch seen to the left of the illustration. Switches and fuses are also placed lower down on the framework, by which the secondaries of the transformers are connected to the low-pressure omnibus bars. The fuses in the low-tension feeders cannot be seen in the illustration.

The erection of the whole of the work has been superintended by Mr. A. Fell on behalf of the British Thomson-Houston Company. This gentleman previously had charge of the contracts carried out for the City of London Electric Lighting Company, and is to be congratulated on the general finish of the station.

L. C. C. AND TRAMWAYS.

[The following communication by Mr. J. Allen Baker, a member of the Highways Committee of the London County Council, to the chairman will be of interest, as showing that the subject of electric traction is exercising the minds of some members of the Council, and that they are desirous of seeing it fairly tried.—Ed. *E. E.*]

Sir,—I regret again to trouble you with another communication on the above subject, but considering its vast importance, and the evident interest taken in my previous letter by my fellow councillors, I am emboldened to add this further.

You will remember that on my motion in Council on June 23 last the recommendation of the Highways Committee was referred back "with instructions to report, for the purpose of comparison, as to the probable profit to the ratepayers if the Council itself worked such portions of the northern system of tramways as will be within its control after 1898, information being given upon the basis of horse traction and also electric traction or other approved mechanical means."

The present report of the Highways Committee, which is now before the Council, you will observe, deals with the first portion of this reference, but not with the second, and I venture to believe that the Council was especially interested in the results of *mechanical traction* as in use in various cities on the Continent of Europe, in America, and also in some places in England, and was particularly desirous of having an estimate of the probable results for London if such were adapted to our tramways. I especially urged in the Highways Committee again, that before the present report was sent to the Council, such information should be obtained, and was prepared myself to place before the committee much valuable information on the subject, but by a majority of one the carrying out of this portion of the Council's instruction to the Highways Committee was defeated.

During the recess I have given considerable time and study to this subject, and have myself visited numbers of places where mechanical traction or municipal working of tramways is in vogue—notably Blackpool, Huddersfield, Leeds, Glasgow, Edinburgh, etc.—and have had reports and communications from numerous other places both in this country and in America. As a result, I am more than ever confident that we will not obtain proper value for our property either in the sense of giving an efficient service to the travelling public of London or an adequate profit to the ratepayers of London until we adopt a suitable system of electric traction and have the full benefit of the very great advantages that are to be derived therefrom.

I am aware of the provisions in the proposed lease to the companies as the Council's right of insisting upon the adoption of electric traction, but I venture to say that "to lay down and equip about a mile" of electric railway could in no sense give a satisfactory test, either of efficiency or economy, and no trial could be satisfactory in proving actual results except the equipment of a complete line, in which the increase of traffic would be demonstrated.

Further, the provisions of clauses *A*, *B*, *and C* are not such as in my opinion will give the Council anything like the benefit they should derive from the adoption of improved traction, while the whole proposal is fraught with provisions that would be extremely difficult to carry out in actual working.

I am convinced, however, that the results already obtained in other large cities in which similar conditions prevail to those in London, are a sufficient guarantee of success to justify a complete line or system being laid down in London. The engineer has also stated, in a report to the Highways Committee on October 25, 1896: "That it is perfectly practicable

Digitized by Google

to work the tramways in London by means of electricity conveyed either overhead or underground."

I will further add that I am certain there is no city in the world that more greatly needs these improvements, nor in which they would prove more profitable; therefore if in cities on the Continent, in America, and in provincial towns in the United Kingdom, the adoption of electric traction in substitution for horse traction effects an economy in working of from 25 per cent. and upwards, and secures an increase of traffic of from 25 to 100 per cent., such results may also be *confidently anticipated* for London.

I believe there are *no* exceptions to this rule in any country where electric traction has been adopted, and with the immense travelling population of London and the necessity for a frequent and efficient service of tramways in all parts of the Metropolis, the possibilities are enormous.

As an illustration of the above facts, let me instance the case of the new electric line installed by the Dublin Southern District Tramway Company. The line runs from Dublin to Blackrock, Kingstown, and Dalkey. In the first year of working the Southern system (then in three sections with horse traction), the traffic was carried on upon an expenditure of 136 per cent. of the gross revenue! The lines were afterwards united, and the year before its conversion to electric traction earned 2½ per cent. on capital. In May, 1896, the electric line was opened and at once became a marked success. Notwithstanding the fact that the fares are only half what they were formerly under horse traction, the gross takings are five times greater, and within two months of the new line starting operations the 7¾ miles of a double line with electrical equipment was sold to the Dublin United Company for the enormous sum of £273,000. (I estimate the entire cost of installing the line to have been but little, if any, above one-third this sum.) And the line is now reported as "paying well" on this huge capital.

The Dublin United Company are now proceeding to convert the Clontarf line of horse tramway to electric, and are also seeking parliamentary powers for the conversion of the whole 32 miles in the city. My informant adds: "This is very much the outcome of a visit of inspection to various cities on the Continent, and also to America, made by three of the directors and the manager. Their action may have been hastened by the enterprise of the Dublin Southern District Tramways Company."

I give the following extracts from a letter just received from the Mayor of Springfield, Mass.: "The introduction of the electric system in Springfield has increased our service from about eight miles of track to 60 miles. This has connected all suburban towns, to the very great benefit of our business men. It has increased our taxable property tremendously, and given our workmen much better homes.

"No one factor has done so much for the general welfare of our city as the change from horse power to electricity. The advantage to the road has been that it has lessened the cost of operating per car mile considerably, of course more in some places than others, but I should consider 40 per cent. a safe estimate for the average decrease in this State.

"The rapid transit has very largely increased the traffic, and the pleasure riding, during the summer months, is enormous. I should consider 50 per cent. a very moderate estimate of the increased traffic occasioned by the change of power.

"The longest ride for one fare (five cents) is about 15 miles."

I know this town and its electric system well. This is but one of the *hundreds* of like cases that can be produced from every part of the United States and Canada.

Coming nearer home, the town of Leeds has had a system of partly horse and partly steam traction worked by the Corporation itself since February, 1894. A trial line of electric traction has been installed, with the result that the whole of the lines in the town, amounting to about 17 miles of double line, are about to be installed. The Corporation engineer, in carefully prepared estimates, shows that the advantage to the Corporation by reason of the change will be over £27,000 per annum.

The improvement in the earnings, even under the present system of traction, has been remarkable since the Corporation itself has worked the lines, like experiences being also shown in Glasgow, Sheffield, and other towns where municipal working prevails. The hours and conditions of labour in all these cities have also been improved.

In Sheffield, during 14 weeks of municipal working, with a reduction of fares and shorter hours of labour, the traffic receipts have increased over £112 per week on their nine miles of double lines. So successful has the Corporation venture been that they have decided to immediately add 22 miles of lines, and are now seeking information by deputations visiting the Continent and America with a view of installing electrical traction.

The experience is universal in favour of municipal as *versus* company working of tramways, and I maintain that the most important point of all in connection with the present proposals of the Highways Committee is the fact that if carried we would tie up for 14 years the possibility of obtaining a united tramway system for London.

The present proposal deals with two companies only. There are 10 left? With separate working are divided interests, unnecessary working expenses, and the absolute impossibility of securing for London *the* tramway system that it so greatly needs. This was most ably put by Viscount Mountmorres in the admirable speech which he made during the tramways debate on June 23, when the necessity of a much more efficient and extended tramway service for the benefit of the whole of London's millions was forcibly pointed out.

In an article in the *Times* on Monday, April 27, appeared the following: "The present arrangements in connection with the tramways of London are very unsatisfactory. These arrangements always left much to be desired, but it is only within the last few years that the condition of affairs has become so bad that amendment is imperatively demanded. The chief evil always was that the area covered by the tramways was in the hand of too many different companies, only two, or at most three, of which were really prosperous and consequently in a position to do their work well. Even if all the companies had been successful financially the existence of so many separate centres of administration would have been an evil. An even greater evil is the fact that at present the tramways of the Metropolis consist of two entirely disconnected areas—one to the north, the other to the south of the Thames. The want of a coherent and well-organised system of working has become plainly manifest now that portions of the lines hitherto under the control of the companies have fallen through lapse of time into the hands of the London County Council, and that other portions are on the point of doing so. . . . The working and administration of tramways broken up into sections under different authorities must obviously be wasteful and inefficient. . . . There can be little doubt that sooner or later electric traction will have to be adopted for London, as it has been for many other cities, especially in the United States. Cars driven electrically occupy less space than horse cars; the streets in which they run are cleaner; speed can on the average be greater; and there will consequently be less hindrance to other traffic. . . . It seems to us that any scheme by which the present piecemeal administration would be perpetuated ought to be rejected!"

In 1901 the whole of the lines north of the Thames, except a few unimportant fringes, will be in the possession of the Council, and also about 20 miles of the southern system. Within five years, therefore, the trunk lines on both sides of the water will be available for the Council to work as a united system.

The case is therefore overwhelming in favour of the improvements in service and traction for London, and nothing could be more favourable for the Council than to itself acquire and work the various lines as they fall in, and gradually adapt the most satisfactory mode of traction. This would give the needed experience for the undertaking, and be more practical and satisfactory than at the end of 14 years having the whole of the old lines taken over and operated without previous practical experience. The interval would be useful in enabling the Council to gain the needful experience and study both the requirements of the travelling public and the profit to the ratepayers.

The number of car miles run by the North Metropolitan and London Street Companies during the last year is 12,346,474.

The cost of working per car mile is about 10d., amounting to (approximately) £514,436.

The cost of working the conduit system line at Budapest is 5d. per car mile, and a further liberal estimate for interest, depreciation, and sinking fund would be 2d. per car mile, say, 7d. in all as an outside cost of working per car mile, including repayment of capital, repairs, and maintenance of lines. This would give 3d. per car mile of clear profit on the introduction of the conduit system for the North London lines, and would mean an extra annual income or profit (above the earnings of the present horse traction) of £154,329 per annum. (The difference of 1d. per car mile in cost of working amounts to over £51,000 per annum.)

The conditions of London as compared with Budapest are more favourable for mechanical traction, as there would be needed a much more frequent service, and as it has an enormously greater travelling public, this proportionately decreases the working cost, and I think it certain that with the still later improvements in underground traction than are now in use at Budapest the working per car mile for London would be well within the above figure.

The passengers carried per car mile run in Budapest are	8·25
Ditto, ditto, by the North Metropolitan year ending June 30, 1896	10·66
Ditto, ditto, for the London Street	10·61
The receipts per car mile are, in Budapest	11·1d.
By the North Metropolitan line (half-year ending June 30, 1896)	12·39d.
Ditto, ditto, London Street	12·57d.

This is entirely in favour of economy in working and profit for London as compared to Budapest.

Add to this the certain increase of traffic, which upon a

Digitized by Google

moderate estimate might be reckoned at 25 per cent. (the increase in the gross takings of the above two companies even with horse traction during the past year amounts to £54,915), and it will be seen that to tie our hands and complete the present arrangement with the companies would be a suicidal policy for the Council to pursue, and directly opposed to the best interests of the London ratepayer.

I would plead one further and still greater consideration—viz., the claims of the millions whom we represent, to whose health and well-being an improved means of street transit will manifestly be a consideration of the first importance.

The fact that the 131,506,427 journeys during the past year made on these two lines alone could be lessened in expenditure of time, fatigue, and possibly in cost also, thus giving to this vast number an increase of leisure, strength, and money for self-improvement, should make us hesitate before we hastily settle a question of such magnitude.

Trusting I have not trespassed on your kind indulgence, I remain, dear Sir, yours faithfully, J. ALLEN BAKER.

PHYSICAL SOCIETY.

There was a special general meeting of this society on October 30, Captain Abney, president, in the chair.

The **Secretary** having read a summary of the replies sent by members to a circular which had been addressed to them during the last session, a series of resolutions drawn up by the council bearing on the points raised by this circular were adopted. The chief of these resolutions were to the following effect: (1) That the subscription to the society be raised to £2. 2s.; (2) that present life members be invited to voluntarily subscribe £1. 1s. annually to the funds of the society or to compound for this annual contribution; (3) that a guarantee fund be instituted; (4) that in future members of the society be styled "Fellows of the Physical Society of London"

In the course of the discussion on these resolutions, the **President, Secretary,** and **Treasurer** gave an account of the financial position of the society, and explained that at present each member receives from the society in the shape of *Proceedings* and abstracts printed matter which costs the society more than the amount of the annual subscription.

The ordinary general meeting was then held. A letter was read from **Lord Kelvin** thanking the society for the address which the president on their behalf had recently presented to him.

Prof. W. Stroud read a paper by himself and Mr. J. B. Henderson on **"A Satisfactory Method of Measuring Electrolytic Conductivity by Means of Continuous Currents."** The method consists in placing a balancing electrolytic cell in the arm of the Wheatstone's bridge adjacent to the arm containing the chief electrolytic cell, so that the E.M.F.'s of polarisation in the two cells neutralise each other's effect on the galvanometer. The authors find that if the resistances of the arms of the bridge are high (20,000 ohms), and if an E.M.F. of about 30 volts is used in the battery circuit, then the resistance of a solution (of potassium chlorate in their experiments) can be determined to within about one part in 2,000. With a d'Arsonval galvanometer the balancing cell is so efficacious that it is impossible to tell that it is not a metallic resistance that is being measured.

Prof. Perry asked if the authors had tested whether the difference in resistance of the two cells was proportional to the difference in length of the liquid columns.

Mr. Appleyard said he had found that the resistance of an electrolyte appeared to vary, because in the ordinary arrangement the cell was short circuited through the arms of the bridge. He suggested as a remedy the making and breaking of the circuit by a special key, so arranged that except when taking a reading the cell is on open circuit.

Mr. Blakesley asked if the authors had tried the method in which the resistances are adjusted till, when the battery circuit is broken, there is no immediate change in the galvanometer deflection. It was possible by this method to measure a resistance of between 6,000 and 10,000 ohms to within 0·1 per cent.

Prof. Ayrton said the method referred to by Mr. Blakesley was the ordinary "false zero" theory. In using this method it was a case of working to a continuously altering zero. In Prof. Stroud's method, however, the zero was constant.

Mr. Appleyard said he had found the "false zero" method troublesome to use.

Prof. Stroud, in reply, said they had not tested the proportionality between the resistance and length, and they had not tried the "false zero" method.

Mr. Appleyard then exhibited a number of different forms of electrical "Trevelyan Rockers." The most interesting one consisted of two rods of carbon fixed to a wooden sounding-board, with a third carbon rod lying across the other two so as to form a microphone. A fairly strong current is passed through this microphone and through two electromagnets, which act on the prongs of a tuning-fork fixed to the sounding-board. The tuning-fork acts on the microphone, which by making and breaking the current keeps the fork in vibration. The cylinder of carbon forming the "knife-edge" of a small pendulum, supported on two horizontal carbon rods, kept the pendulum in violent oscillation as long as a current passed from one of the horizontal rods, through the movable cylinder, and out through the other horizontal rod.

The society then adjourned till November 13.

LEGAL INTELLIGENCE.

CLAIM FOR ELECTRIC LIGHTING.

In the Lambeth County Court on November 3 his Honour Judge Emden had before him the case of Froggatt's Electric Lighting Company *v.* Arden. The plaintiffs are electrical engineers, having a registered office at Lorrimore-street, Walworth, and they sued the defendant, Mr. W. H. Arden, of Draper-street, Newington-butts, to recover the sum of 18s. in respect of rent of electric lamps.

His **Honour** said the probabilities of the case were against the defendant, and he would have to pay for the lamps. The verdict would be for the plaintiffs for the amount of the claim, with costs.

THE ELECTRICAL FITTINGS CASE.

Mr. Justice Collins resumed on November 2 the hearing of the case of Andrews and Co. *v.* Ullathorne. In this case the plaintiffs sued the defendants, electrical engineers, of Bradford, to recover £483, the price of goods sold and delivered for use at the mill of Messrs Marshall, Kaye, and Marshall at Dewsbury. The defendants objected to the prices charged as being beyond those usually in force in the trade, and they counterclaimed for delay in sending the goods. They paid into court £173.

The learned **Judge** gave judgment for defendants, with costs of the claim and counterclaim.

WIGSTON ELECTRICAL AND ENGINEERING COMPANY, LIMITED.

In the Chancery Division, on October 28, before Mr. Justice Vaughan Williams, sitting as an additional judge in Chancery, under the Companies Winding-up Act, 1890, the petition of Messrs. Taylor and Hubbard for the compulsory winding-up of the Wigston Electrical and Engineering Company, Limited, Leicestershire, came on for hearing. It was a creditor's petition for £85. 14s. 1d.

Counsel stated that the Company had passed a resolution to wind up, and his **Lordship** made an order continuing the voluntary liquidation under supervision.

THE HOLOPHANE CASE.

In the Court of Appeal last week before the Master of the Rolls, Lord Justice Lopes, and Lord Justice Rigby, the case of Holophane, Limited, *v.* Hesseltine came up on an application by the defendant for a new trial of the action tried before Mr. Justice Lawrance and a jury in July last, or in the alternative for judgment to be entered for him.

Mr. Witt, Q.C., and Mr. Ernest de Witt appeared for the defendant; Mr. McCall, Q.C., Mr. Foa, and Mr. Cleave for the plaintiffs.

After hearing the arguments, the Court (Lord Justice Lopes dissenting) allowed the application, and directed judgment to be entered for the defendant, the **Master of the Rolls** saying that the question was whether the defendant had authorised Mr. Mygatt to apply for shares in his name, and whether Mr. Mygatt had acted on that authority. The authority, if any, was to make an application for 500 shares. It was not a proper exercise of that authority to apply for 320 shares. In his opinion the defendant was entitled to judgment.

THE HERMITE CASE.

The action, Hermite and Others *v.* the British Electrozone Corporation, Limited, has been dismissed on plaintiffs' own initiative.

COMPANIES' MEETINGS AND REPORTS.

BRUSH ELECTRICAL ENGINEERING COMPANY, LIMITED.

An extraordinary general meeting of this Company was held on Monday at the Cannon-street Hotel, E.C., Mr. J. B. Braithwaite presiding.

The meeting was to confirm the following resolution, which had been passed at a previous meeting: "That the capital of the Company be reduced from £750,000 divided into 150,000 preference shares of £2 each (of which 90,000 have been issued) and 150,000 ordinary shares of £3 each (of which 90,000 have been issued), to £660,000 divided into 150,000 preference shares of £2 each and 180,000 ordinary shares of £2 each, and that such reduction and alteration be effected by cancelling paid-up capital to the extent of £1 per share on each of the 90,000 ordinary shares which have been issued, and by reducing the nominal amount of the said 90 000 ordinary shares from £3 to £2 each, and by subdividing the 60,000 ordinary shares of £3 each now remaining unissued into 90,000 ordinary shares of £2 each."

The **Chairman**, in moving the resolution, said that it had been carried by a large majority three or four weeks ago, and he had practically nothing to add to what he said on that occasion.

Mr. B. H. Van Tromp seconded the motion, which was unanimously confirmed.

The **Chairman** said that the solicitors to the Company had advised that a formal poll would be necessary, in order to produce

Digitized by Google

as evidence to the court. They had already received proxies in favour of the resolution representing 30,000 preference and 26,000 ordinary shareholders. On the other hand, they had received proxies representing 10 preference and 50 ordinary shares against the resolution, which, of course, he would use as directed.

As a result of the poll the resolution was confirmed almost unanimously.

BRITISH ELECTRIC TRACTION (PIONEER) COMPANY, LIMITED.

A meeting of this Company was held yesterday (Thursday) at Winchester House, Sir Charles Rivers-Wilson in the chair.

The **Chairman** said that the success of the Company had been sufficient to warrant the formation of a new company. That company would be called the British Electric Traction Company, Limited, dropping the word pioneer. The company would be formed with £600,000 capital, divided into 30,000 6 per cent. cumulative preference shares and 30,000 ordinary shares of £10 each. The new company had paid the Pioneer Company £25,000, which allowed a bonus of £1 per £4 share. The Chairman mentioned several provisional orders that will be carried over as an asset to the new company. He also stated that the company had secured the rights of the Esmond system by surface contact, to be used where it was found impossible to use the overhead trolley system.

SUBMARINE CABLES TRUST.

An extraordinary general meeting of the certificate-holders of this trust was held at the offices, Winchester House, the Marquis of Tweeddale presiding.

The **Chairman** stated that the object of the meeting was simply to fill the vacancy among the trustees. This had been caused by Sir John Pender's death, which they all deeply regretted. The gentleman who was proposed to fill the vacancy was well known to them all—Sir Albert J. Leppoc Cappel.

Mr. J. Denison Pender seconded the resolution, which was unanimously agreed to.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Munich.—Tenders will be received by the Postal Authorities on November 14 for 43,260 wooden telegraph posts.

Karlsruhe.—The Grand Ducal Railway authorities will receive tenders on November 9 for the supply of a quantity of telegraph posts.

Bressoux-lez-Liege (Belgium).—The Municipal Authorities are prepared to receive propositions for public lighting by (coal) gas, electricity, or acetylene.

Londonderry.—The Corporation invite tenders for the supply of carbons for one year from January 1 next. Full particulars can be seen in our advertisement columns.

Bucharest.—Tenders will be received at the Mairie, Bucharest, on November 16 for two stand-by steam-engines for a water-power electric generating station at Grozavesti.

Paris.—Tenders will be received on November 19 at the Chemins de Fer de l'Etat, Paris, rue de Châteaudun 42, for, among other supplies, a quantity of telegraph poles.

Arlon (Belgium).—Tenders will shortly be wanted at the office of Les chefs de service, Arlon, rue de la Station 36, for a building for an electric generating station at the Marbehan Station.

Alcazur de San Juan.—The Municipality will receive offers up November 17 for the electric lighting of the town for a period of 30 years. Alcazur de San Juan is in the province of Ciudad Real, Spain.

Malines (Belgium).—Tenders will be wanted for the supply at Malines of about six tons of special lubricating oil for dynamos and gas-engines. Particulars at the Brussels Bourse, where tenders will have to be sent.

West Looe.—The Parish Council invite tenders for the lighting of the place with gas, oil, or electricity. Full particulars from Mr. Wm. Hicks, hon. clerk, West Looe Parish Council. Tenders to be in by November 28.

Paris.—Tenders will be received by the Post and Telegraph Authorities at Rue de Grenelle 103, on November 20, for the supply of various parts of telegraphic instruments for the next five years. Application must be made before November 10.

South Shields.—The Corporation require tenders for a steam alternator and a rectifier, and extension to switchboards. Tenders are to be delivered by November 23. Specifications, etc., can be obtained at the Borough Electrical Engineer's Office, West Holborn, South Shields, on and after November 9, on payment of £1. 1s. (returnable).

Shoreditch.—The Vestry invite tenders for the supply of insulated wires and mains, insulated iron pipes, junction boxes, main switches, tumbler switches, cut-outs, ceiling roses, etc., for the ensuing year. Tenders and samples to be sent in not later than November 17. Particulars from Mr. C. H. Doughty, lighting engineer, Town Hall, Old-street, E.C. See advertisement.

Dundee.—The Gas Commissioners invite tenders for supplies of cast-iron pipes for electrical purposes, indiarubber-covered cables, and electricity meters. Particulars as to quantities, etc., can be had from the City Electrical Engineer, Dudhope-crescent road, Dundee. Persons willing to undertake the supplies required to send in tenders to the Clerk of the Commissioners, City Chambers, Dundee, by November 10.

Hartlepool.—The British Electric Traction Company, Limited, of 1 and 2, Great Winchester-street, London, E.C., on behalf of the Hartlepool Electric Tramways Company, Limited, invite tenders for the construction of the permanent ways. Particulars, specifications, plans, and form of tender may be obtained from Mr. J. Vincent Kitchener, secretary, London, on deposit of £5, which will be returned on receipt of a bona fide tender.

Warrington.—The Cheshire Lines Committee are prepared to receive tenders for the supply during the year 1897 of telegraph materials, instruments, wire, etc. Patterns can be seen and specifications with forms of tender obtained upon application to Mr. S. Saxon Barton, storekeeper, Cheshire Lines, Warrington. Tenders, sealed and endorsed, to be sent to Mr. Glegge Thomas, secretary, addressed Cheshire Lines Stores Department, Warrington, not later than 10 a.m. on November 28 next.

Southampton.—The Corporation invite tenders from engineers resident within the county borough for supplying and fixing the electric wires and fittings at the municipal offices, Guildhall, and police offices, Southampton, according to specification, which, with form of tender, may be obtained of Mr. J. H. Lee, A.I.E.E., Electric Supply Station, Back-of-the-Walls, Southampton. Sealed tenders, on the printed form, to be left at the office of Mr. George B. Nalder, town clerk, Municipal Offices, Southampton, by 2 p.m. on 13th inst.

Glasgow.—The Police Department of the Corporation invite tenders for the construction and erection of fans and motors for the new sanitary chambers, Cochrane-street, Glasgow. Specifications and forms of tender may be had and drawings seen on application at the office of Mr. William Arnot, electrical engineer of the Corporation, 75, Waterloo-street, Glasgow, and tenders, properly sealed and marked outside "Tenders for Fans and Motors," must be lodged with Mr. J. Lang, clerk, City Chambers, Glasgow, by 10 a.m. on November 9.

Copenhagen.—Provided the City Council will vote for spending the necessary amount, an electric station is to be built in Vesterbro, Copenhagen, and tenders are invited for the delivery of (1) boilers, (2) mechanical and electrical plant, and (3) network, in accordance with the description. Conditions and plans to be had upon application to the Electrical Station, 30, Gothersgade, Copenhagen. For each specification a fee of 50 kroner is charged, which is returned on acceptance of the tender. Tenders will be received at the office of the fourth division of the Magistracy until December 4 at 12 noon.

Maryborough (Ireland).—Tenders are invited for the supply and erection of an electric light installation at Maryborough District Lunatic Asylum by the Commissioners for the Control of Lunatic Asylums. Tenders should be sent in a sealed envelope, endorsed outside "Tender for Electric Lighting, Maryborough Asylum," and addressed to the Secretary, Board of Control, Customs House, Dublin, and should be accompanied by a separate sealed envelope similarly addressed and endorsed, containing the detailed estimate, by 10 a.m. on 23rd inst. Forms of tenders and copies of specification will be issued on application to the Office of the Board of Control of Lunatic Asylums, Customs House, Dublin, on deposit of £3. 3s., which will be returned to all persons who have sent in bona fide tenders. Plans can be seen at the office of the electrical engineer, Mr. Walter Leake, 35, Dame-street, Dublin.

Torquay.—The Town Council require tenders for the supply and erection of the following plant: (Section A) boiler-house plant—boilers and fittings, forced-draught apparatus, feed storage, etc.; (B) engine-house plant—steam alternators, condensers, pumps, steam and exhaust pipes, etc.; (C) switch-board, etc.; (D) underground mains, lamp-posts, etc.; (E) transformers, etc.; (F) meters; (G) accumulators, etc.; (H) crane, etc.; (I) builder. Tenderers are at liberty to tender for any section or sections, but not for part of a section. Specification, with terms and condition of tender and contract, may be obtained of Mr. W. H. Trentham, consulting engineer to the Council, 39, Victoria-street, Westminster, S.W., or of Mr. Fredk. S. Hex, town clerk, Town Hall, Torquay, on payment of £3. 3s., which sum will be returned on receipt of a bona fide tender. Tenders must be addressed to the Town Clerk, sealed and marked "Tender for Electricity Works," and delivered by 3 p.m. on November 13, the time having been extended.

Ayr.—The Electric Lighting Committee require tenders for the supply and erection of the following plant (the whole bound up in one specification, price £2. 2s., returnable on receipt of a bona fide tender): (Section A) boiler-house plant—two Lancashire boilers and fittings, mechanical stokers, extensions to economiser, feed-pump, steam and exhaust pipes, valves, etc.; (B) engine-house plant—two 200-kilowatt steam alternators and condenser; (C) underground work—cables and culverts. Tenderers are at liberty to tender for either section, but not for part of a section. The ground plans of plant and specification, with terms and conditions of tenders and contract, may be obtained at the offices of Mr. Robert Hammond, the consulting engineer to the Corporation, Ormond House, Great Trinity-lane, London, E.C., on and after November 10 on payment of £2. 2s. for each copy, which sum will be refunded on the return of the specification filled up with a bona fide tender. Tenders, sealed and marked "Tender for Electric Lighting," must be addressed to Mr. A. G. Young, town clerk, Council-chambers, Ayr, N.B., and be delivered by November 25.

Digitized by Google

West Ham.—The Town Council require tenders for the supply of the following: four steam alternators and exciters; surface condenser and pumps; station switchboard, etc.; high and low tension mains, etc.; transformers, sub-stations, etc.; instruments; arc lamps, posts, etc.; crane. Plans of the suggested arrangements, specification, form of tender, and further particulars may be obtained at the office of Mr. John J. Steinitz, borough electrical engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a bona fide tender. Tenders, endorsed "Tender for Machinery, etc.," to be sent to Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham, by 4 p.m. on November 24. The contractor will be required to enter into a bond, with two sureties, for the performance of contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

RESULTS OF TENDERS.

Whitechapel.—The Board of Works have accepted the estimate of Mr. Badger, at £110, for the supply of hydraulic motor pump.

Windermere.—The Council have adopted an agreement with the Electricity Supply Company, which includes the cost of lamp heads at 38s. each.

Bedford.—The Standing Joint Committee have accepted the tender of Messrs. Kilpin and Billson, of Bedford, for installing the electric light in the offices, corridor, etc., at the Shire Hall for £29. 10s.

Spandau.—The first tender on the published list for the supply of lightning conductors to the Friedrich-Wilhem-Bürger Hospital is from F. Crohn, Spandau, at 235 marks. The lowest is A. Ludewig, 184 marks.

La Rochelle.—From the consular report it appears that Mr. Caudrey, director of the Compagnie Générale de Traction et de l'Eléctricité, 24, Boulevard des Capucines, Paris, has obtained the contract for seven miles of tramway on the electric trolley system.

Clerkenwell.—The following tenders have been received by the London School Board for the electric light wiring and fitting work of the Board's store:—

J. O. Grant and Cocks	£870	0	0
Electrical and General Engineering Company	789	10	0
H. F. Joel and Co	748	0	0
Wenham and Waters, Limited	699	0	0
Strode and Co.	687	0	0
Edmundsons, Limited	649	0	0
C. A. Hemingway	628	0	0
Brush Electrical Engineering Company, Limited	598	0	0
C. E. Spagnoletti and Crookes (accepted)	550	0	0

BUSINESS NOTES.

Direct Spanish Telegraph Company, Limited.—For the month of October the receipts were £2,720.

Bristol.—The Electric Swimming and United Service Cricket Clubs had a very successful dinner last week.

Dewsbury.—During the three weeks ended October 18 6,221 units of electricity were generated, as against 3,391 last year.

Ealing.—It was stated at the District Council meeting that the number of 8-c.p. lamps now applied for was 9,160.

Train-Lighting.—The L. C. and D. R. Company are having 30 corridor carriages constructed which will be lighted by electricity.

Earl's Court.—The London Exhibitions, Limited, announces that its next exhibition at Earl's Court will be the Victorian Era Exhibition.

Aston.—The Local Government Board have sanctioned the Urban District Council's application for a loan of £350 for electric lighting at the offices.

The Public View.—The *Daily Mail* has published an interview with Mr. F. Hastings Medhurst, to show that electric lighting is not experimental now.

Bangor.—The question of electric lighting is the one topic in the town just now. A lecture on the same subject was delivered last week by Mr. W. H. Preece.

Gorton.—The District Council have resolved to apply to the Local Government Board for power to supply electricity in the district for lighting and other purposes.

West India and Panama Telegraph Company.—For the half-month ended October 31 the receipts were £2,407, as against £2,178 for the corresponding period of 1895.

West Ham.—Mr. G. W. Willcocks has held a Local Government Board enquiry into the application of the Council for sanction to borrow £50,000 for the electric lighting scheme.

Roumania.—The Municipality of Braila have determined on the construction of an electric tramway to Lacul Sarat. Negotiations have been started with the Helios Company, of Cologne.

Electricity in Mines.—The electrical transmission plant in Pigg's Peak Mine (South Africa) is working most satisfactorily, and is the only three-phase system at present in use in that country.

Waterloo.—The District Council have approved a plan for an electricity generating station on the west side of Brighton-road for the Liverpool and District Lighting Company, Limited.

South Kensington.—During the harvest festival service at St. Peter's, Cranley-gardens, last Sunday evening, the electric light, which has been installed about three weeks, suddenly went out.

Hampstead.—The Lighting Committee have decided to recommend the Vestry to pass a resolution in favour of lighting High-street and Haverstock-hill, to the boundary of St. Pancras parish, with arc lamps.

Reading.—The Town Council in committee have decided not to accept the invitation of the Reading Tramway Company to visit Bristol, as a body, to inspect an installation there of electric tramway traction.

Torquay.—The time for sending in tenders for electrical plant has been extended to Friday, November 13. We publish full particulars under the heading of "Contracts Open" in our advertisement columns.

Yarmouth.—Mr. G W. Willcocks has held a Local Government Board enquiry into the application of the Corporation for power to borrow £135 for lighting the Beach Gardens with five arc lamps of 1,200 c.p. each.

Newington.—The Vestry have decided to give notice in writing to the London Electric Supply Corporation, Limited, of the intention of the Vestry to apply for a provisional order to supply electricity within the parish.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ending November 1 amounted to £1,112, as compared with £1,046 in the corresponding week of the previous year, being an increase of £66.

Stafford.—Alderman W. H. Peach stated at the Town Council meeting that the rental in the electric light department for the quarter ending September 3 was £211. 16s. 9d., which was 15 per cent. more than in the previous quarter.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ending October 30 were £1,883. 4s. 5d., compared with £1 841 15s. 11d. for the corresponding period of last year, being an increase of £41. 8s. 6d.

Midland Cycle and Motorcar Exhibition Company, Limited. This Company has been registered with a capital of £1,000 in £10 shares. The object of the Company is sufficiently indicated by the title. Registered office: 174, Corporation street, Birmingham.

Belfast.—The Corporation have adopted a site in the Lagan-bank-road for the new central station. The present station has a capacity of about 17,100 lamps, and there are applications now for 17,145. The amount of money required for the new station will be about £50,000.

Islington.—The London County Council have agreed to lend the Vestry £24 000 towards the cost of the electric lighting installation. The question of providing tools for the machine shop at the lighting station comes up at to day's meeting of the Vestry. The estimated cost is £250.

Lamp Improvements.—We have received particulars of improvements which Messrs. E. Gossens, Pope, and Co. have made in fixing the caps of incandescent lamps. Owing to extreme pressure on our space we are compelled to hold over further remarks on this subject till another issue.

Rouen Exhibition.—Among the recipients of diplomas of honour at the Rouen Exhibition are the Franco-Belgian Tudor Company, and the Compagnie des Compteurs Thomson, and the India Rubber, Gutta Percha, and Telegraph Works, Persan-Beaumont. Mr. G. R. Blot has a gold medal.

Dublin.—The usual misleading statements as to electric lighting losses have been freely circulating in the town, and Mr. Wm. Buckley, chairman of the Electric Lighting Committee, has issued a long statement to the Press which shows the true state of affairs, and is a complete answer to the malicious allegations.

Birkenhead.—Alderman Deakin, replying to Mr. Hughes at the Town Council meeting as to the insurance with the Fine-Art Insurance Company, Limited, of the central electrical generating station, and the electrical plant therein, for £10,000, said the insurance was about one half lower than other companies.

Larne.—At the meeting of the Town Commissioners a discussion ensued with regard to the erection of new lamps at Gardenmore-place, Rodden's-road, and Memorial-avenue, and owing to the expiry of the Board's contract with the electric light company in April next it was agreed to defer the erection of new lights.

New Companies.—Veritys, Limited, has been registered, with a capital of £140,000. The first directors are J. B. Verity, G. H. Verity, J. E. Coles, P. G. Ebbutt, and C. L. Harris.—Savage's Engineering Works, Limited, which has just been registered, and takes power to construct electric works among other things.

Newington.—The Electric Lighting Committee of the Vestry recommended at the last meeting of that body that notice should be given in writing to the London Electric Supply Corporation, Limited, of the intention of the Vestry to apply for a provisional order to supply electricity within the parish. After discussion the recommendation was agreed to.

Dover.—Councillor G. Mowll asked at the Town Council meeting if they were going to take any further steps towards charging the Telephone Company a fairer rental for their poles than a shilling a year. The Town Clerk said they would have to give the company first notice to terminate the present agreement. A motion to that effect was carried.

Digitized by Google

Harrow.—At the Urban District Council meeting a notice was received from Mr. Hawtayne, consulting engineer to the Harrow Electric Light and Power Company, stating extensions of main would be made down the High-street to South-hill-avenue, Byron-hill to Middle-road, Peterborough-road to Station-road, to opposite the Victoria Hall, taking Lyon, St. John's, and Gayton roads.

Poole.—The Sunlight and Safety Lamp Company, Limited, have received the consent of the Poole Town Council to fix two or three of their lamps in the borough by way of experiment, and the Bournemouth and District Electric Supply Company, Limited, have had the consent of the Council to an application for a provisional order for supplying electricity within the borough.

Longton.—At the meeting of the Town Council the committee recommended that the agreement between the Corporation and the British Electric Traction (Pioneer) Company, Limited, for the construction and working of light railways in the borough, and from Longton to Trentham and Blyth Bridge be approved, and the common seal of the borough affixed thereto. The report was adopted.

Barking (Essex).—At a meeting of the Urban District Council it was suggested that it was time the old system of oil illumination should be done away with and electricity employed instead. Some of the councillors suggested gas, but eventually it was decided to obtain a report from Mr. Hawtayne, of 20, Bucklersbury, on the possibility of lighting by electricity, before anything further was done in the matter.

Aberdeen.—The Gas and Electric Lighting Committee of the Town Council have agreed to erect a new water superheater for the boilers at the electrical station, the estimated cost being £400. The Town Council have agreed to execute the works necessary for supplying electric light to the harbour quays. The cost of the works will be £9 336. The Commissioners agree to pay for an annual supply of not less than 80,000 units.

Barrow.—The Gas and Water Committee are considering the proposal from the British Thomson-Houston Company to work the trams by electricity. The committee have also under consideration the question of laying down an electric lighting installation. The Watch Committee want the National Telephone Company to supply metallic circuits in connection with the telephone system between the central police station and outlying districts.

Lambeth.—With reference to the proposed transfer of the electric lighting provisional order now held by the Lambeth Vestry to Mr. Julius Sax, the Board of Trade have written pointing out certain objections to the transfer of the order to an individual. The Vestry have sent a copy of this letter to Mr. Sax for his observations, and a small committee has been formed to consider the letter and Mr. Sax's reply, and to report thereon.

The Cyanide Case.—Judgment was given on Wednesday at Pretoria in the action brought by Mr. James Hay against the African Gold Recovery Company to decide whether the patent rights of the company in the McArthur-Forrest gold extraction process, generally known as the cyanide process, are valid in South Africa. The decision is in favour of the plaintiff, with costs. Patents 47 and 74 are set aside on the ground of want of novelty.

Hoylake and West Kirby.—The District Council have resolved to apply, on or before December 21, for a provisional order under the Electric Lighting Acts, 1882 to 1888, to authorise the supply of electricity by the District Council for public and private purposes within the Council's area. A sub-committee especially dealing with the parliamentary Bill—Messrs. Cook, Bird, Aldred, Wall, Ellison, and Dr. Wilkinson—was appointed to consider the question.

Salford.—The Town Council have resolved to apply for a provisional order to construct tramways by a connection with the existing lines in Broad-street, Pendleton, along Cross-lane and Trafford-road, and connecting with the tramways in Chester road, within the urban district of Stretford; also from the existing double line in Eccles New-road, and passing along that road to a point opposite the Manchester Carriage and Tramway Company's offices at Weaste.

West Hartlepool.—A resolution was passed at a meeting of telephone subscribers expressing indignation at the great inconvenience which has been experienced in the use of the telephone service since the trunk lines have been under the control of the Government, and demanding that immediate steps be taken to remedy the grievance, which consisted of great and unreasonable delays in communication, practically rendering the system useless for business purposes.

Wrexham.—The Town Council have decided that the compulsory area of supply of electric light be High-street, Hope-street, Regent-street, Queen-street, Henblas-street, Charles-street, Townhill, and Chester-street, up to the Guildhall, and that the area proposed to be included in the powers of the order beyond the municipal boundary shall comprise the portions of Stansty and Broughton lying within the parliamentary borough, and the townships of Bersham, Erddig, Abenbury, and Acton.

Phonographs.—The Edison-Bell Phonograph Corporation, Limited, have given notice that, in the action brought by them against Mr. J. E. Hough, Mr. Justice Romer, on October 28 last, granted a perpetual injunction restraining infringement of their patent No. 6,027* of 1886, and that they will commence actions for infringement of their patents against all persons in the United Kingdom found dealing in or using phonographs, graphophones, records, or cylinders not purchased or leased from them or their agents.

Archbishop Tenison's School, Leicester-square.—Important structural alterations have recently been effected at this school in order to bring it up to the required standard as an organised science school. A new floor has been inserted about halfway up the large hall, having an area of 60ft. by 25ft., which has been equally divided into chemical and physical laboratories, each of which has accommodation for 20 students. The total cost has been approximately £900. The schools were formally opened last week.

Telegraphic Rates to Japan.—The Liverpool Chamber of Commerce have received a further letter from the Postmaster-General on the subject of rates for telegrams to Japan, stating that as a result of the negotiations at Budapest the rate to Japan will be reduced from 8s. to 6s. 2d. per word by the route of the Great Northern Telegraph Company. The rate of 10s. 8d. per word by the route of the Eastern Extension Telegraph Company will also be reduced, but in the latter case the reduced rate is not yet definitely settled.

Norwich.—Speaking the other day at a meeting in support of a candidate in the recent municipal elections, Mr. George White stated that a very important scheme would shortly be before the city. This was a scheme for giving Norwich electric tramways. There was not a town in civilised Europe as important as Norwich which did not possess tramways. There would be many difficulties in the way, and rival systems would be placed before the citizens, but he hoped some system, before many months were over, would be adopted.

Birmingham.—The Public Works Committee and the directors of the City Tramways Company have had a meeting. The committee agreed to a scheme, which was to run a line along Navigation-street to the bottom of Lower Temple street. The other important new route agreed to was one to relieve the Perry Barr lines. The committee gave permission to lay down rails in Church-street, so as to bring the trams from Snow-hill by way of Lionel-street or Great Charles-street and Church street to Colmore-row. Other routes were also decided upon.

London Lighting Extensions.—The London County Council at their last meeting granted applications for extensions of mains, etc., from the London Electric Supply Corporation, the Metropolitan Electric Supply Company, the Westminster Electric Supply Corporation, the Vestry of St. Pancras, the Notting Hill Electric Lighting Company, the House-to-House Electric Lighting Supply Company, the Kensington and Knightsbridge Electric Lighting Company, the Charing Cross and Strand Electricity Supply Corporation, and the Vestry of Hampstead.

City of London Electric Lighting Company.—The gross revenue return for the quarter ended September 20 shows that the revenue from the sale of current for public lighting was £3,158, against £3,182 for the corresponding quarter last year; from private lighting, etc., £17,274, against £11,600; and from other sources (estimated) £750, against £400—the total being £21,182, against £15,182, an increase of £6,000. The equivalent of 8-c.p lamps connected on September 30, 1896, was 228,740, an increase during the quarter of 13 181; as compared with 170,827 last year.

New Deer.—The Village Lighting Committee are hard at work following up the proposal that the village should be lighted by electricity. They have interviewed several electrical firms in the south as to construction and probable cost. Last week a representative from one firm paid the village a visit, and reported very favourably in various ways about the matter. Motive power can be had from water quite close to the place. A local surveyor has been instructed to take levels in the village as soon as possible. It is proposed to raise funds by issuing shares and forming a company, which has every probability of paying well.

Hammersmith.—The Electric Lighting Committee reported at the Vestry meeting that the surveyor had been in communication with the Brentford Gas Company, who were willing that the gas lamps along the route to be lighted by electricity should remain for a time in their present positions, and if no gas was consumed no charge would be made except for maintenance. The committee recommended the Vestry to confirm the arrangement. Mr. Cubitt asked if the present lamp-posts would be used for the purposes of electric lighting, and Mr. Searle replied that they would not be so used. The recommendation was agreed to.

Lisburn.—At the Town Commissioners' meeting Mr. Harvey impressed upon the Streets Committee the importance of doing something to improve the lighting of the town. They had been making improvements in other departments, and he did not know how it was that they were content to allow the town to remain in comparative darkness. Mr. Boyd said it would take double the number of lamps to sufficiently light the thoroughfares. Mr. Diamond said the Streets Committee had been making enquiries on the subject of electric light. Mr. Wilkins said they had been investigating the matter, and he hoped before the end of the year they would be able to make a definite proposal.

Gloucester.—Mr. Karn called attention at the City Council meeting to the inadequate lighting of Eastgate-street, and suggested that the two lamps opposite the Guildhall should be lit. Mr. Woodward congratulated the committee on putting new lamps in the suburbs. Mr. C. H Clutterbuck said this matter had received the serious consideration of the Streets Committee, and they would have liked to provide the four principal streets with lamps suitable for present-day requirements, but they found that the cost would amount to £600 or £700—too large a sum to expend with the prospect of adopting the Electric Lighting Act. Anything, however, that they could do in the shape of a temporary improvement should be done.

Fenton.—The General Purposes Committee reported at the Urban District Council meeting that a communication had

Digitized by Google

been received from Messrs. Milward and Co., Birmingham, giving notice that an application was about to be made to the Board of Trade for their approval of the transfer of the undertaking authorised by the Potteries Extension Tramways Order, 1896, from Messrs. Sellon, Fell, Ashby, and Garcke to the British Electric Traction (Pioneer) Company, Limited, and that any objections or representations with respect to such proposed transfer should be made on or before the 19th inst. The committee recommended that no objection be made to the proposed transfer. The recommendation was adopted.

Brighouse.—A special meeting of the Town Council has been called to take into consideration the expediency of applying to the Board of Trade for a provisional order under the Electric Lighting Acts, 1882 and 1888, to authorise the supply of electricity for public or private purposes within the borough. The Council agreed some time ago, subject to getting this sanction, to purchase from Mr. A. B. Brook, electrical engineer, his electric lighting plant, with which he has been supplying tradesmen and others in the borough with the electric light during the past three years. The Corporation also own the whole of the gas supply in the borough, having during the past 12 months obtained possession of the Rastrick gasworks at a cost of £50,000.

Luton.—A letter was read at the Rural District Council meeting from the National Telephone Company, asking permission to erect poles on the road from Dunstable to Totternhoe. The usual conditions would be entered into, and the company would pay 6d. per pole. The Clerk said his usual experience was that 2s. 6d. per pole should be charged. The representative of the company said they paid 2s. 6d. for the trunk lines, where the poles carried about 20 wires. In the present case the poles would only carry two wires. He was prepared to offer 1s. per pole. The company was endeavouring to open an exchange at Dunstable. It was decided to object to the poles being erected at a less charge than 2s. 6d. each. The representative said that being so, he was afraid the line would never be set up.

Telephone Employes' Wages.—A deputation from employés of the National Telephone Company throughout the country has waited upon the chief officials of the company in London. Lord Harris, vice-president of the company, presided over the proceedings, which were conducted in private. The chief point in dispute had reference to an increase in the number of hours to be worked in Yorkshire without a corresponding increase in wages, and in connection with this a strike was only averted a few weeks ago by the conciliatory attitude of the company. It was now intimated to the men that Lord Harris would visit the district affected and personally investigate the matter, the men in the meantime to work on the old basis. The questions of wages in London and the payment of overtime were also discussed, and attention was promised at an early date.

Bradford.—The Gas and Electricity Committee have issued notices to all their consumers that they will be entitled on and after January 1, 1897, to one 8-c.p. or 16-c.p. incandescent lamp, supplied free of charge by the Corporation, for every 60 units of electricity consumed since July 1, 1896, by the use of incandescent lamps only. If other and higher candle-power lamps are desired instead of 16 c.p., the number of lamps to which the consumer is entitled will be in the inverse ratio to such candle-power. Thus, 60 units entitles to one 8-c.p. or 16-c.p. lamp; 120 units entitles to two 8-c.p. or 16-c.p., or one 32-c.p.; 240 units entitles to four 8-c.p. or 16-c.p., or two 32-c.p.; 480 units entitles to eight 8-c.p. or 16-c.p., or four 32-c.p., or two 50-c.p. (The balance of units consumed in excess—viz., 105—in this last instance being held over until the following six months' supply, or made up by lamps of a lesser candle-power as may be desired by the consumer.)

Bromley.—A letter was read at the Urban District Council meeting from Messrs. Waterer and Dickins, Market-square, thanking the Council for the statement of the expenditure by the late Local Board in connection with the electric lighting provisional order—viz.: Board of Trade fees and deposit, £50; engineer's fees, £105; printing order, etc., £117. 18s.; advertising, £73. 6s. 6d.; miscellaneous, £14. 18s. 9d.—total, £361. 2s. 3d.—upon payment of which the Council was prepared to transfer their interest in the said order to a small company. The proposed company was prepared to pay the amount subject to approval of such a condition as would be imposed by the Board of Trade retaining the right of purchasing the undertaking by the Council at the expiration of, say, 21 years, or at any subsequent period. They would be glad if the Council would submit the transfer form, to take effect within, say, six months, and in the meantime their clients would set about the formation of a company and the acquisition of a central site and other preliminaries. The matter was referred to committee.

The London Tramways Scheme.—The Finance Committee reported at the last meeting of the London County Council upon the financial bearings of the estimate of £675,000 for the purchase price. They submitted the estimate as chargeable to capital (original outlay) account. The Finance Committee had very carefully considered the subject in the light of the fuller information now placed before the Council, and had also had before them the published accounts of the companies for the year to June 30 last, which showed a considerable increase both in gross receipts and net profits. With this fuller information the committee had come to the conclusion that the offer of the North Metropolitan Tramways Company was not sufficiently advantageous financially to the Council to justify them in endorsing it as it stood, but they thought it expedient to set out their reasons in view of the possibility of further negotiations between the Council and the company. The report was referred back to enable the Finance Committee and the Highways Committee to confer as to the points which were not considered sufficiently advantageous to the Council.

Berlin.—The Upper Silesian steam railway company, which passes through the whole industrial district of Upper Silesia, has determined to use electric traction instead of steam locomotives. The electric traction will be introduced at first both for passengers and freight traffic on the lines—(1) Gleiwitz, Zabrze, Koenigshuette, Beuthen, Deutsch Piekar, and (2) Koenigshuette, Cattowitz, Laurahuette, Koenigshuette, for which 30 motorcars and a corresponding number of trailers are provided. The cars are mounted on two swivel trucks of 785mm gauge. Each of the four axles will be driven by a street railway motor of 18 h.p. to 20 h.p. The Elektricitäts Gesellschaft (Felix Singer and Co.) inform us that they have got the order of the electric installation of these cars, consisting of 120 motors and the whole electrical outfit. Their firm, assisted by the Walker Company, whose representatives they are, have devised a new special motor type for the small gauge. The whole length of both lines is about 20½ miles.

Brewers' Exhibition. — The Brewers' Exhibition has been running during the present week at the Agricultural Hall, Islington. The Improved Electric Glow Lamp Company, Limited, of Queen Victoria-street, E.C., have a stall there, and show their new designs of lamps. There are ammeters and voltmeters, so that it can be seen what the lamps take in the way of current and the light you get for it. Messrs. Glover and Co., of 97, Queen Victoria-street, show lamps, fittings, and a quantity of electrical cooking and heating apparatus Messrs. Charles Johnson and Sons, of Worcester, show forms of telephone suitable for warehouses, hotels, and private houses, or, in fact, any distance short of a mile. The India Rubber, Gutta Percha and Telegraph Works Company, Limited, have a stall, but naturally the telegraphic part of their work is not represented at a brewers' exhibition. There may have been more, but we did not notice them in the course of a cursory visit. What we did notice, however, was the impudent way in which in some instances the title "electric" or "electrical" is attached to goods with which electricity has nothing whatever to do.

Leeds.—A special meeting of the Tramways Committee has been held for the purpose of receiving a report respecting a site on which to erect a depôt for the new electric motorcars. The sub-committee recommended that a site of land comprising 16,825 square yards, in Kirkstall-road, known by the name of "Piggeries," should be acquired by the Corporation for the proposed new building. Originally the owners asked 14s. a yard for the site, but they were now willing to dispose of it at 13s. 3d. a yard, or for about £11,146 for the whole area. The Chairman stated that it was absolutely necessary that something should be done, as Messrs. Greenwood and Batley, the contractors for the supply of the electric motorcars, reported that they had now several cars ready for delivery, and the Corporation had at present nowhere to put them. The committee resolved to purchase the site recommended by the sub committee, and this decision was afterwards confirmed by a meeting of the full Highways Committee which was held afterwards. Mr. Connellan, during the course of the meeting, elicited the information that the extension of the Roundhay tramlines to the Canal Gardens would be completed in three weeks or a month. Until the electric cars are ready, steam cars will be run on these lines.

Western and Brazilian Teleg'aph Company, Limited.—The report of the directors for the half-year ended June 30 last, to be presented at the general meeting to be held in London on Thursday next, states that the total earnings amounts to £71,082, as against £84,937, a decrease of £13,855 compared with the half-year to June 30, 1895. The loss of revenue for the half-year, as compared with the corresponding period, is owing to the diminution of the internal traffic of Brazil, probably occasioned by the disturbed state of commercial affairs. The working expenses amounted to £37,428, as against £37,891, a decrease of £463 Including the amount brought forward from 1895 (£4,953), the balance to the credit of the revenue account is £38,606, from which has to be deducted £10,750 for debenture interest, £5,000 for the debenture redemption fund, £1,719 for income tax, and £3,000 placed to reserve fund. The directors now recommend the payment of a dividend, free of income tax, for the half-year at the rate of £2 per cent. per annum, as against £2. 10s. per cent. per annum for the corresponding period, carrying forward £3,530. The conversion of ordinary shares into preferred ordinary and deferred ordinary is suspended until further notice. The traffic receipts for the past week were £2,988.

Wallasey.—Mr. Rienzi Walton, M.I.C.E., has held a Local Government Board enquiry into an application by the Urban District Council for powers to borrow £17,500 in respect of a scheme for electric lighting. Mr. W. Danger, clerk to the District Council, stated that an application was made to the Board of Trade 12 months ago for a license. This was granted for two years, and a large proportion of the work under the original scheme had been carried out. It was felt, however, that the time was rather limited, and the Local Government Board practically promised, if a provisional order were applied for, to extend the time to 25 years. The application for a provisional order was in hand now. The electric lighting movement was popular in the district, and there appeared to be a consensus of opinion that the improvement was necessary, and that the District Council were justified in going to the expense. The work under the existing license would absorb £12,500, and it was felt that the balance of £5,000 would be sufficient to meet the demands of the next two years or more. Mr. R. M'Geoch said the applications already received for the electric light would nearly pay the interest on the

Digitized by Google

capital and the expense of working. It was considered likely that the consumption of electric light would be trebled before two years had expired. There was no opposition.

Grantown.—For some time a proposal has been before the town with the view of having it lighted by electricity. The River Spey would be utilised to provide the necessary power. The scheme reported on by Messrs. Stewart and Co., Limited, of Glasgow, for the purpose of introducing the electric light shows some interesting features. It rejects the idea of using a water-wheel in favour of the turbine. It was after inspection decided to take advantage of the more rapid part of the fall by building the power-house at a point about 20 yards up from the bridge, and to excavate a lade to carry a body of water 20ft. broad and 6ft. deep at a speed of about 2ft. a second. The lade would tap the river at a point 600 yards above the power-house, from which point to the bridge there is a fall of 8ft. 6in., which would allow an effective fall at the turbine of at least 7ft. One turbine of 70 h.p. is considered enough for present needs. The motor is known as the Achilles reaction turbine, horizontal type. The wheel is 48in. in diameter, and the guaranteed horse-power under a 7ft. head is 72, while the water used is 6,800 cubic feet per minute. The plant would be sufficient to maintain 1,000 lamps of 16 c.p., or 2,000 lamps of 8 c p. The report claims that electricity can be provided at a cheaper rate than either oil or gas lighting, and points out that the scheme admits of supplying Castle Grant, a distance of two miles; Inverallan House, a distance of one mile; and Balmenach Distillery, which is about three miles from the proposed power-house.

Appointments Vacant.—The professorship of natural philosophy in the Queen's College, Belfast, being about to become vacant, candidates for that office are requested to forward their testimonials to the Under Secretary, Dublin Castle, on or before 21st inst., in order that the same may be submitted to his Excellency the Lord-Lieutenant.—The Public Works Committee of Birmingham invite applications for the following appointments in the city surveyor's department—namely, electric inspector and assistant electric inspector. Candidates for the post of electric inspector must be thoroughly qualified electrical engineers capable of undertaking efficiently the duties of electric inspector under the Birmingham Electric Lighting Order, 1894, and of advising upon, preparing specifications for, and carrying out all electrical matters devolving upon the city surveyor's department Salary £200 per annum, rising by annual increments of £10 per annum to £230 per annum. Candidates for the post of assistant electric inspector must be competent electricians. Commencing salary £78 per annum. Candidates for both appointments must not exceed 35 years in age. Applications, in candidates' own handwriting, stating age, experience, past and present employment, accompanied by copies of not more than three recent testimonials, to be sent to Mr. John Price, city surveyor, The Council House, Birmingham, by 20th inst. Canvassing will be a disqualification. The following external examinerships in the Victoria University will fall vacant in December, 1896. Each is tenable for three years, at the expiration of which the examiner is not eligible for re-election: chemistry, mathematics, physics, etc. Further particulars may be obtained from Mr. Alfred Hughes, registrar, The Victoria University, Manchester.

Brighton.—The *Sussex Daily News* says: "Few people in Brighton can have any idea of the magnitude of the business carried on by the Lighting Committee as purveyors of electricity. Already Brighton consumes twice as much electric current per head of population as any other town in Europe, and the demand increases so rapidly that the supply, with all the recent developments at the generating station in North-road, can hardly keep up with it. An important addition to the machinery is due in December, but Mr. Wright, the Corporation electrical engineer, has had to anticipate its arrival by borrowing, and if new applications for current come in at the present rate, it will not be long before the extended engine-room at the works is filled with whirling dynamos. Up to 1895 the highest increase in private consumers in any one year was 197, but up to October 1 the present year had yielded 293 new applications, making a total of 1,322 private consumers connected with the mains. The private lamps number 60,000—a surprising total, all things considered—while there are at present 480 incandescent lights in street lamps, and 170 arc lamps. It should also be mentioned that 100 more arc lamps are in preparation for street-lighting, and that the committee, wherever they run new mains, are fitting the existing street lamps with incandescent lights The great success of the undertaking Mr. Wright ascribes to the forward policy of the committee in pushing mains, even into back street, wherever it has seemed possible for business to be done. Experience at Brighton has shown that wealthy districts and streets of large shops do not necessarily furnish the most profitable consumers of electricity. The few lamps burnt in side streets for a longer period every evening pay better, and the sliding scale adopted by the committee—known generally as the 'Brighton' scale—makes the price to such consumers, it is claimed, considerably lower than that of gas Hitherto the light has been considered a luxury; now it seems it is going to prove an economy, especially as it is quite possible that further reductions in price may be made. The committee in 1894, having a large surplus, immediately reduced the rate, thinking it only fair that those who made the profits should benefit by it. If this principle should again be supplied, Mr. Wright thinks more people will find it profitable to make use of the current for motive power. Some 60 motors are now used for various purposes in the town, and a small reduction of price would make electricity a dangerous competitor with steam and gas, even in large works." Owing to an intimation received by the Town Council that the insurance companies have decided on a considerable advance in the fire insurance premium on the electricity works, the Council have decided to renew the insurance only until Christmas next, and to become their own insurers by creating a reserve fund.

Darwen.—At the Town Council meeting the Mayor moved that the Council apply to the Local Government Board for a provisional order conferring the right to produce, store, and supply electricity for public and private purposes within the area of the borough. Mr. Wardley seconded. Alderman Davies moved that action in regard to obtaining powers to supply electricity should be postponed for further enquiries. He said there had not been shown any very great demand for the electric light in the town, and it was absurd to speak of applying for powers to supply the technical school, upon which they had already spent a considerable sum of money in putting down a dynamo already. As to electric traction for tramways—well, he had heard of castles in the air, but he thought the castle of electric traction for the tramways was likely to remain there for a long time. He analysed the report submitted by Mr. Lacey, the expert, and he said that if the ratepayers went in for the light they would find their rates increasing in another direction. The cost would not be less than £20,000 for the electricity works they would be compelled to put down, and they could not expect to obtain a longer period for borrowing powers than 25 years. He estimated that they would have an adverse balance of £2,000 at the end of the two years, although the expert said they would have a profit on their second year's working, and that had been the experience elsewhere. There had been no expression of opinion that the people wanted the electric light. That thing was being rushed through, irregularity and inaccuracy being apparent wherever they looked, and he asked what could be the result of a movement begun in such a manner. Alderman Duxbury seconded. The Town Clerk explained the effect of the order. They would be able to limit their compulsory area to two or three streets. Mr. Forest said it had been stated that there was no demand for the electric light, but anyone who had his eyes open in the town would not say that. He pointed out that some of the opponents to the scheme were inconsistent, having put down electric lighting plants at their homes and mills, and he asked them to be consistent. The idea of electric traction for the tramways had been scoffed, but he ventured to say that in completing an agreement with the Blackburn Corporation the tramway company had handed themselves over to the Darwen Corporation, who could compel them to take electric traction when it was ready in 1897, or hand over the tramways to the Corporation. The Town Clerk suggested that they should instruct him to prepare and advertise the necessary notices and convene the necessary meeting, to enable the Council to apply in the next session of Parliament for power to supply electric light for public and private purposes. This was decided upon. The surveyor reported that Messrs. R. and T. Tootall, of Crown-street, were laying overhead electric wires from their foundry in Crown-street to premises in Bridge-street, owned by the Co-operative Society, with a view to supplying electricity. The town clerk was instructed to deal with the matter.

The Improved Electric Incandescent Lamp.—The improvement in Mr. Fanta's lamp, which is being brought out by the Improved Electric Glow Lamp Company, consists essentially in depositing a mirror on the stem half of the globe. This seems a simple thing to do, but in practice it has not proved so—that is to say, to do it in such a manner as will stand in ordinary use without deterioration. At any rate, no such lamp is in common use. It is clear that by a metallic mirror surface in optical contact with the glass of the lamp bulb the condition for securing the maximum amount of reflected light is obtained, and the difficulty that besets all metallic mirrors exposed to the air—namely, their rapid tarnish—is avoided. If, however, silver is deposited on the glass by any of the ordinary processes, and then simply painted or varnished over for protection, it is found that the expansion and contraction which follow the heating and cooling of the lamp cause either a cracking or a separation of the film and covering. A film of some tenacity is required, and probably one which being a good conductor of heat may be trusted to keep at a lower temperature than that of the glass. Mr. Fanta meets these requirements by electrolytically depositing on the thin silver film a coating of copper, which, of course, can be carried to the thickness which is judged necessary. As a matter of fact, the metal when peeled off the glass—an operation not to be performed without breaking the lamp—is seen to be a very thin foil indeed. At the outset difficulties were encountered, owing to the fact that the thin silver film which was chemically deposited could not be in any way cleaned to receive the copper. This caused spotting from occasional failure to secure metallic contact due to residues left by the depositing solution. The way out of the difficulty proved simple. It was to "inoculate" the copper-depositing bath with some of the silver deposit instead of attempting to work with as pure a bath as possible. In addition to the mirror deposited on it the shape of the lamp is changed. The ordinary pear-shaped bulb does not give the proper shape for a reflector. Of the two shapes adopted in the "improved" incandescent lamp for ordinary lighting, one is that of a simple sphere, and the other is an oblate affair, like an ordinary round door-handle, or, if the open top were domed over, like the bowl of a champagne glass. For some reason inscrutable to any but themselves, the company are pleased to call this shape a "conical" lamp—a greater outrage on geometry than even the conical shot of the gunnery people. The result of the shallowing of the bulb appears to be to

Digitized by Google

cause an extra turn to be put in the filament. Beyond this there is stated to be nothing special in the construction of the lamp, and, as a matter of fact, they are being made for the company in England by the Ediswan Company. The lamps we have seen are 100-volt ones, but with a very slight modification bulbs of the new shape are made to take the longer filament required for 200 or 220 volts. Of course photometric measurements are beside the mark, as the amount of light to be used is the same whether a lamp has a reflector or not. The question is, how much of this light is to be utilised and how much wasted? It can, however, be said that if "Improved" lamps are substituted in an electrolier for ordinary lamps of the same nominal candle-power, the effect is most marked. The only question appears to the writer to be whether the mirror will stand in use, and Mr. Fanta assured him that there was no trouble in this respect, and that the mirror always outlasted the filament. The lamps as sent out are stated to be rather above their nominal voltage, so as to secure a long life. A prosaic detail remains—namely, price; and the cost of the "Improved" lamp is about 6d. more than an ordinary incandescent lamp without a mirror. The new lamps have already come into use in several places, and, among others, at the "Empire" in Leicester-square. The Improved Glow Lamp Company are also responsible for the electric lights carried by the dancers in the "Monte Cristo" ballet there, and the arrangements possess some interest because the use of primary or secondary batteries is abandoned, and the alternating current from the mains of the Metropolitan Electric Supply Company transformed down to about 25 volts is used. But that is another story, and one to which we hope to recur.

Another Electric Railway.—According to the *Times*, there is a plan on foot, of which the details have been most carefully considered, for making an underground electric railway from Hammersmith-broadway to Cannon-street. For the capital of this undertaking no appeal to the public is needed. It is believed that, should the sanction of Parliament be accorded next session, the Hammersmith and City electric railway will be open for traffic in well under four years from the present time. The route to be traversed is as follows: From "Cannon-street station," which will be at the south corner of Bread-street, where St. Mildred's Church now stands, under Carter-lane and by a double curve to Ludgate-hill, with "Ludgate-circus station" a little way along on the north side of Fleet-street. The "Law Courts station" will be on the south side of the Strand on the site of Thanet-place, with a subway, probably, leading from the Temple to the courts, under the road. The next stopping place will be "Wellington-street," the station being put at the south-west corner, almost exactly opposite the Lyceum Theatre. Leaving the Strand to pass under King William-street the line will reach "Trafalgar-square" station at the end of St. Martin's-lane, close to the National Gallery, and will then pass by way of Leicester-square and Coventry-street to Piccadilly-circus, where the station will be found at the corner of the Haymarket adjoining the Criterion Theatre and Restaurant. From this point to Hammersmith the tunnels will follow the line of the high road, the stations being "St. James's" at the corner of Arlington-street, "Hyde Park-corner" on the west side of St. George's Hospital, "Knightsbridge" at the beginning of the Brompton-road, "Albert Hall" on the west side of the building, "Kensington Church" at the corner of Church-street, "Earl's Court-road," "Addison-road," backing on to Olympia, and "Hammersmith," the terminus, a little to the east of the District station and almost opposite the West London Hospital. The works and depôt will occupy some acres of land lying between the Hammersmith-road and Brook-green. The total length of the proposed line is just under six miles, and it will be contained in double tunnels, having an internal diameter of 11ft. 6in. These, together with the lift, shafts, and the station tunnels, of which the internal diameter will measure 21ft., will be made in iron segments, no brickwork entering into their construction at all. The depth of the line is to be at least 60ft. below the street level, and the whole of it, with the exception of a small part in the City, will pass beneath the roadway. The soil through which the tunnels will be driven is London clay throughout. This has been ascertained by careful borings, and no engineering difficulties are feared. It may be mentioned here that the projectors are in active consultation with Sir Benjamin Baker as to the construction of the new line. The trains are to be made up of corridor carriages built on the tramcar principle with platforms at each end. These carriages will be 45ft. in length, containing seats for 48 passengers. Seven of them will make up a train, which will thus accommodate 336 persons. There will be either a 2 or a 2½-minute service all through the day, since the promoters count upon a very large intermediate traffic They do not, they say, expect to compete so much with the underground railway as with the omnibuses, which they rely upon excelling, as regards both speed and comfort. Especially do they look for a very considerable evening traffic from the patrons of evening entertainments of all kinds. The journey from one terminus to the other will take not much more than half an hour, including the stoppages at each of the 12 intermediate stations. With regard to the cost of the undertaking, which, as was stated at the outset, will be subscribed by a small syndicate without any capital being publicly issued, it is calculated that the expense of construction, including the stations and the general equipment of the line, will come to about £500,000 per mile. The system of electric traction to be adopted will be decided upon later, and any new development that may take place in this direction will be taken advantage of when the date for the final choice arrives. Steps are now being taken by Messrs. Ashurst, Morris, Crisp, and Co. for the presentation to Parliament in the ensuing session of a Bill embodying the scheme that has been thus roughly sketched out, and, though the promoters are quite prepared to see determined opposition offered to their proposal, they are resolved to press it forward as energetically as possible, and, even if beaten once, to persevere until they succeed. They expect, no doubt with reason, that a battle will have to be fought with the District Railway and the omnibus companies, but they believe that their scheme would so greatly add to the convenience of the public that Parliament will not feel justified in refusing to allow them to proceed.

Bath.—Mr. F. H Tulloch, Local Government Board inspector, has held an enquiry respecting the application of the Bath Urban Sanitary Authority to borrow £58,000 for the purposes of electric lighting Mr. R. A Moger (deputy clerk to the Bath Urban Sanitary Authority) reviewed the conditions under which the electric light was established in Bath and the negotiations which led to the authority being granted a provisional order by the Board of Trade for carrying out the work of electric lighting. There was a clause in that order, he explained, that the authority should purchase the undertaking, and the Board of Trade would not cancel the license of the company until the purchase of the works had been agreed upon. The valuation of the concern by the independent valuer appointed by the Board of Trade was £24,500, and the Corporation agreed to purchase at that price Agreements had been entered into and sealed by the company and the authority, but as far as the authority was concerned, it was subject to the sanction of the Local Government Board to the loan. Forty-five thousand pounds was the amount it was originally intended to ask for, but the committee thought further extensions than those Mr. Hammond originally suggested were necessary, and that occasioned £13,000 additional being asked for. The authority did not consider it would be a burden on the rates, but rather a help to them. Alderman Sturges, chairman of the Electric Lighting Committee, said there was no division on this subject until the additional £13,000 was asked for. It would be necessary, in order to make the works a success, to have more powerful engines, dynamos, and electrical apparatus. They were not going to extend mains until they received a guaranteed income from consumers which would represent 10 per cent. on the outlay. Mr. Hammond, the consulting electrical expert, observed that there were two issues—first, as to the advisability of acquiring the works of the company, and then as to making extensions. He believed all the ratepayers would be unanimous in their desire to take over the electric light if they felt convinced the profit would not only be sufficient to pay interest and sinking fund, but leave a margin to make a reduction in the rates. Any opposition must be from those who thought the Corporation would not be in pocket sufficient to pay the annual charges, and that it would mean a call upon the rates. Continuing, Mr. Hammond said all the data in connection with electric light works showed that they were prosperous. At the present time the works under statutory powers in operation numbered 106, 60 of which were now in the hands of local authorities, and there were some 30 works in course of construction, 22 of which were being put up by local authorities. Mr. Hammond went on to give details of the proposed expenditure, explaining why an expenditure of £58,000 was now proposed instead of £45,000, as set out in the first application to the Local Government Board. The amount of the purchase of plant and works, etc., was £24,535, of which £1,800 was in accordance with Mr. Wilcox's estimate for the land. The sum of £22,735 remaining was the award of Prof. Kennedy. As to the advisability, having acquired the works, of immediately spending a large sum in extending, he drew attention to the fact that, under the provisional order, they were under certain obligations to supply residents throughout the city. The sets of plant at present used were about filled up, and if they did not immediately approach this question of extension it would be utterly impossible for them to supply sufficient electrical energy to meet the demands of the consumers next winter. On the necessity of some extension of the works he urged that there really could not be two opinions. The question arose as to what form the extension should take, and he proceeded in detail to justify the extension proposed by the Electric Lighting Committee. The whole capacity of the Bath electric lighting works was 10,000 lights, and when they put in the three sets of plant which was proposed they must always have one set in reserve. Therefore they would not be able to turn on more than 20,000 lights. Originally he put down £4,650 for cables and transformers—£3,000 for the former and £1,650 for transformers and chambers which it was proposed to place in Milsom-street and Union-street. When the committee came to consider the £4,650, they were confronted at once with the difficulty that under the order anyone could demand the light, and they thought they had better make a large provision. They prepared a long list of streets, the total distance being 21,495 yards. The Corporation might find such a general demand that these mains might be required within the next few months, or they might find that the call for the mains would be delayed. In either case they thought the proper policy at the present time was boldly to face the expenditure. The total sum put down for extensions was £12,455; £7,985 was for cables (high and low tension); £470 for transformers and chambers; provision for making good pavements, £1,000; underground work in connecting new customers, £600; meters and transformers in the outside area, £2,400. He averaged the price for private lighting at 5½d. per unit, which was by no means high, and equal to about 3s. per 1,000 for gas, the price in Bath being 2s. 6d. With the plant full up they would supply about half a million units per annum, and that would realise £9,285, while from the public lighting £2,110 would be received, making a gross revenue of £11,945. In Leeds the cost of production was 2·05d. per unit. It might be said coal was cheap in Leeds; so it was, but if they

Digitized by Google

trebled the cost of coal at Leeds the cost came to 2·65d. He put the cost for Bath at 2½d. per unit. He put the interest and sinking fund on £58,000 at 5¼ per cent., making the annual charge £3,045, and, after allowing £1,000 a year for depreciation, there would be a margin of £1,651. Mr. Metzger gave figures showing the increase of business done by the electric lighting company. At the present moment they had 12,000 lights connected, and they had been obliged to refuse many applications because they had not the power at the works to supply more lights. In 1895 the company made a gross profit of £1,570 on a capital expenditure of £39,000, and they could have paid a 4 per cent. dividend, but it was decided to keep it in hand. This year, up to the end of October, the net profit had been £700, and in the next two months they would make £700 more. The chances were that when the light was extended outside the present radius the profit would be increased. Of the present 161 consumers 138 were shops; they had two churches, but five churches would not be equal to one public-house. Another church had just applied for the light, but it was outside the present area. The Inspector intimated that he had a doubt as to whether so large an amount for extensions was required at present, but he would consider the point.

PROVISIONAL PATENTS, 1896.

OCTOBER 26.

23743. Improvements in dynamo-electric machines. George Cheffey-James and Harry Percy Ward, 25, The Nook, Barber-road, Sheffield.

23778. Improvements in electric indicators of water-level. John Ernest Hutton, 28, Southampton-buildings, Chancery-lane, London.

23805. Improvements in or in connection with incandescent electric lamps. Frederick Adolph Max Naumann (commonly known as A. Norman), 6, Lord-street, Liverpool.

23816. Improvements in conduit tubes more especially suitable for electrical conductors. Edward Hibberd Johnson, 45, Southampton-buildings, Chancery-lane, London. (Edwin Truman Greenfield, United States.)

OCTOBER 27.

23827. Improvements in and connected with electrical storage batteries. Edward William Bonson, 54, Bellefields-road, Brixton, London.

23871. Improvements in and relating to commutators and collectors for dynamo-electric generators and electro-motors. Charles Henry Wade, James Moores, and Henry Oliver Farrell, 70, Market-street, Manchester.

23942. Improvements in or relating to electric switches or circuit breakers. Reginald Belfield, 322, High Holborn, London. (Alexander Jay Wurts, United States.)

OCTOBER 28.

23980. Improvements in electric stop-motion drawing frames for fibrous materials. Frank Arrowsmith, 33, Brazennose street, Manchester.

23992. A new system of electrical propulsion for cycles and common road and other vehicles. Robert Alfred Marples, 24, Temple-row, Birmingham. (Complete specification.)

24019. Improvement relating to electric batteries. Louis Jules Hippolyte Rochatte, 11, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, April 21, 1896, being date of application in France.)

24062. Improvements in or relating to brackets or holders suitable for electric lamps and the like. William Sumner, 46, Lincoln's-inn-fields, London.

OCTOBER 29.

24075. Improvements in suspenders for electric lamps. Thomas Laurie, Wellside-terrace, Falkirk.

24084. Improvements in or applicable to switches for electro-motors and the like purposes. Joseph Platt Hall and William Henry Seville Craven, 70, Deansgate, Manchester.

24152. Improvements in signalling apparatus for electric railways or tramways. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (Homer Alton Parrish, United States.) (Complete specification.)

OCTOBER 30.

24177. Improvements in and relating to dynamo-electric generators. Charles Henry Wade, James Moores, and Henry Oliver Farrell, 70, Market-street, Manchester.

24178. Improvements in and connected with magneto and dynamo electric machines. Charles Henry Wade, James Moores, and Henry Oliver Farrell, 70, Market-street, Manchester.

24190. Improvements in electrolier ceiling fittings. Harry Dain Hinks, 12, Cherry-street, Birmingham.

24220. Electric lamp for cycles or other carriages and any other purpose. Alexander Riddell, 97, Fleet-street, London.

24223. Improvements in electric switches. Isaac Henry Storey, Herbert Lushington Storey, and Joseph Parkinson, 5, Market-street, Manchester.

24235. An improved electric lamp. David Forbes, 321, High Holborn, London.

OCTOBER 31.

24291. Improvements in electric burglar alarms. William Harrison Ward, 89, Chancery-lane, London.

24348. Improvements in fittings for electric and other lighting. Charles Edward Bulling, 4, South-street, Finsbury, London.

24350. Improvements in reflectors for electric lamps. Richard Jones 170, Askew-road, Shepherd's Bush, London.

24351. Improvements in or relating to electric railways. A. H. Brunn, Viktor Takács, Louis de Reymond-Schiller, and Philipp Westphal, 322, High Holborn, London. (Complete specification.)

24367. Improvements in conduits for electrical conductors. Erwin Lavens, 28, Southampton-buildings, Chancery-lane, London. (Complete specification.)

SPECIFICATIONS PUBLISHED.

1895.

19130. Chemical substance and the application thereof to industrial purposes such as rubber, guttapercha, or celluloid substitutes, insulations of electrical conductors, coverings for ships' bottoms, or wall and floor coverings. Castle.

20926. Block systems for electric railways. Belfield.

21679. Means for use with electric cables for diverting the current through adjacent cables when required for repairs or other purpose. Edmunds.

22028. Protective coverings for the joints of electric cables. Hardingham. (Felten and Guilleaume.)

22252. Direct electric current transformers or motor generators. Blackburn and Boyden.

22732. Process and apparatus for the electrolytic production of metallic zinc from ores of zinc and metallic zinc and metallic copper from zinc ores containing copper, and the production of oxygen gas in the cases specified. Burghardt and Rigg.

1896.

9048. Electrical fog-signalling apparatus for railways. Tomlins and Gurr.

NOTES.

The Submarine Telegraph Memorial. — The general committee have confirmed the decision of the sub-committee to put off the question of a memorial of the establishment of submarine telegraphy until 1901, and meanwhile to go on with a memorial to Sir John Pender.

Fused Zinc Chloride.—According to the determinations of Richard Lorenz, published in the *Zeitschrift für Inorganischer Chemie*, the E.M.F. required to decompose "pure" fused zinc chloride is about 1·5 volts. The theoretical voltage should be more like 2, but there is the high temperature to be considered.

Oxygen.—It is reported from America that the cheap production of oxygen on a commercial scale has been solved, and that oxygen gas is being manufactured at 3d. per 1,000ft., which, if true, may have very far-reaching effects. This appears to be the old manganese dioxide process over again, which has always hitherto failed on a practical scale.

Books Received.—We have just received from E. and F. N. Spon, 125, Strand, "The Commercial Organisation of Factories," by Mr. J. Slater Lewis. Time has failed to allow us to do more than glance at a mysterious diagram opposite the title-page, and therefore further notice of the book must be reserved for the present. From the same publishers we have Mr. F. J. Britten's "Watch and Clockmakers' Handbook" (ninth edition).

For Those Away.—Last Sunday, when Canon Fleming was preaching at St. Michael's, Chester-square, what seemed to be two Bibles instead of one on the desk of the pulpit arrested the attention of the congregation. But just before his discourse the preacher announced that it was no second book on his desk, but that the Telephone Company had placed there a transmitter by which the discourse could be laid on to the hospitals and to subscribers who were unable to come to church.

Amalgamating Zincs.—Mr. Oppermann's way of amalgamating battery zincs is stated by the *Elektrochemische Zeitung* to give good results. To a nearly saturated solution of neutral sulphate of mercury in water a quantity of sulphuric acid is added to obtain complete solution. Oxalic acid is added and a little sal-ammoniac. The zincs are dipped into this, rubbed, and dried. In this roundabout way of going to work it does not seem clear where the saving comes in.

The Civil Engineers.—At last Tuesday's meeting the papers taken were those by Mr. G. E. W. Cruttwell and Mr. S. G. Homfray on the Tower Bridge and its lifts. The subject is obviously one rather outside the range of the electrical branch of the profession, but it is of interest to note that the bridge has been opened on an average 18 times daily, and on one occasion the bascules were raised as many as 12 times in two hours. The papers will be discussed next Tuesday, November 17.

A Combination.—If there is any electrician who is anxious to try his hand at looking after mad people there is an opening for him at the Three Counties Asylum at Hitchin. For "acting as electrician" he will be allowed the "further sum of £10 per annum" in addition to £27 per annum, his wages as a ward attendant. One would not imagine that the occupation of a lunatic attendant was such an attractive one that any man that had a good trade would care to take it up; and when the asylum gets its electrician, the extra £10 will probably be about the value of his electrical services.

The Cable Conference.—There was a meeting of the Anglo-Colonial Cable Conference on Monday at the Colonial Office. The meeting was informal, and there were present Lord Selborne, chairman; Mr. G. H. Murray, C.B., of the Treasury; Sir Donald Smith, Sir Mackenzie Bowell, and Mr. A. G. Jones, of Halifax, representing Canada; Sir Saul Samuel and Mr. Duncan Gillies as representing Australia; and Mr. Mercer, secretary. There was another meeting arranged at the Colonial Office to take evidence. The proceedings were in both cases private.

Imperial Institute.—A lecture was delivered at the Imperial Institute on Monday evening by Prof. Wyndham Dunstan, F.R.S., the recently-appointed director of the Scientific and Technical Department of the institute, on some of the work of the department. Sir Joseph Lister, president of the Royal Society, was in the chair. Prof. Dunstan explained that the department was now provided with large and well-equipped laboratories at the institute, and that there was a staff of skilled chemists now at work investigating. At the close of the lecture the laboratories were open for inspection.

Coming Events.—The Physical Society meet this (Friday) afternoon (Burlington House, five o'clock). Tomorrow (Saturday) is the Motor Car Club meet at the Hotel Metropôle (10.30).—The Civil Engineers on Tuesday, 17th, discuss the papers on the Tower Bridge.—On Wednesday is the opening address by Major-General Sir Owen Tudor Burne at the Society of Arts (8 p.m.).—On the same evening the Meteorological Society meets at 7.30 p.m. at the Civil Engineers', Great George-street (Mr. Ellis, on "The Meteorological Conference," and the Hon. Rollo Russell, on "Haze, Fog, and Visibility"). Next Friday (20th) the cycle show, including motors, opens at the Agricultural Hall, Islington.

Dimensions of Electric Units.—Mr. Joubin has communicated to the French Physical Society a note on the dimensions of electric and magnetic quantities. Starting with the assumption that the dimensions must be integral powers (positive or negative) of the fundamental units of length, mass, and time, Mr. Joubin says there are 12 possible combinations for K, of which only one can have a mechanical signification attached to it. He finally brings out the dimensions of the electric field as a pressure or tension, the magnetic field a velocity, the current density an angular velocity, and so forth. Which is the necessary result of the identity in form between the equations for elasticity and the electromagnetic field.

The Telephone Service.—The people that used to write letters to the *Times* complaining of the telephone service have apparently transferred their correspondence to the *Daily Telegraph.* The complaints are of the usual character, and involve both the trunk lines and the Telephone Company's exchanges. As, however, it appears from an interview given to a representative of the *Daily Telegraph* by the National Telephone Company's manager that the company considers that as regards the London service there is little or nothing to complain of, it is obvious that a good deal more than mere letters to a newspaper will be necessary before much is done to remedy the faults that must lie at the bottom of these constant complaints.

The Royal Society.—The following is a list of those who have been recommended by the president and council of the Royal Society for election into the council for the year 1897 at the anniversary meeting on the 30th inst.: President—Sir John Lister; treasurer—Sir John Evans; secretaries—Prof. Michael Foster, M.D., Prof. Arthur William Rücker; foreign secretary—Edward Frankland;

Digitized by Google

other members of the council—Prof. William Grylls Adams, M.A., Prof. Thomas Clifford-Allbut, M.D., Prof. Robert Bellamy Clifton, William Turner Thiselton Dyer, Prof. James Alfred Ewing, Lazarus Fletcher, Walter Holbrook Gaskell, M.D., Prof. Alfred George Greenhill, M.A., William Huggins, Prof. Charles Lapworth, LL.D., Major Percy Alexander M'Mahon, R.A., Prof. Raphael Meldola, Prof. William Ramsay, Lord Walsingham, Prof. Walter Frank Raphael Weldon, and Admiral William James Lloyd Wharton.

Glow-Lamp Tests.—The reference of the commission on incandescent lamp standards of the German Association of Electrical Engineers (Verband Deutscher Elektrotechniker) has been published in the *Elektrotechnische Zeitschrift*. It relates to lamps for voltages of 60 to 70 and 95 to 125, with an efficiency of three to four watts per candle, and a power of 10, 16, 25, and 32 candles. All these are German "candles"—in reality the Hefner lamp, and possibly slightly under the British candle. In testing, lamps are considered as done with when their light-giving power has fallen 20 per cent. below that specified at the assigned voltage. Conditions are given under which the sub-commission undertake the tests, and a blank form of guarantee to be given by the lamp manufacturers is set out. A reference is provided to the Reichsanstalt in case the correctness of a test is disputed. The Edison socket was recommended for ordinary use.

Voice-Production Extraordinary. — America is the classic land of "wildcat" notions, but the following imported from the *New York Journal* by our own *Daily Mail* is a decided novelty. It is nothing less than to secure "compass" and effect in singing by artificially contracting the vocal chords under the influence of electric stimulation. There is just the possibility of a resultant scream. The question of its relative unpleasantness to the hearer and the executant need not be considered, as the process is not likely to get beyond the first rehearsal. Yet the *Daily Mail* thinks the notion worth nearly a column, with an illustration, quite as though the thing were an established success. It seemed reasonable to hope that as electricity got more common, and people got more familiar with it, they would cease to talk, write, and believe so much nonsense about it. But there is more electricity in America than in England—and more nonsense. It is not hopeful.

St. Elmo's Fire. — Further observations on the phenomena of a brush discharge into the air observed at sea, and sometimes, though more rarely, on land, have been published by the *Deutsche Seewarte*. The classification of recorded observations of the phenomenon has been made by Mr. Halbermann. In about 77,000 ship-days of observation the St. Elmo's fire was noted 164 times. The greater frequency of the phenomenon at sea is explained by the fact that on land there are almost always a large quantity of points capable of determining a discharge, and therefore it seldom attains a sufficient density to give a noticeable glow. Cognate to this subject is a curious story told by the *Zeitschrift für Elektrotechnik* of how an agricultural labourer, who was going with a horse and cart down a country road between wire fences, was followed for some seconds by a ball of fire and frightened by a blue light and crackling sound from the wire fences. There is no record of a thunderstorm at the time anywhere near, but the weather is stated to have been variable and rainy.

Integrity of Cables.—Speaking of the pending trial between the United States and Hayti Cable and Telegraph Company and the Compagnie Française des Cables Télégraphiques, *Le Soleil* fears that all submarine communications of the world being in English hands may prove a source of considerable power to England in case of war, and urges that all attempts made by French enterprise to battle against this ought to be encouraged and supported. Without the French to tell us of it, we English should never be able to realise the deep-laid cunning with which in spite of our deficiencies, we maintain our position against the rest of the world. Up to the present we have been believing that there was serious danger as to the integrity of our telegraphic communications in time of war, and that there was not much use in the capital and direction of the cable company being English if the cable is landed on a possibly unfriendly shore, or even if it is laid in shallow waters along foreign shores where the finest fleet in the world could not guarantee it from mischief at the hands of a hostile cruiser.

Fire Brigades.—The officers of the provincial fire brigades who had taken part in the Lord Mayor's Show dined at the Holborn Restaurant on the 9th, Captain Shean presiding. Captain Dyson, replying to the toast of "The Fire Service," proposed by Mr. Arnold, complained that there were certain defects in the law which were greatly detrimental to fire brigade work. Members of the service could not be put into electrical communication with the fire stations, and it was proposed to bring this matter before Parliament next session if possible. Their brigades were deficient in appliances for dealing with fires upon premises where electricity was largely used, and they might with advantage follow the lead of America in this respect. A little elementary knowledge of what to do with wires carrying a current of any magnitude would do no harm in the officers of a fire brigade, but unless many of the tales that are told in America are grossly untrue, some of the brigades there seem to have succeeded in remaining wonderfully ignorant on the subject, considering the frequency of fires and overhead wires in that country.

Acetylene.—The investigations of Messrs. Berthelot and Vieille on the conditions of the explosibility of acetylene unmixed with air were referred to last week. According to the account of the researches in the *Comptes Rendus* of the Académie des Sciences, it would appear that though liquid or highly compressed acetylene in steel bottles is violently explosive when detonated, the investigators were unable to bring about explosion by any mere mechanical shock unless the latter was carried so far as to break the bottle and liberate the gas into the air. The investigators have an hypothesis to account for this last result. At ordinary pressures acetylene would appear to be safe if unmixed with air, and in small quantities absolutely safe. It is, however, suggested that if carbide of calcium is attacked by small quantities of water, ignition (presumably of the mixed acetylene and air) may result from local overheating, and various precautions are suggested as to the manufacture and manipulation of the highly compressed gas. The investigators are throughout favourable to the extended use of acetylene, and do not think that the possibility of danger should be allowed to restrict this.

Secondary Education.—Sir Henry Roscoe has written to the *Times* to enforce a point of some importance in any scheme for organising secondary education. It is that while primary education covers much the same subjects for all, secondary education requires to be specialised to meet individual or, if we may say so, "district" wants. "The children of the Dorset peasant and of the Manchester mechanic require different treatment, and here specialisation and local requirements come in. Hence it is that, whilst decentralisation and local authority are the watchwords for secondary, a uniform system and centralised authority are the principles upon which our primary education has rested and ought still to

Digitized by Google

rest." Without being quite so confident as Sir Henry Roscoe as to the absolute perfection of our primary education, it is impossible not to see that his principle is right, though the way of giving effect to it may prove untrustworthy. The official mind always tries to run things in a uniform groove, because this makes matters easy and safe, and allows of inspection examinations, while the public is caught by the apparently businesslike notion of "payment by results." In another field there can be little doubt that it is to the comparative, not to say competitive, independence of the German universities in the past that much of the scientific progress of that nation has been due.

Accidents Abroad.—According to a telegram from Calais, an extraordinary accident took place last week at Tourcoing. A boiler 15ft. in height was being conveyed through the town, 16 horses drawing it. Two men were set to keep the overhead wires clear, but allowed them to come in contact with the boiler. Immediately the horses were struck down, some being killed, and the workmen received violent shocks. If the tale is true, there would seem to have been great carelessness somewhere, but it is by no means easy to gather from the telegram what occurred. The boiler appears to have been carried on a trolley of some sort. The Brussels correspondent of the *Pall Mall Gazette* is responsible for a tale of how, in the Place du Théâtre at Liège, a woman, "catching her foot in a coil of electric wire connected with the theatre and the electric tram system, fell to the ground, and received a succession of shocks. Several passers-by attempted to pull the woman clear, but themselves received a shock. An officer attempted to cut the wire with his sword, but was prostrated by the current he received. As a last resort several men wrapped their hands in bandages, and thus protected succeeded in rescuing the sufferer." It is difficult to understand how "live" wires and uninsulated could be left about the ground in coils. In fact, both narratives as they stand require to be taken with a certain amount of reserve.

Cryptoscope Screens.—In *L'Elettricità* there is given an account of a note presented by Prof. E. Salvioni to the Accademia Medico-Chirurgica of Perugia on the subject of the comparative value of various salts for the purpose of fluorescent screens for Röntgen ray work. The method of comparison adopted consisted essentially in varying the density of the radiation received by changing the angular direction of the screens—*i.e.*, making the rays fall at a more or less oblique angle on the screen. When the two screens give an apparently equal illumination the relative efficiency of the fluorescent salt is immediately determined by the angle between the screen and the direction of the ray. (This looks open to several errors, but it is stated that experience shows it to be reliable.) The results are given for various substances to four significant figures, a degree of precision which is obviously altogether out of the question in photometric work of this kind. In fact, different samples of barium platino cyanide differ by 40 per cent. Potassium platino cyanide would appear to be about half as effective as the barium salt weight for weight, and sodium and calcium platino cyanides less than a quarter. The power of tungstate of calcium and ammonium-uranyl fluoride comes out as about a twentieth of the best sample of barium platino-cyanide. The American suggestion of oxide of zinc was not tried. Probably very different results would be obtained with a different tube and voltage, and experiments in this direction and also as to the differential absorption of different screens are promised.

The Junior Engineers.—The inaugural meeting of the Institution of Junior Engineers' sixteenth session was held last Friday at the Westminster Palace Hotel, the chair being taken by the retiring president, Mr. A. Denny, M.I.N.A., of Dumbarton. The preliminary business included the announcement of the admission of 28 new members, the presentation of the institution premium to Mr. F. J. Bancroft, of Hull, for his paper on "The Stability of Tall Chimneys," and a cordial vote of thanks to Mr. Denny for his services as president, which was proposed by Mr. H. B. Vorley, chairman of the institution, and seconded by Mr. E. Berry. Mr. Denny then introduced the president-elect, Mr. A. R. Binnie, M.I.C.E., who proceeded to deliver his presidential address. After referring to the beneficent character of the work of the engineer, mention was made of the varied nature of the subjects of which he should have some knowledge in the intelligent and successful execution of his duties. The principal portion of the address was devoted to considerations with respect to some of the ways in which water enters into and demands the professional attention of the engineer. On the motion of the vice-chairman of the institution, Mr. Basil H. Joy, seconded by Mr. Ernest King, a hearty vote of thanks was passed to Mr. Binnie for his interesting address, and the proceedings terminated with the announcement of the ensuing meeting on Friday, December 4, when a paper would be read on "Electric Central-Station Working," by Mr. P. W. McDougall, A.I.E.E., of Deptford.

Society of Arts.—The opening meeting of the one-hundred-and-forty-third session of the Society of Arts will be held on Wednesday evening, November 18, at 8 p.m., when an address will be delivered by Major-General Sir Owen Tudor Burne, K.C.S.I., C.I.E., chairman of the council. For the other meetings before Christmas the following arrangements have been made: November 25—W. Worby Beaumont, M.I.C.E., "Mechanical Road Carriages." November 2—W. A. S. Hewins, M.A., "The Teaching of Economics." December 9—Bennett H. Brough, A.R.S.M., "Mining at Great Depths." December 16—Arnold Dolmetsch, "The Chamber Music of Purcell, Handel, and Bach." For subsequent meetings the following papers have been promised: by Messrs. R. Brudenell Carter, "Children's Sight"; Edward R. Calthorpe, "Light Railways"; George Lacy Hillier, "Cycling—Historical and Practical"; George Cullow, "Line Engraving"; Leon McCulloch, "Lithography"; W. H. St. John Hope, M.A., "Heraldry"; and M. J. R. Dunstan, M.A., F.R.S.E., "Dairy Produce." The Cantor lectures will be by Prof. Vivian B. Lewes, "The Use of Gas for Domestic Lighting" (three lectures, beginning November 23); Mr. William Burton, F.C.S., "Pottery" (four lectures, January 18); Mr. C. F. Cross, F.C.S., "Cellulose" (three lectures, February 15); Prof. W. Chandler Roberts-Austen, C.B., F.R.S., "Alloys" (four lectures, March 15); and Mr. Lewis Foreman Day, "Lettering" (four lectures, May 3). The Howard lectures will be by Prof. J. A. Ewing, M.A., F.R.S., on "The Mechanical Production of Cold" (six lectures, beginning January 28).

Patent Agents.—The annual general meeting of the Society of Patent Agents took place at Anderton's Hotel, E.C., on Wednesday night, the presidential address being delivered by Mr. J. Sinclair Fairfax. It was commendably short. The expense of patent litigation was dealt with and the anomalous position of the expert witness. Mr. Fairfax expressed a fear that unless something was done a new profession would arise—namely, that of expert witnesses, whose fees would be immense, and who would be practically sworn advocates. These witness-advocates would tell the truth, but the eminent barrister who examined them might arrange that they did not tell

Digitized by Google

the "whole truth," and the judge, unless an expert, would be unable to detect and check this. As a remedy it was suggested that much of the preliminary work before coming into court should be transferred to the Patent Office, and the evidence of the experts taken on affidavit, leaving it for the judge, with or without assessors, to decide points of law only after the facts had been threshed out. In the discussion that followed, general dissatisfaction was expressed with the state of patent litigation, though it was suggested that the evils complained of, and particularly that the issue was too often at the mercy of the longest purse, were common to all law in all countries. It may, however, be doubted if they do not exist in a somewhat higher degree in patent litigation than in general practice. One curious suggestion made was that, to meet the difficulty of a patentee getting a capitalist who necessarily knew nothing of the matter to take up his invention, a "court" ought to be instituted which would examine any invention and give a "certificate of merit." The expert would come in here again, only apparently the Government would have to pay him instead of the inventor.

Motor Car Club.—There has been a considerable amount of expectation as to the turn-out to be made at the Motor Car Club's meet to-morrow (Saturday) at the Hôtel Metropole, and given reasonable weather it is a safe prediction that there will be a crowd. The arrangements are that the motorcars shall start from Whitehall-place at 10.30, Mr. Harry J. Lawson, president of the club, leading the way. Crossing Westminster Bridge, the cars are to go in procession and at a slow speed as far as Brixton, from which point they will be free to take their own routes to Reigate, where a stoppage of an hour is allowed for luncheon. When the foremost cars have reached Preston Park, on the outskirts of Brighton, they will halt for some time in order that as many as possible of the others may overtake them and enter the town in procession. In view of the certainty that there will be many more guests invited to the meet than could be seated on the cars, the club has arranged to run a special train from Victoria to Brighton at 11 a.m., and this train will stop at Reigate on the way down so that passengers by it may witness the arrival and departure of the cars and proceed to Brighton in ample time to see them enter the town. As many as 54 motorcarts have been entered for the meet, and it is believed nearly all of them will be brought out. After two cars belonging to Mr. Harry J. Lawson will come the two Daimler cars which finished first and second in the race from Paris to Marseilles and back six weeks ago, and the muster will include 16 other Daimler cars, six electric carriages, three Pennington carriages, two Bollées, and three Dions. Besides these there are to be five Arnold carriages (made in Germany), four Anglo-French motors made in England, and two Durya motors from America, besides private cars belonging to the Hon. Evelyn Ellis and the Hon. C. Rolls.

Magnetic Photographs.—When the Röntgen ray excitement was at its height various observers found that in certain cases when a magnet had been left in close proximity to a sensitised photographic plate a sort of image was obtainable on development even when there had been no possible access of light. Those observers who were at all shaky in their physics naturally thought the magnetism had something to do with it, a confusion of ideas which was not diminished by the practice of expressing the magnetic circuit in lines of force. Although this was obviously impossible, the nature of the action was not in all cases explicable either by the influence of difference of temperature, pressure due to the magnet, or the presence of stray light, and as a matter of fact remained unexplained. A photographic plate as now manufactured is such a sensitive affair that almost anything will affect it, as many photographers who have wrapped them up in the wrong sorts of paper have found to their cost, and it would now appear that the infinitesimally small amounts of vapour emitted by metals at ordinary temperature are capable of affecting a photographic plate. Mr. Henri Pellat some years ago showed that the presence of steel would affect such a plate even when separated from it by a sheet of cardboard or any substance which is not impermeable to vapour. Much more marked effects have been obtained by Mr. R. Colson from more volatile metals, such as zinc, magnesium, and cadmium, provided the surface of the metal is first polished to remove the coating of oxide, and it is even suggested that the process might be of practical use. No results were obtained from lead, tin, copper, or aluminium, but that, of course, only goes to show that the vapour did not react on the plate, not that there was none. It should also be added, in view of Mr. Pellat's result, that so far as they went Mr. Colson's experiments gave no result with iron.

Motorcarts.—In connection with the exhibition of motor carriages at the Crystal Palace the following awards have been made: Diploma for gold medal—C. C. Burrell and Sons, for light compound traction engine; Emile Delahaye, for benzoline carriage; Mons. Serpollet, for steam carriage; the Steam Carriage and Wagon Company, for steam van. Diploma for silver medal—Société Franco-Belge, for steam brake; L'Hollier, Gascoigne, and Co., for benzoline carriages. Diploma for bronze medal—Arnold's Motor Carriage Company, for benzoline carriage. The report by the jurors is signed by W. Worby Beaumont, M.I.C E.; Walter Hancock, M.I.E.E.; H. A. O. Mackenzie, C.E.; and Alf. R. Sennett, A.M.I.C.E., hon. executive commissioner. "Although none of the vehicles exhibited approached that degree of perfection which would place them beyond adverse criticism," the jurors consider the prospects of benzoline motorcarts hopeful, and of steam motorcarts more hopeful. As to electric carts, "the jurors considered it matter for regret that no electrically-propelled vehicle had been submitted for trial." In fact, not having seen them they cannot well say. The motorcart in the Lord Mayor's Show on Monday behaved very nicely. The oil-engine is warranted not to bolt or shy, but it is not altogether clear that it may not possibly jib. This one did not. The crowd received it with approval and the horses treated it as beneath their notice. So far the oil motorcart has been having all the honours, but if it is true as stated, that as an immediate result of the new Motor Act coming into effect on Saturday arrangements have been made by the London Electrical Cab Company to place a large number of electrical cabs almost immediately for hire in the streets of the Metropolis, we shall see something in a week or two. But we must confess that we should have more confidence if communications of this sort were made to the technical as well as to the daily Press.

London Chamber of Commerce.—The chamber have arranged with Major S. Flood Page to deliver an address on "Motor Vehicles" in the council-room of the chamber on Tuesday, December 1, at 3.30 p.m. The chair will be taken by Mr. W. H. Willans (chairman of the council). In a circular to members it is stated that, in reference to code telegraphy, last year most vigorous opposition was offered by the chamber to the obligatory application to code telegrams of an official vocabulary of code words drawn up by the International Telegraphic Bureau of Berne, and which it was intended to enforce at the beginning of 1898 in respect of European code messages. "A general and detailed criticism was

Digitized by Google

made of the vocabulary, and the support of Continental as well as of home chambers was sought, with gratifying success, in representations to the telegraph administrations urging the withdrawal of the vocabulary or the extension of the period before its application pending radical revision," and when the International Telegraphic Conference assembled at Budapest it was decided to prepare a second edition of the vocabulary to include all the words obtainable from the eight authorised languages of not less than five nor more than 10 letters or Morse telegraphic signals, and to postpone the enforcement of this revised vocabulary to a date to be fixed by the next conference in 1901. In its protest against the application of the vocabulary to European code messages, the chamber was careful also to object strenuously to the application of any vocabulary to extra-European code messages. From a communication received from the Berne office it is, however, quite evident that the intention is eventually to prescribe extra-European code messages in the same way as European code messages, but until the revised or second edition of the vocabulary is available the past opposition in this respect will be continued. "The council are thus able to report that their action has been very successful in regard to the most essential objections, and they have conveyed their thanks to the home and Continental associations who co-operated in securing proper attention to the question." As to English telegrams, in a reply, under date October 31, to representations made by the chamber in favour of various postal and telegraphic reforms, on behalf of the Postmaster-General, it is stated: "With regard to the charging of commercial terms in telegrams, his Grace directs me to say that both in inland and foreign telegrams it is the practice to count the terms 'cif' and 'fob' as one word, but they must be written in small letters and without stops." Lastly, as to the metric system. The council "note with satisfaction that a Bill has been prepared (and was introduced towards the end of the last session of Parliament) by the President of the Board of Trade to render the use of metric weights and measures permissive in the United Kingdom, and providing for the verification of such weights and measures by Board of Trade standards. As the law at present stands, the use of these weights and measures is prohibited for purposes of trade, and it is largely at the instance of the chamber that this anomaly is to be removed. It is intended, therefore, to heartily support this permissive measure in the ensuing session, leaving for future effort the compulsory introduction of the system, as was recommended by the Select Committee of the House of Commons."

Solution and Electrolysis.—In the October number of the *Philosophical Magazine* Prof. Poynting endeavours to explain the phenomena of the osmotic pressure of solutions by the hypothesis of chemical combination between the solvent and the dissolved matter. Any successful theory of solution must explain the fact that the osmotic pressure follows the laws of gaseous pressure, and has the same absolute value as that of the pressure which the dissolved molecules would exert in the gaseous state when filling a volume equal to that of the solution. Whatever be the ultimate cause of the osmotic pressure, the gaseous laws must be obeyed by dilute solutions, as the molecules of any finely divided matter must be in general out of each other's sphere of influence, so that each will produce its effect independently of the rest. This is all that is necessary for Boyle's law and Avogadro's law to hold, so that these, as well as the mere existence of osmotic pressure, are explained by chemical combination just as well as by molecular bombardment. On the other hand, no good reason has been hitherto given why chemical forces should be so adjusted that the osmotic pressure of the dissolved molecules should have the same absolute value as that of the pressure which the same number of gaseous molecules would exert when filling an equal volume. Prof. Poynting follows the older supposition that each molecule of dissolved matter combines with the solvent to form unstable compounds but with the addition that these continually exchange constituents. The molecules of solvent thus combined will be less energetic than the molecules of pure solvent, and thus may be unable to evaporate. Nevertheless, since they are always being liberated and recombined, they will still be effective in retaining molecules of vapour condensing on the surface. The vapour pressure will therefore be reduced, and it follows that if we make the additional assumption that one molecule of the dissolved substance unites with one molecule of the solvent the fractional diminution of vapour pressure will be the same as that calculated from the osmotic pressure given by Van 't Hoff's law. We can, of course, working backward from this result, show that the osmotic pressure will have the gaseous value. If one dissolved molecule combines with two or three solvent molecules the osmotic pressure would have double or treble its normal value. Mr. W. C. D. Whetham, discussing this view, in a letter to *Nature* says: "The evidence in favour of the view that the opposite ions of an electrolyte are dissociated from each other is enormously strong, though there is no reason to suppose that the ions are not united to the solvent. Some of the chief points in favour of their freedom may shortly be summarised as follows: (1) The fact that the electrical conductivity of a dilute solution is proportional to its concentration; whereas, if the ions moved forward by taking advantage of collisions between the dissolved molecules and consequent rearrangements, it would vary as some power of the concentration higher than the first. (2) The confirmation of the values given by Kohlrausch as the specific velocities of the ions, the velocity of each ion being, in dilute solution, independent of the nature of the other ion present. (3) The successful calculation by Nernst and Planck of the coefficients of diffusion of electrolytes, and of the contact differences of potential between their solutions on the hypothesis that the ions migrate independently of each other. Thus we cannot lightly give up the idea that the ions are free from each other, and it seems to me that a very simple extension of Prof. Poynting's theory will enable us to retain that view. We have only to suppose that, in the case of electrolytes, the dissolved molecules are resolved into their ions, and that each ion so produced unites with one solvent molecule, or, at all events, destroys the mobility of one solvent molecule. A simple compound like NaCl, which is decomposed into two ions, Na (positive) and Cl (negative), will thus produce double the normal effect on the osmotic pressure and its consequences, the diminution of vapour pressure and the lowering of the freezing point. In the same way a molecule like H_2SO_4, which gives three ions, will produce three times the effect which would be obtained if it were undissociated." As to all this it has always seemed to us that, although the laws on which it is founded are beyond doubt, the current theory of ionic dissociation has been accepted because it is a complete explanation of them, which works out mathematically correct, and without considering whether it is the only possible explanation. It is not always the simplest suggestion that is the true one, and the recent light that has been thrown on the manner in which conduction takes place through gases would seem distinctly to favour some theory like Prof. Poynting's in the case of fluids.

THE PRINCIPLES OF ALTERNATE-CURRENT WORKING.*

BY ALFRED HAY, B.SC.(EDIN.), A.I.E.E.

(Continued from page 483.)

95. If the periodicity is so related to the inductance and capacity that the condition $L p = \frac{1}{C p}$ is fulfilled, then it follows, by the last article, that the current will be in phase with the impressed E.M.F. This phenomenon of the neutralisation of an inductance by means of a capacity is generally referred to as *electrical resonance.* As an example, let us suppose that it is required to neutralise an inductance of ·0127 henry, when the periodicity is 100 ~ per second. Let C stand for the capacity required. Then we have

$$L p = ·0127 \times 2 \pi \times 100 = 79·5.$$

Hence we must have $C p = \frac{1}{L p} = ·01258$,

so that $C = \frac{·01258}{200 \pi} = \frac{·01258}{628·32} = 2 \times 10^{-5}$ farads approximately, or C = 20 microfarads.

Let us suppose, further, that the resistance of the circuit is 10 ohms, and that the impressed E.M.F. is 100 volts. The current is in this case $\frac{100}{10} = 10$ amperes. The P.D. at the condenser terminals is $\frac{10}{C p} = 79·5 \times 10 = 795$ volts, or almost *eight times as great as the impressed E.M.F.* The P.D. across the inductive resistance is $10 \sqrt{r^2 + p^2 L^2} = 10 \times 80·1 = 801$ volts.

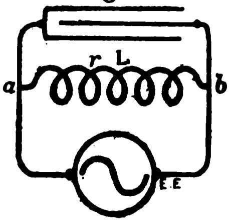

FIG. 67.

We therefore see that a comparatively small impressed E.M.F. may under suitable conditions give rise to very high P.D.'s between certain points in the circuit. It is important to bear this fact in mind, for neglect of the necessary precautions might in some cases result in the breaking down of costly apparatus which was never intended to stand the P.D. to which it was unwittingly subjected.

Excessive rises of P.D. in a circuit may be prevented by the introduction of sufficiently large non-inductive resistances. Thus, if in the example just considered we suppose that the resistance of the circuit is 50 ohms instead of 10, the current will be two amperes, and the P.D. at the condenser terminals only 79·5 × 2 = 159 volts instead of 795 as in the first case.

If a rise of P.D. is not objectionable, then we may take advantage of the phenomenon of electrical resonance to increase the current in an inductive circuit when the available impressed E.M.F. is insufficient for the purpose.

96. We shall next consider the effect of shunting an inductive resistance by means of a condenser. If the student has followed the explanation given above for the case of a condenser placed in series with an inductive resistance, he will have no difficulty in understanding what follows.

Let r and L denote the resistance and inductance of the circuit, and C the capacity of the shunting condenser. The arrangement of connections is shown in Fig. 67. Let E stand for the amplitude of the simple harmonic P.D. which is maintained between the points a and b. The problem is to find the currents in the various branches of the circuit.

* Based on a series of evening lectures delivered at the University College, Liverpool.

The amplitude I_1 of the current in the inductive part of the circuit is, by Art. 38, equation (23), equal to $\frac{E}{\sqrt{r^2 + p^2 L^2}}$. Proceeding as in Art. 92, we lay off a vector O L (Fig. 68), of length I_1; a vector O M, of length r I, and at right angles to this a vector O N, of length $L p$ I. The resultant of O M and O N is O P, whose length is E. Let this diagram of vectors revolve round O with constant angular velocity p. Then the projections of the vectors O L, O M, O N, and O P on the vertical axis at any instant give the instantaneous values of the current in the inductive part of the circuit, the $r i$ component of the impressed P.D., the $L i'$ component, and the total impressed P.D. respectively. Since the capacity of the shunting condenser is C, the amplitude of the condenser current I_c is, by Art. 92, equation (25), equal to p C E, and we know that this current is $\frac{\pi}{2}$ in advance of the impressed P.D. as regards phase. Hence, if we draw a vector O R, of length I_c, at right angles to O P, the projection of this vector on the vertical axis at any instant will give the value of the condenser current. Now, the total current which comes from the source of alternating E.M.F. is at every instant equal to the algebraical sum of the currents through the inductive part of the circuit and through the condenser. Hence the total current at any instant is equal to the sum of

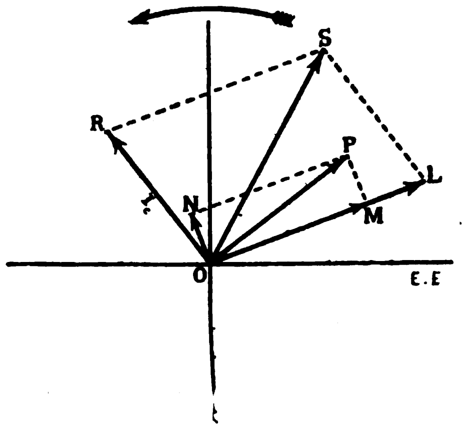

FIG. 68.

the projections of O L and O R on the vertical axis, or, which comes to the same thing, the projection of O S on the vertical axis; O S being the resultant of O L and O R.

97. From the diagram, Fig. 68, it is evident that the current in the main circuit may be either greater or less than the current through the inductive resistance. Let us suppose that the resistance and inductance of the circuit are fixed, but that we have the means of varying the capacity of the shunting condenser. The amplitude of the impressed P.D. is also supposed to be fixed. This is equivalent to saying that the vectors O L, O M, O N, and O P are all given, but that the length of the vector O R may be varied (the direction of O R is fixed, since it must always be at right angles to O P). The length of the vector O R will evidently be in direct proportion to the capacity of the shunting condenser, since $I_c = p$ C E. When the capacity is nothing—*i.e.*, when the condenser is entirely removed—the vector O S will be coincident with O L, which is another way of expressing the fact that the current in the main circuit is the same as that in the inductive resistance. As the capacity is gradually increased, the extremity S of the vector O S will travel along the straight line L S, which is parallel to O R. The current in the main circuit will therefore gradually diminish and *reach a minimum value* when O S becomes perpendicular to L S (or coincident *in direction* with O P)—*i.e.*, when the *current in the main circuit comes into phase with the impressed E.M.F.* If the capacity is still further increased, the vector O S will increase in length and at a certain stage become equal to O L; it will then go on increasing indefinitely as the capacity is increased. Now, it is evident from the diagram that for all values of the current in the main circuit which lie between the *minimum* value of that current and its value when the shunting capacity is zero, we may have *two* different values

Digitized by Google

of the capacity. With the *smaller* value of the capacity, the current will *lag*, the vector O S lying between O L and O P; with the *larger* value, the current will *lead* by the same amount, the vector O S lying on the other side of O P.

We shall work out a numerical example to illustrate this point. Let $r = 6$ ohms, $L = \cdot01273$ henry, $E = 100$ volts, and let the periodicity be 100 ~ per sec. The impedance is $\sqrt{r^2 + p^2 L^2} = 10$, hence $I_1 = \frac{100}{10} = 10$. If θ denote the angle of lag between the impressed P.D. and the current in the inductive resistance, then, by Art. 38, equation (24), $\tan\theta = \frac{Lp}{r} = \frac{8}{6} = \frac{4}{3}$. Take a line O L (Fig. 69), of total length 10, and at L draw L A at right angles to O L, making $LA = \frac{4}{3} OL$. Then $\tan LOA = \frac{LA}{OL} = \frac{4}{3} = \tan\theta$. Hence the angle L O A is equal to the angle of lag θ. From L draw L T at right angles to O A. The lines O L and L T in Fig. 69 correspond to O L

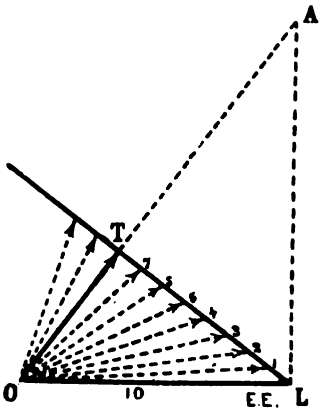

Fig. 69

and L S in Fig. 68. When there is no shunting condenser, the maximum value of the current in the main circuit is the same as in the inductive resistance—viz., 10—and the angle of lag is L O A.

Let us now introduce a shunting condenser and gradually increase its capacity. Suppose we consider values of the capacity corresponding to 1, 2, 3, etc., amperes of maximum condenser current. Since $I_c = pCE$, we get $C = \frac{I_c}{pE} = \frac{I_c}{200\pi \times 100}$; corresponding, therefore, to 1 ampere of the maximum condenser current we have a capacity of 15·92 microfarads, corresponding to 2 amperes, $2 \times 15{\cdot}92$

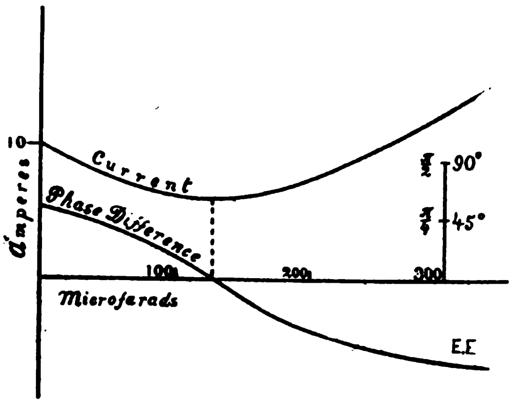

Fig. 70.

or 31·84 microfarads, etc. In order to determine the effect of this condenser current on the current in the main circuit, we lay off lengths L 1, L 2, L 3, etc., and join the point O to the points 1, 2, 3, etc. The lines O 1, O 2, O 3, etc., give the values of the maximum current I in the main circuit, and the angles 1 O T, 2 O T, 3 O T, etc., the corresponding values of the angle of lag between the impressed E.M.F. and the current in the main circuit. Taking corresponding values of the capacity and the maximum current in the main circuit, we may plot a curve as in Fig. 70, showing the relation between these two quantities. Another curve, shown in the same figure, may be plotted to exhibit the connection between the capacity of the shunting condenser and the phase difference between the impressed E.M.F. and the current in the main circuit. The angle of phase difference is reckoned *positive* if the current *lags*, *negative* if it *leads*.

(To be continued.)

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 486.)

The bell code in use does not differ materially from that in use for double-line working in cases where all distinguishing signals are by bell, and need not be further referred to.

The operation of withdrawing a staff at either cabin is very simple, and can only be done by the joint action of the two signalmen at opposite ends of the section. (The connections being identical at each end only one station is shown in the diagram.) Assuming that a staff is to be withdrawn at "A" under the conditions of the apparatus as shown by Fig. 88, and that the preliminary notification signals have been given and accepted, the operation is as follows: "A" places the right-hand switch to "for staff," "B" depresses bell key and keeps it down, "A" withdraws staff, and then turns the left-hand switch to "up staff out," turning the switch *hard down* before releasing

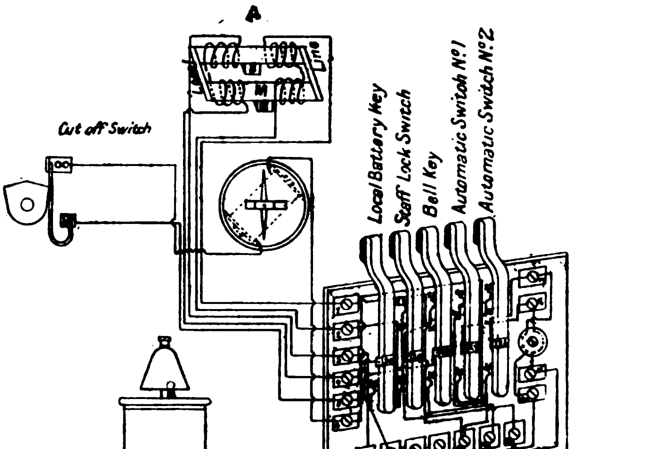

Fig. 88.—Webb and Thompson's Electrical Train Staff Diagram of Connections for One Section of Single Line.

it. This latter action notifies "B" that the staff is out, and he releases the bell key. This completes the operation, the right-hand switch at "A" being replaced automatically to "for bell" during the operation of withdrawing the staff.

Remembering that the "local battery" bar is making contact at "31," and the "staff lock" bar at "32," at "A," and that the "bell key" at "B" is making contact at "33," it will be seen that two currents are passing around the staff lock electromagnet, M, at "A"; and following the directions of the currents through the windings of the "local" and "line" coils respectively, it will be found that the resultant magnetic effect is to produce poles at "N" and "S" (Fig. 88). Under these circumstances the lock, L, will be raised, with the electromagnet, M, by the movement of the lever, *l*, when the staff is being withdrawn from the pillar towards H (Figs. 86 and 87). The paths of these

Digitized by Google

currents, in the positions occupied by the automatic switches Nos. 1 and 2, at "A" and "B," is as follows:

"A."	"B."
	From carbon of line battery to 12, 33, 28, 5, cut-off switch and galvanometer, 6, 18, 25, 26, 17, 14, 9, and line wire to
9, 14, 17, 26, 25, 18, 6, cut-off switch and galvanometer, 5, 28, 23, 20, 29, 32, 2, line coils, 1, 11, 19, 24, 27, 16, 15, 10 to earth, and	10, 15, 16, 27, 24, 19, 11 to zinc of line battery.
Local battery. From carbon to 8, 31, 30, 4, local coils, 3, 7, to zinc.	

These currents excite the electromagnet, M, and it will be noted that not only are two currents necessary, but their directions must be in accordance in order to do this. Since the electromagnet is provided with a complete magnetic circuit, either of the two currents would fail to excite it, effectively, for the purpose it is intended for alone; and if the direction of either current is reversed, the effect upon the lock pawl, L, will be nil. The method of obviating the disadvantages of an air-gap by making the lock pawl, L, the armature for the consequent poles developed is also worthy of notice.

The movement of the cam-wheel changes the points of contact of the switch bars Nos. 1 and 2 from "24" and "25" to "34" and "35." The breaking of the contacts of these bars with "24" and "25" breaks the path of the current from "B," and releases L from M; this path being immediately replaced by another through "34" and "35." If the new path is traced it will be found that the current from B has been reversed in direction through the line coils at "A," and consequently poles are not formed at "N" and "S" as before, and the lock pawl will be unaffected by any subsequent movement of M whilst these conditions obtain. Not only is this the case, but if the operations described are gone through with the object of liberating a staff at "B" it will be found that the direction of the currents through the line coils at "B" is such, as, in conjunction with the fixed direction of the current through the local coils, is ineffective for the purpose of raising L in order to allow the cam-wheel to turn.

The instruments are said to be "out of phase" when the switch bars Nos. 1 and 2 make different contacts at the two ends of the section, and they can only be made operative again by putting them "in phase." This may be done by replacing the staff in either A's or B's pillar. In the first case the switch bars Nos. 1 and 2 at "A" return to the top contacts "24" and "25"; in the second case the switch bars at "B" are caused to make contact with the bottom springs "34" and "35," and thus make contacts at the same points as the similar bars do at "A." Shortly, if the paths of the currents are traced, under the various conditions necessary, it will be found that staffs may be withdrawn at either place when the switch bars Nos. 1 and 2 make similar contacts only.

It will be noticed from the path of the line current that it passes through the galvanometer at each cabin, and, therefore, during the time the bell key at "B" is depressed, to enable a staff to be withdrawn at "A," the galvanometer needles are deflected. Some means of notifying "B" of the completion of the operation of withdrawal is necessary, and this is effected by breaking the circuit at the cut-off switch by pressing it hard over, as already observed. Both galvanometer needles assume a vertical position, and the signalman at "B" accepts this as an indication of the completion of the operation.

The right-hand switch is automatically replaced to "for bell" by the turning of the cam-wheel, and a study of the connections will show that at the moment of replacement the current will pass through the bell at "A." No notice of the one blow on the bell, resulting from the change of connection, is taken, and it is of no significance whatever, since the man engaged in withdrawing the staff requires no signal to tell him when he has got it out.

Such an instrument as that just described is obviously a great advance on the simple single staff and ticket system, in so far as facilitating the working of traffic and immunity from danger of accident is concerned. Under ordinary circumstances there need be no delay, as in the single-staff system, owing to the staff being away; and the lock, L, being contained in a strong lock-up iron case, if the batteries and connecting wires are protected against being tampered with it is not possible to, even burglariously, take a second staff out of either pillar. This, of course, is the premier object of the design, without which it would be worthless as an instrument for single lines. A minor point in connection with the design of the instrument may be noticed. It is that, although both men are actively engaged during the whole time occupied in withdrawing a staff at either end of the section, only one

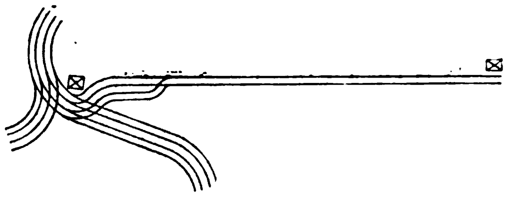

Fig. 89.

of them is concerned with its replacement. Under these circumstances it will be observed that it is not *essential* for the signalman at the sending end of the staff section to remain in his cabin until the last train through the section at night, say, has been signalled out. The staff can be placed in the pillar at the opposite end, and the two instruments put in "phase," without the assistance of the man at the point from which the train started. An understanding between the signalmen would, of course, have to exist before this could be done.

Single lines differ considerably in character. Some, as Fig. 89, end as single lines; others, again, form a connecting link between two double lines, as Fig. 90, and feed both. With such a line as Fig. 89 the traffic is bound to balance—*i.e.*, the same number of trains must emerge at the junction as enter it—and the number of staffs kept at each staff cabin will remain fairly constant. In such a case as is shown by Fig. 90] this may not occur, especially where the single line is fed from a number of points in its length, and there exists a number of staff stations between the extreme points of the single line. A number of trains may enter at one junction and leave by the other, and there would thus be an accumulation of staffs at some

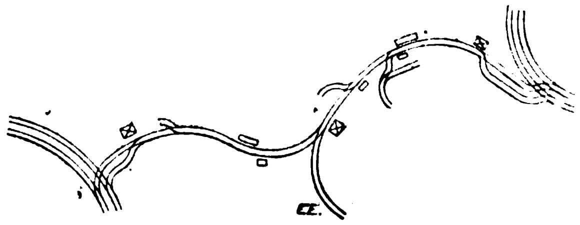

Fig. 90.

point and a corresponding denudation at another point, dependent upon the preponderating direction of traffic. In such cases, for instruments such as Webb and Thompson's, and others of similar design, special means have to be taken to restore the balance of staffs, or the line would ultimately be in the same condition as with a single-staff system. This is usually done by giving to the telegraph lineman for the district a key which will open the case of the instrument and enable him to lift the lock, L, by hand until a sufficient number of staffs has been removed from the pillar having a surplus for conveyance to the point where a deficiency exists. Of course, this is only done under the supervision of the more responsible officials of the locality; and the person removing staffs in this way must give and take receipts for them, and it must only be done at such time as no staff is in ordinary use. In this connection it will be noticed that an *even* number of staffs must be removed for conveyance to the opposite end of the section, in order that the instruments may be left in "phase" for ordinary work during the time occupied in

Digitized by Google

conveying the staffs from one point to the other. If the lineman conveys his bundle of staffs by a train passing in that direction, the driver must be furnished with a separate one, in order to leave the instruments out of "phase" during the passage of the train through the section.

On single lines where the traffic is light at night provision is made for switching out an intermediate staff station, staff working being carried on between the two cabins on each side. In such cases the instruments for working the longer section are distinct from those working to the intermediate station, and the staffs are of such form and size as to prevent them from being worked in conjunction with any instrument but the right one. The switching operation is somewhat elaborate, and a good idea will be more readily formed from the instructions given for its performance.

"As soon as the train next before the time specified in the working time-table for switching out has passed B and has arrived at C or A, as the case may be, and train out of section......... has been received for it at B, the signalman at B must ascertain by single needle or telephone, as the case may be, that all the staves at A and C are in their respective staff pillars. Having ascertained that such is the case he must give ('closing cabin signal') on bell........., which signal must be acknowledged. B must then peg down the bell key of each of his staff instruments by means of the pin provided for the purpose, and A and C must each of them hold down the bell key of the instrument working to B, which will be shown at B by the deflection of the needles. This action electrically unlocks the switch at B and permits that station to switch out, which he must do by depressing the lever on his switch instrument and turning the pointer from 'Switched in' to 'Switched out.' Having done this, he must send to A and C on the single needle, A A A.........which signal must be repeated to show that it has been understood, which will call the attention of these stations to the fact that the action of closing B has been accomplished (or where single needles do not exist the communication must be made on the telephone). On the receipt of this signal on the single needle, or the notification by telephone, A and C may cease to hold down their keys. All the instruments at the three stations have thus become disconnected, and the staves, both local and through, locked up in them. In order to bring the through staff instruments into operation, A and C must then turn the pointer of their battery switches from intermediate station to through section, which act will connect the through instrument at A with the through instrument at C. Stations A and C must then exchange the test signal with each other, and having done so must intimate to B that their through instruments are in circuit by sending him, by the single needle or telephone, the word 'through.' B is thus made aware that A and C are working on the through circuit, and after switching out his cabin-to-cabin single needle or telephone in the usual manner, if he is supplied with one, and unpegging the bell key on each of his staff instruments, he may close his cabin and leave."

"The rules for opening B are as follows: On the arrival of the signalman at B he must first switch in the cabin-to-cabin single-needle instruments if they exist (but if the telephone is in use without a single needle then a verbal communication must be made on that circuit), and then send 15 beats on the needle, thus (five to the left, five to the right, and five to the left) to A and C. If there is no staff out of the pillars, A and C must each return the code of 15 beats, and then hold down their bell keys on the through staff instruments, which will unlock the switch at B. B must then depress the lever of his switch instrument and turn the pointer from switched out to switched in, and having done so he must move the handle of the single-needle cabin-to-cabin instrument to and fro three times—thus, N, N, N—which will call the attention of those stations to the fact that the action of opening B has been accomplished, and those stations must turn the pointer of their battery switches to intermediate station A and C must then each of them exchange with B the test signal on the bell, and working by local staff can then be commenced."

(To be continued.)

INSTITUTION OF ELECTRICAL ENGINEERS, Nov. 12.

THE TELEPHONE TRUNK LINE SYSTEM IN GREAT BRITAIN.

BY J. GAVEY, MEMBER.

In the early days of the telephone, whilst various local systems were being developed, and before the idea of providing trunk lines between neighbouring towns had been matured, the question of long-distance telephony received careful consideration. The pioneer experimenters at once found themselves face to face with the numerous troubles, generally ascribed to induction, which rendered speech impossible on single-wire circuits during the busy telegraphic hours of the day, and very difficult on such metallic loops as could be made up from existing telegraph circuits. In a paper read before the Physical Society on January 19, 1878, Mr. Preece described the various causes to which these disturbances were due, and he suggested a method of screening a single-wire circuit both from electrostatic and electromagnetic induction. He also pointed out the true solution of the difficulty—*i.e.*, the use of metallic circuits for telephonic purposes—a practice adopted by the Post Office from the first, and one that has been consistently urged as necessary if a really efficient telephonic service is sought. Prof. Hughes continued the subject in his paper read before the Institution on March 12, 1879, in which he described the method of revolving the two wires of a metallic loop to obtain a practical balance. In a subsequent paper read before the British Association in 1885, Mr. Preece pointed out the merits of copper as a conductor, and in 1887 he enunciated the K R law in a paper read before the Royal Society.

The following are the theoretical principles involved in the erection of balanced telephone circuits: when two complete circuits, either wholly metallic or partly metallic and partly earth, are placed in juxtaposition, each is subject to the following interferences on the establishment, the cessation, or the variation in the volume of a current of electricity in the other:

1. *Induced Currents due to Electromagnetic Induction.*—If two circuits or portions of circuits be contiguous to one another, then, on establishing a current in No. 1 circuit (Fig. 1), a

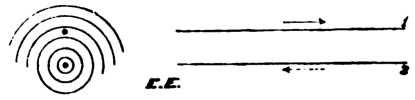

Fig. 1.

certain number of magnetic lines of force cut No. 2, and a current of brief duration is observed in the lattter, and, disregarding direction for the present, corresponding results are observed on the increase, the cessation, or the diminution of the current in No. 1.

2. *Induced Currents due to Electrostatic Induction.*—Electrostatic induction induces a momentary redistribution of electrification in neighbouring wires, the result being the passage either transversely or longitudinally of currents of short duration. The cessation of the primary current results in momentary induced currents in the reverse direction to the former.

3. If a single wire with an earth return be used, in addition to the above results, leakage from the earth-plates and stray currents from other electrical circuits, or from the earth itself, enter the circuit. This aspect of the case may, however, be disregarded at present, for in practice trunk circuits always consist of metallic loops.

If we consider the combined effects of electromagnetic and electrostatic induction from a single-wire circuit with an earth return—first, on a similar circuit, and then on a looped or balanced circuit—we get the results, on the closing or the increase of the current in the primary circuit, which are

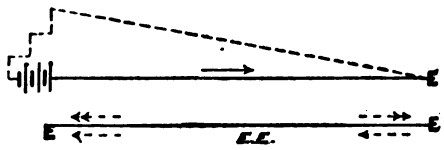

Fig. 2.

illustrated in Fig. 2, where the continuous arrow, ——>, shows the primary current, the dotted arrows, — — —>, the induced current due to electromagnetic induction, and the double-barbed arrows, — — —>>, that due to electrostatic induction.

The reverse results are observed on the breaking or diminution of the current in the primary circuit. It will be observed that in unbalanced earthed circuits the current due to electromagnetic induction is opposite to that in the primary on closing the latter, whilst that due to electrostatic induction is in the

Digitized by Google

same direction as the electromagnetic induction current at the battery end, and in the opposite direction at the far end. Thus, at one end of such a circuit a disturbance due to the sum of the two currents is observed, whilst at the other end one due to the difference alone is seen.

In the case of the balanced circuit, if all the conditions for silence indicated below are realised, the result of electromagnetic induction is that similar potentials are developed along both sides of the loop; the single-barbed dotted arrows

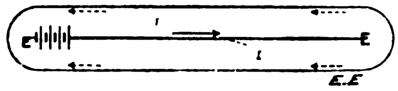

Fig. 3.

(Fig. 3) showing the direction only that the current would flow in either branch if, owing to defective balance, the potential in the other were reduced.

The electrostatic effect will depend on the condition of the circuit. If the primary or disturbing circuit be perfectly insulated, and if it be disconnected at the far end, or if it be terminated in a condenser, and if the insulation of the secondary be extremely high, minute currents cross the conductor transversely so as to effect the redistribution illustrated by + and − signs in Fig. 4, no currents in a longitudinal direction being

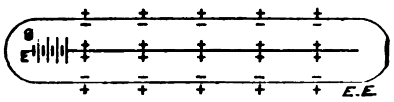

Fig. 4.

developed. If, however, the disturbing or primary circuit be to earth, or if it consist of a neighbouring loop, minute longitudinal currents in the direction shown by the double-barbed arrows in Fig. 5 actually circulate. The combined effects on a balanced loop with the resultant earth in the centre of each wire are illustrated in Fig. 5A.

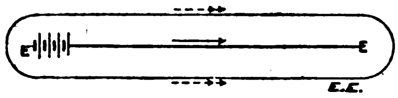

Fig. 5.

With open wires, however, leakage always takes place over the insulators; hence a much larger static charge is accumulated than with a perfectly insulated secondary, the above conditions are subject to variation, and an actual flow of current in each arm takes place, the direction of which is dependent on the distribution of the leakage, or the position of the resultant earths.

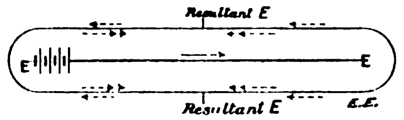

Fig. 5A.

The conditions which are necessary to obviate interference due to the above causes between two neighbouring circuits, one of them at least being a metallic loop, are the following. For practical purposes each circuit which has great length compared to its depth is considered to consist of two sides alone, the ends being neglible. (1) Each of the wires of one loop should maintain throughout the same or an average equal distance from each of the wires of all neighbouring loops; (2) the two conductors of each loop should be of the same material; (3) they should have the same conductivity; (4) each half of the circuit, including apparatus in direct circuit, should possess the same coefficient of self-induction; (5) they should have similar electrostatic capacities; (6) they should have the same degree of insulation, whether high or low; (7) the resultant faults due to loss of insulation should be in the centre of each wire of the loop, but if not there, each should occupy similar positions at equal distances electrically from the extremities.

The necessity for the above conditions is obvious when it is considered that the induction from all neighbouring wires causes constant variations of potential and local currents to circulate along each wire, which must not affect the telephones at either end. Thus, any difference in electromagnetic inertia, resistance, or capacity between the two arms of a circuit will cause currents to traverse the terminal telephones. With a symmetrical circuit these two telephones occupy absolutely neutral positions at opposite extremities of the circuit, and if each telephone be wound differentially and be perfectly balanced earth may be applied at the centre of each instrument without creating disturbance, whereas, if earth be applied at any other point in the circuit, even at the point where the line wire joins the telephone, the disturbance from neighbouring wires becomes at once marked. Again, any two points of equal potential in the circuit can be bridged without creating disturbance, which means that any number of telephones or indicators may be placed in multiple arc across the balanced wires without upsetting the balance.

Conditions 1 to 5 are readily met, and once attained they are stable. No. 6 is more difficult to ensure, for the insulation of either arm of a loop may at any time be lowered by innumerable accidental causes, so that the most careful attention to maintenance is necessary to remove this source of trouble. No. 7 is at times a source of considerable difficulty, especially in the case of telephone trunks erected on poles carrying high-speed Wheatstone wires when the latter are worked with shunted condensers. Thus, in Fig. 6, with the resultant earths at points 1, points 2, or at other symmetrical positions, the circuit is silent; but with positions 3 disturbance becomes evident, for the currents entering at these points traverse the telephones in establishing the electrostatic redistribution.

Normally, the currents due to electromagnetic induction would be more considerable than those arising from electrostatic

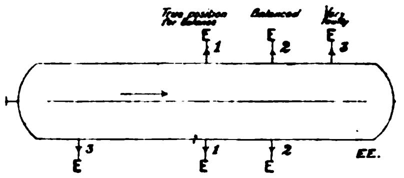

Fig. 6.

induction in a single-wire circuit with an earth return. Experiments made between Newport, Cardiff, Swansea, and Haverfordwest between ordinary parallel wires under certain conditions gave the ratio between the two as 9,096 : 306 at the battery end and 9,096 : 153 at the far end; and the disproportion would be still more marked in a loop. Notwithstanding these facts, it is far easier with open wires to balance magnetic than static disturbance, as the conditions necessary to ensure the former are more readily controlled. This is illustrated by a simple experiment with a high-speed transmitter working an ordinary telegraphic circuit, attached to the same poles as a balanced loop. With the telegraphic circuit to earth, in the usual manner at the far end, and a current of 30 or 40 milliamperes, the balanced loop may be practically silent. Add a shunted condenser, or disconnect the far end of the telegraph circuit, and disturbance may become most marked. The effect is much greater than would be accounted for by the mere fact that in the extreme case of the far end being disconnected the average

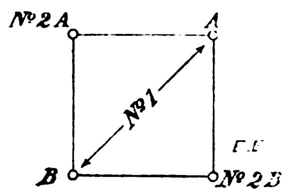

Fig. 7.

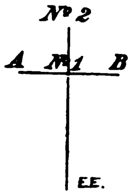

Fig. 8.

potential of the disturbing line is as a maximum doubled throughout. The fact is that when the primary circuit is disconnected, or a shunted condenser is fitted at the extremity, the rise and fall of potential is practically instantaneous, and the effect on the telephone circuit is at its maximum; whereas with the conditions for simple working the electromagnets of the receiving instrument cause a flattening of the current curve and the rise and fall of potential is too slow to injuriously affect the telephone.

The methods of construction of telephone trunk lines differ but slightly from those adopted in the erection of ordinary telegraph lines, the principal difference arising from the necessity for providing the balanced circuits referred to above.

Taking first the simple case of two contiguous metallic circuits, if they be arranged so that the two arms of each loop are at diagonally opposite angles of a square (Fig. 7), then the condition No. 1 is observed, and the circuits are balanced for distance whether the wires are run straight or whether they revolve; and in a similar manner a loop on a horizontal arm (Fig. 8) is balanced against a single wire on a saddle with an earth return, so long as the single wire is at the apex of an isoceles triangle of which the loop forms the base. With this exception, to obtain a balance between one loop and a second circuit external to it, whether metallic or with earth return, the wires of each loop must revolve uniformly the one round the other. In underground work this revolution is a uniform spiral, but with open work the wires simply change their positions regularly on each successive pole. In England the

Digitized by Google

method adopted is almost uniform, and it consists in continuous changes of position, every wire being moved transversely at an angle of 90deg. at each pole, so that a complete revolution is effected in every four spans. Other methods of crossing have been adopted on the Continent, but the above is perhaps the most simple way of achieving the end in view. In some cases the wires are run parallel and crosses introduced at intervals to obtain an approximate balance.

The present practice is to erect four wires on arms 48in. long, divided as shown in Fig. 9, the arms being fixed on the poles 12in. apart from centre to centre. Thus, two arms provide space for four metallic circuits, the four wires on each side of the pole forming a section of a 12in. square, the diagonal wires in these squares being taken up by each circuit.

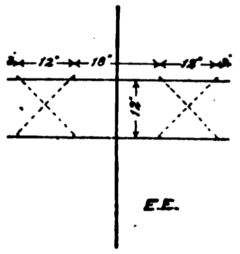

Fig. 9.

Of course, as previously pointed out, the two diagonal circuits in one square are perfectly balanced against one another, and therefore free from mutual disturbance, but in dealing with a large number of telephone loops, if the relative average distance between each of the two wires of any one circuit, say, in the right-hand square and those of the two wires forming each circuit in the left-hand square be measured, it will be found, when all wires have the same twist, either right or left handed, that the average distances between wires of the circuits, the diagonals of which are at right angles to one another, are equal, whilst those that are parallel are not. If one square has a right-hand and the other a left-hand twist, then the converse is true—viz., the circuits that are parallel at each pole are balanced, and those that are transverse are not. It is found in practice that disturbances that arise between neighbouring twisted circuits can be eliminated by crossing systematically. Thus, dealing with a number of circuits on one route, the four wires forming the first square may be revolved uniformly throughout. The next four have the A and B wires of each circuit crossed eight miles from the starting point, and at intervals of eight miles onwards. The third group have the first cross four miles from the former point, then the remainder of the crosses succeed at intervals of eight miles. The wires of Group 4 are crossed throughout at intervals of four miles. Those of Group 5 have the first cross two miles from the terminal, then the remainder of the crosses at four-mile intervals. Group 6 is crossed at intervals of two miles. It will be observed, on examination of Fig. 10, which illustrates the arrangement, that each circuit is balanced against all the neighbouring ones, and by this simple method it has been found possible to establish a series of wires absolutely free from overhearing.

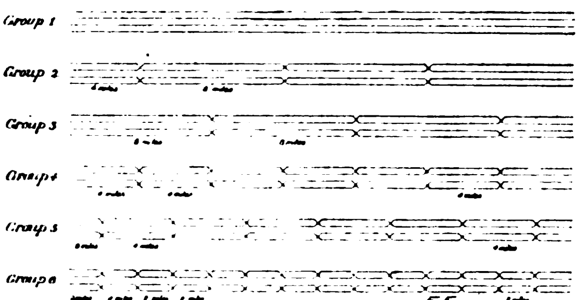

Fig. 10.

Hard-drawn copper wire is universally used for trunk lines. Its high conductivity, its freedom from electromagnetic inertia, its great strength, and its durability, fit it eminently for this class of work. The trunk lines erected by the Post Office vary in gauge from wires weighing 100lb. per mile to wires weighing as much as 800lb. per mile. The use of such heavy wire as the latter was a subject of much controversy when the present policy of the Department was decided upon, but the results obtained have fully justified the action taken by Mr. Preece. There is, of course, no doubt that with overhead wires pure and simple it would have been quite possible to speak from one end of Great Britain to the other with smaller wires than those actually used for the "backbone system," but many critics appear to have overlooked the fact that this system was designed with a view to provide for conversation through submarine cables and through city underground work between London, Belfast, Dublin, and the Continent on the one hand, and the great provincial business centres on the other.

The resistances and the inductive capacity of the various overground wires used in practice are as follows:

Lbs. per mile.	Resistance, standard ohms.	Capacity to E.	Capacity, wire to wire.
100	8·782	0·0144	0·00864
150	5·854	0·0147	0·00882
200	4·391	0·0150	0·00900
300	2·929	0·0153	0·00918
400	2·195	0·0156	0·00936
600	1·464	0·0158	0·00948
800	1·098	0·0160	0·00960

It will be observed that with the standard distances at which the wires of a loop are erected in this country the capacity, wire to wire, is 0·6 that of the wire to earth.

The use of underground wires for trunk lines was utterly impracticable so long as guttapercha, indiarubber, and other kindred materials only were available for insulating purposes. The introduction of what is practically an air-space cable by the use of paper insulation appears to offer the solution of a difficulty looming in the immediate future—namely, the finding of space for the numerous wires, both telegraphic and telephonic, which will be required between busy centres. Unfortunately, the need for two wires for each telephone circuit results in the rapid filling up of all aerial supports; and the undesirability of overcrowding poles with wires in a climate like ours, subject to snowstorm interruptions, is obvious.

(*To be continued.*)

MOTORCAR REGULATIONS.

The Local Government Board have, in accordance with the power given by the Locomotives on Highways Act of 1896, issued the following regulations. The regulations have been forwarded to all the county councils, sanitary authorities, urban district councils, and rural district councils throughout the United Kingdom. The document will be called "The Light Locomotives on Highways Order, 1896," and is dated November 9.

Article I.—In this order—The expression "carriage" includes a wagon, cart, or other vehicle. The expression "horse" includes a mule or other beast of draught or burden, and the expression "cattle" includes sheep. The expression "light locomotive" means a vehicle propelled by mechanical power which is under three tons in weight unladen, and is not used for the purpose of drawing more than one vehicle (such vehicle with its locomotive not exceeding in weight unladen four tons), and is so constructed that no smoke or visible vapour is emitted therefrom except from any temporary or accidental cause.

In calculating for the purposes of this order the weight of a vehicle unladen, the weight of any water, fuel, or accumulators used for the purpose of propulsion shall not be included.

Article II.—No person shall cause or permit a light locomotive to be used on any highway, or shall drive or have charge of a light locomotive when so used, unless the conditions hereinafter set forth shall be satisfied—namely:

1. The light locomotive, if it exceeds in weight unladen 5cwt., shall be capable of being so worked that it may travel either forwards or backwards.

2. The light locomotive shall not exceed 6½ft. in width, such width to be measured between its extreme projecting points.

3. The tyre of each wheel of the light locomotive shall be smooth and shall, where the same touches the ground, be flat and of the width following—namely: (*a*) if the weight of the light locomotive unladen exceeds 15cwt., but does not exceed one ton, not less than 2½in.; (*b*) if such weigh exceeds one ton, but does not exceed two tons, not less than 3in.; (*c*) if such weight exceeds two tons, not less than 4in.

Provided that where a pneumatic tyre, or other tyre of a soft and elastic material is used, the tyre may be round or curved, and there may be upon the same projections or bosses rising above the surface of the tyre if such projections or bosses are of the same material as that of the tyre itself, or of some other soft and elastic material. The width of the tyre shall, for the purpose of this proviso, mean the extreme width of the soft and elastic material on the rim of the wheel when not subject to pressure.

4. The light locomotive shall have two independent brakes in good working order, and of such efficiency that the application of either to such locomotive shall cause two of its wheels on the same axle to be so held that the wheels shall be effectually prevented from revolving, or shall have the same effect in stopping the light locomotive as if such wheels were so held.

Provided that in the case of a bicycle this regulation shall apply as if, instead of two wheels on the same axle, one wheel was therein referred to.

5. The light locomotive shall be so constructed as to admit of its being at all times under such control as not to cause undue interference with passenger or other traffic on any highway.

Digitized by Google

6. In the case of a light locomotive drawing or constructed to draw another vehicle, or constructed or used for the carriage of goods, the name of the owner, and the place of his abode or business, and in every such case, and in the case of every light locomotive weighing unladen one ton and a-half or upwards, the weight of the light locomotive unladen shall be painted in one or more straight lines upon some conspicuous part of the right or off-side of the light locomotive in large legible letters in white upon black or black upon white, not less than 1in. in height.

7. The light locomotive and all the fittings thereof shall be in such a condition as not to cause, or to be likely to cause, danger to any person on the light locomotive or on any highway.

8. There shall be in charge of the light locomotive when used on any highway a person competent to control and direct its use and movement.

9. The lamp to be carried attached to the light locomotive in pursuance of Section 2 of the Act shall be so constructed and placed as to exhibit during the period between one hour after sunset and one hour before sunrise, a white light visible within a reasonable distance in the direction towards which the light locomotive is proceeding or is intended to proceed, and to exhibit a red light so visible in the reverse direction. The lamp shall be placed on the extreme right or off-side of the light locomotive in such a position as to be free from all obstruction to the light.

Provided that this regulation shall not extend to any bicycle, tricycle, or other machine to which Section 85 of the Local Government Act, 1888, applies.

Article III.—No person shall cause or permit a light locomotive to be used on any highway for the purpose of drawing any vehicle, or shall drive or have charge of a light locomotive when used for such a purpose unless the conditions hereinafter set forth shall be satisfied—namely:

1. Regulations 2, 3, 5, and 7 of Article II. of this order shall apply as if the vehicle drawn by the light locomotive was therein referred to instead of the light locomotive itself, and Regulation 6 of the article shall apply as if such vehicle was a light locomotive constructed for the carriage of goods.

2. The vehicle drawn by the light locomotive, except where the light locomotive travels at a rate not exceeding four miles an hour, shall have a brake in good working order of such efficiency that its application to the vehicle shall cause two of the wheels of the vehicle on the same axle to be so held that the wheels shall be effectually prevented from revolving, or shall have the same effect in stopping the vehicle as if such wheels were so held.

3. The vehicle drawn by the light locomotive shall, when under the last preceding regulation a brake is required to be attached thereto, carry upon the vehicle a person competent to apply efficiently the brake. Provided that it shall not be necessary to comply with this regulation if the brakes upon the light locomotive by which the vehicle is drawn are so constructed and arranged that neither of such brakes can be used without bringing into action simultaneously the brake attached to the vehicle drawn, or if the brake of the vehicle drawn can be applied from the light locomotive independently of the brakes of the latter.

Article IV.—Every person driving or in charge of a light locomotive when used on any highway shall comply with the regulations hereinafter set forth—namely:

1. He shall not drive the light locomotive at any speed greater than is reasonable and proper having regard to the traffic on the highway, or so as to endanger the life or limb of any person, or to the common danger of passengers.

2. He shall not under any circumstances drive the light locomotive at a greater speed than 12 miles an hour. If the weight unladen of the light locomotive is 1½ tons and does not exceed two tons, he shall not drive the same at a greater speed than eight miles an hour, or if such weight exceeds two tons at a greater speed than five miles an hour.

Provided that whatever may be the weight of the light locomotive, if it is used on any highway to draw any vehicle, he shall not under any circumstances drive it at a greater speed than six miles an hour.

Provided also that this regulation shall only have effect during six months from the date of this order, and thereafter until we otherwise direct.

3. He shall not cause the light locomotive to travel backwards for a greater distance or time than may be requisite for purposes of safety.

4. He shall not negligently or wilfully cause any hurt or damage to any person, carriage, horse, or cattle, or to any goods conveyed in any carriage on any highway, or, when on the light locomotive, be in such a position that he cannot have control over the same, or quit the light locomotive without having taken due precautions against its being started in his absence, or allow the light locomotive or a vehicle drawn thereby to stand on such highway so as to cause any unnecessary obstruction thereof.

5. He shall when meeting any carriage, horse, or cattle keep the light locomotive on the left or near side of the road, and when passing any carriage, horse, or cattle proceeding in the same direction keep the light locomotive on the right or off side of the same.

6. He shall not negligently or wilfully prevent, hinder, or interrupt the free passage of any person, carriage, horse, or cattle on any highway, and shall keep the light locomotive and any vehicle drawn thereby on the left or near side of the road for the purpose of allowing such passage.

7. He shall whenever necessary, by sounding the bell or other instrument required by Section 3 of the Act, give audible and sufficient warning of the approach or position of the light locomotive.

8. He shall, on the request of any police-constable or of any person having charge of a restive horse, or on any such constable or person putting up his hand as a signal for that purpose, cause the light locomotive to stop and to remain stationary so long as may be reasonably necessary.

Article V.—If the light locomotive is one to which Regulation 6 of Article II. applies, and the particulars required by that regulation are not duly painted thereon, or if the light locomotive is one to which that regulation does not apply, the person driving or in charge thereof shall, on the request of any constable, or on the reasonable request of any other person, truly state his name and place of abode, and the name of the owner, and the place of his abode or business.

The following regulations as to the use of petroleum are also being issued conjointly with the above:

In promulgating the following regulations relating to the keeping, conveyance, and use of petroleum in connection with light locomotives, the Secretary of State for the Home Department desires to call public attention to the dangers that may arise from the careless use of those more volatile descriptions of petroleum to which these rules apply, being petroleum to which the Petroleum Act, 1871, applies, and commonly known as "mineral spirit." Not only is the vapour therefrom, which is given off at ordinary temperature, capable of being easily ignited, but also, when mixed with air, of forming an explosive mixture. Hence the necessity for strict precautions in dealing with and handling the same, and for the employment of thoroughly sound and properly closed vessels to contain the same, the importance of avoiding the use of naked lights in dangerous proximity to the same, or to any place where such petroleum may be kept, and generally of taking precautions to prevent contact of the highly-inflammable vapour of this very volatile liquid with any form of artificial light.

Regulations.

By virtue of the powers conferred on me by the fifth section of the Locomotives on Highways Act, 1896, I hereby make the following regulations for the keeping and use of petroleum for the purposes of light locomotives. Save as herein provided, the provisions of the Petroleum Acts shall apply to all petroleum kept or used or sold for the purposes of light locomotives.

In these regulations the expression "petroleum" shall mean the petroleum to which the Petroleum Act, 1871, applies, provided that when any petroleum other than that to which the Petroleum Act, 1871, applies, is on or in any light locomotive or is being conveyed or kept in any place on or in which there is also present any petroleum as above defined, the whole shall be deemed to be petroleum as above defined.

1. Petroleum shall not be kept, used, on conveyed, except in tanks or cases of metal so made and closed that no leakage, whether of liquid or vapour, can take place therefrom, and so substantially constructed as not to be liable, except under circumstances of gross negligence or extraordinary accident, to be broken or become defective or insecure in course of conveyance or use; and every air inlet in any such tank or case shall be at all times, except when the valve, if any, is required to be removed for immediate use or repair, protected by securely affixed wire gauze, the openings in which shall not be less in number than 400 to the square inch.

2. Every such tank or case shall be clearly stamped or securely labelled with a legible metallic or enamelled label with the words "mineral spirit, highly inflammable, for use with light locomotives."

3. The amount of petroleum to be in any one such tank or case at one time shall not exceed 20 gallons.

4. There shall not be at the same time on or in any one light locomotive more than two of such tanks as aforesaid.

5. Before repairs are done to any such tank or case that tank or case shall, as far as practicable, be cleaned by the removal of all petroleum and of all dangerous vapours derived from the same.

6. When petroleum for use in or in connection with any light locomotive is not being so used it shall be kept either in accordance with the provisions of the Petroleum Acts, or in such tanks or cases as aforesaid; provided that the amount of petroleum which may be so kept in tanks or cases as aforesaid shall not exceed the amount of petroleum which may be kept on or in any one light locomotive at the same time, and that the tanks or cases shall be kept in the open air or in some suitably ventilated place.

7. The filling or replenishing of a tank with petroleum shall not be carried on, nor shall the contents of any such tank be exposed by artificial light, except a light of such construction, position, or character as not to be liable to cause danger, and no artificial light shall be brought within dangerous proximity of the place where any tank containing petroleum is being kept.

8. In the case of all petroleum kept or conveyed for the purpose of or in connection with any light locomotive (*a*) all due precautions shall be taken for the prevention of accidents by fire or explosion, and for the prevention of unauthorised persons having access to any petroleum kept or conveyed, and to the vessels containing or intended to contain, or having actually contained the same; and (*b*) every person managing or employed on or in connection with any light locomotive shall abstain from every act whatever which tends to cause fire or explosion, and which is not reasonably necessary, and shall prevent any other person from committing such act.

9. These regulations shall come into operation on the 14th day of November, 1896, and be in force until further notice.

Whitehall, November 3, 1896. M. W. Ridley.

UNDERGROUND ELECTRIC EXPRESS.

The following is Sir Benjamin Baker's report on the proposed electric railway between the Mansion House Station and Earl's Court. It is a good augury that such an eminent engineer should advise the Metropolitan District Railway Company to adopt electric traction on the proposed new line. We trust that the difficulty arising over changing from steam locomotives to electric at Earl's Court will be got over by the employment of electric locomotives over the whole Metropolitan system.

2, Queen-square-place, Queen Anne's-mansions, Westminster, S.W., October 13, 1896.

District Railway (Electric Express).

Gentlemen,—In accordance with the instructions received by me at the Board meeting of the District Railway on September 29, I have carefully studied the question of constructing an electric express line under the existing District Railway, and now submit my report, plans, and estimates.

Description of Line.

At the Board meeting aforesaid it was considered essential that trains from Hammersmith, Putney, etc., should be able to run through by the express route to the City so that the necessity of passengers changing trains at Earl's Court might be avoided. This obviously involved a physical junction of the proposed railway with the existing rails of the District at some convenient point between Earl's Court and Gloucester-road Stations.

The proposed express line, therefore, as laid out by me after detailed consideration of all the conditions of the case, will commence by a junction with the main line of rails of the District Railway about midway between Earl's Court and Gloucester-road Stations, and, curving to the right, will run under the Cromwell-road for a distance of about 300 yards on a descending gradient of 1 in 42, when it will be at a sufficient depth to pass under the side wall of the covered way of the District Railway near to the west end of Gloucester-road Station, from whence it will continue to run under the District Railway to the terminus at the Mansion House.

Having been engaged personally on the construction of the District Railway, I have an intimate knowledge of the soil through which the electric line tunnels would have to be driven, and of the works of the District and other railways, sewers, and buildings over or near to the proposed line. After further detailed study, I confirm the opinion expressed at the Board that under proper engineering supervision and with experienced contractors the proposed works can be carried out without interference with the District Railway or risk of damage to any works or property in the neighbourhood. The tunnels throughout would be in perfectly solid and dry London clay, which is the most suitable soil for such works.

It is proposed that there should be one intermediate station between Earl's Court and the Mansion House at Charing Cross. At Earl's Court the existing platforms would be used by the electric railway passengers. At Charing Cross the platforms for the latter would be 63ft. below the present District Railway platforms, or 78ft. below street-level, and at the Mansion House the corresponding depths would be 71ft. and 95ft. respectively. Hydraulic lifts and stairs would be the means of communication between the platforms of the electric railway and District Railway at Charing Cross and Mansion House, and above that level the existing entrance and exit stairs, slightly modified, would be common to passengers by both lines.

At the most convenient intermediate point between Earl's Court and Charing Cross and between Charing Cross and Mansion House respectively, a 9ft. diameter iron shaft would be sunk to facilitate the construction of the tunnels in the first instance and to serve subsequently as block signal stations and as electric fan shafts for ventilating the new line.

In the working of the line the steam locomotives and electric locomotives would change places at or near Earl's Court Station, and the most convenient way of effecting this has involved a great deal of consideration and discussion. By a readjustment of the existing lines at Earl's Court, and a modification of the traffic arrangements, it would be possible to change engines at the Earl's Court platforms, but as this would indisputably involve some inconvenience and delay to the District traffic I have considered it necessary to provide an alternative, in which the existing arrangements at Earl's Court would be unaffected. This is attained by constructing the first 176 yards of line under the Cromwell-road as a brick-covered way of sufficient size to admit the shunting of a steam locomotive, so that the change of engines might take place clear of District lines. There is no difficulty in this from an engineering or traffic point of view. To meet Board of Trade requirements, as the change of engines would take place on a gradient, the ordinary air-brakes would be supplemented by a rack railway brake on the rear carriage of each train so that no running away could occur even if the air-brakes failed. As regards the time element, I doubt if there would be much difference between changing engines on the District lines at Earl's Court Station and on the electric line a little further east, as the extra stop would be compensated for by the increased facilities of exchange at the latter point and by the stop at Earl's Court being reduced, say, from $1\frac{1}{2}$ minute to 20 seconds. However, my plans and estimates provide for either alternative and the decision may be left for the future.

At Charing Cross the station tunnels have been placed on the east side of the South-Eastern Railway Charing Cross bridge so as to be well clear of the cylinder foundations of that structure. The necessary modifications of the existing stairs at this place are very small.

At Mansion House Station advantage could be taken of the carrying out of the necessary modifications for the electric railway to improve the existing arrangements of stairs.

No property would have to be acquired for any of the preceding works, but in certain places easements would have to be acquired independently of that which could be granted by the District Railway Company.

This question, though probably a small one as regards cost, is a very important one from a legal point of view, as there are many novel questions to be dealt with, and any serious error might imperil the Bill. If there be any intention to proceed with the matter, therefore, it would be desirable that the solicitors and parliamentary agents should consult with me as early as possible with regard to the necessary property plans and parliamentary notices. In some instances the District Railway has been built over and in others it has limited rights in the subsoil, so there may be considerable investigation required before the notices could be prepared.

It would be desirable also that a land surveyor should confer with me, as it will be necessary to schedule some five to ten acres of land for sidings and shops for the electric railway rolling-stock at some place adjoining the District Railway suburban lines. Land also will be required for the generating station as close to Earl's Court as possible.

In drafting the Bill it would be well to disarm opposition as far as possible by adopting practically the clauses as to the construction of the shield-driven iron tunnels inserted in the Central London Railway Act, and as regards the small length of brick tunnel in the Cromwell-road to insert a clause providing that the roadway shall not be broken up for the construction of the works to a greater extent at any one time than one-half the width of the roadway by a length of 100 yards.

Estimate.

In the statutory form of estimates for Parliament nothing is set forth for rolling-stock and plant, nor for professional charges, interest during construction, if authorised, and other expenses, the cost of which is assumed to be provided out of the borrowing powers of one-third of the capital.

I have prepared the estimate, therefore, in the present case in two sections, the first of which includes the items necessarily set forth in the parliamentary estimate, and the second those which in ordinary cases would be provided for out of the borrowing powers :

(1) *Cost of Railway Works and Land.*

Length of line, five miles, double.

Tunnelling and shafts	£745,440
Permanent way, etc.	29,500
Permanent way for sidings	1,360
Stations	25,000
Contingencies—10 per cent.	80,100
	881,400
Land and buildings, including easements, say	118,600
Total	£1,000,000

(2) *Cost of Electrical Installation, Rolling-Stock, etc.*

Electrical installation capable of working eight trains on the line at the same time if required. Rolling-stock, consisting of 10 full-powered electric locomotives, 80 long American-type carriages; also repairing shops and depôt for same, and hydraulic installation and lifts at stations	£264,000
Professional charges, parliamentary and other expenses, and interest during construction, say 15 per cent. ...	189,600
Total	£1,453,000

The preceding estimate, based upon actual surveys and detailed quantities, differs little from the rough estimate of £1,500,000, which I gave at the meeting on September 29 as the probable total cost of the proposed line and equipment.

On an estimate of £1,000,000 for works and land Parliament would, in the case of an electric railway, probably authorise a capital of £1,200,000, which, with the borrowing powers of one-third, would make a total available sum of £1,600,000.

I believe my estimate to be in all respects sufficient, but, as already stated, the sum of £118,600 for land, buildings, and easements requires verification by a competent land surveyor, as it is not based upon an actual valuation of any specific lands to be acquired for the generating station and for the repairing shops and depôt, but it is merely the round sum of £100,000 of my original rough estimate with an arbitrary addition to bring the parliamentary estimate up to even figures.

The triangular plot of land between the Gloucester-road curves would be an admirable site for generating station, but the District Railway Company, I fancy, holds that land under certain restrictions which might prevent its use for such a purpose.

This report is accompanied by small scale plans and sections of the railway. The enlarged plans can be seen, if desired, at my office.—I am, gentlemen, yours faithfully,

Benjamin Baker.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	4s. 11d.	9s. 9d.	19s. 6d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVII. of new series of "THE ELECTRICAL ENGINEER" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

MOTORCARS.

The restrictions which for years have hampered the development of self-propelled vehicles on the public roads are to be withdrawn to-morrow. The new regulations under the Light Locomotives on Highways Act containing the conditions of the freedom now given appear elsewhere in our present issue. It will be noticed at the first reading that the subject has been approached in a most broad-minded spirit, and that the Local Government Board have not harshly used their statutory powers. It is no slight task to dovetail the new requirements of the motorcar into the old regulations affecting the general vehicular traffic without experience as to what the new cars can do. Hence we note with approbation that the speed regulations are made to hold for the short period of six months. In the Act a maximum speed of fourteen miles an hour was mentioned, but the present regulations reduce this to twelve miles per hour. If, however, the weight of the light locomotive exceeds one and a half tons and is under two tons when unloaded, the maximum speed is reduced to eight miles an hour. For vehicles over this latter weight five miles an hour is to be the limit. A reduction in speed for heavy traffic and also for cars drawing a trailer is only fair in the interests of the public. These regulations can be made more stringent by the local authorities, but we trust these bodies will follow the advice of Sir Hugh Owen, and not use their powers until some experience has been obtained as to the working of the present general regulations. The rest of the conditions to be observed will doubtless be of interest to our readers. The question before us is as to which of the various sources of power will find most favour with the public. The chief competitors comprise electricity, steam, gas, and oil, and the comparison must not be made only from the standpoint of the owner of the self-propelling carriage. Taking first the danger to the general public. Here the use of oil or of compressed gas stand easily first. The risk of explosions elsewhere than in the cylinders cannot be wholly done away with, and that such risks are by no means small is shown by the regulations as to the use of petroleum drawn up by Sir M. W. Ridley. The danger from the use of steam is not appreciable, and with due precautions can be eliminated; while with self-contained cars the use of electricity carries with it absolutely no risk, either to the occupants of the carriage or to the general public. The next point is that of inconvenience to the public. No engineer has yet had the courage to discharge the products of combustion from a gas-engine at a low level in the public streets, and the smell in the engine-room soon gives him warning when the joints in the exhaust-pipes need attention, yet these gases, with both oil and gas driven cars, are to be discharged directly into the atmosphere under conditions really worse than apply with a stationary gas-engine. This will form a serious objection in the streets of a town, although in the country a single car may not vitiate the atmosphere appreciably. The steam carriage labours under somewhat similar disabilities to, perhaps, a smaller extent, while electricity again scores

Digitized by Google

heavily. The remaining point of comparison is that of the owner, who naturally considers first cost and cost of upkeep to be of no small importance after convenience, speed, and power to run long distances have been provided. The results of trials up to the present have been rather in favour of oil as a motive power from the owner's standpoint, but the true solution will only be found after more extended use. It behoves makers of accumulators to look carefully into the matter; the electrical engineers must also remember that careful design is needed both in the electrical parts and also in the mechanical gearing. The manufacturer of a commercially successful carriage propelled by electricity will find a large demand even at the present time. This demand will also grow as the freedom of the new Act becomes appreciated, and will further extend the scope of the electrical engineering profession. The Motorcar Club hold their first meet to-morrow, and will celebrate the occasion by a trip to Brighton by road. A representative gathering of self-propelled carriages is expected, and we notice that some half-dozen of these will be propelled electrically.

THE INSTITUTIONS.

The various engineering societies throughout the kingdom are now commencing their winter programmes. The Institution of Electrical Engineers held their opening meeting last evening, when a valuable paper by Mr. J. Gavey on telephone trunk lines was read and discussed. We trust that the Institution has a profitable session before it, and that the high tone of this paper will be kept up by those to follow. Practical papers dealing with practical questions are wanted, but not contributions advertising specialities, and we hope that matters of internal management of the Institution will not take such a large proportion of time as last year. The Northern Society have taken the lead as to date of commencement. Mr. J. S. Raworth's paper brings the Universal engine prominently into notice. Its designer has naturally a high opinion of its capabilities, but our readers must be careful in accepting some of his assumptions as to cost of upkeep and labour, which at present cannot be based on experience. The figures of economy are more firm, but even then a single trial needs confirmation, and trial-trip results are not reached in daily work.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

THE BLOCK SYSTEM.

Sir,—In accordance with the editorial note which appeared in your issue of October 30, I have pleasure in making some extracts from my collection of early official records relating to the block system, and forward the same as follows:

Mr. (afterwards Sir) William Fothergill Cooke and his coadjutor Wheatstone, immediately after having invented the "electric telegraph," saw its value as a means of regulating and controlling the working of railway trains, and as early as December, 1839, the records of the Great Western Railway Company prove that the inventors induced the directors to have the arrival and departure of their trains telegraphed from station to station between Paddington, West Drayton, and Hanwell, and instructions were given that if a second train should arrive at any telegraph station before the previous train was telegraphed as "arrived," it was to be stopped by the outdoor signals and detained until such telegraph message was received. This was to all intents and purposes the object and spirit of what we designate the "block system."

Messrs. Cooke and Wheatstone in the year 1841 introduced independent instruments for controlling the trains in order to show at a glance if the line was "clear" or "blocked." Upon left-hand top corner of the block instrument they printed the word "stop," and on the right-hand corner "go on." They also provided a brass pin in order to hold over the handle of the instrument and consequently the needle; they further added an electric bell to call attention.

The invention of the "block system" as used at the present day was therefore practically completed by Cooke and Wheatstone in 1841. In 1844 Cooke and Wheatstone put their block system into use between Norwich and Yarmouth, but the instruments instead of having the words "stop" and "go on" had "line clear" and "line blocked." The official records of the old Birmingham and Gloucester Railway Company prove that during the winter of 1843-4 an accident occurred upon the Lickey incline, and that upon the advice of Mr. James E. McConnell, the company's locomotive superintendent, block working was carried out by complete telegraph messages. The following extract from the book used to record these messages is interesting. Blackwell, for instance, telegraphed: "Bristol goods is approaching here." Bromsgrove replied: "Right; let her come." Before the goods train could have reached the foot of the incline Blackwell telegraphed: "The Bristol passenger is approaching"; to which Bromsgrove replied: "Keep her back, goods not here yet." But in a few more minutes a further reply was sent: "Right now; send her on."

When the Midland Railway Company opened their branch from Knighton Junction to Burton in August, 1849, the engineers, Robert Stephenson and Charles Liddell, considered that the incline $4\frac{1}{2}$ miles in length between Bagworth and Desford was so steep that it would not be safe to allow any train to start till the previous one was "clear," and they had the "electric three-wire block" put into force. At each end there was a bell upon the top of the block instrument and two dials, one for "up," the other for "down" trains, each dial having a needle. The official records of the Midland Company show that the code used was as follows:

To call attention	1 stroke of bell	—
Passenger train approaching here	2 strokes of bell	2 beats of needle to left.
Goods train, ditto	3 ,, ,,	3 ,, ,, ,,
The West Bridge train	4 ,, ,,	4 ,, ,, ,,

Upon a train leaving either Desford or Bagworth, the following signals were given:

To call attention	1 on bell ...	—
Passenger train leaving	6 ,, ...	6 on needle to right.
Goods ,, ,, ...	7 ,, ...	7 ,, ,,
West Bridge train ,, ...	8 ,, ...	8 ,, ,,

Upon arrival at either end the signal was given:

To call attention	1 on bell ...	—
Passenger train arrived	— ...	2 on needle to right.
Goods ,, ,, ...	— ...	3 ,, ,,
West Bridge train ,, ...	— ...	4 ,, ,,

The above-mentioned instruments and the same "code" were in use from 1849 to about 1863, when the Midland Company removed the instruments from the station-master's offices, and at the same time put in two of their "single-needle" instruments, and those are working at the same places now. The outdoor signals at Desford and Bagworth were always kept at "danger" except when lowered or turned off for a train to enter upon the incline, and no two trains were allowed to be in the same section at one time. Drivers were instructed to whistle when about half a mile from either Desford or Bagworth—thus, two whistles if a passenger train, three whistles if a goods train, four whistles if the West Bridge train, upon hearing which the first, or "be ready" signal, "train approaching here," was sent on the "block system."

The telegraph engineer of the South-Eastern Railway in

Digitized by Google

1851 carried out "block working" by means of a code of rings on the bell, and did not employ dial instruments.

The records of the London and North-Western Railway prove that in 1853 added a third position to the block instruments, and then had "line clear," "train on line," also "line blocked" when the needle was in the vertical position; the telegraph wires were brought down the posts so that in case of a breakdown of a train the driver or guard could run to a post and cut the wire and block either one or both lines as necessary. This improvement was introduced by Mr. Edwin Clark, and the late Sir George Findlay, in his interesting book, states that "Mr. Clark's apparatus took the form of what is known as the 'three-wire' block telegraph for double lines, and this form has held its own up to the present time."

In 1855 the South-Eastern Company's records show that they adopted a form of block instrument having a miniature semaphore signal with two arms instead of needles.

The above few extracts from my official notes prove that the "block system" as used to-day was invented considerably over 40 years ago, and that the claim of a person who says "he invented it in 1865" is perfectly absurd.—Yours, etc., CLEMENT E. STRETTON, C.E.

Saxe-Coburg House, Leicester, October 31, 1896.

SIR,—I very much regret that I am unable to supply exact information concerning the date of the introduction of the block system for the regulation of railway traffic, as requested by Mr. Stretton. I am afraid I have neglected any opportunities of acquiring such information, from being more interested in Omega than Alpha. What information I have, however, is very much at Mr. Stretton's service; he may already have it or not; that, however, I have no means of ascertaining.

I have not the slightest desire to moralise on this question, but it would appear to be one of a class which requires more rigorous definition than has yet been applied to the terms used in describing it. What is meant by "block system"? Is it the preservation of the space limit between successive trains, which is the fundamental object of all block and signalling apparatus, without reference to the means employed, or the degree of perfection attained by its use? If so, the block system may be said to have originated with the old tail disc and fire-grate. These appliances were imperfect no doubt, but they were a means by which a space limit might be preserved if noticed in time.

If the introduction of the block system was coincident with the division of the line, or any portion of it, into sections, with electrical means of communication between the ends, and the provision of persons at each end charged with the mutual control of the section, the instrument shown in your issue of July 3 was a block instrument, as will be seen by a reference to the code accompanying the illustration. I have no means of ascertaining when this instrument was first fixed, but a label on it reads: "24th February, 1862. From Shildon Tunnel, North End, to Mr. R. Brown, superintendent, Darlington"—when it was probably returned for repairs, as the instrument was in use at a later date to my own knowledge. (As this letter deals with history, may I here interpolate a question as to whether the instrument here referred to is not the first instance of the employment of an *induced* needle?)

In the issues of the *English Mechanic* of July 6 and 20, 1866, will be found Parts II. and III. of a series of articles entitled "Train Signalling in Theory and Practice," by Charles V. Walker, F.R.S., F.R.A.S. These articles are supplemented by footnotes "extracted from No. XV., Vol. IV., of the *Popular Science Review.*" In these articles Mr. Walker describes in most minute detail the system of bell signalling in use on the South-Eastern Railway, of which he was the electrical engineer. He there states: "The fundamental law is: 'Two trains or engines are not to be allowed to run on the *same* line between two signal stations at the *same* time.' In order to carry out this important regulation, upon which the security of those who travel so largely depends, 'every train or engine must be signalled *out* to the next station before it *leaves* or *passes* a station.' . . . 'The train or engine must not be started, or allowed to pass, until the next station has *taken* the *out* signal.' It is not enough for the first station to *give* the signal, the other station must *take* it, for 'no signal *given* by one station is complete until *taken* by the other station *repeating* it,' by which process a clear understanding is established between the two signallers that the precise signal *sent* by one is *received* by the other. The next rule applicable is that 'every train or engine that *arrives* at or *passes* a station is to be immediately signalled back *in* to the last station,' and it follows from what has been already stated that 'no second train or engine is to be allowed to follow until the *in* or *arrival* signal of the *previous* train has been taken'—that is to say, has been repeated back blow for blow." "And in order that there may be no mistake as to whether or not the whole of the train is safely in, it is not to be signalled *in* until 'after it has been clearly ascertained by actually *seeing the tail lamps*, or communication with the guards, that no portion of the train from any cause has been left behind." The italics are all Mr. Walker's The "out" signal corresponds with the present "train on line," and the "in" signal corresponds with the present "train cleared section" signal.

The extracts given above describe a complete block system by means of bell signals alone, and one which if strictly adhered to is as safe as any system in use at present. Mr. Walker, in the parts available, gives no direct date of introduction, but "on the day of the Foresters' *fête* (August 19, 1862) no less than 535 trains were signalled at one intermediate station in the London Bridge yard on one pair of bells . . ."

Again: "The simplest case of deviation from 'a general code' of signals is when the trains of two companies travel on the same lines, as the South-Eastern and the Brighton trains between London and Redhill. In this case one blow indicates a South-Eastern train, whether up or down; and two blows a Brighton train, all other signals remaining unchanged; or to take a case somewhat more complex and which is the oldest of the codes, *dating as far back as October 29, 1851*, and provided originally for up trains on the half mile of line intervening between Spa-road and the entrance to the joint station at London Bridge, one blow for a Croydon train, two for a Brighton train, three for a South-Eastern train." The italics in the last extract are mine.

These extracts indicate, I submit, that a most carefully thought out system of block working existed on the South-Eastern Railway in 1851.—Yours, etc., J. PIGG.

OPENING AT BURY.

The Bury electricity supply works, a description of which appeared in our issue of last week, were formally opened on Thursday, 5th inst., a large and representative gathering of townspeople being present to see the light switched on by the Mayoress (Mrs. J. Hall).

The MAYOR (Alderman Hall) conducted the proceedings, and, in declaring the station opened, referred to the delay which there had been in adopting electric lighting in Bury. It had been talked about for a great many years, but he thought those present would all agree that nothing had been lost by waiting, since the latest improvements had been embodied in both buildings and plant. The various apparatus with which the station was equipped was much more efficient than would have been the case a few years back. He had great pleasure in calling upon the chairman of the Electric Light Committee (Councillor Ashworth) to start the first engine.

The first engine was then started by Councillor Ashworth, and the second by the Mayor, cheers being raised as the machines were set in motion.

At this point Councillor ASHWORTH ascended the switchboard gallery and asked the Mayoress to switch on the light, at the same time expressing his hope that the electric light in Bury would prove a great success, and that the supply of the electric current for lighting and heating purposes would assist in bringing success to the business of the town. The Mayoress then switched on the light amidst prolonged cheering.

With a few appropriate remarks, Mr. ALEXANDER SIEMENS, the contractor for the plant, then presented the

Digitized by Google

Mayoress with a handsome statuette in bronze fitted with a graceful pendant electric lamp, and bearing the following inscription on a silver plate : "Presented to the Mayoress (Mrs. J. Hall) by Messrs. Siemens Bros. and Co. upon the occasion of her switching on the light at the opening of the municipal electric supply station, November 5, 1896."

The MAYORESS expressed her thanks to Messrs. Siemens for the handsome memento and to the Corporation for inviting her to perform the ceremony which it had been her pleasure to perform that afternoon.

Subsequently, Alderman Brierley presented Councillor Ashworth with a similar memento from the members of the Town Council in recognition of his services as chairman of the Electric Light Committee.

Councillor ASHWORTH said he hardly knew how to sufficiently express his thanks for the kind mark of appreciation bestowed upon him by the Council for his services in connection with the electric lighting undertaking, but the handsome statuette would always be highly prized by him.

Formal proceedings being then concluded, the guests were entertained by the Mayoress, an excellent programme of music being rendered by the Oxford Band while light refreshments were partaken of. Congratulations on the success of the opening were exchanged all round.

Subsequently, during the evening a banquet was held in the Town Hall, about 100 guests assembling. Councillor Ashworth (chairman of the Electric Light Committee) presided. An excellent repast was partaken; and after full justice had been done to this, and the usual loyal toasts duly honoured, Mr. A. SIEMENS rose to propose "Success to the Electricity Works." In doing so, he said he was confident of the success of the works which they had just completed. There were one or two things which it was necessary to observe if they would make their electricity works a success. In the first place, the works ought to be properly designed and constructed ; in the second place, they ought to be properly equipped ; and in the third place they ought to be properly carried on. He spoke also at some length as to the advantages which electric light offered over other artificial illuminants, and called attention to the unreliability of comparing the cost of the two rival illuminants—electricity and gas—respectively without taking facts other than the mere relative cost on paper into account. He coupled with the toast the name of Councillor Ashworth.

Councillor ASHWORTH briefly responded, thanking Mr. Siemens for the kind manner in which he had proposed the toast. He also thanked Mr. Siemens for the advice which he had given.

In a humorous speech Mr. CRAWFORD (Messrs. Belliss) proposed the toast of "The Engineers," coupling the toast with the names of Mr. Cartwright and Mr. Lacey, to whose abilities as engineers in their respective capacities he paid high tribute.

Mr. CARTWRIGHT, in responding, said that from observations he had made and the attention he had paid to the subject he was convinced that there were greater possibilities and probabilities for the uses of the electric current than had yet been brought before their notice. He had faith that there was a great deal to be obtained from the use of the electric current. He did not think there could be two opinions on the point as to whether or not the Corporation should have undertaken the work of electric supply or left it to a private company, because it had been proved that corporations which had allowed private companies to instal the electric light regretted now that they had done so.

Mr. LACEY also responded, remarking that electricity was a much more healthy light than gas. He also mentioned that machinery could be worked more economically by electricity than by steam, by adopting the separate motor system.

Mr. L. HOLMES, of Newcastle, gave the toast of "The Mayor and Corporation of Bury." He referred to his pleasant associations with the Bury Electric Light Committee in years past.

The MAYOR thanked Mr. Holmes for the manner in which he had proposed the toast. He believed that the electric light undertaking would pay sooner than many people thought, because they knew that as soon as one shopkeeper saw that by means of the electric light his neighbour's goods were shown off to better advantage he would want the electric light as well.

Dr. MELLOR proposed the toast of "The Chairman," which was responded to by Councillor ASHWORTH, who in concluding his remarks expressed the thanks of the Corporation to the Mayoress for switching on the light and for entertaining a large company that afternoon.

The proceedings, which we may add were happily relieved with songs and music, thereupon terminated.

CROYDON ELECTRICITY WORKS.

The inauguration of the electric supply at Croydon took place on the 6th inst., as was mentioned in our issue of that date. The chairman of the Electric Light Committee invited a representative company to witness the ceremony. The station was open for inspection at 7.30 p.m., the approach to it along Factory-lane being decorated by two paraffin lamps. These were sufficient to mark out the footpath, and made a great contrast with the lighting in and around the buildings. After the station outfit had been admired, the company gathered into the meter-room to hear a few short speeches.

The CHAIRMAN (Alderman Miller) said he was most pleased to welcome those present to the electric lighting works. He had been an advocate of the municipalisation of the electric light for many years, and felt proud to be able to ask the present Mayor to switch on the public supply that evening. Of the many important improvements in the borough completed under the Mayor's supervision, he considered the present venture to be by no means the least important. The opposition from the gas interests in Croydon had been keen, but he would console his opponents with the fact that healthy competition would improve rather than depreciate their property. He then called upon Prof. Kennedy to say a few words as to the method of working and the principles employed.

Prof. KENNEDY thought the five minutes allowed him to be rather short for a full description of the plant and the general theories of electricity. He was very glad indeed to be present at the opening of the works, the completion of which was a credit to all concerned. The preliminary running had been carried out without the slightest breakdown, which was greatly to the credit of Mr. A. Fell, the contractor's engineer. He then gave a short popular account of the actions going on in the alternators. With regard to the street-lighting, he considered that the Corporation were quite right in the plan they had followed. Well-lighted streets increased the prosperity of the town, and also that of the electric supply department, in more ways than one. The competition between the internal lighting of the shops and external lighting in the streets tended to increase the consumption of both electricity and gas ; also in some places the light entirely altered the character of the streets of an evening. Thus, in Edinburgh, certain streets had recently become fashionable promenades of an evening due to the new illuminant.

Alderman MILLER then called on the Mayor to declare the works open.

After a short speech from the MAYOR the Mayoress switched on a street-lighting circuit, in series with which was connected an arc lamp in the room. In order to actuate the switch a gold bracelet had to be pulled, which bracelet was presented to the Mayoress by the British Thomson-Houston Company in honour of the event.

The street-lighting was supplied for the time being from a Thomson-Houston arc-lighting dynamo, belt-driven from one of the alternator flywheels, but after this week it is expected that the Ferranti rectifiers will be ready to take over the load.

Two interesting features of the Croydon plant were not referred to in our last week's issue. The first is the fact that on light load the motor alternator, which is coupled to the direct-current dynamo for charging the accumulators, will be used to supply the idle current. The accumulator will then act as the source of power, and an economy in labour will thus be effected, as in the summer two shifts of men

Digitized by Google

can be saved. The other feature of general interest is the construction of the high-tension fuses used in the sub-station. These fuses, which can be seen in the illustration, consist of fine wire drawn into thin indiarubber tubing. The tubing used is similar to that employed for insulating wire in instrument connections. The number of these wires is, of course, varied with the current to be carried. It is found that this type of fuse will always break the circuit without damaging anything in the neighbourhood. As a rule, even the rubber tube is not ruptured.

ON CHEAP STEAM POWER.*

BY J. S. RAWORTH, MEMBER.

The main muscle of civilisation is the steam-engine. Steam supplies the power and man directs it. The price at which steam power can be supplied is the principal factor in determining at any moment the degree of domination which man may exercise over the world in which he lives. These are facts which, when they may be in danger of being forgotten by the general public, will still shine brightly in that atmosphere which I trust may at some not distant day be called the fair firmament of Manchester. When that day comes, as it undoubtedly will, when the mayor and Corporation having awoke to the knowledge that smoke and smuts no longer contaminate the air they breathe, and on the strength of that knowledge restore to the town hall the natural colour of its stone, you will enjoy the felicity of feeling that you, with your electricity, have been the main movers in that marvellous metamorphosis.

Considering the vital importance of this subject to the world generally, and to Great Britain in particular, it is somewhat strange that we have never been treated to a Royal Commission to enquire whether we engineers were really doing our level best to put this country in a position to obtain the highest possible return in power for the expenditure of its native treasures of coal and labour. The difficulties of determining in any particular case the conditions of maximum efficiency have, however, been so great, owing principally to the preponderating influence of local circumstances and to the great difficulty of making accurate tests, especially with small engines, that one cannot imagine even a Royal Commission coming through such an enquiry with much *eclât*. It may appear to the builders of large engines, such as are used in Manchester and Bolton, that the problem is not so seriously complicated after all, and it may be admitted that their section of the problem is fairly simple—the conditions being practically alike in all cases. But there are more small engines than large ones, and it is highly probable that in aggregate power the small engines far exceed the large ones. Large engines have had expended upon them much skill and ingenuity, and in consequence have attained a high degree of excellence, but small engines, until electricity came on the stage, were like gutter children—neither understood nor cared for, and yet they take more than their share of the coal-bill of the country.

The cost of steam power is made up of several main elements, which may be stated as follows: (*a*) coal per horse-power hour; (*b*) labour per annum; (*c*) maintenance—oil, stores, ordinary repairs, etc.; (*d*) interest on capital; (*e*) depreciation (amortisation); (*f*) direct and consequential cost of breakdown. It is obvious that the last item (*f*) cannot be expressed in figures, but it is nevertheless a serious and important one, and the items (*d*) and (*e*) are often inflated in the hope of diminishing it. Water is not included, as it is commonly obtained free, or at a very small cost. These five principal items of expenditure, although stated separately, are to some extent inter-dependent. (*d*) and (*e*) Interest and depreciation being fixed charges on capital may be bracketed together at 10 per cent. on total prime cost of engines, boilers, land, and buildings. (*a*) Coal usually grows less as (*d*) and (*e*) increase, but not in any well defined ratio. (*c*) Maintenance, on the other hand, has a tendency to increase with refinement and elaboration in detail.

The relative importance of the several items depends entirely on the amount of power developed per annum—in short, on the load-factor. The variations which occur in practice are so great that it must suffice to take two well-known cases: (1) cotton-mill engine working 2,700 hours per annum at 90 per cent. of full power; (2) electric light engines working at full power 500 hours per annum. The first instance gives us a load-factor of

$$\frac{2{,}700}{8{,}760} \times \frac{90}{100} = 27{\cdot}7 \text{ per cent.}$$

The second gives us a load-factor of

$$\frac{500}{8{,}760} = 5{\cdot}7 \text{ per cent.}$$

Both at first sight appear ridiculously small, but it is doubtful whether a much larger load-factor than that of the cotton-mill example is ever obtained, except in the isolated cases of some factories which work night and day, and occasionally with pumping engine. The figures for the two examples work out as below.

EXAMPLE No. 1.—Cotton Mill—1,000 h.p. Corliss.

Total capital expenditure = £10,000.

		Total cost.		Cost per I.H P. hour.
(*a*)	Coal at 2lb. per I.H.P. and 10s. per ton	£1,084	......	·105d.
(*b*)	Labour	243	......	·024d.
(*c*)	Maintenance	250	......	·025d.
(*d*) (*e*)	10 per cent. on £10,000	1,000	......	·100d.
		£2,577	......	·254d.

Even in this case the capital charge is about equal to the coal and labour combined.

EXAMPLE No. 2.—Electric—1,000-h.p. Corliss.

Total capital expenditure on steam power only = £16,000.

The increased cost over example No. 1 is due to the subdivision of power and increase in size of buildings.

		Total cost.		Cost per I.H.P. hour.
(*a*)	Coal at 4lb. per I.H.P. and 10s. ton	£445	......	·215d.
(*b*)	Labour	475	......	·225d.
(*c*)	Maintenance	500	......	·24d.
(*d*) (*e*)	10 per cent. on £16,000	1,600	......	·76d.
		£3,020		1·44d.

The basis of the calculations are assumed to be as nearly alike as practicable—that is to say, the engine, boilers, buildings, and coal are taken to be similar in efficiency, style, and relative cost. In the second example the horse-power hour costs six times the sum that it costs in a cotton mill, and the item of capital charge is multiplied by 7½. Moreover, the charge for capital exceeds all the other items by 13 per cent. The most striking feature of these two examples is the item of coal; in a cotton mill it is the predominating factor of cost, but in an electric lighting station it only stands at 14·7 per cent. of the total charges. At first sight, therefore, anyone might think that, although economy in coal may be desirable in a cotton mill, it is of little importance in an electrical lighting station; but this is not so. Mr. Crompton, in one of his always excellent papers, read in April, 1894, before the Institution of Electrical Engineers, said: "I agree with Prof. Kennedy that the importance of the cost of fuel used on electrical energy supply works is not to be measured merely by the money spent on the fuel itself, but that it is to a certain extent a measure of the quantity of plant that must be employed, and so affects the cost of upkeep of the plant, and to some extent every cost item except, perhaps, management and profit." I am prepared to go a step further, and to say that it affects those items also. In other words, an increase in the coal bill means an increase in boilers, pumps, pipes, economisers, flues, and labour; the only item which is not increased is the cost of the engine itself, for no doubt can be entertained that a wasteful engine does not cost more than an economical one: it usually costs less.

We now come to the practical question, Can the cost of steam power be reduced; and if so, how? The papers read before this society during the last session, and the discussions thereon, demonstrated most clearly that your members have a firm grasp of the subject, and consequently that it would be sheer waste of time to bring this most important question before the society without attempting to provide an answer which may at least enable you to realise in some practical and tangible form the aspiration of all engineers and manufacturers after cheap steam power. This is the object of the paper. The two examples given above are intended to be as nearly as possible typical of two power plants working with similar engines under widely dissimilar conditions. We now proceed to enquire what improvements are possible and how those improvements can be effected. Considering the fact that at present the capital charges amount to about one-half of the total cost of steam power, it is obvious that economy in coal obtained by means of increased capital outlay is not likely to have much beneficial effect. That this factor in the equation is fully understood in Lancashire is shown by the statement of Messrs. Hick, Hargreaves, and Co., whose opinions naturally and very properly carry great weight: "That in the majority of cases the saving of fuel to be gained by the use of even triple-expansion engines would not balance the accompanying disadvantages, such as extra first cost, greater complication, and consequent risk of breakdowns." With this opinion before us, which is in absolute conformity with the teaching of the two examples quoted, it may be assumed that the improvement aimed at must be gained by a diminution either of all the items of cost or at least of some without increase of the others. It may also be observed that with regard to our indefinable item (*f*) Messrs. Hick, Hargreaves, and Co. consider that the risk of breakdown increases with complication.

* Paper read before the Northern Society of Electrical Engineers, November 10, 1896.

At this point it is necessary to consider exactly how much power can be obtained from a given quantity of steam—we might even go further and say "from a given quantity of coal," but that would open up a field far too wide for one evening's work. Record figures are useful as a basis of comparison, and although they may not ordinarily be realised in practice, they stimulate mental activity and tend to improve results all round. Whenever an existing record is surpassed, we may conclude that the engine tested possesses all the good points of its predecessors, and at least one special one of its own, and if we can succeed in defining the exact nature of that special improvement, then we may conclude that engineering science has advanced at least one step. The standards of steam consumption per indicated horse-power, as they are generally understood to-day, are as below, subject, of course, to those corrections which the varied and highly critical knowledge of the subject possessed by members of the society will naturally suggest:

	Con-densing.	Non-condensing.
(a) Vertical compound moderate speed	18·5	24·5
(b) Ditto, high speed	17·0	22·0
(c) Vertical Corliss slow speed	15·5	21·0
(d) Horizontal Corliss	14·5	20·5
(c) Triple Corliss	12·5	—

This list of five different types comprises examples of the principal style of engines now in general use; it may be fairly stated of them that as they increase in economy they increase also in cost—the apparent economy is not all real, because, speaking generally and without regard to any particular case, the mechanical efficiency falls off as the thermal efficiency rises. Unfortunately the exact efficiency of large engines is very difficult to determine, but from the available data it may be taken that the best examples do not surpass 92 per cent., and the worst do not fall below 86 per cent.

The increase of cost with increase of economy is by no means regular, neither is it as great as might be expected, having regard to the engine alone; the Corliss engine is, for its size and weight, a cheap engine to build, and if the flywheel be left out of the calculation it is probably no more costly than its smaller and quicker competitors. In this it resembles man's first and fastest friend—my lady fair—who costs little and eats less but wears all she can get. Flywheels, foundations, and fancy framing, all very expensive, go to swell the cost of installing a Corliss engine. It will be noticed that the Corliss engine, in its several forms, leads the list in economy of steam, and although several fitful attempts have been made by its rivals to equal its performance, they do not succeed in carrying off the palm of its well-earned popularity. The Corliss engine in this country dates from the year 1863, and half a page of its history is necessary to show why it came and why it stayed. Prior to its advent, mill engines, and indeed all engines, so far as they were governed at all, were governed by the Watt governor and throttle valve, which gives but poor results mechanically, and with single-expansion engines is a particularly wasteful arrangement. There did not exist at that date a single form of automatic expansion gear suitable for large engines; the millowner had therefore no option but to adopt throttle governing, which was both bad and wasteful—so when the Corliss engine arrived, with its excellent facilities for perfect governing and automatic expansion, it soon became first favourite—it had absolutely no rival worthy of consideration. Increasing boiler pressure only tended to emphasise the peculiar advantages of its admirable valve gear. It is very curious to note that while the real virtues of the Corliss engine are little spoken of, there is no end of admiration foolishly wasted on the peculiarly regular and square-cornered diagrams which it produces, but facts have dispelled this illusion. Engines with no diagrams at all, so to speak, have run it very close, and even the common throttle-valve beats it at low loads. Under these circumstances one must look further and deeper for the cause of its exceptional economy. These causes, I believe, may be summed up under the two heads of small clearance and good drainage. The loss from clearance is a very serious one to engines fitted with piston-valves, especially when the stroke is short. The clearance may easily be as much as 15 per cent. of the volume swept by the piston. Happily the pure clearance loss is definite, and may easily be calculated, but there is an indefinite loss connected with it which cannot be so readily summed up—that is, the initial condensation due to increase of exposed surface, of the worst kind, moreover, for it is swept alternately by the live and exhaust steam.

The Corliss valve reduces the clearance very considerably, so much so that it is possible in long-stroke engines to reduce clearance to about 3 per cent. In the matter of drainage the Corliss engine also maintains its superiority. A vertical engine with piston or slide valves has no natural drainage, and if it were run very slowly would fill up with water, and under any conditions of speed there must always be some water present. Any water carried up by the piston on the up-stroke will be delivered into the exhaust-port and retained by compression until it is met by the high-pressure steam, when it will be blown back into the cylinder. This defect exists also, but to a smaller degree, in a vertical Corliss engine, and prevents it achieving the same degree of economy as the horizontal pattern, in which the exhaust-valves at both ends of the cylinder are placed at the lowest points. In these engines the exhaust-valve has a considerable capacity, and any large volume of water coming over with the steam will be swept into it and discharged at the next stroke, instead of being blown back into the cylinder.

With all these advantages in favour of the horizontal Corliss engine, advantages which are costly in price of engine, buildings, and foundations, how can it be possible for any other type of engine to reduce the total cost of steam power? In the first place, I should remark at electric lighting stations working under peculiar conditions, very uneconomical engines, if cheap and small, will probably be more economical on the whole than the highest class of Corliss engine, provided that one engine and dynamo of a size suited to the day load shall have the highest known efficiency, thermal and electrical. That particular set of plant may work 18 hours out of the 24, and will repay any reasonable expenditure of capital on its construction, but the full load plant works such a short time per diem that economy in first cost, including boilers, becomes the first consideration. These facts are so fully appreciated by members of this society that I should not have dared to trespass on their time by reciting them but for the absolute necessity of making a paper of this kind logical and coherent. To indulge in aspirations after better things may be evidence of a devout mind, but unless some way be made evident by which those better things may be attained the result is not likely to be immediately beneficial to the human race. The members of this society are fully aware that an idea which has quite lately appeared on the face of this globe for a novel method of constructing a steam-engine has selected one of your members as the medium of its incarnation, and as that idea has received the unqualified approval of many leading lights of the engineering profession, I need not apologise for taking this opportunity of endeavouring to show how that idea may be utilised to hasten the attainment of some of the objects described in this paper.

The construction of the Universal engine is now so generally understood that I need not occupy any time in describing it, more particularly as it is only one part—namely, the leading idea as embodied in its steam cycle and the means employed in effecting it—that has any particular bearing on our subject this evening. The construction of the cylinders, pistons, and valves is applicable to all classes of engines, whether long stroke or short stroke, vertical or horizontal, the modification necessary for a horizontal engine being quite simple. Comparing the arrangement of valves and cylinders with that of the Corliss engine, as being the acknowledged best existing, we find: (a) the clearance can easily be made less for a given length of stroke; (b) the surface exposed to inital steam pressure is also less; (c) the drainage is obviously better in both cylinders and in the receiver; (d) the valves are entirely embedded in or between the cylinders, thus reducing loss by radiation. These palpable facts all point to an increase of economy; how great it is difficult to say; the margin between the actual Corliss compound using 14½lb. of steam per indicated horse-power and the theoretical engine working under similar conditions is about 6lb., or 41½ per cent. There is therefore most obviously plenty of room for improvement.

As regards actual facts derived from careful tests of the Universal engine, there are at present only a limited number, but they have been taken from exceedingly small engines. The published figures were obtained from an engine having a 14½in. high-pressure cylinder by 6in. stroke; the consumption at 45 h.p., with 140lb. boiler pressure, was 19·8lb. per indicated horse-power. After the trial the high-pressure clearance was found to be excessive, and the piston was lowered ⅜in., which reduced the consumption to 19·3. This diminution of clearance did not alter the area of exposed surfaces. I believe, subject of course to correction, that this figure of 19·3 is a record figure for any size of engine, and it may certainly be expected to improve in larger engines and under more favourable conditions, for during the test we had 88ft. of steam-pipe in circuit, of which 44ft. were unclothed. The theoretical consumption for the conditions of the trial is 16¼lb., leaving a margin of only 16 per cent. This, however, must not be directly and rigorously compared with the 41½ per cent. mentioned above, as it is well known that non-condensing engines can more easily get a higher percentage of their theoretical possibility than condensing engines. It is unfortunately extremely difficult to find examples of the steam consumption of first-class engines, except Willans's working non-condensing; in fact, the only one I have been able to find is Mr. Hammond's test at the Leeds station of a Corliss engine by Messrs. Hick, Hargreaves, and Co. The indicated horse-power was 405, and the steam used per indicated horse-power 20·31lb. The theoretical consumption was probably about 16¼lb. It is worthy of remark that the consumption obtained in this trial coincides as nearly as possible with Willans's results under apparently similar conditions. The above-mentioned results obtained with a very diminutive Universal engine, com-

Digitized by Google

bined with the structural advantages described, under the heads *a*, *b*, *c*, and *d*, above all tending to increase economy do, I believe, justify the expectation that this steam cycle, and the means whereby it is obtained, will, when applied to large engines, effect a very considerable saving of steam.

It now remains for us to consider whether the cost will be increased or diminished. I say unreservedly "diminished." Assume for one moment that the cylinders be applied to any existing design of compound Corliss engine. The first result is to reduce the number of valves from eight to four, and of valve-boxes from four to two. The high-pressure cylinder and piston cost no more than the present tail rod and guide, and at the same time the cost of the low-pressure piston and cylinder is reduced, whilst lagging, cylinder cocks, and other trimmings come down from pounds to shillings. This is the least effective case; all we can say for it is that it will be in some degree both better and cheaper. Now take the triple-expansion engine, in which there is an acknowledged saving in steam of about 12 per cent. at similar pressures. This, however, in a Corliss engine involves four cylinders, eight valve-boxes, and 16 valves, with other gear to match—but with the Universal cycle there are still only two valve-boxes and four valves—in fact, the triple engine is distinctly more simple in construction than the two-crank compound, and can be made for the same price. The saving in the cost of a triple-expansion engine would, therefore, obviously be very considerable. There is yet one step more: shorten the stroke and make the engine vertical—that is, if you like; if you don't like, don't; rest satisfied with the advantages aforesaid. But there are further advantages to be gained by short stroke and vertical position: first, no loss of economy as heretofore; second, no unequal wear of cylinder; third, perfect lubrication by simple means; fourth, increased mechanical efficiency; fifth, reduced cost of engine; sixth, reduced cost of foundations and buildings; seventh, greater facility of repair; eighth, reduced cost of flywheel and gearing. Every item of cost reduced, and with a possible, or rather probable, saving of steam with a triple engine, a certain saving.

Now we turn to our original tables of costs and substitute the following figures, which I leave to your intelligent criticism.

EXAMPLE No. 1.—Cotton Mill—1,000-h.p. Universal.
Total capital expenditure, £7,000.

(*a*) Coal at 1¾lb. per I.H P. and 10s. per ton	£950
(*b*) Labour	225
(*c*) Maintenance	150
(*d*) 10 per cent. on £7,000	700
(*e*)	£2,025

0·2d. per H.P. hour, saving 20 per cent. = £552.

EXAMPLE No. 2.—Electric—1,000-h.p. Universal.
Total capital expenditure on steam power only £10,000.

(*a*) Coal at 3lb. per I.H.P. and 10s. per ton	£334
(*b*) Labour	250
(*c*) Maintenance	300
(*d*) 10 per cent. on £10,000	1,000
	£1,884

0·9d. per H.P. hour, saving 37½ per cent = £1,136.

Having now dealt with the cost of steam power in two well-defined cases, both being on a comparatively large scale, it is desirable to revert for a few moments to the statement made in the opening of the paper—namely, that there are more small engines than large ones, and that they take more than their share of the coal bill of the country. My opinion is that any measure of reform in steam practice to be in any sense universal in its operaton must be applicable to small engines as well as large ones. Last year Mr. Lindley said on this subject: "It would not have been difficult to make small copies of the slow-speed mill engine." This statement may be perfectly true in the abstract, but the practical difficulties surrounding it are commercially prohibitive. The fact remains that all small steam-engines at present in use up to about 50 h.p. are decidedly wasteful, and from that power up to 100 h.p. they are much less economical than the Lancashire mill engine. The Willans engine is an exception to the general rule, but sundry considerations have militated against its general adoption for ordinary industrial purposes. Take the case of a 40-h.p. engine driving a mechanics' shop, with, say, a 12in. cylinder by 20in. stroke running at 120 revolutions, or with a 10in. stroke at 240 revolutions. With an average load of 25 h.p. the steam consumption per horse-power is usually at least 50lb. per horse-power hour.

It is not possible to arrive at the total cost of power with anything approaching the accuracy of the former instances, but it may be approximately estimated as follows:

EXAMPLE No. 3.—40-h.p. Engine.
Average load, 25 h.p., 54 hours per week.

Load factor.—$\frac{2,808}{8,760} \times \frac{25}{40} = 19{\cdot}2$ per cent. H.P. hours = 70,200.

Total capital expenditure, £400.

(*a*)	Coal, 7lb. per I.H.P. and 10s. a ton	£110	0	0
(*b*)	Labour, at 26s.	67	10	0
(*c*)	Maintenance	30	0	0
(*d*) (*e*)	10 per cent. on £400	40	0	0
	= 0 84 per H.P. hour.	£247	10	0

Assume now that a similar installation be made with an engine of the Universal type. The only saving in prime cost would be in the boiler, which would be reduced to half the size of the former.

40-H.P. UNIVERSAL.
Total capital expenditure, £360. H.P. hours, 70,200.

(*a*)	Coal at 3lb. I H P. and 10s. a ton	£47	5	0
(*b*)	Labour	67	10	0
(*c*)	Maintenance	20	0	0
(*d*) (*e*)	10 per cent. on £360	36	0	0
	= 0 58d. per H.P. hour = £76 15s.	£170	15	0

It will be noticed that the sum saved, though only a small fraction of a million, is enough to maintain one working-man and his family, or, from another point of view, it is equal to the interest on £2,800 of consols. From another point of view the saving alone would pay for the whole installation in 4½ years.

APPLIED ELECTRO-CHEMISTRY.*

BY JAMES SWINBURNE.

LECTURE IV.

(Concluded from page 496.)

On the other hand, the distribution of acetylene may well be much more simple in proportion than that of coal gas. If it is to be delivered by pipes, its only advantage, as far as distribution is concerned, is that the pipes will be smaller. This would make but little difference in the total cost of distribution, as it only reduces the capital sunk in mains a little. The cost of laying them would not be very much reduced.

The first thing is to get some idea of the cost of calcuim carbide. The estimates given vary enormously, as very little has been published as to actual cost of manufacture. It seems probable, however, that the cost of manufacture—that is to say, the cost of lime, coke, carbons, labour, and energy—taking energy at a ¼d. per kilowatt-hour, will be a little over £6. If water is used, the price comes out a little lower; but, as already explained, water power must not be reckoned upon too much, as rents will probably go up soon. It is best to be on the safe side, so we may perhaps take £10 a ton as the final price of electrically-made calcium carbide, capable of giving five cubic feet of acetylene per pound, packed and delivered on rail, after paying manufacturers' profits and all charges. This seems a low price, and it may be said that the various aluminium works have all the plant ready, and know exactly the cost of manufacture, and have reduced the price as far as it will go already. The business has really hardly commenced, however, and there is little doubt that the processes will be cheapened. At present it is the roughest and crudest method imaginable.

Let us assume the final price to be £10 a ton, and see exactly what its future may be at that figure. Allowing five cubic feet of acetylene per pound, this gives, in round numbers, 18s. per 1,000 cubic feet. Calcium carbide is not acetylene, however. Suppose the treatment with water raises the acetylene to 20s., and that it gives 20 times as much light as coal gas, it would then correspond with gas at 1s. per 1,000 cubic feet. Now let us look at the price of gas. A ton of coal at, say, 10s. gives 10,000 cubic feet of gas; so gas should be 1s. per 1,000 cubic feet. But the ton of coal gives 15cwt. or so of gas coke, which is worth something, and over 100lb. of tar, which is valuable, and 20 gallons or so of ammonia liquor. Some of the 15cwt. of coke is used to heat the retort benches, and labour, etc., has to be paid for, but still the actual value of gas at the hydraulic main is really only a few pence per 1,000 cubic feet, and acetylene has no chance in comparison. The common practice of taking the price—generally the prime cost—of carbide of calcium, reckoning from it the price of acetylene, and comparing it with the price of delivered coal gas is absurd. In addition, the great difference in lighting power comes in when the acetylene burner, though using little gas, is giving a very powerful light. Except in sitting-rooms, people want small lights about their houses, and they want to be able to turn them down at will.

Acetylene may be used for enriching coal gas. Whether it will pay depends very much on the local conditions. Cannel coal is usually employed when enrichment is necessary. The prime cost of gas at any works depends on the price of coal and

* Cantor lectures delivered before the Society of Arts.

Digitized by Google

labour, and on the selling price of coke, tar, and ammonia. The cost of scrubbing and purifying would have to be incurred in making acetylene on the large scale, and the cost of distribution by pipes and collection would be about the same in both cases. It is impossible, however, to give any answer as to whether it would pay to enrich coal gas, unless one knows the real cost price of gas in a given case. Thus, to take a rough example, suppose crude gas costs 6d. per 1,000 cubic feet; so that acetylene costs 40 times as much. Adding 3 per cent. of acetylene would about double its lighting power, so that to replace 1,000 cubic feet of gas we would have 500 cubic feet costing 3d., and 15 of acetylene costing over 3½d. It is therefore clear that it will not pay to enrich with 3 per cent of acetylene at these prices. I have not worked out figures to find the best enrichment for each relation of values of acetylene and coal gas, for it seems clear that unless the cost of carbide is much less, or the cost of crude gas much greater than here assumed, there is no chance of its being utilised in that way. A public company does not make improvements if it can help it, and of all public companies gas companies, owing to their constitution and the sliding scale arrangement, are least likely to adopt such methods as enriching gas, even with the by-products of electric lighting companies, who make carbide to get decent load-factors.

In addition to this, gas is not only used for lighting. It is very largely used now for heating purposes, and the incandescent mantle has come to stay, and people with stoves and Welsbach burners would strongly object to having their gas bills doubled and their gas contaminated with a body which necessitates their renewing all their gas fittings and removing all copper and brass taps and couplings.

It does not look, therefore, as if acetylene will compete with gas at present. It may be a different matter in other countries. In the United States, for instance, gas is generally very dear. I had charge of a works in Boston some years ago, and we paid 10s. per 1,000 for gas. One shudders to think what it must cost in outlying districts. The enormous strides made by the electric light in America is not owing to the good electrical engineers, but to the bad gas producers. Perhaps the gas-works are run by the urban authorities; this would account for anything. If sulphate of ammonia does not fetch good prices in America, and if tar distilling and the manufacture of dyes are not brought to the perfection they are in Europe, it is quite probable that acetylene has a much greater future there than over here, especially as in proportion to the inhabitants water power is much more plentiful so that power prices may remain low for a very long time.

The next scheme is to deliver calcium carbide to houses, and let the consumers make their own acetylene. All that is needed is to add water. This sounds very simple. In the beginning of the century gas was to be made on the spot in the same sort of way. All you did was to put coal in a retort and heat it, and off came the gas. Yet this was never practised, except in special cases, and gas never came into use generally until it was distributed by pipes ready for use. There are, of course a few country houses and isolated establishments where they make a fluid they call illuminating gas. Exactly the same thing happened with the electric light. Each house was to have a gas-engine and a dynamo, and generate its own power. Then the next idea was that the accumulators were to be left at the houses with the milk, and changed next day or week or month; but this never came into practice either. These two schemes correspond very fairly with those of distributing carbide for use in generators, and distributing liquid acetylene in bottles. The generators would always be troublesome in an ordinary house. No doubt the light would be much cheaper and better than that of gas, as commonly used, but that is by no means everything. People forget that the average households are controlled by women. Women may understand people, but they are completely wanting in the faculty of understanding things, and they have the unreasoning conservatism and conventionality belonging to the undeveloped mind as seen in boys and savages. A woman hates everything new, and would never understand how to work an acetylene generator until it had been in use for generations, and it was considered part of the duty of a good housekeeper to make good acetylene, as it used to be to make good beer. Of course, even then, it would be done by rule of thumb. There is more than this. The first thing a woman asks when she sees anything new, be it a mousetrap or a telephone, is, "Will it explode?" Now, no one can say on his honour that an acetylene generator won't explode. He does not think it will—in fact, he feels sure it won't, and he sincerely hopes it won't; but an explosion might possibly occur. This settles the matter. The only thing to be done would be to utilise a woman's instinctive hero worship and belief in authority, and to arrange that acetylene generators should be recommended by her clergyman or doctor. I say her doctor advisedly, as she does not believe in other women's doctors.

The plan of distributing liquid acetylene in iron bottles sounds more promising, as very little goes a long way, and the bottles could be connected to the house service by the acetylene company without the women of the house having anything to do with the matter. Acetylene is given off on the addition of water to the carbide, at enough pressure to liquefy in a cold bottle at once, and it might be purified at the same time. It must be remembered, however, that the comparison must be made, as to cost not with gas burned in the ordinary batswing burner, which is generally not even good of its kind, but with the incandescent mantle. If anyone is going to improve his lighting, he will not take up acetylene, as against the incandescent burner, unless it is better. Acetylene gives, for a cubic foot, about three times the light of the Auer burner, so that at 20s. per 1,000 cubic feet it corresponds to gas at 6s. 9d. Gas seldom costs 6s. 9d. per 1,000. Besides, it is easier to put in the Welsbach burners; but if a considerable alteration is to be made, the electric light may be preferred.

All the same, there is a very large opening for acetylene, apart from competition with coal gas. For country houses, and in carriages, omnibuses, trains, and on board ship, it ought to have its own way. One of the chief things wanted is a good burner, that will not give smuts under any conditions.

A good portable acetylene lamp is also much needed. If the lamp generates its own acetylene there is the difficulty of having it attended to properly, at least by maidservants. Even paraffin lamps are seldom in good order where there are no men servants, and the old colza oil lamps never were. There are other difficulties, however. The action of the carbide on the water is so energetic that each time they touch too much acetylene is given off, and some sort of gasholder is needed. I have tried mixing alcohol with the water to reduce the vigour of the action, and it works fairly well. I have lately found that this plan has been already fully worked out. Another difficulty is that the water gives off vapour which generates acetylene, so that when the lamp is out of use acetylene is being generated slowly. This means that the lamp will smell, and the smell of acetylene is not pleasant.

Small bottles of liquid acetylene for portable lamps should be no more difficult to deal with than mineral-water siphons, and a small steel tube bottle would run a light and portable 10-c.p. lamp for a long time. The want of portability is the great drawback to gas. The electric light is a little better, but not much. The result is that candles are still used. Acetylene lamps would not ruin the carpets, or cement the piano keys together.

Too much has been generally said about the poisonous nature of acetylene. Experiments show that it is not at all a serious poison, and its smell is a great safeguard. It uses so little air in burning that, on the whole, it would be a very much more healthy illuminant than gas, oil, or candles, especially if it contains no sulphur. Healthy breathing is not generally sufficiently appreciated yet. Many people still sit in close rooms and sleep with their windows shut, and the smaller air consumption of acetylene would not really appeal to them very much. Besides, according to experiments recently made on polluted air, the evils of vitiated atmosphere have been greatly exaggerated. Though acetylene, like carbon disulphide, is an endothermic compound, it is not easily exploded. Fulminate of silver only fires it locally. The explosion does not spread. Carbon disulphide explodes under curious conditions. If some is put in a bulb, and an air-pump connected and used, it will go off. I do not know if acetylene has any analogous properties.

Calcium carbide may come to be used in the manufacture of alcohol, benzene, and other organic products, but it is too soon to prophesy its future in these directions. A great deal must depend on its price, and one of the chief items is the cost of electrical power. It is to be hoped that it will soon be made by non-electrical methods, and its price may then be reduced considerably.

COMPANIES' MEETINGS AND REPORTS.

WESTERN AND BRAZILIAN TELEGRAPH COMPANY, LIMITED.

This Company held its thirty-second ordinary general meeting at Winchester House yesterday (Thursday). The total earnings for the half-year ended June 30, 1896, were £71,082. 4s. 9d., being a decrease of £13,854 compared with the half-year to June 30, 1895.

The **Chairman**, Mr. W. S. Andrews, in moving the adoption of the report, stated that this loss of revenue was owing to the diminution of the internal traffic of Brazil. There was a decrease in the working expenses of £463. 0s 5d. The directors recommended the payment of a dividend of £2 per cent. as against 2½ per cent. for the corresponding period last year. This dividend will be 3s. for each share. There was no change in the position of affairs between the Government of Brazil and the Company as to the acquisition of cables.

The report was adopted.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Londonderry.—The Corporation invite tenders for the supply of carbons for one year from January 1 next. Full particulars can be seen in our advertisement columns.

Arlon (Belgium).—Tenders will shortly be wanted at the office of Les chefs de service, Arlon, rue de la Station 36 for a building for an electric generating station at the Marbehan Station.

Belgrade.—Tenders will be received on November 27 for an electric lighting installation at the National Theatre at Belgrade. Application is to the Servian Ministry of Public Works, Belgrade.

Alcazur de San Juan.—The Municipality will receive offers up November 17 for the electric lighting of the town for a period of 30 years. Alcazur de San Juan is in the province of Ciudad Real, Spain.

Malines (Belgium).—Tenders will be wanted for the supply at Malines of about six tons of special lubricating oil for dynamos and gas-engines. Particulars at the Brussels Bourse, where tenders will have to be sent.

Nuremberg.—Tenders will be received up to November 20 for the supply of telegraph posts for next year for the Bavarian State telegraphs and telephones. Application to the Kgl. Oberpostamte, Nürnberg, Germany.

West Looe.—The Parish Council invite tenders for the lighting of the place with gas, oil, or electricity. Full particulars from Mr. Wm. Hicks, hon. clerk, West Looe Parish Council. Tenders to be in by November 28.

South Shields.—The Corporation require tenders for a steam alternator and a rectifier, and extension to switchboards. Tenders are to be delivered by November 23. Specifications, etc., can be obtained at the Borough Electrical Engineer's Office, West Holborn, South Shields, on and after November 9, on payment of £1. 1s. (returnable).

Shoreditch.—The Vestry invite tenders for the supply of insulated wires and mains, insulated iron pipes, junction boxes, main switches, tumbler switches, cut-outs, ceiling roses, etc., for the ensuing year. Tenders and samples to be sent in not later than November 17. Particulars from Mr. C. H. Doughty, lighting engineer, Town Hall, Old-street, E.C. See advertisement.

Hartlepool.—The British Electric Traction Company, Limited, of 1 and 2, Great Winchester-street, London, E.C., on behalf of the Hartlepool Electric Tramways Company, Limited, invite tenders for the construction of the permanent ways. Particulars, specifications, plans, and form of tender may be obtained from Mr. J. Vincent Kitchener, secretary, London, on deposit of £5, which will be returned on receipt of a bona fide tender.

Warrington.—The Cheshire Lines Committee are prepared to receive tenders for the supply during the year 1897 of telegraph materials, instruments, wire, etc. Patterns can be seen and specifications with forms of tender obtained upon application to Mr. S. Saxon Barton, storekeeper, Cheshire Lines, Warrington. Tenders, sealed and endorsed, to be sent to Mr. Glegge Thomas, secretary, addressed Cheshire Lines Stores Department, Warrington, not later than 10 a.m. on November 28 next.

Dublin.—Tenders are required for the supply of general stores and sundries during year ending December 31, 1897, for the Dublin United Tramways Company. Forms of tender (price 1s. each), conditions, and all information can be obtained and patterns seen at the Company's Offices, 9, Upper Sackville-street, Dublin, from 16th to 30th inst. Tenders, sealed and marked outside "Tender for Stores," and addressed to the Chairman, to be lodged with Mr. Wm. Anderson, secretary, by 30th inst.

Paris.—Tenders will be received at the Undersecretariat of Posts and Telegraphs, Paris, rue de Grenelle 103, up to November 26 for the supply of 50,000 cross-pieces with accessories, 315,000 galvanised iron brackets, and about 14 tons of tin solder for the telegraphic service. Application for permission to tender must be made before November 16. Tenders will be received on November 19 at the Chemins de Fer de l'Etat, Paris, rue de Châteaudun 42, for, among other supplies, a quantity of telegraph poles.

Hanley.—The Corporation require tenders for air-compressors (alternative arrangements driven by steam and by electric motors), and alternating-current electric motors at the sewerage works. Full particulars, specifications, bills of quantities, and forms of tender may be obtained at the office of Mr. Joseph Lobley, borough engineer and surveyor, Town Hall, Hanley. Contracts will only be given to firms paying the standard rate of wages. Sealed and endorsed tenders must be sent to the Borough Engineer before Monday night, 30th inst.

Greenhithe. — The Greenhithe and Knockholt Lighting Inspectors require tenders for lighting, cleaning, and extinguishing the lamps in the said district from December 1 next to November 30, 1897, both inclusive (except the months of June and July) from sunset to 1 a.m., for either one, two, or three years at the option of the inspectors. Tenders to state the price per lamp and the proposed method of lighting, and to be addressed to the Lighting Inspectors, Railway Hotel, Greenhithe, and delivered there before 8 p.m. on 24th inst. Mr. A. H. Walter, clerk.

Copenhagen.—Provided the City Council will vote for spending the necessary amount, an electric station is to be built in Vesterbro, Copenhagen, and tenders are invited for the delivery of (1) boilers, (2) mechanical and electrical plant, and (3) network, in accordance with the description. Conditions and plans to be had upon application to the Electrical Station, 30, Gothersgade, Copenhagen. For each specification a fee of 50 kroner is charged, which is returned on acceptance of the tender. Tenders will be received at the office of the fourth division of the Magistracy until December 4 at 12 noon.

York.—The directors of the North-Eastern Railway require tenders for the undermentioned articles, in such quantities as they may require, during the six months ending June 30, 1897, delivered carriage paid at the company's telegraph stores at York: (1) telegraph apparatus; (2) telegraph wires and line stores. Payment for each month's delivery will be made at the end of three clear months, or in cash, less 2½ per cent. discount. Forms of tender may be obtained on application to Mr. Graves, Telegraph Department, York, and tenders must be sent in to the secretary, Mr. C. N. Wilkinson, at York, sealed and marked "Tender for Telegraph Stores," not later than noon on Monday, November 23.

Monmouth.—The Town Council require tenders for the following: (1) machinery (consisting of turbines, alternators, steam-engines, boilers, electric motors, sewage pumps, etc.); (3) cast-iron pumping main; (4) electric lighting mains. Plans may be seen on and after 19th inst. on application to Messrs. Bramwell and Harris, engineers, 5, Great George-street, Westminster, S.W., or to the Town Clerk, Monmouth, from either of whom may be obtained, on deposit of £2. 2s. (to be returned on receipt of a bona fide tender), a printed form of specification and tender for either contract. Tenders, on the prescribed form, must be delivered with the specification attached (enclosed in a sealed envelope), endorsed "Sewage-Disposal, Tender for No. —," and addressed to Mr. T. R. Oakley, town clerk, Monmouth, by 12 noon on November 23.

Derby.—The Midland Railway Company require tenders for (10) telegraph instruments; (10A) telegraph stay rods, bolts, etc., (galvanised); (10B) telegraph and signal wire, etc. Contractors cannot be allowed to submit their own patterns, or tender to supply goods thereto, nor can the company's patterns be sent away for inspection, all being sealed and exhibited at Derby only. The patterns will be ready for the inspection at the General Stores Department, Derby, and forms of tender may be had on application to Mr. G. Morrall, stores superintendent, Derby, care being taken to give reference to the particular contract (by the above numbers) for which it is proposed to tender. Tenders, addressed to the Secretary of the General Stores Committee, Midland Railway, Derby, and endorsed "Tenders for Stores," must be sent so as to be received by 9 a.m. on 17th inst.

Maryborough (Ireland).—Tenders are invited for the supply and erection of an electric light installation at Maryborough District Lunatic Asylum by the Commissioners for the Control of Lunatic Asylums. Tenders should be sent in a sealed envelope, endorsed outside "Tender for Electric Lighting, Maryborough Asylum," and addressed to the Secretary, Board of Control, Customs House, Dublin, and should be accompanied by a separate sealed envelope similarly addressed and endorsed, containing the detailed estimate, by 10 a.m. on 23rd inst. Forms of tenders and copies of specification will be issued on application to the Office of the Board of Control of Lunatic Asylums, Customs House, Dublin, on deposit of £3. 3s., which will be returned to all persons who have sent in bona fide tenders. Plans can be seen at the office of the electrical engineer, Mr. Walter Leake, 35, Dame-street, Dublin.

Ayr.—The Electric Lighting Committee require tenders for the supply and erection of the following plant (the whole bound up in one specification, price £2. 2s, returnable on receipt of a bona fide tender): (Section A) boiler-house plant—two Lancashire boilers and fittings, mechanical stokers, extensions to economiser, feed-pump, steam and exhaust pipes, valves, etc.; (B) engine-house plant—two 200-kilowatt steam alternators and condenser; (C) underground work—cables and culverts. Tenderers are at liberty to tender for either section, but not for part of a section. The ground plans of plant and specification, with terms and conditions of tenders and contract, may be obtained at the offices of Mr. Robert Hammond, the consulting engineer to the Corporation, Ormond House, Great Trinity-lane, London, E.C., on payment of £2. 2s. for each copy, which sum will be refunded on the return of the specification filled up with a bona fide tender. Tenders, sealed and marked "Tender for Electric Lighting," must be addressed to Mr. A. G. Young, town clerk, Council-chambers, Ayr, N.B., and be delivered by November 25.

West Ham.—The Town Council require tenders for the supply of the following: four steam alternators and exciters; surface condenser and pumps; station switchboard, etc.; high and low tension mains, etc.; transformers, sub-stations, etc.; instruments; arc lamps, posts, etc.; crane. Plans of the suggested arrangements, specification, form of tender, and further particulars may be obtained at the office of Mr. John J. Steinitz, borough electrical engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a bona fide tender. Tenders, endorsed "Tender for Machinery, etc.," to be sent to Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham, by 4 p.m. on November 24. The contractor will be required to enter into a bond, with two sureties, for the performance of contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract. In the

Digitized by Google

event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

RESULTS OF TENDERS.

Dewsbury.—The Town Council have accepted the tender of Messrs. Crawshaw and Warburton for the supply of coal to the electric lighting station.

Shoreditch.—The Vestry have accepted the tender of Messrs. Atherton and Dolman to carry out the work of erecting the sub-station, the amount being £893.

Kingston-on-Thames.—The Lighting Committee have accepted a tender of Mr. P. H. Dyson for unloading and delivering coal at the electric lighting station at 1s. 2d. per ton.

Brussels.—The lowest tenders for converting local tramways in the neighbourhood of Charleroi for electric working were those of the Societé anonyme Electricité et Hydraulique, Charleroi, and the Compagnie général de traction electrique, Paris. Both tenders were very close together and varied according to the nature of the posts proposed to be erected.

Morley.—The Town Council have accepted the following tenders for the various sections of the work connected with the scheme for lighting the borough with electricity, subject to Mr. Hammond being satisfied with the details of construction of all the work, and certain other conditions:

Holdsworth and Sons, Bradford, boiler-house (two Lancashire boilers, stokers, pumps, and economiser and accessories)	£1,499	5	0
Electric Construction Company, Limited, engine-house (two slow-speed flywheel alternators, motor-alternator, and accumulators)	5,731	0	0
Electric Construction Company, Limited, switch-board and instruments	600	0	0
Bedford Engineering Company, Limited, overhead travelling crane	250	0	0
Callender's Cable and Construction Company, Limited, cables and culverts	1,790	8	3
Electric Construction Company, Limited, transformers and switchgear	822	0	0
Electric Construction Company, Limited, arc lamps and posts	324	0	0
Westinghouse Electric Company, Limited, meters...	114	8	9
Total......	£11,131	2	0

BUSINESS NOTES.

Great Northern Telegraph Company.—The receipts for the month of October were £25,000.

Newport.—The National Telephone Company are about to make several connections in the town.

Rangoon.—The Cantonment Committee are considering a scheme for laying down the electric light.

Ambleside.—The Council at their last meeting considered the electric lighting question in committee.

Halstead (Essex).—The Urban District Council have adjourned the electric lighting question till May next.

Matlock Bath.—The question of electric lighting has been referred to the Sewerage Committee of the Urban District Council.

Guernsey.—The Guernsey Electric Railway Company's sheds at St. Sampson's northern terminus were destroyed by fire last week.

Fareham.—The application of the District Council to borrow £1,900 for purposes of electric lighting is before the Local Government Board.

The Testing of Wires and Fittings.—The City Commissioners of Sewers have fixed the fee for testing consumers' wires and fittings at 10s.

Wimbledon.—The Urban District Council have passed the formal resolution to apply for a provisional order in respect to electric lighting.

Dundee.—The Town Council have authorised the proposed agreement to be executed between them and the National Telephone Company.

Dover.—We learn that the churchwardens of St. Mary's Church are seriously contemplating having the electric light instead of gas in that edifice.

Change of Address.—Messrs. L. Andrew and Co. have removed from 21, Cannon-street to larger premises at 2, Carr-street, Blackfriars, Manchester.

Colwyn Bay.—The District Council have resolved to offer prizes of £30 and £20 for the best scheme for supplying electricity to the district.

Urmston.—The probability of the introduction of the electric light into the district by a company was discussed at the meeting of the District Council.

Huddersfield.—At a meeting of property owners and ratepayers a resolution was passed consenting to the promotion of the Tramways Bill. A poll was demanded.

Redditch.—At the United District Council meeting the clerk was instructed to take steps to obtain a provisional order to enable the Council to light the town by electricity.

Wrexham.—The Rural District Council have decided that they cannot agree to certain portions of their district being included in the Corporation's electric lighting provisional order.

Blackpool.—The Ratepayers' Association have invited Mr. Quin, the borough electrical engineer, to attend a meeting for the purpose of explaining to them the proposed new charges for electric light.

Machinery for Sale.—The Board of Works for the St. Olave District, Southwark, have for sale by tender a dynamo and accumulators. Further details are published in our advertising columns.

Colombo.—The electric light is gradually being introduced into Government establishments, and the Colombo Customs are to be lighted with it. Messrs. Boulstead Bros. have secured the contract.

Southport.—The Town Council have resolved to apply to the Local Government Board for authority to borrow £12,000 for the purpose of extension to the electricity works, machinery, mains, etc.

Mile End.—The Vestry have agreed to oppose the application of the County of London and Brush Provincial Electric Lighting Company, Limited, for a provisional order to supply electricity to the parish.

Chelmsford.—At the meeting of the Rural District Council a letter was read from the Postmaster-General stating that it was proposed to extend telegraphic communication from Danbury to Little Baddow.

Dublin.—The Dublin, Wicklow, and Wexford Railway Company intend promoting a Bill in Parliament for the purpose of obtaining power to use electricity as a means of traction on the Dublin and Kingstown line.

Wells.—At the meeting of the Town Council Dr. Hopkinson's report and plans for the lighting of the city with electricity were referred to the Lighting Committee, who are to report to the December meeting.

Derby.—The Electric Lighting Committee have decided to abolish the meter-rent charge as from Michaelmas, 1896, on condition that a minimum consumption of electricity of 20s. worth per annum is taken.

Birmingham.—The question of lighting the meat market by electricity will be discussed at the next City Council meeting. The lowest tender is that of Messrs. Mavor and Coulson, of Glasgow, at £7,877. 10s.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended November 8 amounted to £1,065, as compared with £1,063 in the corresponding week of the previous year, being an increase of £2.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended November 6 were £1,929. 4s. 9d., compared with £1,858. 17s. 8d. for the corresponding period of last year, being an increase of £70. 7s. 1d.

Ayr.—It was reported at the meeting of the Town Council that the total works' costs for October was £94. 13s. 2d., while the estimated receipts amounted to £263. 18s. 4d., leaving a balance to interest and sinking fund of £169. 5s. 2d.

Personal.—We have been sorry to hear of the serious indisposition of Dr. Edward Hopkinson, of Messrs. Mather and Platt, of Salford. We understand that Dr. Hopkinson has now been able to get away in order to recuperate his health.

Brentford.—At the District Council meeting the Works Committee reported having considered the letter from Mr. W. H. Druce, of Manchester, with reference to electric lighting. The committee would keep the letter for future reference.

Grange.—The District Council have decided to inform the Board of Trade that they object to any further extension of time within which the deposit required by Section 7 of the Windermere and District Electric Lighting Order, 1895. may be made.

Brighton.—An electricity main is to be laid in West Hill-road at an estimated cost of £91, and another in Bedford-street, from Marine-parade to Bristol-road, at a cost of £48, and the public lamps in these streets lighted by electricity instead of by gas.

Electrical Cabs.—As an immediate result of the Motorcar Act coming into effect on Saturday, arrangements have been made by the London Electrical Cab Company to place a large number of electrical cabs almost immediately for hire in the streets of London.

St. Pancras.—The Vestry have decided that the following districts should be lighted by arc lamps, in addition to the area already lighted by electricity: Haverstock-hill to the parish boundary, Fortess-road and Highgate-road as far as Gordon House-road.

Worsley.—At the United District Council meeting, the recommendation of the Highways Committee, in reply to a letter from Mr. Druce, of Manchester, that the Council should take no action with regard to the electric lighting of the township was confirmed.

Bury St. Edmunds.—In nominating Alderman Lake as mayor of the town, Alderman Gough said that in reference to the contemplated introduction of the electric light, his services would be required in helping to settle how best to deal with the monetary aspect of the question.

Darwen.—We notice that the system recommended by Mr. E. M. Lacey for the electric lighting of this town is the three-wire, with 220 volts between adjacent wires. The erection of a refuse destructor in connection with the electricity works is also advised on the ground of economy.

Kirkby-in-Ashfield.—At the meeting of the District Council, Mr. Shacklock moved that it be an instruction to the Gas and Water Committee to prepare a rough estimate of the cost of lighting the parish with electricity and report to the next Council. Mr. Elliott seconded, and it was agreed to.

Digitized by Google

City and South London Railway.—The returns for the week ended November 8 were £1,036, compared with £1,009 for the corresponding period of last year, being an increase of £27. The total receipts for the half-year 1896 were £17,747, compared with £16,658 last year, being an increase of £1,089.

Blackburn.—Mr. Thomas Barton, M.I.E.E., consulting electrical engineer, Blackburn, has published an interesting description of the Corporation electricity works, which were opened on February 18, 1895. Accompanying the description is a plan of a portion of the town, showing the area of supply.

Newark.—Messrs. Gilstrap, Earp, and Co., maltsters, have purchased an electric plant from Messrs. Bailey, Grundy, and Barrett, electrical engineers, of Cambridge, for lighting their malting establishment. The machinery is at present driven by gas, but will in future be driven by electric motors.

Ceylon.—The tramways scheme has a fair chance of being inaugurated after all, according to *Indian Engineering*. The report of the special committee has been adopted, and the Council have agreed to engage Mr. Preece, C.B., F.R.S., engineer-in-chief, Postal Telegraphs, G.P.O., London, as their consulting engineer.

Walton.—A letter was read at the Urban District Council meeting from the Walton-on-Thames Electric Lighting and Power Company, Limited, forwarding, in accordance with the regulations, notice that it was the intention of the company to proceed with their application for a provisional order in the ensuing session of Parliament.

A New Electric Carriage.—A new electric carriage has just made its appearance, which is constructed on the "Ward" system. It has been completed to the order of Mr. William Marshall, of Tokenhouse-yard. It was travelling about London on Monday afternoon, running through the parks and visiting many of the West-end clubs.

Long Eaton.—At the meeting of the District Council the question as to what were the powers of the Council in regard to electric lighting was considered. The Deputy Clerk stated that he had looked over the minutes, and that as other notices would have to be given, no steps were taken. That was in 1889. It was decided the matter should stand over.

Appointments Vacant.—The Shoreditch Vestry require at the technical schools a competent man to act as assistant instructor to the electrical fitting class for one night per week at 5s. per night. Application, stating age and experience, to be sent to Mr. H. Mansfield Robinson, vestry clerk, Town Hall, Old street, E.C., by 27th inst., endorsed "Electric Fitter."

Yarmouth.—At the Town Council meeting the principle of electric tramways for the borough was agreed to, and the Lands Committee deputed to settle details, so that the promoters may apply for a provisional order within the statutory time. During October £188. 19s. 6d. was earned by the electric lighting department beyond the cost of producing the light.

Mountain Railways.—According to the *Revue de l'Electricité*, the recent storms have impeded the progress of the Jungfrau electric railway. On the same authority it would appear that Turin Chamber of Commerce is agitating a project for an electric railway from Aosta to Martigny over the Great St. Bernard. An English syndicate is said to be at the back of the enterprise.

Progress of Electric Lighting.—Tuesday night's *London Gazette* contains notices by the Denton, Epsom, Reigate, Hoylake and West Kirby, Bury St. Edmunds, Brighouse, and Watford Corporations and local authorities respectively of their intention to apply to the Board of Trade for provisional orders to supply electricity under the Electric Lighting Acts in their districts.

Cheltenham.—The electrical engineer has reported upon the best mode of supplying residents in Bayshill-villas (and subsequently in Royal-parade also). The cost of the preliminary works for supplying Bayshill-villas will be about £140. The Lighting Committee have resolved to add this amount to the £2,150, for which they have already resolved to apply for sanction to borrow.

Newmarket.—The Urban District Council have decided not to accept the offer of the gas company to share with the Council the expense of engaging an electrical engineer to report as to the suitability of the town for electric lighting. A public meeting has been held to protest against the action of the Urban District Council in resolving to apply for an electric light provisional order.

International Telescriptor Syndicate, Limited.—This Company has been registered, with a capital of £10,000 in £1 shares, to acquire the patents and inventions of B. Hoffman for all countries (other than Great Britain and the British colonies and dependencies) relating to telegraphic apparatus and to typewriting machines, and to carry on the business of a telephone and telegraph company.

Acton.—With the consent of the District Council Mr. Buxton deferred for a fortnight the proposition of which he had given notice with respect to electric lighting. It is reported that the Works Committee of the District Council have instructed the clerk to the Council to write to the secretary of one of the motor-car companies asking for an estimate of the cost of a scavenger's cart fitted with motors.

Liverpool.—A large section of Liverpool teamowners recently discussed the advisability of adding a new telephonic system to give increased facilities for carrying out promptly the heavy work which increasing trade brings to the port. As the result of the deliberations an executive committee was appointed to at once make the necessary arrangements, so that the new system shall be promptly put in working order.

Leigh (Lancs.).—The Urban District Council have appointed a committee to consider and report on the advisability of introducing a tramway system, and deciding whether the work would be better undertaken by the Council or by a company. A letter was read at the meeting on behalf of a company that proposed to obtain powers, stating that they only sought to do so in case the Council were not willing to undertake the risk of the project.

St. George's (Tower Hamlets).—At the meeting of the Vestry Mr. Pipe moved that the consent of the Vestry be given to the application to the Board of Trade of the County of London and Brush Provincial Electric Lighting Company, Limited, for a provisional order under the Electric Lighting Acts in respect of the St. George's East parish, the compulsory area being Cable street, Commercial-road, Cannon-street-road, and St. George-street.

Wellington (Somerset).—Under the title of Gent and Tomlyn a new firm is commencing business at the Champion Electrical Works, Wellington, as manufacturers of electric indicators, bells, and electric light and telephonic engineers. Mr. W. A. Gent, the first-named member of the firm, is the son of Mr. J. T. Gent, formerly of Gent and Co., Leicester, and Mr. Tomlyn is well known locally in connection with an old-established engineering firm.

Dudley.—The Public Works Committee reported at the Town Council meeting that Mr. Sellon, engineer to a company who are preparing to purchase the whole of the tramways in the South Staffordshire district, attended their meeting, and after much discussion it was arranged that Mr. Sellon should give further particulars on various points which were discussed, and that the whole matter should be further discussed at the next meeting of the committee.

York.—The Streets and Buildings Committee of the City Council have resolved that the letter from Messrs. Leeman, Wilkinson, and Badgerf, on behalf of a client, with proposals in regard to the transfer to him of the electric lighting order of the city, to be applied and worked by their client on terms mentioned, shall be considered in conjunction with the tenders to be invited for the installation under Prof. Kennedy's specifications, as agreed upon by the committee.

Hammersmith.—Rapid progress is being made with the electric light installation now being carried out by the Vestry, and in a short time the parish authorities will be prepared to supply current in the following thoroughfares: Hammersmith-road (between Broadway and St. Paul's Schools), Broadway, King-street (between Broadway and Ravenscourt-park), Brook Green road, Shepherd's Bush road, Shepherd's Bush green, Goldhawk-road to Starch-green pond, Uxbridge-road to Percy-road.

The Royal Train.—Several improvements in the Royal train used for the Queen's journeys to and from Scotland have been made at her Majesty's command by the London and North-Western Railway Company. Formerly the Royal carriages were illuminated by oil lanterns in their roofs. These, however, as well as her Majesty's reading lamps on the saloon table, have been replaced by electric incandescent lights, the current for which is supplied from a series of accumulators under the floor.

Maidstone.—We are informed that as soon as the preliminaries for acquiring a suitable site have been settled, a motorcar, carriage, and implement factory will be started in the town. The company will be in no way connected with any existing local works, and will not be associated in any way with any foreign syndicate; but will be of a purely English character, and principally under the directorship of landowners and gentlemen interested in the prosperity of Kentish agriculture and the hop trade.

Morley.—In bringing up the report on the electrical tenders at the Town Council meeting, which we publish under the head of "Results of Tenders," the chairman of the Lighting Committee congratulated the Council upon the fact that the total amount of the tenders—viz., £11,131, plus £750 for excavation work not included in the specification; a total of £11,881—was almost identical with the amount of the estimate laid before them some months ago by Mr. Hammond, the consulting engineer.

Rotherhithe.—At the meeting of the Vestry the General Purposes Committee recommended that the request of the County of London and Brush Provincial Electric Lighting Company, Limited, for the formal consent of the Vestry to their application for a provisional order for Rotherhithe be acceded to. The London Electric Supply Corporation, who already hold a provisional order entitling them to supply electricity to the parish, wrote objecting to a second company being allowed to come in. The matter was referred to committee.

Coseley.—At the meeting of the District Council Councillor Rolinson called attention to the syndicate which was being formed to take over first the steam trams and then those propelled by horses, the motive power to be taken from the nearest source. There were tramlines at Ettingshall and Princes End, and as it was probable that in future the trams would be driven by electricity, he thought the Council should be alive to the importance of the matter. It might be necessary that they should take the electric lighting into consideration again.

New Pocket Diary.—We have received from the *Mechanical World* offices a copy of the "Mechanical World Pocket Diary and Year-Book for 1897." We notice that a large amount of new matter of a thoroughly practical character has been introduced. Many new tables have been added, and sections included on such subjects as the testing of gas-engines, incrustation and corrosion in steam-boilers, notes on annealing, hardening, and tempering; the power required to drive machine tools, etc., which make the book of great value to the electrical and mechanical engineer.

West India and Panama Telegraph Company, Limited.—The report for the half-year ended June 30 states that the amount to

Digitized by Google

credit of revenue is £42,317, against £39,849 for the corresponding half-year of 1895, and the expenses have been £22,280, against £21,848, leaving a balance of £20,037, which, with £1,325 brought from last account, makes a total of £21,362. The directors have placed £1,000 to reserve, and propose to pay a dividend on the ordinary shares of 1s. 6d. per share, tax free, leaving £1,968 to be carried forward. The traffic receipts show an increase of £2 695, while the expenses of repairing cables during the half-year amounted to £8,787.

Sale.—At the meeting of the Urban District Council the clerk (Mr. Halliwell) read the proceedings of the Joint Committee of the Ashton-on-Mersey and Sale Councils on the subject of the proposed line of tramway from Stretford to Peel Causeway along the Manchester highway, to be laid by the Manchester Carriage and Tramways Company and the syndicate who proposed to work the same length of tramways by electricity. The committee, after careful consultation so far as it affected their districts, unanimously recommended that the Ashton and Sale Councils take the feelings of the ratepayers by a poll as to the desirability or otherwise of adopting any tramway scheme. The minutes were received.

The Brussels Exhibition, 1897.—A meeting of the British Commission for the Brussels International Exhibition of 1897 was held this week at the London Chamber of Commerce, Sir Albert K. Rollit, M.P. (president), in the chair. The President said that the space they had originally taken—30,000 square feet—was insufficient, but they now had, as a result of negotiations, the opportunity of taking an additional 30,000ft. at a reduced rate. After discussion the Commission unanimously resolved to authorise the taking of the proposed additional space and to increase the guarantee fund. It was announced by the president at the conclusion of the meeting that the total amount guaranteed was nearly £5,000.

Mathematical Instruments.—We have received from W. J. Stanley, Great-turnstile, Holborn, W.C., his "C" catalogue of mathematical, drawing, and surveying instruments. The catalogue is a very full one—Fuller's slide, for instance, is quoted—and besides instruments proper there are sections for photographic, electrical, and "optical" work, as well as the particular kind of stationery affected by the student and engineer. A new feature is a very complete telegraph code for ordering. This is a new feature in Mr. Stanley's catalogue, and from a business point of view is not a bad idea, since it encourages the engineer or surveyor to carry the catalogue about with him, so that if he finds he wants anything he can get it at once.

Sheffield.—At the meeting of the City Council Mr. Harry Fisher asked the chairman of the Tramways Committee a question with reference to the acquisition of various plots of land for power stations. It was, he said, several weeks since the electrical expert returned, and though they had not yet heard what recommendations they had made, it would appear, as they were securing land for power stations, that they had come to some decision Alderman Clegg said the only object in asking for power to acquire these lands was that the Council could comply with the statutory requirements. If the committee did not decide in favour of electricity, then they would have committed themselves to nothing and need not proceed further.

Hastings.—At the Town Council meeting the Public Lighting Committee submitted the following communication from the Board of Trade: "Hastings (Public Purposes) Electric Lighting Order, 1890.—With reference to previous correspondence on the subject of the above-mentioned order, I am directed by the Board of Trade to inform you that they approve of the system, of which a description is annexed hereto, for the supply of electrical energy for the purpose of the order, subject to the regulations for securing the safety of the public (a copy of which is also annexed), which are hereby imposed upon the undertakers, under the above-mentioned order by the Board of Trade." It was resolved that the communication should be entered on the minutes.

Aberdeen.—The mason's work of the extension of the electric lighting station in Cotton-street has just been completed by Mr. Robert Smith, builder. Kemnay granite has been used in the front, and the features are a picked panel above the central doorway, and rustic masonry all along the front between two dressed bands; the quoins are also rusticated, the remainder being puncheoned ashlar. On the top, in the centre of the building, is a conspicuous architectural feature in the form of a dressed pediment or tympany, 17ft. long and 12ft. high, with ball ornament for finish, projecting boss, and large well-cut rams'-horn scroll ornamentation. The date "1893" appears in raised figures, 20in. in length. A lofty chimney shaft in brickwork is also nearly completed.

Mold.—At the meeting of the Urban Council it was reported that a special meeting of the Council was held on the 14th ultimo to confer with Mr. Fawcus, engineer, of Manchester, regarding a proposal to construct a light railway between Mold and Holywell, *viâ* Halkyn. At that meeting Mr. Fawcus said the railway might be worked by electricity, but before going into the matter further he would like to know if he had the support of the various local authorities through whose districts the line would pass, and whose ratable value would be increased. At the special meeting the members declared themselves in sympathy with the proposal, and recommended its further consideration. Several members now supported the project most heartily, and a resolution declaring sympathy with it was carried.

Hampstead.—At the meeting of the Vestry the Lighting Committee recommended that High street, Hampstead, Rosslyn-hill, and Haverstock-hill, as far as the boundary of the St. Pancras parish, be lighted with electric arc lamps. The recommendation was adopted. Mains for the supply of electric current to private consumers are to be laid in the following roads: Ebbsfleet-road, at an estimated cost of £58; Steele's-road, £63; Hilgrove-road and part of Adelaide-road, feeder and distributor extension to Avenue-road, £210 The number of electric lighting consumers at Michaelmas was 485, as compared with 212 at the corresponding date last year. The revenue for the quarter ended at Michaelmas was £1,595. 1s. 4d., as compared with £754. 10s. 10d. for the corresponding period last year.

Accident at an Electric Lighting Station.—A report was current on Saturday night as to a serious accident having occurred at the works of the St. James's and Pall Mall Electric Lighting Company, resulting in injury to six men, four of whom had been carried to the hospital. On enquiry, however, a Press representative was informed that the accident, which happened at the Mason's yard station of the company, was but a slight one. Some men belonging to a firm of engineers were repairing electric lighting machinery, when a pulley rope holding a cylinder broke, and the metal in falling was shattered. Two of the workmen were injured by being struck by pieces of the cylinder, but only one at all seriously. He was hit with such force as to cause a fracture of a bone in the left leg.

The British Electric Traction Company.—This Company has been registered, with a share capital of £600,000 divided into 30,000 6 per cent. cumulative preference and 30,000 ordinary shares of £10 each, and the issue of £300,000, in 30,000 ordinary shares of £10 each at par, is now advertised in this paper. The Company is formed under the auspices of the Electric and General Investment Company (on lines similar to those of the City of London Electric Lighting Company), to acquire the business of the British Electric Traction (Pioneer) Company which has a subscribed share capital of £50,000, and was established to develop electric traction in the United Kingdom and elsewhere, with a view to the formation in due course of the present Company. The list of subscriptions closes to-day (Friday) for both town and country.

Edinburgh.—At a meeting of the Royal Infirmary managers, Dr. Claude Muirhead gave in the report of a committee as to the appointment of an honorary medical electrician to the infirmary. It stated that the committee had approached Dr. Milne Murray, who had consented to give what time he could spare to aid the managers in the installation of electricity for medical purposes and to give his advice in the starting of the electrical department. The committee, therefore, recommended that the managers appoint Dr. Murray as honorary medical electrician to the infirmary. The report went on to say that as Dr. Murray could not give the necessary time for the full working of the new department, the committee recommended that the managers appoint Dr. Dawson Turner to be honorary assistant medical electrician to the infirmary. The report was approved of.

Kingston-on-Thames.—Councillor Collings, chairman of the Lighting Committee, stated at the Town Council meeting that during the last nine months the working expenses had amounted to £1,926, and the receipts were £1 866, showing a loss on the nine months' working of £60. But from a careful computation he believed he could safely predict that by the close of the year the receipts would show an excess over expenditure of about £11. Within the last few months successful experiments had been made with a system of lighting street lamps in series with incandescent lamps turned on and off from the works. He mentioned that a scheme was now under consideration by which householders could have their houses wired free of cost, the proprietors of the electric works paying the company who did the wiring a certain percentage on their outlay.

Chester.—The new electric light works in Crane-street are fast nearing completion. The chimney shaft has been erected, and its height is 140ft. In the boiler-house there are three boilers, fixed up by Messrs. Babcock and Wilcox. The whole of the ironwork, the roofing and the columns, are of extra strength, and have been manufactured and fixed by Messrs. Smith and Sons, Whitchurch. In conjunction with the boilers there is a range of Green's economisers. In the engine-house there will be three engines of 130 h.p. There are 230 accumulators. The sole contractors of the works are Messrs. Parker (Wolverhampton), and the whole of the buildings and chimney have been entrusted to Mr. Thomas Browne, contractor and builder, Chester, the erection of the machinery and buildings being under the supervision of Prof. Kennedy and Messrs. John Davies and Sons, architects, Newgate-street.

London.—At the meeting of the Commissioners of Sewers the Finance and Improvement Committee recommended that a fee of 10s. should be fixed for the testing of consumers' wires and fittings under the provisions of the regulations made by the Board of Trade under the Electric Lighting Acts and Orders, and that notice of the intention of the Commissioners to prescribe such fees be duly advertised. Mr. Voysey, in answer to Mr. Barham, said the meters registering the current of the electric light were not always correct. The meters varied from 30 per cent. fast to more than 20 per cent. slow, but on the whole he believed the electric current was fairly registered. Indeed, the balance was in favour of the consumer. The report of the committee was adopted. The electrical engineer (Mr. Voysey), in answer to Mr. Gordon, said he intended reporting upon several failures of the public and private supply of the electric light.

Penarth.—Application will be made to Parliament this session for an Act empowering the construction of an electric tramway between Cardiff and Penarth. We understand that the owners of the road—the trustees of the Bute estates and the representatives of Lord Windsor—look upon the scheme with favour; and settle-

Digitized by Google

ment of the question of purchasing the road by the local authorities is expected to form part of the scheme. It is further intended to apply for a provisional order to supply the electric light to Penarth from the generating station which the promoters of the tramway scheme will establish at that end. It is understood that the difficulty which has barred the negotiations between the owners of the road and the local authorities—namely, the desire of the former to retain power to make railway crossings on the level—will be obviated. The electric tramway will at its Cardiff end have two branches—one terminating in St. Mary-street and the other near James-street Bridge, the route to the latter being from Penarth-road, along the Corporation-road, and over Clarence Bridge. A 10-minute service of cars is projected.

The Mumbles Railway.—The *Cambrian* says it has reliable authority for stating that the second offer of the electrical syndicate to purchase the Swansea and Mumbles Railway, with a view of working it by electricity, has been definitely refused. Two members of the syndicate, which includes several very wealthy and influential commercial men, visited Swansea the week before last and made an inspection of the railway and its immediate surroundings. A few days afterwards, Sir John Jones Jenkins, M.P., as chairman of the Mumbles Railway Company, received a letter making an improved offer for the purchase of the line. The directors, after some consideration, decided to refuse it because sufficient was not offered for the goodwill of the undertaking. This does not mean that all negotiations have fallen through between the syndicate and the railway company. It is probable that they will be resumed at an early date, but whether the terms will come up to the demands of Sir John Jones Jenkins and his co-directors remains to be seen. It is stated that another electrical syndicate is making overtures for the purchase of the railway.

Kingston-on-Thames.—At the meeting of the Surrey County Council the Highways and Bridges Committee reported that they had received a communication from the Motorcar Club asking for permission to run motorcars over a portion of the main roads of the county on the occasion of the proposed running of motorcars from London to Brighton on the 14th inst., but as it was quite impossible that the cars should be run in accordance with the existing Highways Acts and the by-laws of the Council, the committee could not of their own motion nor recommend the Council to grant such permission. Mr. E. Ellis moved the adoption of the report, and said that a great objection to the motorcar was the question of speed. The recent Act allowed them to be propelled at the rate of 14 miles an hour, which the committee thought was excessive, and they had written to the Local Government Board to that effect. They also suggested that, having regard to the narrowness and crookedness of some of the highways in Surrey, that the width of the cars, which might be 7½ft., was too great, and that 6ft. should be the maximum width. Some of the roads in Surrey were only 6ft. wide. They further suggested that the person in charge should be duly licensed. The report was adopted.

Accumulator for Motorcarts.—The Sola-Headland accumulator has been described in the *Daily News*, having been demonstrated to a representative of that paper apparently by no less a person than Mr. Spagnoletti himself. The invention is yet one more new form of grid. "The plates are made up of leaden bars, into which the active material is pressed, and, from the construction of these bars, it becomes practically impossible for the paste to drop out. Equal surfaces being exposed on four sides to the action of the current, buckling of the plates is avoided, even on the severest test of short-circuiting the cells. This feature renders it unnecessary to employ the large amount of lead hitherto required to give the older form of plates the strength necessary to stand the heavy strain of traction work. The cells thus equipped, presenting the largest possible surface of active material to the action of the current, are consequently much smaller for a given capacity than any other on the market, and a saving in weight of over 50 per cent. has been effected." If all this is sustained, the battery ought to do for motorcart work, and as a matter of fact the London Electric Omnibus Company have fitted their electric cart, which will take the road on Saturday next, with it.

Stroud (Gloucester).—Messrs. Marling and Co., Limited, have recently had an electric light installation put down at their Ebley Mills. The generating plant consists of a "Tyne" compound-wound continuous-current dynamo, having an output of 175 amperes at 105 volts when running at a speed of 950 revolutions per minute, and is capable of feeding 350 incandescent lamps of 16 c.p. each. The motive power is derived from a 35-h.p. vertical high-speed engine, fitted with two heavy flywheels and crankshaft governor, to ensure steady running, and is transmitted to the dynamo by an 8in. Leviathan belt. Throughout the mill there have been fixed 350 lights attached to brackets and flexible pendants, each being provided with an enamelled iron reflector and controlled by a separate switch, or arranged in groups as has been found most convenient. The whole 350 lights are further controlled from a main switchboard in the engine-room, on which are fitted a main double-pole quick-break switch and fusible cut-outs and a voltmeter and ammeter. The work has been carried out by Messrs. Ernest Scott and Mountain, Limited, Close Works, Newcastle-on-Tyne, who are the manufacturers of the machinery, under the supervision of their local representatives, Messrs. Macdonald and Golledge, St. Aldate-street, Gloucester.

Southampton.—The Corporation, with the assistance of Mr. J. H. Lee, borough electrical engineer, are making preparations for erecting a lighting station of the most modern type in which the existing machinery purchased from the Southampton Electric Light and Power Company will be placed. The Electric Lighting Committee recommended at the Town Council meeting that the engineer be empowered to purchase an additional donkey engine, at an estimated cost of £12. 10s. Mr. Manville (consulting engineer) reported that there was no reason why the main with the present plant should not be extended to the end of Oxford-street and East-street. The committee recommended the Council, as soon as the consulting engineer was prepared with the necessary drawings, specifications, etc., to advertise for tenders for extending the mains for which sanction had been received, and that the extension of the main to Oxford-street and East-street (eastern end) be carried out at an early date. It was also resolved that after March quarter the maximum price for the supply of electric light be reduced from 7d. to 6d. per unit, and that the present charge of 6d. per unit for motive power to the Harbour Board and other consumers be reduced to 3d. per unit, such reduction to take effect at and after the Christmas quarter. The report was adopted.

Limehouse.—At the meeting of the District Board of Works the question of the provisional order being granted to the British Electric Lighting Company was discussed. Mr. Brennan asked the terms of agreement with reference to purchase price to be paid in the event of the local authority desiring to take the lighting into their own hands, and having elicited that 33 per cent. premium would have to be paid to the company for the purchase of the mains, etc., of the company as laid down in the district, he objected to the whole thing as an endeavour to create a monopoly. Mr. Warren moved that the whole matter be referred back for an exhaustive report. Mr. Hartnoll said that the question of monopoly seemed to him to exist rather in the gas company than in the suggested provisional order being granted. Of course, there were vested interests, but if they did away with the coal-whipper they put the electrician in his stead. The Clerk, in reply to questions, said that the granting of the order would not in any way prejudice the Board in making an application to the Board of Trade for permission to lay down their own installation. Mr. Knight could not consent to giving what belonged to the people to any company. It seemed to him monstrous for any corporation to ask for a margin of 33 per cent. on their outlay. It would be wisest to refer the matter back to committee. He should delight in the establishment of electric lighting in the district. It was agreed to sanction the recommendation of the committee.

"Electric Locomotives."—By favour of the Westinghouse Electric Company, Limited, 32, Victoria-street, S.W., we have received what is called a pamphlet (it has stiff covers and runs to 123 pages) by Mr. D L. Barnes on "Electric Locomotives." The book is really a catalogue of the various makes of the Westinghouse-Baldwin locomotives. The number of standard types of these already in manufacture in America will probably be a surprise to the outsider. They, of course, are most of them street railway—*i.e.*, tramway—types, but there are some others. All are really electric locomotives, not like the Heilmann engine—a steam locomotive with an electrical speed gear. So much for the subject of the book. In other respects it is an example of the way in which the Americans do not spare expensive illustrations, excellent paper, and sumptuous print in turning out a work of this class. A now forgotten writer, De Morgan, once advocated the adoption of brown printing ink. If anyone wants to see the result, the present catalogue may be taken as the best that can be done in that way. There are abundant illustrations (not in brown), including one of the mining locomotive that was a short time ago described in a note in this paper, and a quantity of efficiency curves for various types of motors and 11 examples of how to use them. The illustrations, as we have remarked before, are excellent. The letter-press is obviously designed for popular consumption, and not for the electrical engineer. All the same, the glossary of electrical terms at the end should either have been better done or omitted altogether. The description of magnetic saturation, if not absolutely incorrect, is certainly likely to give a wrong impression to anyone who did not already know something about it, while to the same sort of person the definition of "polyphase" would probably convey no idea at all. The irritating practice of calling a stationary transformer a "converter" is probably merely an American peculiarity.

Rathmines.—The proposed tramway from Rathmines to Ball's Bridge was discussed at the meeting of the Commissioners. The Chairman took the opportunity of referring to the letter of Mr. William Murphy which had appeared in the papers on behalf of the tramway company. He (the chairman) was prohibited owing to a resolution he long since arrived at of not replying in the newspapers. He desired to say that no member of that Board was actuated by any feeling of hostility towards the tramway company, and if the Commissioners constructed the proposed line to Ball's Bridge it would be with the intention of leasing it or hiring it out, as it were, to those who gave them the best terms. All the directors of the tramway company were personal friends of his, and it would be his last thought to do anything that he could avoid to harass them. Of course, it was the duty of every commissioner of the township, as such commissioner, to serve the interests of Rathmines, and it was with that object the Board were promoting this Bill. A meeting of the ratepayers of the township would be held, and a full statement would be made on behalf of the Commissioners at that meeting. Mr. Bolton said Mr. William Murphy had referred to him in the letter, stating that he was wrong in what he had stated as regards electric traction in Glasgow. The statements he had made were taken from a report of Mr. Hopkins, and were in black and white. Mr. Carey said Mr. Murphy's letter pointed to a compromise and arrangement between the tram company and the township, and for his part he would be quite prepared to agree to that. They had no complaint against the company, which was working for the

Digitized by Google

benefit of the people at large. The Commissioners wanted to come to fair terms. With regard to Mr. Murphy's objection that the tramway company was prohibited from selling by the Tramways Act of 1878, he wished to refer Mr. Murphy to the twenty-eighth section of that Act, which clearly showed that the prohibition was to a voluntary sale by the company and did not apply to a compulsory purchase.

Branksome.—The General Works Committee reported at the Urban District Council meeting that they had had before them an application from the Bournemouth and District Electric Supply Company asking the Council to sanction their coming into the district, and the committee recommended the Council to approve of the order subject to a condition being inserted requiring the company to give notice before disturbing the roads, and some guarantee that the ground should be reinstated to the satisfaction of the surveyor. Mr. Brown thought the Council should give every facility for the installation of the electric light in the district and encourage the company. The Clerk said that in addition to adopting the recommendation of the committee they should pass a special resolution on the subject. The company had deposited a copy of the provisional order, which the committee had had before them. The electric company wanted power over the whole of the Branksome district. The Chairman said it was very expedient that no obstacle should be thrown in the way of the company coming into the district as soon as they could. The resolution suggested by the clerk seemed to meet all points very well, and was equitable to all parties. Mr. Gulliver proposed and Mr. Arnold seconded the following resolution: "That the consent of the Branksome Urban District Council be and the same is hereby given to the grant of a provisional order under the Electric Lighting Acts, 1882 and 1888, to the Bournemouth and District Electric Supply Company, Limited, in respect of the urban district of Branksome, subject to a clause being inserted in such provisional order that before commencing any repairs, renewals, inspection, or amendments of their existing works which will involve the breaking up of the surface of any street or road repairable by any local authority, the undertakers shall serve a notice thereof upon the local authority, and immediately after the completion of the works the undertakers shall repair, reinstate, and make good the street or road to the satisfaction of the surveyor of the local authority, and in default of the same being so repaired, reinstated, and made good within seven days after the surface of the street or road is so broken up, the local authority may themselves repair, reinstate, and make good such street or road, and recover summarily from the undertakers the costs thereof." The resolution was carried.

Telephone Delays.—Complaints of delay and indistinctness of communication on the part of London subscribers to the telephone system using the trunk lines to the North have induced a representative of the *Daily Telegraph* to make some enquiries at the General Post Office, and at the headquarters of the National Telephone Company, in Orchard-court, Cannon-street. At the Post Office the officials in charge of the Government trunk telephone lines to the North, while admitting that complaints of delay had been received by them, said no reference to indistinctness was made in connection with the lines to Glasgow. That city was now connected with London by a specially-constructed trunk line, which included all the latest improvements in long-distance telephony. Its only fault was that it was unable to accommodate the vast amount of work required of it between eleven o'clock and four in the daytime. The only remedy which the officials could suggest was an increase in the number of telephone lines to Glasgow. In the last session of Parliament a sum of £300,000 had been voted to improve telephonic communication, and this money was being expended as rapidly as possible for that purpose. The manager of the National Telephone Company, on being interviewed, admitted that the wires to the North had been faulty for some days, but he could not explain the defect, as it occurred on the Government lines It might be due to atmospheric causes, or be occasioned by the linesmen in the course of their work. Questioned with reference to the particular case of Glasgow, the manager said in that city the old single-wire system was still largely used, and some of the faults complained of might be due to it. The company, however, were ready to put up metallic circuits at any time, but the Corporation of Glasgow refused the necessary wayleaves, and the old system had to continue. He would admit at once that the single-wire circuit was unsuitable for long-distance telephony and the operators for the company had instructions not to "switch on" subscribers using it to the long-distance trunk lines. In London the company had spent a quarter of a million in establishing metallic circuits and supplying Deckert transmitters. If a similar course could be adopted in Glasgow, he believed most of the inconveniences now experienced would disappear. With regard to local telephony in London itself, he thought there was little to complain of.

Manchester.—We understand that the Manchester City Council intend making an experiment with arc lamps for street-lighting. No extensive scheme is contemplated at present, however, it only being intended to erect a few arcs in prominent positions to judge of their effect. It indeed seems to us surprising that arc lighting has not been adopted long since in a city of such importance as the "cotton metropolis," having regard to the successful lead taken by other towns. The lack of enterprise shown in this direction in Manchester becomes all the more apparent when the wonderful success which has marked the undertaking of the Corporation's supply of electrical energy to private consumers is taken into consideration. It may be that the rapid increase in the output from the Corporation electricity works to private consumers since Mr. C. H Wordingham was appointed to the post of chief engineer has detracted attention from public lighting by taxing to the utmost the energies of those in charge to cope successfully with the demands of private consumers. Now even that extensive additions have just been made to the plant—making Manchester second only in point of total output to the City of London station—it is probable that these latest additions, consisting of four 400-h.p. sets of engines and dynamos, will, together with the original plant, be fully loaded in the near future. Having regard to this fact, it of course becomes obvious that further extensions of plant would be necessary should an extensive scheme of street arc lighting be adopted, and this would also necessitate the extension of the generating station buildings, the present floor space being wholly taken up, Although there is at present no public arc lighting, it may be interesting to observe that close on 1,000 arc lamps have been fixed by private consumers, mostly for shoplighting. The maximum output of the station yet reached has been 5,800 amperes at 400 volts, so that when this output was generated the number of lamps in use must have been equivalent to about 70,000 of 8 c.p. These figures will give a rough idea of the popularity of the electric light in Manchester. While on this topic, we may add that the appointment of Mr. Gilbert Bell, lately assistant engineer at the Manchester station, to the post of resident engineer at Hammersmith caused slight changes to be made in the organisation of the staff at Manchester; but virtually Mr. P. J. Watts, who was chief at Whitehaven, has been appointed to fill the vacancy.

Shoreditch.—At the meeting of the Vestry, Mr. Wells introduced a further report stating that the vestry clerk had informed the Finance Committee that it would be necessary to take up a loan for electric mains, conduits, and drawing-in boxes made up as follows: contract sum, £15,705; engineer's commission, 3 per cent., £471; clerk of works' salary, £102; contingencies and extras, £722—total, £17,000. The Finance Committee advised, and their recommendation was adopted, that the vestry clerk be instructed to make immediate application to the London County Council for their sanction to a loan for £17,000, at 2¾ per cent., for a mean period of 42 years, on the annuity principle, and that the Council be requested to advance the money. At the meeting of the same Vestry Mr. Kershaw introduced a report of the Electric Lighting Committee, stating that they had carefully considered a letter from the Electric Free Wiring Syndicate asking that the Vestry would enter into a contract with them placing them in a position to inform would-be consumers of electricity that they could have their premises fitted up for electric light and power purposes without any initial charge, the stipulation being that the consumer so wired should pay ½d. per unit more for the energy supplied to him than would be paid by a consumer who paid cash for his wiring, and that as the Vestry received payment so the ½d. per unit would be sent to the syndicate. The committee had informed the syndicate that they had approved the scheme in the abstract, subject to further consideration of the terms as to the purchase of fittings by the Vestry after three years. They had accordingly instructed the vestry clerk to draw up an agreement, which is to include, among others, a clause giving the Vestry the option of purchasing at any time after three years, or any consumer after five on terms to be settled in detail; the wiring to be done to the satisfaction of the Vestry's engineers, and the contract not to be exclusive of other firms of free wirers. The Vestry gave their adhesion to the scheme The Electric Lighting Committee reported that they had decided to build the sub-station under the site of the refuge in Curtain-road, opposite Messrs. Law Bros.' premises in preference to the site under the refuge in Great Eastern-street, the former site being more out of the way of traffic and tramway lines. On the motion of Mr. Kershaw the action of the committee was approved; and on his proposition the tender of Messrs. Atherton and Dolman to carry out the work of erecting the sub-station was adopted, the amount being £893. This was the only tender sent in, the estimate of the Vestry's electrical engineers being £850. The Bethnal Green Guardians have asked the Vestry for a price for supplying the workhouse and the Guardians' offices with electricity.

Salford.—The Corporation electricity works at Salford, opened some 14 months ago, have been making gradual progress in spite of odds peculiar to the district. We understand that the Pendleton Co-operative Society are just opening a new branch establishment in Broughton wired for an equivalent of 712 8-c.p. lamps, connection being made to the Salford Corporation mains. A 3-h.p. motor has also been installed. This addition to the number of lamps connected will bring up the maximum output at the electricity works to about 125 kilowatts. The station started with 20 consumers, while there are now 60 connected, with a total of 11,000 lights installed. This total of lights installed will be noticed to be altogether disproportionate with the number of consumers which they are divided amongst, the average per consumer working out at about 184. We believe that the probable high average of lamps per consumer connected, owing to the peculiarities of the districts through which the mains extend, was a weighty consideration with the designer of the present station at Salford. There is no "day-load plant" in the popular sense of the term, one of the three units installed—namely, a 120-kilowatt Mather and Platt alternator—having to be run continuously to take the usual small day load. When it is considered that the usual day load at such a station would probably be not more than 10 amperes, a portion of this being merely exciting current for the transformers, it would appear at first sight a great fault in the design not to have a day-load plant. But in this particular instance, where the district of supply is very scattered, and the runs of main extremely long, a local fog

Digitized by Google

is likely to come over any portion of the network of mains unknown to those in charge at the station. In such an eventuality there are consumers who might switch on a great number of lights at a moment's notice, hence the necessity of always running a large generator to the exclusion of a "day-load plant" proper. Another peculiarity of the Salford station is that the generation of current is at 3,000 volts pressure, which is transformed down in sub-stations, and in some few cases in the houses. Notwithstanding this, however, the station has hitherto been run without a failure or hitch in the supply of any kind, which fact reflects great credit on both the designer and those in charge. A recent survey of the district convinced us that there is a great prospect for the Corporation's electric light undertaking providing that more advantageous terms can be offered to large consumers for the supply of current. The present supply is at 6d. per Board of Trade unit, we believe, without any differential rates of discount to large consumers. This is certainly a mistake which the Electric Light Committee would do well to rectify. There are at present several large prospective consumers negotiating with the authorities for a supply of current, and in the event of satisfactory arrangements being concluded with same it is a question whether extensions to the plant at the station would not have to be immediately considered, as, in accordance with the principle of always holding one unit of plant in reserve, the present capacity of the station is only equal to 10 000-8 c.p. lamps. From further enquiries which we made in the district, we are of the opinion that could the price per B. T. unit supply to large consumers be fixed at from 2d. to 4d., then an enormous increase in the number of lamps connected would result. There seems not much tendency, however, among millowners to adopt the separate motor system of running their machinery; this will come with a reduction of price per unit, but, on the other hand, there is a decided tendency to adopt electric lighting on favourable terms. Salford is altogether a peculiar district to supply, but we must confess we should like to see a differential rate in favour of large consumers adopted.

24381. Improvements in electric switches. Morton Blencowe Cotterell and Hubert Russell, 13, Lanier road, Lewisham, London.

24413. An improved handfeed electric arc lamp. Alexander George Smith, 23, St Nicholas street, Aberdeen.

24456. Improved method of generating alternating currents. David Cook, 30, Lancaster-park, Richmond, Surrey.

24472. Improvements in and connected with frames for electric accumulators. Henry Leitner, 37, Chancery-lane, London.

24473. Improvements in and connected with primary and secondary galvanic elements. Henry Leitner, 37, Chancery-lane, London.

24475. Improvements in and relating to plate carriers for secondary batteries. Henry Leitner, 37, Chancery-lane, London.

24481. Improvements in casings for electric conductors. Henry Reason, Norfolk House, Norfolk street, Strand, London.

NOVEMBER 3.

24548. An improved automatic safety device for electric circuits Lewis G Rowand, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

24551. Improvements in electric railways. Harry Clifton Reagan, jun., 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

24554. An improved way of connecting electrical fittings. Reginald Callaway Jeboult, 5, Rosemont-road, Finchley-road, London.

24577. Improvements in the preparation of filaments for electric lamps. John Hadden Douglas-Willan, 24, Southampton-buildings, Chancery-lane, London.

24594. Improvements in electrical resistance devices. George King Cummings, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

NOVEMBER 4.

24685. An electric arc lamp or regulator for magic lanterns, search-lights, or theatrical purposes. Jacob Bonn, 1, Holborn-place, London.

NOVEMBER 5.

24766. New and improved switches for electric currents. William Robert Rawlings and John Joseph Rawlings, 82, Gloucester-road, South Kensington, London.

24783. Improvements in connection with submarine cables for forming electric communications between lightships and the shore; also applicable for other purposes. James George Browne, 47, Lincoln's-inn-fields, London.

NOVEMBER 6.

24897. An improved pneumatic-electric relay for organ mechanism. Gotthilf Friedrich Weigle, 6, Bream's-buildings, Chancery-lane, London.

24924. Improvements in electrically operated cloth-cutters. George Peter Eastman, 4, South-street, Finsbury, London.

24910. Improvements in brushes for dynamo-electric machines. Pierre Joseph Charles Carron, 45, Southampton-buildings, Chancery-lane, London.

NOVEMBER 7.

24947. Improvements in and connected with electric arc lamps. Albert Lewis Davis, 68, Victoria-street, Westminster, London.

25001. Improvements in electric lighting apparatus for cabs and other carriages. Headland's Patent Electric Storage Battery Company, Limited, and Henry William Headland, 77, Chancery-lane London. (Complete specification.)

25030. Improvements relating to the regulation of electricity meters. Reginald Page Wilson, 70, Chancery-lane, London.

25036. Improvements in or connected with electric batteries. John Laskey Dobell, 57, Chancery-lane, London

SPECIFICATIONS PUBLISHED.

1895.

15215. Telegraphic printing apparatus. Buckingham

19832. Electric propulsion. New and Mayne.

22060. Automatic telephone exchange systems. Lounsbury.

23922. Means for compensating variations of load at electrical stations. Siemens Bros. and Co., Limited. (Siemens and Halske.)

23943. Lighting of streets and the like by incandescent electric lamps. Quin and Reason.

24020. Safety fuse devices for electrical installations. Siemens Bros. and Co., Limited. (Siemens and Halske.)

24049. Electrical contacts for burglar and like alarms. Moulart and de Galard.

24577. Movable supports for movable flexible electric conductors Laurie.

1896.

18549. Electrical primary batteries. Whittemore.

18593. The cores of dynamo-electric machines and other electrical apparatus. Kelly.

18652. Conductors and switches for electric railways. Lake. (Lundell.)

19456. Electric traction system. Thompson and Walker.

NOTES.

The Pacific Cable Scheme.—The conference has taken the evidence of Mr. Sandford Fleming.

Institution of Electrical Engineers.—The annual dinner of the Institution takes place next Wednesday (November 25) at the Criterion Restaurant, Piccadilly, at 7 for 7.30. At Thursday's meeting Mr. Gavey's paper on "Trunk Telephones" is to be discussed.

Water Power for St. Petersburg.—It is stated that the intention of utilising the Imatra Falls in Finland for the electric lighting of St. Petersburg has been abandoned. The scheme which now finds favour is to get the requisite water power from the neighbourhood of Narva.

Electric Furnace Work.—In the *Annales de Chimie et de Physique* Mr. Moissan gives an account of his preparation of titanium, molybdenum, uranium, manganese, and the borides of iron and of carbon by means of the electric furnace. There is little, however, of interest which has not been given from time to time as the work was done.

Mr. Crookes on Kimberley.—Lord Loch presided at the Imperial Institute on Monday, when Prof. W. Crookes, F.R.S., delivered the first of a series of lectures on "The Diamond Mines of Kimberley." At present the lectures are all about the mines. It is possible Mr. Crookes may have something to tell us about diamonds by-and-by.

In and Out.—According to *L'Electricien*, in the first six months of the present year the Austro-Hungarian Empire imported 148 dynamos and exported 117. Of the imported machines, 104 came from Germany, 31 from Switzerland, and nine from England. Of the exported machines, 30 came to England, 24 went to Russia, and 14 each to Italy and Germany.

Institute of Chemistry.—The next examinations for the membership of this institute will be held on Tuesday, January 12, 1897. In consequence of the increase in the number of candidates whose applications for examination have been accepted by the council, it is probable that more than the two ordinary examinations (January and July) may be held in the forthcoming year.

Glasgow Physical Society.—The first meeting of the Physical Society of Glasgow University for the session takes place to-day (Friday), when the presidential address will be delivered by Dr. Magnus Maclean on the subject of the Röntgen rays. Communications have been promised by Dr. J. C. Beattie, Dr. J. T. Bottomley, Mr. Alexander Galt, Prof. George A. Gibson, Mr. John Gray, Mr. J. R. Erskine Murray, and Dr. M. Smoluchowski Smolan (Vienna).

The "Synthetic Philosophy."—It may be worth a line to note that Mr. Herbert Spencer has achieved what was at one time considered the hopeless task of completing his "Philosophy." It has taken 35 years. From the beginning it was recognised that there must be a big *lacuna* in the inorganic part of evolution which roughly corresponds to a theory of chemical properties, and the 35 years have done little to supply a means by which that gap can be filled.

Barbizon.—It is stated in *L'Etincelle Electrique* that an electric tramway is proposed from Fontainebleau to Barbizon, and, moreover, it is to go through "all the most beautiful parts of the forest." But we need not take that last statement too literally, or else a very sinuous course would be implied. It is to be hoped that the artistic traditions of the neighbourhood will result in producing something of hitherto unaccustomed beauty in the way of posts and overhead wire fittings.

Books Received.—We have received from Messrs. Whittaker and Co. the following books, which we hope to deal with in due course: "The Dynamo," by C. C. Hawkins and F. Wallis; "The Metric System," by W. H. Wagstaff; "Transformers," by Gisbert Kapp (translated from the German by the author); "Auto-Cars," by D. Farman, and "Carriages without Horses shall go," by A. R. Sennett.

Lighting in Paris.—It is stated in the *Revue Industrielle* that it is very difficult to get at the exact net cost price of electric lighting in Paris. Our contemporary therefore goes at some length into the accounts of the municipal central station supplying the Halles. Ultimately, figures are arrived at equivalent to about 5·2d. on the current generated, or 7·2d. on the current sold, this including, of course, charges for capital, etc. Probably the private companies do it much cheaper.

Stoppage.—A little while ago we noted how a short stoppage of a private installation was caused by a cat not having been properly educated as to the nature of dynamos. In France they have had a much more serious stoppage caused by a mouse. It took place at Busigny, on the Nord Railway, and, so far as one can disentangle the rather mixed account given by the *Daily News* correspondent, there was a short-circuit and some coils spoiled. The fuses went immediately the alternators were started.

Drying Telephone Cables.—A method now adopted throughout France for drying cables is stated to consist in forcing dry air through the lead pipes containing the cotton or paper insulated cables. The entrance of moisture in such cables renders them unfit for service. One of the advantages of the method is the facility of repairing faults; if a fault exists dry air is forced into the cable from both ends, which will after a few hours raise the insulation sufficiently to enable the cable to be used, after which the hole in the lead covering is soldered.

Circulars.—Prof. Oliver J. Lodge gets so many prospectuses and other rubbish (fancy calling a prospectus rubbish!) delivered by the halfpenny post that he wants the Post Office to provide at a nominal figure a rubber stamp, "Declined," wherewith to return the missives to the sender. Perhaps the Post Office would prefer that Prof. Lodge should burn or sell as waste paper the prospectuses instead of asking it to carry them all the way back for nothing. Moreover, the wicked senders might post them again in new wrappers to other professors.

Canal Working.—Mr. A. de Bovet has a long article or report in the *Revue Generale des Sciences* on the condition of inland navigation in France. Mr. Galliot's arrangements for electric towing on the Burgundy Canal are spoken of as a success, but no figures are given. It is considered that tow-boats warping along a chain are preferable to screw-tugs, as there is less disturbance of the water in the absence of the propeller, and consequently less cost for the maintenance of the canal. Mr. de Bovet thinks the final system of electric navigation on canals will be a trolley system with an extensible conductor to the barge.

A National Railway Museum.—In regard to the establishment of a national railway museum, an influential preliminary committee of 20 members (with power to add to their number), consisting of members of Parliament, engineers, railway officials, and others interested in the preservation of the history and relics relating to the railways of Great Britain, has been formed with a view to promote the foundation of a permanent collection of these interesting records of the railways. Any person interested

Digitized by Google

in the subject should communicate with the honorary secretary to the committee, Mr. Clement E. Stretton, C.E., Leicester.

Block Signalling.—Readers of the articles by Mr. Pigg on "Block Signalling" who are ready in pursuing the subject further to tackle technical German may be interested to learn that in *Dinglers Polytechnisches Journal* (Stuttgart) of the 13th inst. there is an illustrated description of the Siemens and Halske apparatus for block signalling on single lines, the particular apparatus referred to being those erected by Max Jüdel and Co., of Brunswick, on the Brugg, Botzenegg, and Effingen line of the Swiss North-Eastern Railway. The arrangement is not a staff system, but one end of a section sending a train in blocks the other end.

Obituary.—The death has been announced of Mr. John Noble, formerly the general manager of the Midland Railway Company. The course of training requisite to produce a successful railway manager has not yet been specialised. Mr. Noble was intended to be a clergyman, actually became an accountant, and proceeded to the Midland Railway *viâ* the Clearing House. Being there he made his mark, not in accountancy, but by running fast expresses.—We regret also to hear of the death of Mr. William Charles Tyler, of the India Rubber, Gutta Percha, and Telegraph Company. A brief notice of Mr. Tyler's career is given elsewhere.

The Aarau Power-House.—The Aarau water-power station, which was visited on the occasion of this autumn's electrical congress at Geneva, is described in *L'Electricien.* The source of power is the River Aar. Reaction turbines are used, with alternators direct-coupled on the main shaft. At 48 revolutions these machines give two-phase currents at 2,000 volts. There is a pendulum regulation of the inlet gates. The exciter dynamos are also on the main shaft. There are three transmission lines. The town station is about half a mile off. These three motors, each working a pair of dynamos, convert the current into a continuous one for lighting purposes. There is also an accumulator of Tudor cells.

Motorcarts in Ireland.—The Local Government regulations issued for "light locomotives" in Ireland are mostly identical with the English ones, but the following appears to be an additional provision in Art. 4, Sec. 2: "Provided also that no light locomotives shall travel along any public highway within the limits of the Dublin Metropolitan police district, or of any city, town, or village at a greater speed than six miles an hour, or if its weight, unladen, exceeds two tons at a greater speed than five miles an hour." It is to be presumed that this will be construed to mean within the city or village streets, and not within the municipal boundary, but it would be well for the point to be made clear in view of the use of the term "district" in the line immediately preceding.

Russian Patents.—The French Society of Civil Engineers has been discussing the new Russian patent law. This received the Imperial approval in June last. There are the usual provisions as to "novelty," and Russians and foreigners appear to be placed on the same footing. There are, however, to be no "patent medicines" or patent foods, and patents for inventions relating to the military or naval services, though obtainable, will not run against the Government. A preliminary examination is retained, but the procedure is reformed, and an appeal provided for. The patent lasts 15 years, and the fees range from 15 roubles for the first year proportionately up to 400 roubles for the last (say from £2. 8s. to £64), but, of course, the patent can be abandoned at any time. The society had little to say on the subject, but regret was expressed that specifications were not published in France as in other countries. But that is a different matter.

Forthcoming Events.—To-day (Friday) the cycle and motor show begins at the Agricultural Hall, Islington.—At Glasgow Dr. Magnus Maclean delivers the presidential address to the University Physical Society.—On Monday (23rd) is the first Cantor lecture at the Society of Arts (Prof. Lewes on gas).—On Tuesday (24th) the paper at the Institution of Civil Engineers (Great George-street, 8 p.m.), is on "The Bacterial Purification of Water," and is read by Dr. Percy F. Frankland, F.R.S.—There is also a meeting of the Ediswan Company at Cannon-street Hotel called for Tuesday, and the Scottish Engineers and Shipbuilders meet at Glasgow on that day.—The Institution of Electrical Engineers' dinner is on Wednesday, at the Criterion (7.30). On the same evening Mr. Worby Beaumont lectures on motorcarts at the Society of Arts.—On Thursday, the Electrical Engineers discuss Mr. Gavey's paper on trunk telephones; and on Friday at Burlington House (5 p.m.) the Physical Society meets for Captain Abney's paper on the measurement of the efficiency of photographic shutters.

One-Man Companies.—The judgment of the House of Lords in Broderip *v.* Salomon may be referred to here, as it demands the attention of everyone who has dealings with private companies of the class of "So-and-So, Limited." The decision finally establishes the fact that it is now good law that any man can by associating to himself six dummies and paying the company registration fees free himself from all liability for his trade debts. It is generally understood that the letters "Ltd." give warning of that, but there is more. As "vendor" (to self and dummies) he can take payment in such an amount of debentures as will in any event make him a preferential creditor to an amount exceeding the trade assets. Mr. Justice Vaughan Williams invented a way of stopping this little arrangement quite in the old style, and the Court of Appeal (Lindley and Lopes, L.JJ.) backed him. But the law lords would have none of it, apparently holding that the day is gone by for judges to supply the defects in Acts of Parliament, so that the matter stands as explained above. It is sincerely to be hoped that this *reductio ad absurdum* of the operations of the Companies' Act may lead to speedy legislation on the subject of debentures.

The Kinetoscope.—The following lucid description of the way kinetoscope pictures are got is taken from a provincial contemporary, but its origin is evidently on the other side of the Atlantic: "Attached to the rear end of the camera is a thing which revolves at a great rate of speed, but which at certain intervals is stopped by an arrangement which pauses just sufficiently long to permit another thingamajig at the lens to open and so fix the actinic rays upon a continuous what-you-may-call-it at the other side. These work in conjunction, and so perfect is the arrangement that at soon as the first thing stops the second is brought to a standstill and remains so until liberated and started moving again by a little contrivance which is attached to the camera by a long arm attached to a piece of mechanism which moves at the same rate of speed. The negatives are then developed." A similar description of the kinetoscope follows, but the above is enough. To omit the following caution, which comes at the end, would, however, detract from the humour of the thing: "The kinetoscope is protected by patent, and any person desiring to make one by following the description given in this article is hereby informed that he may infringe upon the patent and find himself in a peck of trouble."

Digitized by Google

Electro-Harmonic Society.—There will be a ladies' night on Friday, November 27, 1896, for which the following programme has been prepared. Part I.: violin, piano, and Mustel organ, "Andante Religioso" (F. Thomé), Messrs. T. E. Gatehouse, Alfred E. Izard, and H. M. Higgs; song, "Oh, how I Love Thee" (Pavy), Mr. Herbert Emlyn; pianoforte solo, "Rhapsodie, No. 8" (F. Liszt), Mr. Alfred E. Izard; sacred song, "Ave Maria" (Gounod), Master Percy Hale; hand shadows, Mr. David Devant; recitation, "The Faithful Mind" (Burdette), Mr. W. G. Churcher; song, "Looking Back" (Sullivan), Miss Alice Reed; humorous sketch, Mr. Cecil Barnard. Part II.: violin, piano, and Mustel organ, "Cantique de Noël" (Adam), Messrs. T. E. Gatehouse, Alfred E. Izard, and H. M. Higgs; new song, "The Light of the World" (S. Adams), Mr. Herbert Emlyn; violin solo, three "Lieder Ohne Worte" (Mendelssohn), Mr. T. E. Gatehouse; recitation, "My Experience with a Whistler" (Snazelle), Mr. W. G. Churcher; song, "Mavourneen" (Florence Aylward), Miss Alice Reed; Mustel organ solo, Overture "Semiramide" (Rossini), Mr. H. M. Higgs; song, "Cherry Ripe" (Horn), Master Percy Hale; humorous sketch, Mr. Cecil Barnard.

Meteorological Society.—The first monthly meeting of the Royal Meteorological Society for the present session was held on Wednesday, at the Institution of Civil Engineers, Great George-street, Westminster, Mr. E. Mawley, F.R.H.S., president, in the chair. Mr. W. Ellis, F.R.S., gave an account of the proceeding of the recent International Meteorological Conference which was held at Paris from September 17 to 23. The conference was attended by about 40 representatives from various parts of the world, Mr. Ellis being the delegate from the Royal Meteorological Society. The Hon. F. A. Rollo Russell then read a paper on "Haze, Fog, and Visibility." Haze is most prevalent when the wind is from the north-east, and is due, he thinks, to excess of dust brought about by conflicting currents. The causes of fog are to a great extent the same as the causes of haze, although radiation in certain states of the air and ground plays a more conspicuous part. The main cause of fog is mixture of airs of different temperatures, and the attainment of a size of water particle so much larger than in the case of haze is due to suddenness of mixture, greater humidity, or greater differences of temperature. The conditions favourable to visibility are dryness of the air near the ground-level, uniformity of temperature and moisture, radiation below the mean, steady and homogeneous winds through a great depth of the atmosphere, approximation of the temperatures of sea and land, and a number of dust particles less than the mean.

The Niagara and Buffalo Power Line.—At one minute past last Sunday midnight (it is well to be particular as to the exact moment) the "Mayor of Buffalo, with a distinguished company of his fellow-citizens, announced the formal receipt of electric power from Niagara Falls by a salvo of 21 guns," and the *Times* correspondent (by telegraph) has gone into unaccustomed raptures over the event. The whole of the Niagara business has been so "discounted" and anticipated that it has long ago lost all freshness for the technical Press. One circumstance, however, in connection with this 11,000-volt transmission line has been strongly impressed on us by some excellent illustrations of it that have appeared in the *Western Electrician*, and that is the extreme hideousness of some of the arrangements for carrying it. Wood posts with broad cross-arms are the usual run, and may pass where there is no scenery to spoil. But when the line gets sinuous there is set up, instead of posts, an arrangement which is something like a Rugby football goal, and something like those curious wooden erections which are put up to adorn the entrances of Buddhist temples, only a great deal bigger than either. If the object is to take the side strain, the device does not look a very happy one. The overhead line does not, however, come into the town, and the last three-quarters of a mile of it is through a conduit about 18in. below the surface of the ground. Already 10,000 h.p. has been contracted for in Buffalo, but how long it will be before the 22 miles between the Falls and the city will be "built solid with smokeless and teeming factories" remains to be seen.

Society of Arts.—The first meeting of the one hundred and forty-third session of the Society of Arts was held on Wednesday night at the society's rooms, John-street, Adelphi, when Major-General Sir Owen Tudor Burne, chairman of the council, delivered the opening address, the subject of which was "India: Its Arts, Manufactures, and Commerce." Those present included Sir Richard Webster, Q.C., M.P. (the Attorney-General), Sir Frederick Abel, Sir Charles Kennedy, Sir George Birdwood, Sir Douglas Galton, the Hon. Sir Charles Fremantle, Sir John Donnelly, Prof. J. M. Thomson, Mr. Alexander Siemens, and Sir H. Trueman Wood (secretary). The chairman alluded at the commencement of his address to the diversified character of the natural features of India, and pointed out that its vast population was as varied in character and thought as the Norwegian and the Italian, while, similarly, the climate had its extremes of heat and cold and of drought and rain. This great empire, he reminded his hearers, was protected by a military force which numbered about 73,000 European and 146,000 native troops, besides 30,000 volunteers; it was irrigated by nearly 41,000 miles of canals, traversed by nearly 20,000 miles of railways (none of which might be said to have existed half a century ago), and covered with a network of about 46,000 miles of telegraph line. As to usual features and products, the mountainous tracts of the Himalayas produced all the plants and species of European grain, fruits, and flowers, and the vegetable produce of the plains of India was the same as in all tropical countries. At the close of the address the chairman presented the society's medals gained during the last session. A vote of thanks was afterwards passed to him, on the motion of Sir Frederick Abel, seconded by Sir Douglas Galton. The first of the Cantor lectures will be on Monday next, November 23, at 8 p.m. It is on "The Use of Gas for Domestic Purposes," and will be delivered by Prof. Vivian B. Lewes. On Wednesday, November 25, (8 p.m.), is the second ordinary meeting, when Mr. W. Worby Beaumont, M.I.C.E., lectures on "Recent Developments in Mechanical Road Carriages." On this occasion Sir Frederick Bramwell, Bart., D.C.L., F.R.S., will preside.

Motorcarts.—In reference to the meet and procession to Brighton last Saturday, the Motor Car Club seemed to have made very few arrangements, or, if they were made, they were not carried out. Moreover, though we anticipated a great crowd, the police authorities apparently did not until it was too late. Consequently, things got a bit mixed. The weather was just as bad as it could be. Mud enough to make going bad, and not rain enough to clear the streets. Ultimately, about 30 motor vehicles got off somehow or other. Some stopped at Brixton, others joined in there. Almost all that seriously meant going to Brighton got there, so that, though as a procession the affair was an utter failure, as a demonstration that the motor cars can really go the distance it was a success. They had to contend with crowds, and when outside the regions of crowds with flying squadrons of cyclists. Mud all the way was a matter of course, and at the end it was driving rain and a head wind. The

Digitized by Google

cars that observed the rules of the game got to Brighton about five o'clock. Two Bollée cars, which arrived nearly 2½ hours earlier, started from Brixton and did not stop at Reigate. Even so, however, there does not seem much room to spare for their performance inside the regulation limits of 12 miles an hour. All through the mud and muddle Mr. Lawson preserved his irrepressible spirits, and at the dinner at Brighton in the evening was ready to chaff the "friend of man" and the Walsall whipmakers. So far as it goes, the main result of the trial is to confirm our preconceived opinion, that the bigger the motor carriage, the better it goes. The failures were mostly of the tricycle type. As to safety, one little girl was run over by an American car at Crawley. The Home Office promptly held an enquiry, sending down General Carey to Crawley to investigate the cause. The police on duty, independent witnesses, and medical men were examined, and at the close of the enquiry the inspector said that so far as he could see no one was to blame for it. As the "procession" contained besides the Motor Car Club's approved vehicles experimental cars of all sorts, it would be unfair to lay too much stress on the fact that some of them created a great deal too much smell. For the rest there is little to record. The streets are not yet full of either electric cabs or steam omnibuses, but Mr. Walter Bersey has got himself fined twice more for anticipating the Act. He probably holds the record. The metropolitan police amused themselves by applying for a summons against Mr. Lawson for his motorcart in the Lord Mayor's Show, but the magistrate did not think it worth while. Moreover it is not clear that my Lord Mayor did encourage a breach of the law. There were certainly several flags in front, but whether one of them was red enough would of course have been a question for argument. The red flags of some traction engines are not quite as bright as a grenadier's tunic.

Statistical Society.—The Royal Statistical Society held the first meeting of the session 1896-97 on Tuesday evening at the Royal United Service Institution at Whitehall. Mr. Charles Booth took the chair, the president of the society (Mr. John Biddulph Martin) being prevented by illness from being present. His inaugural address on "Some Developments of Statistical Research and Methods during Recent Years" was consequently read by Mr. R. H. Hooker. The address pointed out, among other things, that electric locomotion was already beginning to furnish matter to be dealt with statistically, and it was impossible to say what might be the result during the next 60 years of the application of science to the service of man. It was conceivable that by that time some of the problems of aerial navigation would have been solved. Even the art of cycling, usually regarded as a pastime, was already beginning to exercise an economic influence. It was for the statistician to discriminate between the ephemeral phenomenon and the inception of an economic movement. [How is he to do it?] Also it was for statisticians to see that statistics are used in a strictly workmanlike manner. Cases had occurred in which they had been wilfully misused; misuse through carelessness was more frequent, and an imperfect statement of facts had in many cases led to divergent views on social problems. [The "social problem" people usually snap up anything which seems to make for their views. It is well to recognises the responsibility of putting dangerous weapons into their hands.] The address also dealt with the graphic method of statistics, with reference to the various forms of expressing statistical totals by geometrical figures, accompanied in some cases by the employment of colours. It was to be regretted that the use of the graphic method, which had sprung up automatically, had not been developed on any conventional lines. Were the employment of particular graphic forms invariably applied to the exposition of the same phenomena, and if this conventional agreement could be made international, the interpretation of statistics graphically presented would be vastly facilitated and might also serve to exchange ideas more efficiently than the illusive Volapuk of which so much had been expected and by which so little had been achieved. [So we are to go back to picture writing.] Reference was made to the application of the higher mathematics and the laws of probability to the elucidation of statistical problems, and the president said that abstract science, save as it bore on the improvement of the human race, had no interest for statisticians.—Why not? And how do they know whether "abstract science" may not be merely waiting for a "constant" in order to bring out a result of the highest practical importance? The way to test a "theory"—*i.e.*, an explanation—is to work it out and compare it with the facts, and some idea of what the facts are wanted for ought not to be without interest to an intelligent compiler.

The Telephone Service.—At the Durham County Council's quarterly meeting, the chairman (Mr. Storey) brought forward the telephone question The present state of affairs he thought was known to all business men to be not merely discreditable to the executive capacity of a Government department, but a very serious loss and trouble to all those engaged in the great industries of that county. In his judgment the whole of the difficulty arose because the Post Office Department adopted a half and half arrangement. The trunk lines were now in the hands of the Government, and the local work was in the hands of a company. He thought the Government ought to have had common sense to know that that sort of dual control did not work well in business any more than it did in the affairs of a nation. Mr. A. F. Pease said they could hardly expect the Duke of Norfolk, not being a business man, to know the effects of the present state of things, and ultimately a resolution condemning the position of things was carried. So much for the North. As to London, the letters to the *Times* have recommenced. Messrs. Hecht, Levis, and Kahn say: "Since the Post Office has taken over the trunk wires, we may safely say that the telephone has become the great impediment to communication. Before that time the service was not perfect, but the operator could at least, when you rang, reply at once, 'You can have them,' or 'There are so-and-so many before you.' When you ring now, the National Telephone Company ask you first, 'Do you want to speak three or six minutes?'—a thing you do not know yourself always. Then they communicate with the Post Office, which sometimes lets them wait 30 to 45 minutes before it tells them how many there are before the applicant. This morning we wanted to communicate with Liverpool. After 45 minutes' waiting we were told, 'There are 11 before you.'" A Government department does not answer newspaper correspondence. But it is possible that some sort of hint as to the lines such an answer would take may be assumed from a passage in Mr. Gavey's paper at the Electrical Engineers last week. Mr. Gavey, who ought to know, says subscribers fix their telephones in out-of-the-way localities and leave them in charge of office boys. The attention given is often bad, much time is wasted in ringing even before an answer is obtained, and more time is lost in fetching a responsible person to the instrument to deal with the matter in hand. In the meantime one of the subscribers is probably standing at his telephone unconscious

Digitized by Google

of the cause of delay, and the result is, not unfrequently a series of bitter complaints addressed to the local Press. That would, however, hardly be a good answer to complaints of the company's service and the trunk lines not working well together. Moreover, "time" in an office is of various values, and there is at least the possibility that the office boy may be as qualified to call or answer the telephone girl as the senior partner himself. That young gentleman has usually keener ears and less to think about.

"Thermo-tropic" Cells.—It was Mr. C. J. Reed that killed that curiously devised giant, the Jacques carbon battery, in America, and now he and other American experts have been trampling on its corpse at the Franklin Institute. It will be remembered that Mr. Reed showed that it was from the heat of the enclosing furnace that the electrical energy of the Jacques cell was mainly derived, and that he could get similar results from quite different and chemically inert combinations. In fact, the whole thing was a thermo-electric arrangement. In the present instance Mr. Reed has been demonstrating that if two pieces of the same metal are separated by a film of their own oxide (or any salt), and one of them is heated, there may be a considerable E.M.F. across the junction. Such an arrangement Mr. Reed, for reasons best known to himself, calls a "thermo-tropic" junction. Unfortunately, the oxide is a very bad conductor. Prof. Elihu Thomson's view of the Jacques cell appeared to be that the function of the air blown into the fused caustic was to form a film of oxide on the iron pot. This oxidised the sodium produced by the reducing action of the carbon on the hot soda. (The oxygen therefore goes in at one end and comes out at the other as carbonic anhydride, the iron and soda being regenerated.) But if that is so then the cell is not a thermo-electric one, which does not seem to be the case. Nor is it even endo-thermic if no other operations go on. Moreover, as Mr. Reed replied, the caustic at the temperature used would certainly contain a sodium ferrate, and if there were any reduction the iron would be reduced before the sodium. This may be good enough as an answer to any attempt to galvanise the corpse into renewed life, but Mr. Reed will not be so easily followed when he goes on to suggest that the proper things to use instead of fused caustic soda would be alkaline arsenates and arsenites, chromates, and, in fact, all the "acid" metals in the table of elements and some others which are only hypothetically acid-forming and at high temperatures. There can be no possible objection to experiments of this sort, though they are hardly likely to lead to much. The life assurance people might object to the fused arsenite cells, but that is a side issue; when they come into use it will be time enough to think of safety rules. Mr. Reed, however, seems to think such cells must be failures because they devour themselves. As with the galvanic battery, "the evolution of electric energy depends upon and is commensurate with the mechanical destruction of the apparatus itself, the cost of renewing which is always much greater than the entire cost of the fuel." After all it did for them in the days before the dynamo, it is unkind of an electrician to talk of galvanic batteries in that way. Moreover, if thought out it will be seen that there is nothing in it provided a way can be discovered of using cheap materials. Moreover, though Dr. Jacques's hot alkali may be no better than Dr. Coehn's hot acid, the relations of various combinations at high temperatures have not yet been worked out and recorded. They are altogether different from those at ordinary temperatures. There is just that last chance remaining for the primary battery inventor.

Two Books.—We have received from the D. van Nostrand Company, 23, Murray-street, New York, Mr. E. P. Thompson's book on "Röntgen Rays." It consists of 13 chapters of abstracts of contributions to societies or technical papers more or less connected with the subject which forms the title of the book. The first is Faraday's experiment on induced currents (1831) A mass of "communications" is thus got together which will greatly facilitate the historian's labours when the history of the discovery comes to be written, and which will be consulted, at any rate in the first instance, by those who undertake the dismal duty of settling questions of priority. If, however, concerning some of these it would be well to bear in mind the caution given the other day by Captain Abney as to implicitly accepting as correct all, for instance, that is published in the *Comptes Rendus*, the compiler is hardly to be blamed. Mr. Thompson's original matter consists of a *pro formâ* introduction (2½ pages) and a preface. In the latter it is said, "The author has prepared himself to withstand with about half as much patience as he expects will be required all the criticisms based upon disappointments which may be experienced by the true, or the alleged true, first discoverer of any particular property of the electric discharge not duly credited. He has been particular in presenting knowledge as to physical facts and principles, but not equally, perhaps, as to the originator of the experiments or as to the actual first discoverer, for the simple reason that the book is in no sense a history nor a biography. Where the paragraph has been headed, for example, 'Swinton's Experiment,' it means that that party (according to the article purporting to be written by him) made that experiment. Someone else may have made exactly the same experiment previously, yet the instruction is equally valuable as though the researches of the first discoverer had been related. On the other hand, the author has never had any intention of giving credit to the wrong party. The dates in the captions indicate the general chronological order in behalf of those thus interested." The style grates somewhat upon the British ear. Mr. Thompson also states that the Röntgen rays are never generated in air or anywhere else than in "a highly evacuated enclosure." To say the least, the qualification "in any great quantity" is needed before it is quite "safe to assert" that. It may be added that the "haloes" of page 143 could probably be explained by a photographer. There is a short chapter on "Theoretical Considerations' by Prof. W. A. Anthony. That gentleman does not commit himself to anything, but appears to be of opinion that the difficulty of getting diffraction fringes shows that the rays cannot be a wave motion. Of course all that it shows is that waves of different lengths have not widely different effects on the photographic plate or fluorescent screen used, but he adds an extract from *Comptes Rendus* which would make the rays infra-red. There are a quantity of excellent reproductions of Röntgen photographs scattered up and down the book.—The second book is Mr. F. J. Britten's "Watch and Clockmakers' Handbook" (E. F. and N. Spon, London), the receipt of which has been already noticed. When a book reaches its ninth edition it is past review, but occasion may be taken to refer to the excellent practice adopted of giving the French and German equivalents of all the technical terms used. These are all collected in the end, so that as far as its subject-matter goes the book serves also as a technical dictionary of the best type. Would that the practice were more common in works of this kind, for no man can know the proper equivalent of every machine "part," even in a foreign language with which he is familiar, and whoso trusts in those matters to the ordinary dictionary finds it "a fraud, a delusion, and a snare."

THE PRINCIPLES OF ALTERNATE-CURRENT WORKING.*

BY ALFRED HAY, B.Sc.(EDIN.), A.I.E.E.

(Continued from page 543.)

98. The action of a condenser when connected as a shunt to an inductive resistance may be thus explained in general terms. The total current in the inductive circuit may be analysed into two components: the *load* current, which is in phase with the impressed E.M.F., and the *idle* current, which is in quadrature with it (Art. 62). The idle current transfers the *stored energy* to and from the inductive circuit. Now, this idle current is $\frac{\pi}{2}$ behind the E.M.F. as regards phase, and the current of the shunting condenser is $\frac{\pi}{2}$ in advance of it. Hence these two currents are always of opposite sign, so that when the idle current is, say, flowing from a to b (Fig. 67), the condenser current is flowing from b to a. We shall thus have a *local current in the branched circuit which does not pass into the main circuit at all.* If the capacity of the condenser is so adjusted that its current is equal to the idle current of the inductive resistance, then it is obvious that the only current in the main circuit will be the load current. *The load current represents the minimum value which the current in the main circuit may have.* For if the idle current in the inductive resistance either exceeds or falls below the condenser current, then the excess of current must pass into the main circuit, and hence the current in the latter will be increased.

There is a fallacy connected with this problem of a shunting condenser to which it may be well to allude. It is the notion that the condenser in some mysterious way becomes a source of power, and develops energy of its own accord. All the condenser does, however, is simply *to relieve the main circuit of the idle current.* The energy which is stored up in the magnetic field of the circuit, instead of surging between the inductive resistance and the source of E.M.F., surges between the former and the condenser. The condenser, in fact, acts as a convenient reservoir for the discharge of the stored energy from the inductive circuit.

99. Advantage is taken of this effect in some cases for the purpose of increasing the power factor of the circuit (Art. 59). The advantages resulting from working with a high power factor have already been briefly considered in Art. 60. Thus, let us suppose that a 6,000-watt transformer of the open magnetic circuit type is found to take a primary current of 1·194 amperes when connected across 2,400-volt mains, the secondary circuit being open; and that the *true watts* (Art. 59) as measured by a wattmeter amount to 151. The *apparent watts* are in this case equal to $2{,}400 \times 1{\cdot}194 = 2{,}866$ watts, so that the power factor is only $\frac{151}{2{,}866} = {\cdot}0527$. The problem is to find the capacity of a shunting condenser which will render the power factor for the mains equal to unity, the periodicity being 83 ∿ per second.

In working out this example we shall assume that the E.M.F. and currents obey the simple sine law—an assumption which would in most cases not be justified in practice. But in the case of problems like the one in hand such an assumption leads to results which are sufficiently correct for practical purposes.

A glance at Fig. 68 will show the student that the relation between the total current, the load current, and the idle current may be represented by the three sides of a right-angled triangle. If, therefore, two of these quantities are known we can at once determine the third. Thus, referring to Fig. 71, we see that, the triangle being right-angled,

$$\textit{idle current} = \sqrt{(\textit{total current})^2 - (\textit{load current})^2}.$$

In our example the total current is 1·194; the load current is $\frac{151}{2{,}400} = {\cdot}0629$. Hence

$$\text{idle current} = \sqrt{1{\cdot}194^2 - {\cdot}0629^2} = 1{\cdot}192 \text{ amperes.}$$

* Based on a series of evening lectures delivered at the University College, Liverpool.

We have therefore to provide a condenser which will take this idle current of 1·192 amperes at 2,400 volts and a periodicity of 83 ∿ per second.

By Art. 91, equation (25), we have, if C denote the capacity of the condenser,

$$C = \frac{1{\cdot}192}{p \times 2{,}400}.$$

Now $p = 2\pi \times 83$, and we find $C = {\cdot}9513 \times 10^{-6}$ farads, or ·9513 microfarad. A shunting condenser of this capacity will therefore render the power factor for the mains equal to unity, so that the current which flows into the transformer from the mains is only ·0629 ampere, instead of 1·194 amperes, which is its value when the condenser is removed.

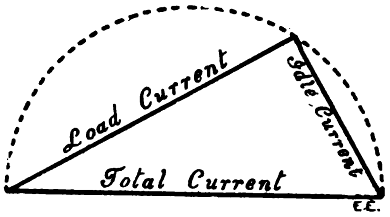

FIG. 71.

100. In all the above investigations we have assumed that the condenser current is a quarter-period $\left(\frac{\pi}{2}\right)$ in advance of the impressed P.D. at its terminals. If this were strictly true, then a condenser would absorb absolutely no power (Art. 61, Prop. II.) and the whole of the energy which is stored up in it during the first half-period, when the current is positive and the charge in the condenser is increasing, would be returned to the source of E.M.F. during the next half-period, when the current is negative and the charge diminishing. As a matter of fact, however, a condenser *does* absorb a certain amount of power, so that there is a small component of the current which coincides in phase with the impressed P.D., and hence the actual current is a little less than $\frac{\pi}{2}$ in advance of the P.D. A condenser, in fact, behaves as if it were a combination of a *perfect condenser—i.e.,* one which causes no dissipation of energy—with a small non-inductive resistance connected in series with it; this equivalent resistance may be termed the *spurious resistance* of the condenser. The small load current of a condenser goes towards producing heat in the dielectric, which gets warmed up by the repeated alternating stresses to which it is being subjected; and a condenser which has been kept working for some time shows a marked rise of temperature.

101. The effects which we have been considering may be briefly summed up by saying that a condenser of suitable capacity connected in series with an inductive resistance may be used for producing a rise of P.D. across the terminals of this resistance; and a condenser connected as a shunt to an inductive resistance may be used for supplying the idle current required by that resistance.

Cases more complicated than those we have dealt with may present themselves, but the student who has followed the preceding explanations will have no difficulty in obtaining, by means of suitably constructed vector diagrams, similar to those of Figs. 66 and 68, the solution of any problem involving combinations of a resistance, an inductance, and a capacity.

(To be continued.)

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 545.)

Fig. 91 represents diagrammatically the arrangement of circuits where switching from "intermediate" to "through" sections is in operation. As will be seen, an additional line wire is provided for the "through" section instruments at A and C, and switches are provided at these places by which the batteries may be used for either the "inter-

Digitized by Google

mediate" or "through" instruments. The main switch by which the change over is effected is situated at B. It consists of two distinct sets of switches of four each; one set being operated by depressing the tapper key, the other set being operated by the arrow-shaped handle. The four switches shown in connection with the key are in their normal position, and change of position of the contact points can only be *maintained* by keeping the key depressed. The four switches on the left will maintain upper and lower contacts according to the position of the handle by which they are operated. The operation of the left-hand contacts from top to bottom, or *vice versâ*, is controlled by locks which are released by the action of two electromagnets of similar construction to that used in connection with the staff lock and shown in Figs. 87 and 88. When the bell keys of the intermediate instruments at A and C are held down, and the similar keys of the two instruments at B are pegged down, depression of the tapper key on the switch causes currents to pass, from A and B, through the coils of one electromagnet, and currents from B and C through the coils of the other. If these currents are in "phase" with each other the electromagnets are energised, but not otherwise, and the handle of the left-hand set of switches may be turned. Assuming that the left-hand switches occupied the positions shown by Fig. 91 before the "intermediate" will show that only one of the releasing electromagnets (the lowest in Fig. 91) will be in use for this operation, the currents from A and C passing through different coils of the same electromagnet which operates on the one lock in this position.

Consideration of the system as a whole will show how absolute the control of the staffs and the switching out of intermediate stations actually is. In all cases of switching the three men at A, B, and C are all actively engaged, and the operation cannot be performed by any two of them alone. Not only is this the case, but owing to the fact that the switching currents must be in "phase" the possibility of error from attempting to switch when a staff is out of any one of the six pillars is prevented. Indeed, so highly is the system approved by Board of Trade officials that they allow fixed mechanical signals to be dispensed with at stations, situated between the staff stations, at which trains are required to stop.

Another feature connected with the switching out of intermediate stations during the times when traffic is known to be slack, other than the saving of wages, etc., is the possibility of using one set of instruments when, from any such cause as a line fault, the set in use has failed. This is an advantage which is not to be despised where traffic is heavy.

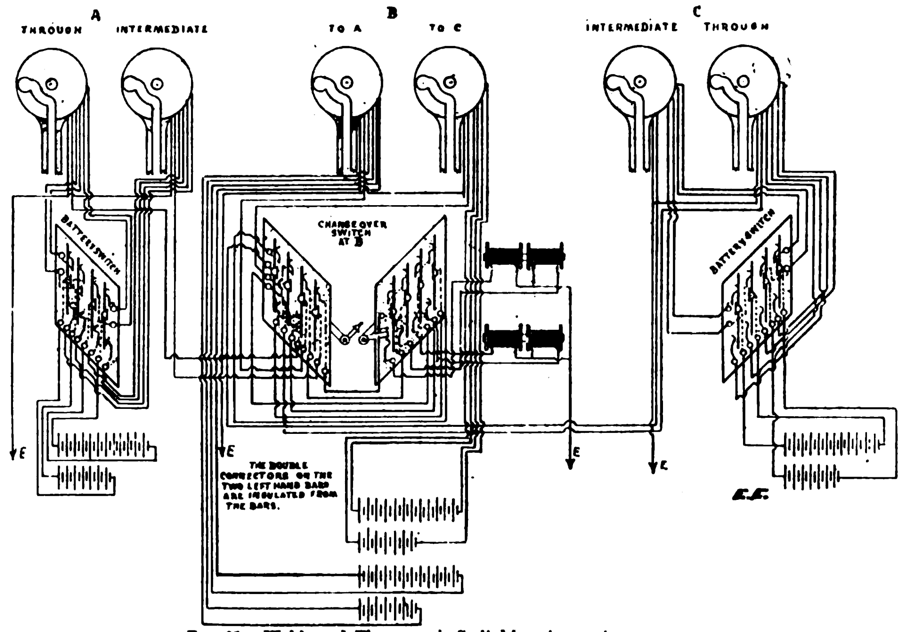

FIG. 91.—Webb and Thompson's Switching Apparatus.

operation commenced, the movements indicated will, if traced, be found to have disconnected the line wires of the "intermediate" instruments, situated at A, B, and C, at B's switch, and to have joined the "through" section line wire through at the same place. By altering the positions of the battery switches at A and C, the batteries previously used for the "intermediate" instruments are connected to the "through" instruments. Further consideration of the connections will show that the switches on the right of the change-over switch are simply used for the purpose of directing the currents set up by the depression of the keys of the instruments at A, B, and C, through the releasing electromagnet coils, and their use is temporary only. The actual change of connections is made by the left-hand switches. Further consideration of the diagram will show that the movement of the left-hand switches breaks the circuits from A, B, and C, through the lock coils and releases the locks and thus prevents the left-hand switch handle from being replaced in the position from which it has just been moved without the whole operation being repeated on the other instruments.

The operations just described constitute the change from "day" to "night" or "intermediate" to "through" instruments. The reversal from "through" to "intermediate" is similarly made, but as B has no instruments on the "through" circuit the pegging of the instruments at B is not a feature of this operation. Consideration of the conditions obtaining in switching from "through" to "intermediate"

Consideration of the instructions issued for switching show clearly that the instruments must be supplemented by some other means of communication in order that the various stages of the operation may be arranged and its completion reported. Where such means of communication do not exist it must of course be provided, and constitutes an additional expense, but there are few places now which are not provided either with a telegraph instrument or a telephone, and there will be less in the future.

(*To be continued.*)

INTERNATIONAL SUBMARINE TELEGRAPH MEMORIAL.

BY AN OCCASIONAL CONTRIBUTOR.

The following extraordinary letter appeared in the *Morning Post* a few days ago:

To the Editor of "THE MORNING POST."

Sir,—I have only just seen a letter signed "X. Y. Z." in a recent issue of your journal, and I would like to ask upon what grounds your correspondent states that the first submarine telegraph concession was granted to Mr. Jacob Brett in the year 1847. I have always understood that the concession granted by the British Government in 1847 was so granted to Mr. West, who was prevented from proceed-

Digitized by Google

ing with his submarine cable scheme for connecting France and England by the dilatoriness of the then existing French Government, which was shortly after overthrown. Further, Mr. Brett's scheme was, I believe, on all fours with that of Mr. West's, except when it came to the question of laying the cable, and then Mr. Brett's methods proved utterly useless for the important work he was engaged upon. It was about this time that guttapercha was first introduced, and Mr. West was a strong opponent of the use of this material for submarine cables, he urging that indiarubber only was a suitable insulator. My object in writing to you is not to increase the number of names identified with the inception of submarine telegraphy, as this has already been overdone; otherwise, I should certainly wonder why Mr. T. N. Gisborne's name has never been mentioned in the newspaper correspondence upon this subject. The importance of submarine telegraphy to diplomatic and commercial interests seems to me to lie in its marvellous extension to all parts of the world rather than to the question as to who first conceived the idea of connecting the countries of the world telegraphically, and surely, if this is so, the names of nearly every person mentioned in connection with the movement now on foot should occupy a relatively insignificant position to those whose names are identified with the memorial now being developed. At any rate, the place occupied by the late Sir James Anderson (and to some extent this remark applies also to the late Sir John Pender) is, I feel, altogether misunderstood by many of the writers. Sir James Anderson was, I believe, empowered in the very early days of submarine telegraphy to form companies, obtain concessions, and generally negotiate for the laying of submarine cables, and this apart altogether from his connection with the famous cable-laying expeditions of the "Great Eastern" steamship, and he spent the remainder of his life in active telegraph work. With regard to the letter of Mr. Charles Bright, in which he mentions the name of Sir F. C. Paseley, R.E., and his 1838 experiments, I would point out to Mr. Bright that Mr. West was engaged during the Canadian Rebellion in 1838 (in connection with the Intelligence Department of the Government) in effecting subaqueous telegraphic communication across the Canadian rivers. It was in connection with this service also that Mr. F. N. Gisborne (who in the fifties introduced the subject of Atlantic telegraphy to Mr. Cyrus Field, and who subsequently became chief of Canadian Telegraphs) was first engaged in telegraphic work. The omission of Mr. West's and Mr. Gisborne's names from the very extensive (and growing) lists of names now coming so boldly to the front must, I presume, be attributed to the fact that much of their early work was done out of England, and consequently out of sight of those who came many years after them. Finally, were not almost all the names in these lists those of men who acted in the capacity of employés carrying out the instructions of their superiors, and where this is not the case, have they been in any way associated with the great extension of ocean telegraphy which the last 30 years have seen? Surely even a prominent place in the early Atlantic work does not entitle them to any but a very small share in the by far greater glory of the perfected systems which now exist. It is asking the public to identify Watt with the quintuple expansion engine.—Yours, etc., G. T.

P.S.—By the way, was not the first British submarine telegraph company actually formed in 1846?

From the above letter, it is evident that Mr. West and Mr. Gisborne have had the privilege of finding favour in "G. T.'s" eyes, though it is convenient to him to ventilate the idea that "the number of names identified with the inception of submarine telegraphy has already been overdone."

In the next sentence "G. T." evidently wishes to lose sight of the actual title of the memorial as then proposed, though remembering it apparently in his previous remarks. The fact is, "G. T." obviously desires to see a memorial erected to Sir John Pender and Sir James Anderson—principally to the latter, apparently—under some important title *apropos* of submarine telegraphy, and with Cyrus Field put in as a makeweight for purposes of internationality. To carry out this design it would have been better if some other prefix had been given to associate these names with than that out of the inception and extension of submarine telegraphy, in order to meet the views of others not educated up to the same notions as "G. T." These financiers had about as much to do with the inception of submarine telegraphy as "G. T." appears to have had; and their association with the extension of submarine telegraphy was of a purely commercial character. Submarine telegraphy, as a branch of engineering, was naturally got into shape by engineers and electricians before financiers could do anything with it, either by putting their hands into their own pockets or by appealing to the public. "G. T." might also have the consideration to remember that the brothers Brett came forward as financiers to submarine telegraphy long before any of the three names which he finds so necessary an accompaniment to the title, but which he considers it should be strictly confined to. At that time the Channel cable was just as great an undertaking as the Atlantic cable was later on.

The attempt to persuade the public any longer that Sir James Anderson was responsible for the 1865 and 1866 Atlantic cables having been given up, "G. T." now, for the first time, puts the work done by Sir James in its true light. Such work, however, scarcely warrants a memorial to him and two others of his sort as representative pioneers of submarine telegraphy in place of those scientists and engineers who rendered the thing possible and a subject for financial exploitation.

The interests which "G. T." has at heart are fairly clear, but his arguments are not equally so.

I have seen several names put forward as more suited than the three financiers named as pioneers, and can safely say that most of these have taken very important parts in the "extension of submarine telegraphy of the last 40 years," which "G. T." finds it convenient to lay special stress on. The question arises as to what "G. T." calls a "mere employé." We are all, I suppose, employés of somebody in a sense. Would he describe the engineers of the Forth Bridge or the Tower Bridge as "mere employés carrying out the instructions of their superiors"? Does he regard the engineer, or firm of engineers, to the owning companies of submarine cables as "mere employés"?

The concluding sentence of "G. T." runs as follows: "Surely even a prominent place in early Atlantic work does not entitle them to any but a very small share in the by far greater glory of the perfected systems which now exist. "G. T." thinks, moreover, "it is asking the public to identify Watt with the quintuple expansion engine." A sentence of this kind lays itself open to serious criticism all round. In the first place, the subject of the proposed memorial was to the *inception and extension* of submarine telegraphy. But even if it had been to the *extension* only, most people would recognise that what "G. T." is pleased to designate "the far greater glory of the extended system which now exists" only came within the sphere of practical politics in virtue of the earlier work carried out by those pioneers whom "G. T." thinks "should occupy a relatively insignificant position to those whose names are identified with the memorial now being developed."

I should imagine that if anyone were proposing to erect a memorial to the steam-engine, and if names were to be identified therewith, the very first on the roll would be that of Watt. Certainly, the quintuple expansion engine could scarcely be a *fait accompli* but for Watt.

Had "G. T." been present at the meeting (concerning the memorial), and had he heard the remarks of Lord Kelvin, I cannot help thinking, according to all reliable reports, he would have been unwillingly forced to come to a somewhat modified conclusion. Lord Kelvin said he had read the correspondence in the *Times* on the subject, and that he agreed with every word. His lordship also drew attention to the circumstance that the late Sir Charles Bright was the first to lay a cable in deep water, and pretty clearly pointed to the fact that if any names require special mention in regard to submarine telegraphy, Sir C. Bright was certainly one of the first three deserving recognition. This view was not probably quite welcome to some of those present.

However, the matter has now been settled in a different way, and it is to be hoped we shall not hear any more of

Digitized by Google

immortalising the names of three financiers in association with any such title as "The Inception and Extension of Submarine Telegraphy"!

ON CHEAP STEAM POWER.

(Continued from page 556)

We have received from Mr. J. S. Raworth a small addition to his paper on the above subject, which was read before the Northern Society of Electrical Engineers. He also sends us a letter replying to the discussion, which we also give below. It will be noticed from the curves that the steam consumption curve for the Universal engine is not a straight line, as is usually the case for high-speed engines.

The conditions which prevail in the last example quoted are in some respects similar to those which so severely worry the brains of the chiefs of our electric supply stations—namely, variable load with an average much below the maximum. It is in cases of this kind that the advantages of automatic expansion show themselves more decidedly than with a steady load, as, for instance, in a cotton mill. Probably the best exposition of this subject is contained in Captain Sankey's paper on the "Governing of Steam-Engines," read before the Institution of Mechanical Engineers in 1895. In that paper Captain Sankey shows curves of the total water consumption with automatic expansion, as calculated and as obtained in practice and both compared with the Willans straight line diagram. The conclusions he arrives at are as follows: (1) that the theoretical gain by automatic expansion is less for high pressure than for low; (2) that the gain is less in practice than in theory; (3) that as the mean pressure is reduced a point is reached below which the consumption is greater with automatic expansion than with throttling, and that for 150lb. initial pressure this point corresponds with a mean pressure of 14lb.

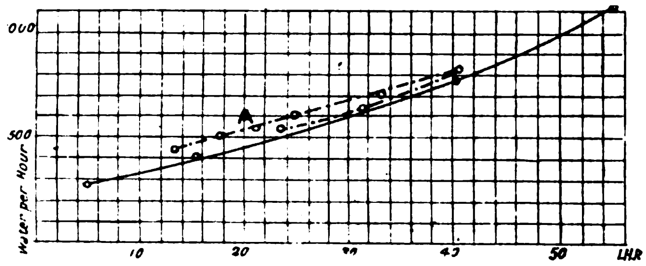

FIG. 1.

In the diagram (Fig. 1) I have plotted the results of three tests made under nearly identical conditions; the upper or straight line is taken from Willans's non-condensing trials; it is a constant expansion curve. The second short curve is from the same engine with varied expansion; the third and lowest curve is from a Universal engine of the same stroke as the Willans, but with a 14½in. low-pressure cylinder in place of 14in. It will be observed that whereas the middle curve if produced downward would cut the straight line at the point marked "A," representing 20 h.p., the lower curve never cuts it, and therefore maintains superior economy over the constant expansion to the last. This is due to the fact that the automatic shaft governor at light loads not only cuts off early but also throttles the steam, thus reducing the range of temperature within the cylinders. The main practical result is, therefore, that the Universal engine fitted with the shaft governor is at all loads more economical than a throttled engine, and that from half-load to full load the consumption per indicated horsepower is nearly constant. The saving in the cost and worry of working an electric lighting plant will be so obvious to all that I need not further enlarge upon it.

Having now given you my views on the subject of cheap steam power, illustrated by examples, which at best are only comparative—for in the nature of the case it is obviously impossible to select an example of each class that would be accepted by all engineers as a correct average—and having indicated one method by which I believe the cost of steam power may be reduced, to some extent, at least, with every existing class of steam-engine, and particularly with the high-speed vertical, I desire, in conclusion, to offer my humble tribute of admiration and of obligation to the memory of the late Peter William Willans. Not only did he give us clear and practical expositions of the theory of the steam-engine, but he also gave us experimental data so varied and so voluminous that in his "Steam-Engine Trials," "Condensing and Non-Condensing," one may find an example to fit almost every case.

Probably the most important feature of those trials is the fact that they were made on the same engine, in which, without doubt, the leakage was very small, but whatever it was the conditions remained practically constant throughout. Ordinary engine trials made on different and dissimilar engines are often extremely misleading, for many a well-designed engine fails to do justice to itself simply because the valves and pistons accidentally allow steam to pass. Thus the good points of the general design are beclouded.

There is another aspect of Mr. Willans's work which I think has not received sufficient recognition—namely, that he demonstrated that short stroke did not necessarily involve, as it was then believed to involve, either mechanical loss of power or loss of thermal efficiency—in fact, he obtained results with an unjacketed engine of 6in. and 14in. low-pressure cylinder which are difficult to beat in any size or any design of steam-engine. These results, although they are much better than those usually guaranteed to purchasers of Willans engines, were, I firmly believe, fairly and honestly obtained, and they have done more to stimulate and encourage the engineering profession than anything that has been done or said in my time. Although I am much indebted to Willans, I am more so to Corliss, for without the Corliss valve the Universal engine, if it could exist at all, would be but a mere makeshift; the very essence of its economy would be absent.

The following is the reply to the discussion:

The discussion on my paper on cheap steam power before the Northern Society of Electrical Engineers brought out one fact very clearly which I had not previously appreciated—viz., that the valves of the "Universal" engine are not generally understood. Both Mr. MacLaren and Mr. Ferranti spoke under the impression that the valves were of the cylindrical pattern, depending for steam-tightness on their fitting accurately the valve casing. I freely admit that the published drawings distinctly favour this view, and I find no fault with my critics for expressing it. The actual facts are as follows: The high-pressure valve seating is lapped out accurately to gauge; the valve is then carefully fitted so that it may be quite steam-tight when the engine leaves the works. The valve is then put in a lathe eccentrically and rather more than half of its circumference reduced, so that it may bear solely on the surface adjacent to the ports. The valve is as free as any Corliss valve to follow up as it wears. The cylindrical form is chosen partly for strength and partly in order that steam may enter freely from one end of the valve-box. The low-pressure valve is arranged with a preponderance of pressure towards the lower ports, so that it may always wear in that direction. The tendency, of course, is to render the upper or high-pressure port leaky, but that is of no moment, for the upper part of the valve may be cut away without permitting steam to pass. I retain the upper part, however, for two reasons—firstly, to facilitate manufacture; secondly, to interpose a door between the live steam and any water which may be left lodging in the valve from the preceding stroke. Should any serious wear show itself in this valve it will then become simple Corliss, neither better nor worse. The Universal engine as made by the Brush Company is a combination of many parts, some being novel and some merely developments of existing ideas. The arrangement of cylinders and valves is, however, applicable to any engine, and the object of my paper was principally to show that the theoretical and practical knowledge which we possess of the action of steam within the cylinder leads to the belief that the adoption of this construction in combination with any existing pattern of steam-engine would reduce both prime cost and working expenses. The test figures of steam consumption were adduced merely as collateral evidence in support of this view; they were not actually necessary, because the theory of the steam-engine is now sufficiently firmly established to enable the performance of an engine to be approximately estimated from the drawings.

INSTITUTION OF ELECTRICAL ENGINEERS.

At the opening meeting of the session on the 12th inst., the president (Dr. John Hopkinson) in the chair, after the usual formal business, and before proceeding with Mr. Gavey's paper on trunk telephones,

The **President** said that under the new arrangements the appointment of the Council for the year came before them that night. As these came into force now for the first time, some explanation of the procedure might be desirable. After reading Article 43, which regulates the election, the President said it would be seen that at the ordinary general meeting which occurred 28 days before the annual general meeting the chairman was to announce a list of candidates prepared by the Council, and any 10 members might nominate additional names, and must send them in, with the written consent of the nominee, within seven days, after which these names would be added and the whole list go to ballot. The "house list" was subsequently read as follows.

Digitized by Google

PRESIDENT.

Sir Henry Mance, C.I.E., M.I.C.E.

VICE-PRESIDENTS.

*Robert Kaye Gray.
*Prof. S. P. Thompson, D.Sc., F.R.S.
†Prof. John Perry, D.Sc., F.R S.
†Joseph W. Swan, F.R.S

ORDINARY MEMBERS OF COUNCIL.

*G. von Chauvin.	†Prof. J. A. Ewing, F R S.
*Henry Edmunds.	†W. P. J. Fawcus.
*S. Z. de Ferranti.	†Major R. Hippisley, R E.
*W. E. Langdon.	†E. Manville.
*Prof. J. A. Fleming, M.A., D.Sc , F R.S.	†J. S. Raworth, M I C E.
*Dane Sinclair.	†James Swinburne, M.I.C.E.
†S. L Brunton.	†Herbert Taylor, M.I.C.E
	†Charles Henry Wordingham.

ASSOCIATE MEMBERS OF COUNCIL.

*Captain W. P. Brett, R.E.
*H. W. Miller.
*Sydney Morse.

HONORARY AUDITORS.

Frederick C. Danvers.
Augustus Stroh.

HONORARY TREASURER.

Prof. W. E. Ayrton, F.R.S. (past-president).

HONORARY SOLICITORS.

Messrs. Wilson, Bristows, and Carpmael.

* Remaining in office. † New members of Council.

It was the intention of the alteration to secure that the new officers and members of Council should be those really elected by the members, and it was desired that the new arrangements should be taken advantage of, and not remain a dead letter. The reason why the consent of 10 members had been fixed on was to ensure that the candidates put forward should stand a reasonable chance of election, and the consent of the candidate was imposed in order that elections might not be made which would prove ineffective owing to the candidate not attending. Beyond this he (the President) would like to refer to the retirement of Sir David Salomons from the office of honorary treasurer. Sir David had been a most admirable treasurer, and, though they had been able to find an admirable successor, it would be impossible for him to discharge the duties of the office better than Sir David Salomons had done, and it should be distinctly understood that the Council felt very great regret at the loss of his services.

Mr. A. Campbell Swinton asked why the very important business before them had not been notified in the notice of the meeting. He had enquired about it not more than 20 minutes before the meeting and could not find out if it would come on or not. He did not think one tithe of the members were aware that it was to come on.

The **President** said the time for bringing out the list was specified in the articles.

Mr. Swinton intimated that he would move that notice should be given in future, and a discussion whether this would or would not be in order seemed likely, but was averted by an intimation that in future a notice of the kind desired should be given by the secretary.

The meeting then proceeded to the reading of Mr. Gavey's paper, a portion of which has already appeared in our columns, and the continuation of which we give herewith :

THE TELEPHONE TRUNK LINE SYSTEM IN GREAT BRITAIN.

BY J. GAVEY, MEMBER.

(Concluded from page 547.)

Hitherto, the capacity of underground insulators, which roughly equalled 0·3 of a microfarad per mile, seriously limited the use of subterranean conductors. The capacity to earth of paper cables has already been reduced to a figure varying from 0·06 to 0·08 microfarad per mile with small conductors weighing 20lb. to 40lb. per mile; and although these are not well adapted for long trunk circuits, their use for relatively short circuits will soon become general. For heavier conductors, weighing 100lb. or 150lb. per mile, the capacity to earth is about 0·1 microfarad per mile.

The growth of the trunk system of this country, at first slow, has received a remarkable impetus since the Post Office has determined on its present policy. The first trunk circuit in Great Britain was erected between Cardiff and Newport, and was opened in August, 1881. Shortly afterwards a second loop was erected. Next followed two metallic circuits between Liverpool and Manchester, opened January 27, 1882; and in May, 1883, two trunk circuits were erected between Newcastle and Sunderland. The system grew slowly, as the local telephone exchanges increased in size, until the year 1884, when the various telephone companies were authorised to erect trunk wires between any of their exchanges. They then commenced the erection of a trunk-wire system which has now been acquired by the State. At the end of the year 1895, the mileage of telephone trunk wires in Great Britain and Ireland, actually complete or in course of completion, had reached the following figures:

	Miles.
Post Office system	20,522
National Telephone Company's system	28,999
Giving a grand total of	49,521

Further and rapid growth may be confidently expected, so that the present mileage will soon be largely exceeded. Every great town in the country is, or will be, connected with the telephone trunk wires of the State; and it is probably not unsafe to predict that within the course of a few years practically the whole of the commercial business of the country will be transacted by telephone. In neighbouring manufacturing and commercial districts this condition of things has already been nearly attained.

The method of working the telephone trunk system of the country, with due regard to all the interests at stake, has been a matter of careful consideration on the part of the Post Office Department in conjunction with the responsible officers of the Telephone Company. The acquisition of the whole of the trunks by the State involved the application of the maxim that "no favour should be shown and no priority given," but that all her Majesty's subjects, whether subscribers to exchanges controlled by the Department or by private companies, or non-subscribers using call offices, should be placed on an equal footing, and have an equal right to the use of the trunks in the order of application. This involved as a first step the termination of the trunk circuits at the post offices of the towns served—a course which has accordingly been followed. Every such post office is fitted with one or more silence cabinets at the public counter, where communication can be obtained through the switchroom with the trunks serving the town, and through them with any part of the country. Although, however, communication from public silence cabinets, in the manner provided for, is at times of considerable convenience to individuals, the vast mass of the telephone trunk traffic must obviously emanate from and be for subscribers permanently connected with local exchanges; and accordingly the important problem which had to be solved was the working out of a system that would provide for establishing the most facile and rapid means of communication between the trunk circuits of the Postmaster-General and the subscribers to local exchanges, whether those of the Post Office itself or of the company. As the majority of the local exchanges are situated in the company's buildings, at a distance from the respective post offices, it would at first sight appear as though the concentration of the trunk circuits in the latter would introduce undesirable delay in manipulation; but on examination of the problem it becomes evident that this is not necessarily the case. At all large offices the separation of the trunk system from the local switch was long ago effected; and although the local subscribers' wires were generally multipled on the trunk switchboard, a subscriber's request for trunk line service was necessarily first communicated to the operator in charge of the local section, and, as it was impossible to arrange for every such local operator to have direct access to the trunk circuits, the request had to be conveyed by telephone to a recording operator, who first registered the want, after which the ticket containing the details was passed by a collector to the trunk operator in charge of the particular circuit wanted. Thus, whether, as was usually the case at the company's offices, the trunk switch was in the same room as the local switch, or, as occasionally happened, in an adjoining one, the same number of operations would be necessary in either case. Now, instead of the trunk switch being in the adjoining room, it is in another building in a neighbouring street, and, so far as the actual mode of transmitting information as to a subscriber's requirements is concerned, the operations are the same in number and character in both cases.

The general system adopted is as follows: All the trunk circuits are terminated at the respective post offices. Connection between the trunk and the local subscribers' switches is established by means of "junction circuits." For each trunk circuit one junction is provided to the local post office switch, and one to the company's principal exchange switch. These junctions are used solely for switching.

For conveying instructions, call or service circuits are established in the ratio of two circuits to each local switch for every 20 or less number of trunks. Half these circuits, known as "up" call circuits, connect the local switches with the recording tables, and they terminate in headgear telephones, which are worn continuously by the ticket operators. The other half, known as "down" call circuits, serve to connect successive groups of 20 trunk jacks direct with the switches of the local subscribers, and they likewise terminate in headgear telephones.

At the smaller offices, where a few trunk circuits only exist and the traffic is but slight, the call wires are fitted with indicators, and at the larger offices the call wires are terminated on indicators during the slack periods, as it would obviously be absurd to retain an operator listening continuously for a few intermittent calls.

The method of working is, briefly, as follows: A demand for a trunk call is conveyed to the local switch operator; the latter at

Digitized by Google

once, without initiatory ring or signal, transmits the request to the recording operator, who enters the particulars on a ticket, which is then timed in telegraphic code and sent to the trunk section affected. It may thus be said that a local subscriber's want is immediately made known to the trunk operator at the neighbouring post office, although the actual time of putting through and the commencement of conversation depend, of course, on the number of prior calls, and the time lost in obtaining the distant subscriber's attention. When the call matures—*i.e.*, when the trunk circuit is free or previous calls have been disposed of—the trunk operators at each extremity come in on the "down" call circuits, and request the junction operators to join specified junctions through to the subscribers who are wanted. This done, the trunk operators then ring up the subscribers, and on receiving replies they connect them direct to the trunk circuit.

Stripped of all technicalities, the method of working is, briefly, as follows: A subscriber, say 100, in a town "A," wishes to communicate with one, No. 200, in a town "B." The former calls his local exchange, and expresses his wish to the local operator, then hangs up his telephone. This request is at once transmitted on the "up" call wire to the ticket operator at the post office, where it is recorded on a white numbered ticket, which is timed and placed on the trunk switch. In proper turn with others the ticket is dealt with thus: The trunk operator at "A" transmits the request to the trunk operator at "B," who enters details on a pink ticket. The "A" trunk operator then comes in circuit on the "down" call wire, and asks the junction operator to connect subscriber 100 to junction, say, 4, at the same time inserting the necessary pegs in junction 4 and in the trunk. The junction operator ascertains in the usual manner if the subscriber is disengaged, and, if so, she makes the necessary connection, advising the Post Office operator of the fact on the selected junction circuit. The latter then rings up subscriber 100, and tells him he is through to 200. At the same time the trunk operator at "B" is getting through to and calling 200 in a similar manner, and when both subscribers answer their calls they find themselves in communication with one another. Although the detailed description of the operations may appear complicated, the facilities for communication between the trunk and the junction operators are such that the brief instructions that are necessary are conveyed in a few seconds, and the loss of time in manipulation by skilled operators is insignificant.

The above describes the ideal condition of things. Unfortunately in many cases subscribers fix their telephones in out-of-the-way localities, and leave them in charge of office boys, who frequently regard them as toys rather than as a serious means of effecting important correspondence. In these cases the attention given is often bad, much time is wasted in ringing even before an answer is obtained, and more time is lost in fetching a responsible person to the instrument to deal with the matter in hand. In the meantime one of the subscribers is probably standing at his telephone unconscious of the cause of the delay, but anathematising the Post Office, the Telephone Company, and all connected therewith, and not unfrequently he concludes with a series of bitter complaints addressed to the local Press.

The obvious remedy for this undesirable state of things is for firms who have a considerable amount of telephone correspondence to provide two or more local connections, one of which should be rigidly reserved for trunk work. The telephone in connection with the latter should be fitted in the office of a responsible member of the firm.

In designing the apparatus necessary for working the Department's trunk circuits in accordance with the foregoing principles innumerable matters of detail had necessarily to be considered, amongst the more important being the following: (1) The capacity of the separate sections of a trunk switch, and the provision for growth and extension at each office; (2) the working capacity of the operators—*i.e.*, the number of trunk circuits each could manipulate satisfactorily and without delay during the busiest periods of a working day; (3) the signalling and calling arrangements both for trunk and junction circuits; (4) facilities for through trunking—*i.e.*, connecting two or more trunk circuits at intermediate offices to provide communication between towns not directly connected; (5) general details of switch and transfer on through trunking sections.

1. *Capacity of Sections.*—In dealing with this branch of the subject, requirements of very wide diversity had to be provided for, ranging from cases of offices with a single trunk circuit only to those with 200 or more circuits. Again, the growth of the system, which in certain localities will unquestionably be rapid, had to be considered, and it was obviously desirable to adopt arrangements of such a character that even in the case of abnormal increase there would be no necessity for any material modification of the apparatus already joined up. To meet these requirements it was determined to adopt as a unit a section complete in itself, containing all the necessary jacks, cords, indicators, keys, etc., for a certain number of trunks, and to provide as many of these sections as were needed at each office. Each such section is of such a size as to provide space and work for one operator in busy times, although in slack periods the whole of the apparatus on three sections is within the reach of and can be worked by a single individual. Thus, an office with one or two trunk circuits is fitted with one section, and, briefly, as many sections as are necessary to provide for the existing number of trunks and for a reasonable growth are fitted up to start with. Subsequent growth is met by the addition of the requisite number of sections without serious modifications of the existing ones; a mere redistribution of the position of the circuits to facilitate the traffic, together with the undermentioned slight alterations in the case of minor offices, being all that is necessary. Although switch sections of uniform size and pattern have been adopted, the requirements at the smaller offices are, of course, not exactly of the same character as at the larger ones, therefore three types have been provided, respectively known as "A," "B," and "C" sections. Small offices with less than three trunks are provided with an "A" section, offices with from three to 10 trunks are fitted with "B" sections, offices with more than 10 trunks with "C" sections. These sections differ only in the minor details of the arrangement of junction circuits, the presence or absence of transfer circuits, referred to later on, and other small points. The principle of working is the same throughout, and, if the ultimate growth of the system at an office renders it desirable to substitute a "B" for an "A," or a "C" for a "B" section, the removal of the existing section is not necessary, but the conversion can be readily effected *in situ* by withdrawing certain movable ebonite slip holders fitted with one class of apparatus and substituting others.

2. The number of trunk circuits on each section is practically determined by the manipulating capacity of an average trunk operator. If the latter be unduly burdened with work, delays arise in establishing communication, the idle periods on each trunk during busy hours become serious, more circuits are necessary for the transaction of business than would otherwise be required, and, as a consequence, there is a waste of capital and of maintenance charges. On the other hand, if the trunks are overstaffed, loss arises in clerical wages. The latter is, perhaps, the less serious item of the two, more especially when long and costly trunk circuits are in question. As the result of the general experience of telephonic working in this country, and after careful consideration of the whole question, it was concluded that, as an average, a fairly skilled operator should work five trunk circuits with facility and without delay. Accordingly the unit section was designed to accommodate this number.

3. *Signalling, etc.*—In the very earliest days of telephone exchange working Mr. Preece introduced an automatic system of signalling, which was so designed that the mere act of removing a telephone from its support announced a call by the dropping of a shutter in the exchange, whilst the restoration of the telephone to its normal position caused a current to be sent to the exchange which indicated, by a visible signal, the completion of the conversation, and the necessity for withdrawing the connecting pegs and restoring the shutter. This system became general in all post office exchanges, both on local and in a modified form on trunk circuits. In ordinary methods of open circuit trunk working the switch operator first inserts a peg in the trunk jack, then rings up her correspondent by means of a separate key or press button. The reverse operations are repeated at the close of the transactions, and if several trunks are connected at intermediate points these operations have to be repeated on each trunk. With an automatic system of signalling the insertion of the peg indicates a call at the distant office, and its withdrawal indicates the close of the transaction. These signals are automatically repeated through any number of independent trunks which for the time being may be joined up to form one circuit. The conventional signals which have been adopted by the Department are the following:

Indicator needle to the right	Line disengaged.
" " " left	Calling.
" " vertical	Line engaged.

The line indicator is a combination of a polarised relay, the electromagnets of which are placed horizontally, with an indicator needle in front of the poles. Normally, when the switch is fully manned, the traffic is regulated by the movements of the indicator needle alone, but for slack periods and at night the relay is brought into use to repeat calling signals through a local circuit by means of a bell or a buzzer. These bells are cut out of circuit by suitable switches during the day. The manner in which the signals are transmitted is illustrated in Fig. 11. It will be observed that in its idle position the line terminates on the indicator relay, in circuit with which is a battery of six cells known as the "permanent current line battery." A second battery of three cells, known as a "permanent current local," is joined up through a 350-ohm resistance and through the right-hand half of the relay electromagnet in such a manner as under certain conditions to reverse the polarity established by the line battery. The distant end of the line being terminated in a similar manner, the two positive poles of the respective line batteries are normally connected to the "A" line, and the two negative poles through relays to the "B"

Digitized by Google

line; thus, if the insulation is reasonably high, no current flows from either end, and these batteries have no effect on the relay indicators. On the other hand, the local permanent current batteries send currents through the right-hand half of each relay electromagnet, the effect being to deflect each indicator needle to the right. If the distant operator now inserts a peg, she disconnects her indicator relay with its opposing batteries, and substitutes the

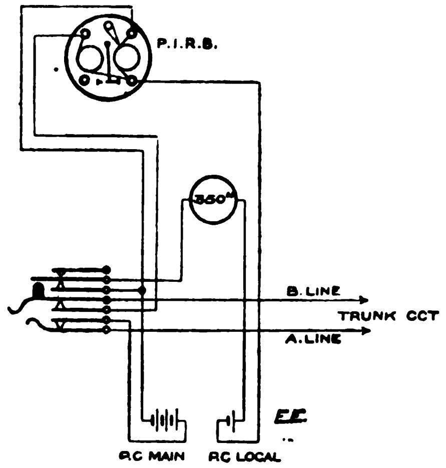

Fig. 11.

resistance of her local apparatus alone. The permanent current line battery current at the near end then flows with a reduced E.M.F. due to the effect of the local battery, but in the opposite direction to the local current through the right-hand coil, and with the added E.M.F. of the local battery through the left-hand coil of the relay. The polarity of the electromagnet is reversed, and the needle deflected to the left. On the insertion of a peg in the home jack to respond to the call, that indicator

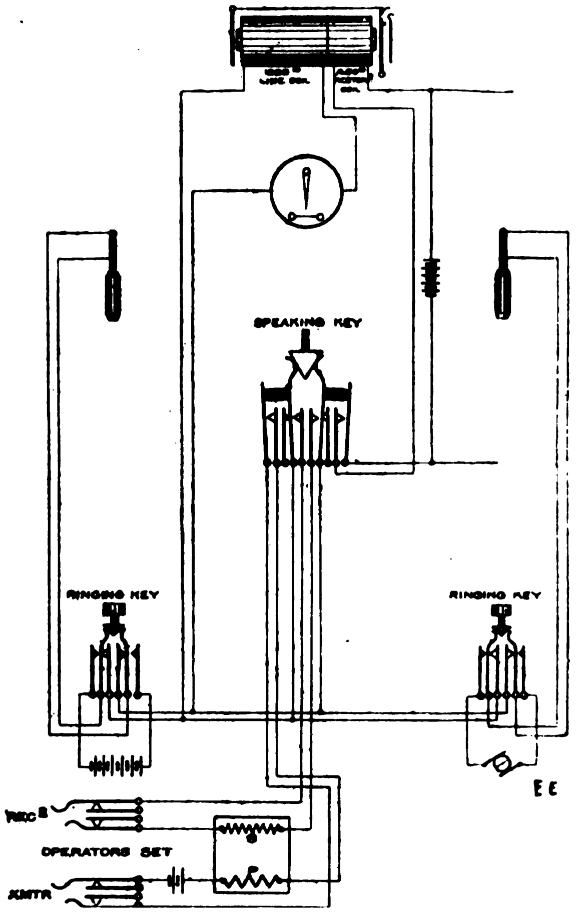

Fig. 12.

is also cut out of the line circuit, the local and line signalling batteries are disconnected, and the indicator needle becomes vertical. Ringing keys are likewise provided; one set, with black press buttons, being connected to batteries; the second set, with red press buttons, being joined to a small alternating dynamo, a pole changer, or a magneto ringer, according to the size of the office. The connections are illustrated in Fig. 12. The black keys are used for ringing up subscribers to Post Office exchanges, and for occasional use on the very long trunk circuits; the red keys for calling up the National Company's exchanges and subscribers. Separate indicators are provided in the switch cords to announce the completion of the conversation or the "ring off." There are two of these joined in series and bridged across each pair of cords, which form an electromagnetic shunt with a resistance of 2,000 ohms. Owing to the self-induction of these shunts, they act as choking coils to the rapid vibrations of the microphone, whilst responding readily to permanent currents or slow alternations. One of the indicators is a simple form of galvanometer designed to repeat the automatic signals in use on the Department system, the second a Western electric self-restoring indicator to respond to the magneto "ring off" of the company subscribers. When a Post Office subscriber is using a trunk circuit, and on the completion of his conversation, the restoration of the telephones to their supports sends a permanent current to the exchange. This deflects the galvanometer needle described above. The exchange operators at both ends withdraw the pegs, and if only one trunk circuit is in use the indicator relays, which are now brought into circuit, are both deflected to the right. If several minor trunks have been joined through at various intermediate points the line permanent currents from the terminal offices deflect the needles of the telephone galvanometers at the intermediate points where connections have been

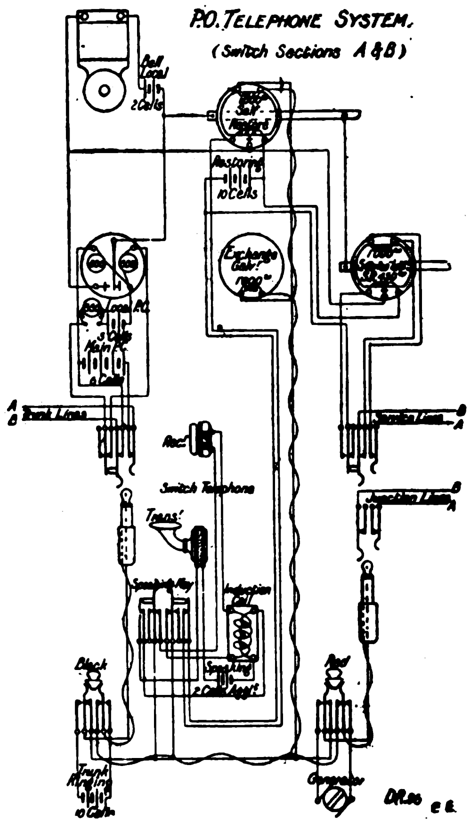

Fig. 13.

effected. The operators, without further enquiry, withdraw the pegs, and the normal condition of things is restored. When a trunk is in use by a subscriber to the National Telephone Company the operators are dependent on the business-like aptitude, or otherwise, of the subscribers for the "ring off." Should the latter fail to give the requisite turn of the handle to his magneto ringer the Post Office operators have to come into circuit at the expiration of the allotted period to enquire if the conversation is finished before withdrawing the pegs. Should a prompt reply not be given to an automatic call on a trunk circuit the black keys can be brought into use to obtain attention. Fig. 13 illustrates the connections on an "A" or "B" section.

4. Communication between different sections in one office to admit of joining one trunk circuit through to another can be effected in several ways. The most simple method of dealing with the problem consists in providing direct junction wires between each section and all the others; and this plan has been adopted where the sections are four or less in number, or where through trunking will, from the nature of the traffic, be infrequent. At large offices, however, the number of junctions necessary for this system would be very considerable; and as in practice it would be necessary to limit this number, then each junction would have to be multiplied along all the sections. To work these would involve the following operations: (1) testing for the engaged signal; (2) ringing up the section wanted; (3) on receipt of reply, transmitting the demand; these operations in practice involving more or less delay.

To overcome these difficulties, a modification of the divided board arrangement was introduced, which is, briefly, as follows:

Digitized by Google

A through trunking or transfer section, sufficient to meet the requirements of 50 trunks, is provided for each 10 ordinary sections. From each section three "down" junction wires bearing the number of the section, and lettered A^1, A^2, A^3, are carried to the transfer section, where they terminate in cords and pegs. Similarly, two "up" junctions, terminated on jacks numbered and lettered B^1, B^2, start from the transfer section to the respective switches, where they terminate in jacks. The transfer switch is fitted with a three-position key for each "A" junction: first position, normal; second position, speaking; third position, through; and both these and the jacks are provided with contacts which actuate small grid indicators, which have in practice received the somewhat inappropriate name of "visual indicators," through local circuits.

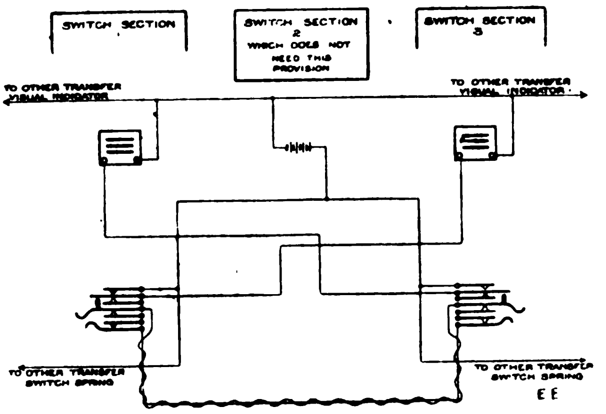

Fig. 14.

The method of working is, briefly, as follows: Glasgow requires communication with Cardiff, which at present would be obtained through Leeds. Glasgow calls Leeds, obtaining attention on, say, section 3, whilst the Cardiff trunk is, say, on section 14. The Leeds operator on section 3, on hearing the requirement, simply pegs Glasgow trunk through a disengaged "A" junction to the transfer switch, and this operation actuates a visual indicator on the junction at the l tter point. The operator at the transfer switch then turns

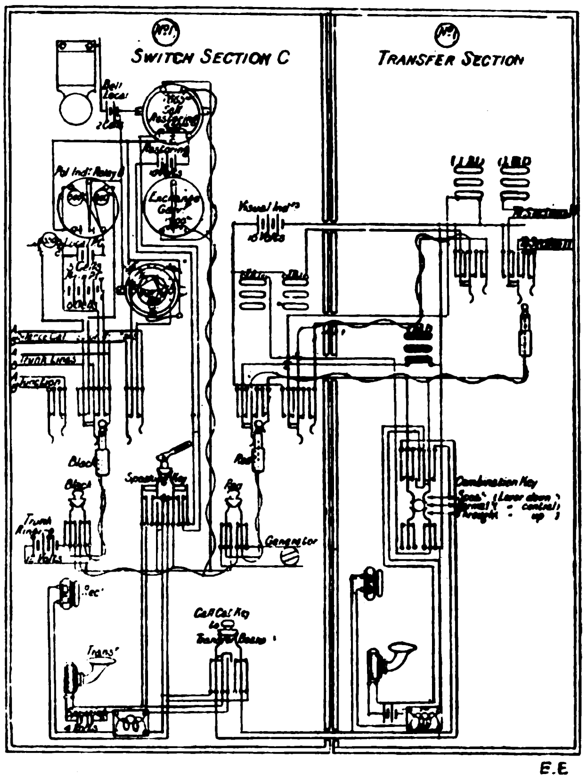

Fig. 15.

the key to "Speaking," and ascertains from Glasgow what is required, whilst the act of turning the key to "Speaking" drops a visual at section 3, which intimates to the operator at that section that the requirement is having attention. The transfer operator, on hearing that Cardiff trunk is wanted, pegs the "A" junction from section 3 into a "B" junction to section 14, thereby dropping a visual at the latter. The operator at this section, in pegging in a cord to reply, drops a visual at the transfer section corresponding to the "B" junction brought into use, which shows that the call is being attended to at the section on which the Cardiff trunks are terminated. The operator in charge of the latter then completes the connection. The talking is thus reduced to a minimum, being limited to two repetitions of the request for the Cardiff trunk, the automatic signals in all cases intimating to the operator who has pegged a trunk or a junction through that the next individual is attending to the call. None of these visuals are in the line circuit, but they are joined up on local circuits, and they remain depressed as long as the trunks are through. When the conversation is complete, this is indicated at sections 3 and 14 by the automatic signals from Glasgow and Cardiff respectively. The operators at these sections by withdrawing the pegs release the visuals at the transfer. The transfer operator on observing this withdraws the connecting peg and restores the speaking key to "Normal," which also releases the visual of switches 3 and 14. The connections for direct junctions connecting limited number of sections in small offices are shown in Fig. 14, whilst Fig. 15 illustrates the transfer-board working.

5. The general details have been partially illustrated by the preceding figures. Actual switch and transfer sections have been joined up in this room, and can be inspected at the close of the meeting. The system of duplex working that has been

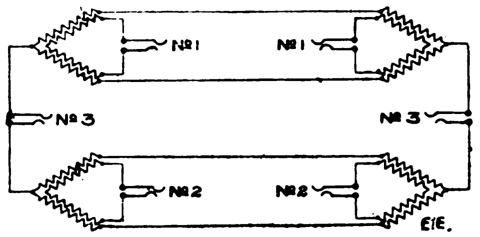

Fig. 16.

used by the National Telephone Company for some time has been adopted by the Department. Fig. 16 gives a diagrammatic sketch of the method of joining up. In this it will be observed that differential transformers are used, the secondaries being accurately balanced both for resistance and self-induction before they leave the workshop. No variable resistances are inserted, as any attempt to adjust in order to compensate for variations in the line would probably be a perfectly hopeless task. Under these conditions circuits of moderate length work satisfactorily, no ordinary changes in insulation resistance causing an upset of the duplex working so long as each of the arms is in sufficiently good order to work efficiently as a simple circuit. It is found, however, that if the circuits exceed a certain length it is difficult to maintain satisfactory duplex working; so that, for the present, this method is not applied to any exceeding 50 miles in length.

In the preceding remarks an endeavour has been made to describe succinctly the system of working adopted by the Post Office for its trunk lines. Of course these arrangements are not final, and already modifications are under consideration which have in view tbe facilitating of the switching operations by the further substitution of automatic signalling for verbal instructions on the junctions connecting the National Company's exchanges with the post offices. The growth of the system itself is progressing by leaps and bounds, and although trunk telephony is but of modern growth, and has in the past served rather as an adjunct to the ordinary methods of telegraphing, the time is rapidly approaching when it will rival the older methods in the extent of the plant, and in the importance, if not in the number, of daily transactions.

Discussion.

The **President** (Dr. Hopkinson) said that Mr. Gavey had given them a most valuable and interesting paper. The details of the system which had been explained to them had required the working of more than one brain for their development. Mr. Gavey's paper was one of a kind that the Institution wanted, as it gave them information which they had no means of otherwise obtaining. He might add that the earlier part of the paper had thrown great light upon the scientific part of the work and the theoretical questions which underlay it. There would, he thought, be time for only one speaker that evening.

Mr. Dane Sinclair wished Mr. Gavey had given him more chance of quarrelling with his paper. If he said what he thought about it, it would be that he wished he (Mr. Sinclair) could have written it himself. For those who were not telephone men the interest would lie in the first part of the paper. He was quite in agreement with Mr. Gavey in his exposition of those matters. He remembered the time when they sat and listened to induction and said it was heavy rain at the other end of the line. In order to deal with the problems before them it was necessary to get at the facts in the way that had been done by the author. As to duplex telephone lines, he believed that whatever might be the case with other branches of telephony, in that branch Great Britain was in advance of other countries. He had recently been in Stockholm and Copenhagen and seen what was done there, and he thought that the arrangements that had been shown them that evening would be beyond criticism by anyone who came from Scandinavia.

The discussion was then adjourned to next Thursday.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	4s. 11d.	9s. 9d.	19s. 6d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVII. of new series of "THE ELECTRICAL ENGINEER" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

TRACK CONSTRUCTION.

The advent of electric traction has vastly improved the service on those tramlines on which it has been adopted. The ease with which estimates of the power required by the car can be obtained when electricity is employed has also tended toward improvements in the permanent way. As in America they have had more extended application of electric traction than in this country, many new methods of track construction have been exploited there. Mr. M. K. Bowen, in his recent paper before the American Street Railway Association, gives some details of his practical experience in track work. He refers shortly to the sections of wheels and rails, and shows how inadequate the bevel on tramway wheels is to prevent slipping on the sharp curves used in street work. To prevent slipping as a car is going round a 50ft. radius curve, a bevel of about 1¾in. on a 30in. wheel would be required. Still, the present bevelling is of service when running on easy curves and on straight portions of the track. The author afterwards gives particulars of his experience with a cast welded joint between rail sections. He looks upon the joint as ordinarily made as the weak spot in track construction, and as causing the greatest amount of depreciation both in the wheels and track. In the cast welded joint the ends of the two rails are scraped and brightened, and a cast-iron mould is then placed round the joint. The molten iron consists of 25 per cent. of scrap, 25 per cent. of soft and 50 per cent. of hard silicon pig. The contraction of the metal makes a solid joint, and it is stated that amalgamation usually takes place. Still, bonding is usually adopted to ensure a metallic return. As will be readily understood, this method gives a practically continuous rail, and hence is open to objection on the ground of the strains set up by variations of temperature. Thus on one particular line some one hundred and fifty-four joints out of seventeen hundred were broken in one frost. The failure was readily seen, as the contraction of a considerable length is relieved at the broken joint. A space of three inches often is found between the adjacent rails at the break. The enormous tensional stress set up has been sufficient to tear a rail in two when great strength has been given to the joints. The greatest trouble is likely to occur at the curves, which both in extreme hot and extreme cold weather will be distorted. In spite of the care taken to make the joints while the rails are at a mean temperature, such troubles have regularly occurred. We do not, in spite of Mr. Bowen's approval, see any prospect of the introduction into our English practice of this system of rail jointing, which in cases has pulled in two a ninety-four pound rail. The author proceeds in his paper to consider the vexed question of how bad a track must be before reconstruction. The question of the large additional expenditure to be undertaken often causes the change to be deferred. The common-sense view of the subject is that of how much power is being wasted by running cars over a bad track. This, in a special case quoted, showed that, assuming a twelve-year life for the new

Digitized by Google

track, the cost of the power saved would repay the outlay and interest on nearly five times the actual cost of reconstruction. When converting many of the old horse tramlines for electric working, the reconstruction of the track will repay for extra outlay. The English practice of providing good concrete foundations for the rails will mitigate some of the faults due to the joint. A better method than the cast welded joint for finally preventing wear at these places is that adopted by Messrs. Siemens and Halske in the line through the Thiergarten, Berlin. In this case each rail is built up in two longitudinal sections arranged to break joint. The joint between rails of each section is also made by dovetailing the two parts. This method provides for changes of temperature, and is eminently more in accord with the best engineering practice.

INVENTION v. DESIGN.

The great rush for electrical inventions in the early days of electric light has practically subsided, and large sums are no longer given for crude ideas backed by a blue book. Still, amongst the rising engineers the idea of inventing has a great attraction, as is shown by the numerous patents issued each year. It is said that every electrical engineer who makes a position for himself at some time or other must invent an improved arc lamp, a commutatorless dynamo, or a new switch. The expectation of making large royalties from these inventions cannot be realised in the face of competition with existing types, and yet the stream of invention continues to pour into the Patent Office. The original thought exercised in producing some of them is worthy of every commendation, although the conclusions have generally been forestalled by earlier workers in the same direction. The inventors either have not the convenience or do not trouble to look up the previous patents, and often claim existing types as entirely new. The great opening in the present state of the electrical industry is for design rather than new invention. The man who can design machinery in such a way as to save 5 per cent. in the cost of materials or labour is always valuable. He must be versed in detail and capable of readily grasping the commercial details of the subject. The question of commercial efficiency also comes largely into the design, and the manufacturers who can maintain the reputation of their apparatus for smooth working and durability are sure to succeed. Hence, while striking departures from existing practice may bring success to one man, two others will make fortunes by being able to get the best results at the least cost from everyday types.

THAT MEMORIAL.

We have purposely refrained from taking any active part in this controversy; but in consideration of a contribution which appears elsewhere, we may venture to express the opinion that no one has a right to dissent to a personal memorial being arranged, though many will claim a right to dissent when the memorial is of a character to indicate scientific representativeness. The gentlemen in whose memory a memorial is considered necessary filled a particular niche in commercial economy, but had no claims to scientific attainments, nor did they ever venture, so far as we know, to put forward such claims.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

MACDONALD'S RELAY.

SIR,—With regard to a notice of my relay in your issue of July 31, 1896, my agent writes: "Perhaps if you were to write to the editor the errors in this paragraph would be exposed . . . Evidently the American and English Press has taken considerable notice of your relay." I esteem it an honour to be noticed for what is only an improvement of the Morse relay. Your paragraph implies a total misconception of what that improvement is. I shall deem it an especial favour if you will correct the erroneous impression it has caused. First, then, two springs are not used. The thought occurred, and also its limitations, which, to one practiced in the use of the Morse relay, are readily perceived. Perhaps the best thing to do will be to give you a succinct account of my purpose in this invention and the manner in which the purpose was effected.

First, then, I supposed that the armature was not as free *mechanically* as it might be made. A cursory consideration of the matter showed that this supposition was well grounded. I took a relay, American pattern, wound to 144 ohms, and got working on the finest possible adjustment through 780 ohms extra, with one Leclanché cell. This was the ordinary instrument in the ordinary state. I tilted this relay, nothing more, and got working through 1,400 ohms, when its cores were vertically placed. The *armature* was then horizontal, and so moved more freely. There was no *vis inertia* about the armature then as compared with it in its former poise.

Next, I put a balance weight on the end of the armature away from the contact points (see British patent 20,886, October 31, 1894; French 242,533, October 31, 1894; American 551,192, December 10, 1895; also Canadian, Indian, and Colonial—all full patents). This rendered the relay still more free at its armature, and also ensured a firm contact all the time. I wondered at this, but it was due to the balance being on the free end and opposite to the contact points, so that when the armature swung down on to the contact the balance flew up, and by its centrifugal force increased the contact pressure at the opposite end. You have to see this to understand the gain that ensuring perfect contact makes to a telegraphist. But this was not all.

Thirdly, I proportioned the retractile spring—one only being used—so accurately to the difference in force of attraction of armature to core when pulled down and of attraction of armature to core when held back, that with the simple relay described, *total* resistance only 144 ohms of ordinary relay wire—*i.e.*, 72 ohms each leg—I worked on a *line* through 6,200 ohms external resistance with only one Leclanché cell (No. 2, I think), and old voltage, say, 1·3. Of course this was not the limit of its power, and only the usual care required in adjusting a relay to best advantage was used, but the attracted parts and contacts were close. Relays wound with a greater number of turns of wire I have found give proportionately better results. Adjustment was effected by retractile *spring alone* for any variation of current from 35 milliamperes to one-fifth of a milliampere. Having the balance in a horizontal position, I weighed in grains and parts of a grain the attractive force of the armature and core for various strengths of current. My patent mentions one grain, but, as a matter of fact, a relay set as described readily responds to very much less weight. The effect of a momentary moderate current in increasing magnetic sensibility is an interesting item, but I

Digitized by Google

have already been too prolix. This increased sensibility lasts for several days.

I shall be very glad if you will make such corrections as are needful. When made, kindly post me copy of your journal, as I am far from city life. You will greatly oblige—Yours, etc., A. D. MacDonald.

Telegraph Office, Hamilton, Victoria, Australia, October, 12, 1896.

OBITUARY.

WILLIAM JAMES TYLER.

With feelings of deep regret we have to announce that on Friday, 13th inst., there passed away, at his residence in Blackheath, Mr. W. J. Tyler, the much-esteemed secretary of the India Rubber, Gutta Percha, and Telegraph Works Company, of Silvertown. Mr. Tyler had been in failing health for some time, but the end came as a surprise to most of us. The deceased was much liked and respected by those who had the advantage of his acquaintance. In 1870-71, Mr. Tyler served with those who went to aid the wounded during the Franco-German War, and here he won the regard of all his fellow-workers in this excellent cause, including Sir Henry Brackenbury, Sir Vincent Barrington, Sir William MacCormac, and Mr. Archibald Forbes, the famous *Daily News* war correspondent of that fearful campaign. On the retirement of Mr. G. A. Brand, late in 1871, our lamented friend was appointed to the secretaryship of the Silvertown Company, which responsible and prominent position he held, with much credit and dignity to this firm, up till the time of his death. In 1872 he represented his company in the colonies of the Cape of Good Hope in endeavouring to bring about the establishment of submarine telegraphic communication to the Cape by the East Coast of Africa. His arduous work (which involved loss of health) did not, however, bear fruit until some years later in the Eastern and South African Telegraph Company's cable system, which, as we know, has proved a complete success ever since its lines were laid.

It is the man rather than his useful work that we like best to look back upon and remember. The deceased was one of those who would have done well, to the best of his ability, whatever he turned his hand to. His courtly manner would, perhaps, have been turned to more useful account in the service of diplomacy than in the city of London. Chance did not decree this, however, and thus it is that we have had the advantage of experiencing that extreme courtesy and thoughtfulness (towards all alike) which was so strong a feature in his character.

Much good that Mr. Tyler has done as an energetic Churchman with a strong sense of humanity will probably never be heard of. We may rest assured, however, that his memory will be sacred to all those who have known him. Anyone more accurately carrying out the true meaning of the word gentleman it is difficult to imagine. It was but in his sixty-first year that the deceased left us, much to our loss. He was a good and kind friend to many, and one for whom and with whom it could not fail to be a pleasure to be associated with in business or in work of any description. A man of his modest and retiring nature (living for others rather than himself) shines more in his own family circle that in public. This is, perhaps, the highest praise that can be bestowed on anyone, and it seems to us it really applies in this instance. Finally, we wish to tender our deep sense of sympathy to those of his family he has left behind, and especially to his widow. We also desire to do so to the Silvertown Company and his fellow-workers, who must, indeed, sorely miss him. Many friends gathered at his grave at Charlton Cemetery on Tuesday last to pay their last respects to his memory on the occasion of the funeral.

Belgrade.—Tenders will be received on November 27 for an electric lighting installation at the National Theatre at Belgrade. Application is to the Servian Ministry of Public Works, Belgrade.

THE HUTIN-LEBLANC FLYWHEEL ALTERNATOR.

A large 600-kilowatt alternator of the above type has recently been delivered by the firm of J. Farcot, of Saint-Ouen, to the electric light company in the Champs-Elysées district in Paris. The plant previously installed in the station consisted of three 400-kilowatt Hillairet alternators driven by Farcot engines. It is stated in *L'Industrie Electrique*, from which paper we cull the following details, that the power factor of this station at full load is only ·8, and hence that when the alternators were given the full current the engines had only to provide 80 per cent. of their rated power. We do not understand why this full-load power factor should

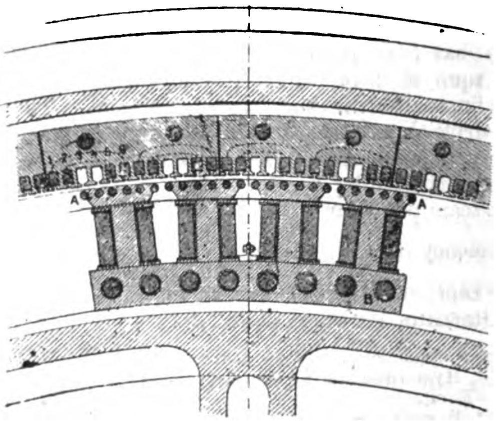

Fig. 1.

be so low, but from it the new alternator has been designed to give 600 kilowatts apparent output, corresponding to 480 kilowatts actual power. The current, 200 amperes, is generated at 3,000 volts, and the frequency of supply is 40 ∼ per second. The speed of the engine is 60 revolutions per minute. The sections of the machine (Figs. 1 and 2) will enable the reader to follow the description. The iron of the armature is built up in laminated blocks, having six recesses in the space opposite one pole. The form of these recesses can be seen in Fig. 1. The idle spaces not used for winding tend to keep an approximately uniform magnetic resistance. The armature circuit consists of 80 coils, wound flat and connected in two parallel circuits. Each coil consists

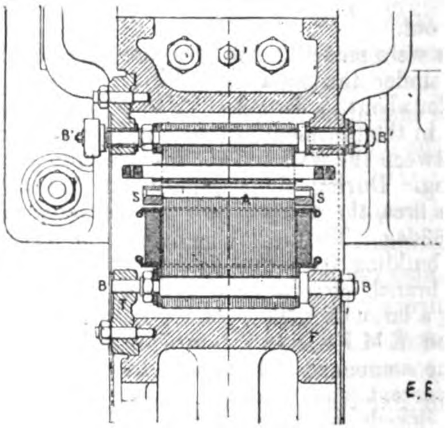

Fig. 2.

of two concentric windings, each containing 12 turns of wire of ·05 square inch sectional area. The wires are insulated by micanite, which gives a very high insulation resistance between the circuit and the iron of the armature. This iron circuit is built up of 40 blocks, each carrying two armature coils, and the blocks are insulated from each other by ebonite ·120in. thick. The bolts, B' B' (Fig. 2), which support the block are insulated by ebonite, both from the laminated iron and from the cast-iron frame of the alternator. This insulation tends to prevent discharges to the frame due to the capacity of the line. The air-gap is only ·31in. The external diameter of the

Digitized by Google

armature is 23ft. 6in., and its breadth is 2ft. 1in. In this machine the magnets are the moving parts, and are attached to the flywheel of the engine. The magnetic system is formed of 80 poles, built up of sheet iron 78 mils thick fixed to the wheel by two bolts, B B. These are clamped to a rim of the flywheel at one side (Fig. 2), and on the other rest in movable segments, T. There are 20 of these movable segments, each of which secures four poles. The magnets are wound with wire ·021 square inch section, connected in four parallel circuits. The polar projections are also provided with six grooves to receive six copper bars of ·82 square inch section, which are riveted at both ends into copper segments extending over four poles. These bars form practically a squirrel cage, and reduce fluctuations of the magnetic flux. The external diameter of the magnets is about 19ft. 7in. The machine is excited by a 40-kilowatt direct-current dynamo at 220 volts. This machine has four poles, and has in its polar surfaces a similar squirrel cage. This precaution is also used to prevent fluctuations in the exciting current. The engine used to drive this alternator is of the single-cylinder Corliss-Farcot type, condensing. The diameter of the piston is 31½in., and the stroke 4ft. 7in. The guaranteed consumption of steam per hour is 14½lb. per indicated horse-power. The efficiency of the set—*i.e.*, $\frac{\text{E.H.P.}}{\text{I.H.P.}}$—is found to be 83·5 per cent. at full load.

The alternator losses are as follows :

Armature—Copper loss	17,000	watts.
Hysteresis and Foucaults	7,500	,,
Magnets—Excitation	12,000	,,
Damping coils	6,500	,,
	43,000	,,

This, at an output of 480 kilowatts, gives an electrical efficiency of 91·8 per cent.

TEST OF AN ISOLATED ELECTRIC LIGHTING PLANT.*

BY S. A. BEYLAND.

This article contains the results of tests of the gas-engine and lighting plant belonging to the First M. E. Church, of Knoxville, and was made in order to ascertain the economy of such a plant in actual service as run by the janitor. No precautions were taken to have the machinery in better order than usual, and the gas was measured by the regular meter furnished by the gas company, by which the bills were made out.

The tests were made by the engineering students of the university under the supervision of Dr. Perkins. They continued for about three hours. The engine and dynamo are located in the basement of the church, and in a cramped position between the wall and the furnace used for heating the building. During these experiments, on account of starting the fires, the temperature of the room rose from 60deg. to 82deg. The switchboard was on the opposite side of the building from the dynamo, on the main floor, and all the branch circuits were fed from this point, thus introducing a large drop in pressure, as mentioned below. Current and E.M.F. were measured by Weston instruments. The ammeter read only to 50 amperes. Above that point current was reckoned by the number of lamps in circuit. Speeds were measured by a tachometer, and quantities of gas by the meter in regular use furnished by the gas company.

The engine was the regular Otto 10-h.p. machine, fitted with a governor controlling the speed by regulating the number of explosions. This governor worked well at high loads, but at very light loads the speed would frequently drop five revolutions or more below normal before an explosion would occur. The dynamo was rated at 110 volts and 60 amperes. It was compound wound, and the characteristic is shown in Fig. 1. For further regulation a rheostat is placed in the shunt field coils, which is cut out at high loads in order to compensate for the excessive losses in the feeders. The dynamo was run at a speed of about 1,550 revolutions per minute. During the course of the test additional lamps were thrown on until the current rose to 70 amperes, while the temperature of commutator increased from 60deg. to 122deg., the temperature of the room increasing during the same time to 82deg., as above mentioned. With a current of 50 amperes a drop of 7·7 volts was noted between dynamo and switchboard, indicating a resistance of about 15 ohms. The wire was evidently too small, causing a loss of 1 per cent. for 10 lamps, 5 per cent. for 50 lamps, and 10 per cent. for 100 lamps. The loss in branch circuits was also quite large, but was not determined, the lamps in the main chandeliers being inaccessible. The lamps used required about 80 watts, or 5 watts per candle-power if we take them at their rated (16) candle-power.

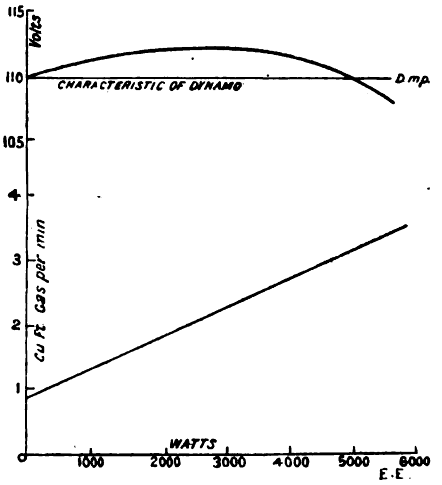

Fig. 1.

The consumption of gas above that necessary to run the engine and dynamo unloaded increased quite uniformly with the load. The accompanying figures show the cost of lighting per hour of actual plant for different loads, also cost for same plant if four-watt lamps or three-watt lamps were used. Lines are also drawn showing the cost of the same illumination using gas, the gas being taken at 20 c.p. as given by the regular tests of the gas company. The gas is reckoned 1dol. (4s. 2d.) per 1,000 cubic feet, and at 1½dol. (6s. 3d.) per 1,000 because the local company charges the latter price for gas used for illumination, while for gas-engines and all fuel consumption they charge 1dol.

The illustration (Fig. 2) shows the cost per hour in cents, and the price of gas in dollars.

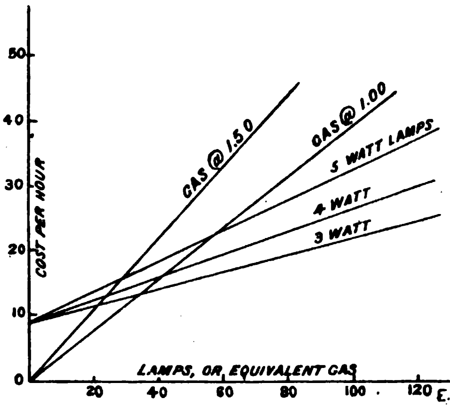

Fig. 2.

From a consideration of the figure it will be seen that where only a small number of lights is required gas used directly is much cheaper. Above 30 lamps it is decidedly cheaper to use the gas for fuel in driving the dynamo. Thus if it is desired to illuminate but one or two of the smaller rooms the gas-burners are used, but if the main audience-room or the entire building is to be lighted the dynamo is put in operation.

THE INSTITUTION PAPERS.

A cry has been raised for a change of intent,
A slur has been cast upon efforts foregone;
And if ink has been wasted, if time has been spent,
To the purpose of nothing—go, spread the cry on!

The sting of the cry and the knob of the slur
Are directed at certain MM.I.E.E.;
And, if one is an unit and two are a pair,
Then names and intentions are easy to see.

Produce the *Proceedings* and turn the leaves o'er;
Most papers are useful, most authors renowned;
Small blame to the scribe if behind and before,
And perchance in the middle the Morals are found.

The Morals that deal with the author's machine,
The Morals that point out defects in the rest,
The Morals whose meanings are plain to be seen,
Regarding devices, and which is the best.

But sandwiched between, like the thorns and the bud,
And scattered about like the plums in the duff,
The data and useful experience should
Atone for the rest of the innocent "puff."

* * * * * *

When a change has been wrought in the nature of man,
When the *Ego* is not but the *Tu-toi* remains,
Then papers will read on a different plan,
The products of virtue, as well as of brains.

But while the Old Adam is still in each heart,
We'll take and be thankful for what we can find;
And store up the "tips" that the papers impart,
And leave all the Morals for those who are blind.

November 17, 1896. J. H. C. B.

ELECTRIC LIGHTING AT DARWEN.

REPORT BY MR. E. M. LACEY, A.M.I.C E.

On July 15 last you informed me that your Council had resolved to ask me to report as to lighting the town of Darwen with electricity, and in transmitting this resolution you stated that the Electric Lighting Committee would like me to show (1) the lighting area; (2) the capital cost of the works, and particulars; (3) the cost of machinery, and whether there would probably be a profit consequential upon the installation; (4) the utilisation of refuse destructors for steam-raising purposes in connection with the proposed electrical works.

Having satisfied myself that, for the proper consideration of the complex conditions associated with the investigation, an inspection would be necessary, I visited Darwen on August 21 and September 10, and after having placed myself in communication with Mr. Stubbs, the Corporation engineer, who kindly furnished me with certain local information and other necessary details, I again visited Darwen on September 21. Having since that date thoroughly considered the entire subject, I now beg to submit the following report thereon.

In order to place the matter before you in the clearest possible manner, I have considered it advisable to divide my report under five headings, as follows: (1) probable demand for current; (2) the most suitable system; (3) capital outlay necessary; (4) probable profit, after payment of interest and sinking fund on the capital expended; (5) the desirability of combining the electricity works with a system of refuse destructors.

Before dealing with the advisability of establishing corporation electricity works in your town I think it desirable to refer to the feeling which has influenced some municipal authorities to discountenance electric lighting, on the grounds of presumed injury to the gas properties which they own. This idea is purely imaginary, and it has been proved, not only in London, but also in many other towns, that with the adoption of electric lighting the gas demand for cooking and warming purposes has still increased to so great an extent as to more than balance any decrease for purposes of illumination.

Probable Current Demand.

Lighting.—I have been carefully over those portions of the town where a demand for a supply of current for lighting purposes is possible, and I find that in the event of electricity works being established, there would be an immediate demand for current in the following localities: Market-square, Railway-road, Church-street, Frederick-street, Bolton-road from the Market square to the cemetery, Duckworth-street, and Blackburn-road to Westwell-street. I estimate that, with current sold at the rate of 6d. per Board of Trade unit, the demand in these streets and their immediate vicinity should, during the first two years' working, amount to the equivalent of 6,000 lamps connected, and that the number of lamps connected at the end of three years, both in the above streets and in the remainder of the area, will amount to at least 11,000. This number will, of course, be increased as the charges for current are reduced, which reduction can be effected by the Corporation, owing to the greatly decreased cost of production.

Power.—From my investigations I do not anticipate there will be any considerable demand for power purposes during the first year, although there undoubtedly will be eventually an appreciable demand for small power motors, but this will not entail any further capital expenditure, as current required for power purposes being almost entirely during perids of light loads there would be no necessity to make any addition to the capacity of the generating plant.

Traction.—Several municipal authorities have recently entered into arrangements with tramway companies serving their districts for the supply of electricity for traction purposes, and a profitable arrangement for such supply might at any time be made in your town The economy and other advantages of electric traction for tramway work are now being fully recognised by the tramway companies, and any company working a tramway within the range of your provisional order would be unable to carry mains for current generated by themselves, provided that your Corporation were prepared to supply. At the same time it is an advantage for electricity works to supply current for traction purposes, as the generating plant can then be utilised at those periods of light load when it would otherwise be standing idle, thereby reducing the cost of production and increasing the efficiency of the works.

The Most Suitable System.

The System of Supply.—In arriving at a decision as to the most suitable system to be adopted, it must be remembered that there are now, in addition to the two original systems—viz., high-tension alternating, as at Bolton, and low tension direct, as at Bolton—several other simple or combined systems of supply which are at present working most satisfactorily. Amongst these may be mentioned high-tension direct current with sub-stations and low-tension network, as at Wolverhampton; low-tension five-wire direct current, as at Manchester; low-tension three-wire direct current (400 volts), as at St. Pancras extensions; direct current three-wire supply, combined with high-tension alternating supply for outlying districts, as at Blackburn. Any of the above systems might be the most suitable one for a proposed area of supply, and in selecting or designing a system, the conditions of the localities, the nature of the demand, and the area of supply have principally to be considered. The points which constitute the most satisfactory system are as follows: (1) low capital expenditure compared with capacity of supply; (2) immunity from breakdown and failures, and low annual expenditure for repairs and maintenance; (3) economy in the production of current, and its transmission to the consumers' premises; (4) the arrangement of the system of distribution, such that extensions both within the area and to outlying districts may be carried out on the most economical lines. In addition to the above points, it is most necessary in such a town as Darwen to provide only such generating plant as may be necessary for immediate use, but at the same time to so design the station that additions may be made from time to time without interfering with the original installation, or necessitating a cessation of supply. It is also desirable to design works which can be most economically adapted to the supply of current for power or traction purposes, provided this can be done without impairing the efficiency of the system. By designing the works on the above lines an enormous advantage may be subsequently obtained, since should power be supplied to the tramways in the future, an exceedingly small expenditure of capital would be entailed, and the cost of the production of additional current for power purposes would be reduced to a minimum.

The System Recommended.—Taking all the above points into consideration, the system which is most suitable, most reliable, and which would give the best results, both from an electrical and a commercial point of view, is a system of direct-current three-wire supply, with a difference of potential of 440 volts between the outer cables throughout the whole area, and a 220-volt service to the consumers. This system, if applied in your town, will comply in every way with the points enumerated above. The generating station, if properly designed, will allow of a low capital expenditure, and the plant can be such as to secure immunity

Digitized by Google

from failure. The system of distribution will be such as to give the least possible loss in your particular area, and both the first cost and cost of future extensions will be exceptionally low if sufficient care be given to the initial arrangement. The annual works costs for current production will also be kept at a minimum, as the ease of regulation and the absence of transformers or of any complicated apparatus for maintaining the required pressure will enable the system to be worked with the least possible amount of skilled labour, and at the same time avoid the many consequent losses between generation and consumption. This system, besides being actually the most serviceable for lighting purposes in your town, also complies with the requirements of power and traction work, and the same plant can be designed, without additional cost, in such a manner that it is interchangeable for either traction or lighting purposes.

CAPITAL EXPENDITURE.

The Plant Necessary.—In order to provide for the adequate supply of current for the number of lamps connected during the first year as estimated above (6,000), generating plant would be required of a capacity of 120 kilowatts, but it would also be necessary with a first installation of plant to provide a duplicate generating set as a stand-by during cleaning or repairs. This spare set will be a sufficient stand-by until such time as an additional plant has been added to the equivalent of 18,000 lamps connected. It can therefore be seen that the cost of extensions will not be in the same proportion as the initial cost of the installation. To provide steam for the above plant a boiler of sufficient size is required, together with a duplicate boiler of the same capacity. The remarks applied to the duplicate generating machinery also apply to the boiler extensions. With this plant a balancing apparatus for the centre main and accumulators for storage purposes are required, together with main switchboard for the efficient regulation of the current supply. The above, together with all requisite steam, exhaust, water, and electrical connections, overhead travelling crane and engine-room accessories, are all that are necessary; but I have also included the cost of condensing plant, as the saving which will be effected by this will at present more than pay the interest and sinking fund on the increased capital expenditure, and with the future increased output will effect a very considerable saving.

The Site.—I have ascertained that a site for the works is available on the vacant property in the possession of the Corporation adjoining the technical schools. This site I have visited, and I find it most suitable for the purpose required and for the system recommended above.

Buildings.—The buildings should comprise engine and boiler house, chimney shaft, accumulator-room, test-rooms, stores, and offices, and these would be so designed as to facilitate extensions at the least possible cost. I estimate the cost of the works described above as follows:

Central Station, Frederick-street.

Buildings, inclusive of overhead traveller	£3,100
Two steam dynamos, each having an output of 120 kilowatts	3,200
Balancing apparatus, switchboard regulating gear, electrical connections, instruments, etc.	800
Accumulators	900
Two boilers, condensing apparatus, feed pumps, steam and exhaust pipes	1,900
Feeder and distributing mains, junction boxes, and all necessary street works	4,100
Service connection to consumers	900
	14,900
Contingencies, 5 per cent.	745
	£15,645

That this capital outlay is an exceptionally small one may be best demonstrated by a comparison with the cost of other electricity works in the neighbourhood. I therefore append the following costs of some of the smaller systems calculated on the basis of 6,000 lamps connected: Blackburn, £18,000; Bolton, £24,000; Burnley, £19,000; Bury, £19,000; Lancaster, £20,000; Preston, £32,000; and Southport, £22,000. In making this comparison I am placing the cost of your proposed system at considerable disadvantage, for, with the exception of Burnley and Bury, the above works have all a considerably greater number than 6,000 lamps connected, and therefore, as I have mentioned above, the outlay for spare plant is proportionately much lower. The works can be so designed that the additional cost of plant and mains for a further 6,000 lights would not exceed £6,100, or a total of, say, £22,000 for 12,000 lamps connected. Further extensions could be carried out on a slightly advanced ratio of cost.

PROBABLE PROFIT.

During the first year's working the cost of production and receipts should not be estimated on a higher basis than that of an average of 2,000 lamps connected for the whole year. During the second year of working I think I may safely calculate the profits on the basis of 5,000 lamps connected for the whole year. I also add the cost of production and receipts from an installation of 12,000 lights, which should be in the fourth year.

Probable Receipts and Expenditures at a Charge of 6d. per Unit.

	First year.	Second year.	When 12,000 lamps connected.
Average lamps connected	2,000	5,000	12,000
Estimated number of units sold	52,500	96,000	180,000
	£ s.	£	£
Receipts from sale of current	1,312 10	2,400	4,500
,, ,, meter rents, etc.	46 0	88	130
Total receipts	£1,358 10	£2,488	£4,630
	£ s.	£	£
Works costs—Coal	145 0	270	425
Engine-room stores	33 0	52	125
Salaries and wages	410 0	525	750
Repairs and maintenance	45 0	120	250
Rent, rates, taxes, etc.	80 0	100	200
	713 0	1,067	1,750
Interest and sinking fund on £15,600	780 0	780	1,100*
Total costs	£1,493 0	£1,847	£2,850

* Interest and sinking fund on £22,000.

These accounts show a deficit for the first year's working of £135 after payment of all capital charges; a net profit on the second year's working, after paying off first year's deficit (£135), of £406; and a profit when 12,000 lamps are connected of £1,780. The above figures on revenue and works costs are not theoretical calculations, but are based directly on the revenues obtained and the actual costs achieved at several electricity works which have been supplying current for from one to three years. As before mentioned, I have not taken into account current which may be supplied for power purposes, the receipts for which will add considerably to the profits of the undertaking, as no extra capital expenditure is necessary to meet this demand.

REFUSE DESTRUCTORS.

During recent years most exaggerated views have been advanced both by experts and others with regard to the immense savings to be effected by the utilisation of the products of the dustbin as fuel for steam raising in connection with the generation of electricity. By comparing the figures given above for cost of coal with the interest on capital expenditure and cost of upkeep of a system of refuse destructors, it can be seen at a glance that the refuse is actually the most expensive fuel. If, therefore, the question of electric lighting only were under consideration, and the town's refuse already being economically dealt with, I should be slow to advise the expenditure necessary for destructor works for the sake of the possible savings. In the case of Darwen, however, it is not so much a question of the advisability of destructor works as of the combination of these works with an electric lighting scheme, since I understand that it has already been decided that such works are practically necessary and will of themselves effect a saving on account of cartage, etc. Under these conditions there can be no doubt whatever as to the advisability of combining the two works. If this can be carried out on the site mentioned above, the saving effected will be very considerable, and even if it were found necessary to erect the destructor works at some distance from the centre of the town, it would still be of advantage to also transfer the electricity works, although this might require some alteration in the system proposed above and a possible increase in capital cost. The proposed site near the technical schools would enable the combined operations to be carried out in a singularly advantageous manner both on account of its central position and the formation of the ground. I might also add that in other more populous districts there has been little or no opposition to the establishment of electricity works consuming refuse, where there would undoubtedly have been considerable opposition to the erection of an ordinary refuse destructor. The advantages of combining the destructor and electricity works may be described as follows:

1. *Capital Expenditure.*—The first cost of destructor works to deal with the refuse of your town would be approximately £3,750. If these works were to be specially designed for combination with the electricity works, the additional cost of the destructor portion would be approximately £500, which would be more than balanced by the saving effected in the cost of buildings for the electricity portion and the utilisation of one chimney shaft for both purposes.

2 *Steam Raising.*—The steam power which could be obtained from the destructor boilers may be taken during winter load at about 200 h.p., and during summer at about 100 h p. It must not, however, be supposed that this power is available to its full extent for electric lighting purposes, this being impracticable owing to the fact that plant for electric lighting is working at heavy loads for only about four hours in the twenty-four, whereas, on the other hand, refuse is continually being delivered for from eight to ten hours, and must be dealt with almost at once. Even if destructors were designed to deal with the whole of the refuse during the period of heavy load, the fact that interest on capital expenditure would more than balance the value of the fuel saved renders such a scheme commercially impracticable. Storage either thermal or electrical is also too costly to be employed on a sufficiently large scale. I, however, estimate that the actual saving in fuel value effected by a combined scheme would be from £90 to £200 per annum as the output of the station increases. Should an arrangement, however, be entered into for the supply of power during the day for traction or other purposes, the generating station would then be provided with a continuous load, and the refuse could be utilised to its fullest extent.

3. *Working Cost.*—By combining under one staff both the destructor and the electrical portion of the works, the annual cost of management and labour for both undertakings could be considerably reduced.

Digitized by Google

Taking the above facts into consideration, I am of opinion that, even putting on one side all question of future traction or power supply, the economies to be obtained by the combination of the electricity with the destructor works are such as to render the undertaking one that will prove of very considerable benefit.

SUMMARY.

I advise (1) that the area which may be profitably supplied at once includes the streets mentioned above and coloured red on the plan (this being the proposed compulsory area), and that the area which can be economically supplied is all that district coloured pink on the same plan; (2) that the system which will best meet the requirements of the area of supply is a direct-current three-wire 440-volt supply; (3) that works be erected and a system of distribution laid down at a cost of £15,645, this being sufficient for the supply of current to 6,000 lamps connected; (4) that the undertaking will yield a profit on the second year of working, and from that time forward will be an exceedingly profitable concern, even after allowing for a reduction in the current charges to consumers; (5) that since it is already decided that a refuse destructor is necessary for the town, a proper combination of such destructor with the proposed electricity works will very appreciably reduce the cost of the production of current, and the capital expenditure on the combined scheme will be less than that of both works if erected independently.

In conclusion, I would add that the prospects of making an electricity undertaking a financial success in Darwen are such that it will probably not be long before electricity works are established by private enterprise should the Corporation not take steps to obtain a provisional order and exercise their powers under it.

The following letter has also been forwarded by Mr. Lacey to the town clerk with reference to the proposed electricity works, Darwen:

Dear Sir,—You may remember that at the meeting which I attended on Thursday last I informed the committee that whilst not prepared to quote figures for other electricity works off-hand, I should be pleased to forward the Board of Trade returns for other towns where corporation electricity works are established.

By referring to my report you will see that for the first year's working I estimated an average number of 2,000 lamps connected throughout the whole year, this average representing 4,000 lamps connected at the end of the year. I give below my estimated figures for Darwen and the results obtained in various towns for the purpose of comparison. These figures are all taken from Board of Trade returns, and are for municipal works only. I have not given the results achieved by private companies, although these are in some cases even more satisfactory.

COMPARISON.

Town.	Lamps at end of year.	Units sold per lamp.	Total units	Price per unit. d.	Revenue. £	Total costs. £	Deficit. £	Surplus £
Darwen..	4,000	13	52,000	6	1,400	1,535	135	—
Nelson	4,500	16 26	64,981	5	1 281	1,025	—	256
Burnley	6,708	15 77	74,383	6	1,802	1,932	131	—
Lancaster......	6,312	15·05	78,264	5	1,612	1,918	306	—
Hanley	11,930	16·80	180,469	6	3,512	3,441	—	71
Oldham.........	6 940	16·99	68 988	6	1,775	1,927	152	—

The above figures will, I think, show that my estimates are not too sanguine, provided a connection of 4 000 lamps can be obtained in Darwen by the end of the first year's working. You will note that I have only allowed for an annual consumption of 13 units per lamp connected, this number being exceeded in each of the results given above. I refer to this more particularly, as some members of the committee appeared to think that I had over-estimated the probable number of units consumed per lamp. I have also made enquiries at Blackburn with regard to the falling off in the consumption of gas during the last 12 months, and find that this is directly traceable to the large number of mills and factories which have been closed owing to the bad trade in the town. I find also that so far as concerns that portion of the town which is within the area of the electricity supply there has been no appreciable falling off in the consumption of gas.—Yours faithfully,

E. M. LACEY.

LEGAL INTELLIGENCE.

A MOTORCAR TRANSACTION.

In the Queen's Bench Division on Monday, before Mr. Justice Wright, Koosen *v.* Rose was an action brought by Mr. John Adolphus Koosen, a gentleman residing at Southsea, against Mr. S. Rose, a bicycle manufacturer, carrying on business at Southsea, to recover £150, the price of a motorcar. Defendant denied liability.

The plaintiff's case was that in August last he had at Southsea a motorcar, which had been previously exhibited at the Imperial Institute and Hurlingham. The defendant was anxious to purchase a machine of the kind, and plaintiff said that after having had a trial of the car the defendant agreed to purchase it for £150—£100 down, and £50 in three months. Plaintiff further said that the defendant did not pay the £100, and afterwards refused to take the car.

Defendant said the arrangement between him and the plaintiff was that if the car worked satisfactorily at the carnival held on Southsea Common on the afternoon of Saturday, August 22, he would purchase it. The car, instead of working properly, stopped and had to be pushed home. Under these circumstances defendant said he was not bound to take the car.

His **Lordship** gave judgment for the plaintiff.

CLAIM FOR TELEPHONE WIRE.

At the Huddersfield County Court on November 12, an action was concluded in which the National Telephone Company sought to recover £10 from Messrs. E. A. Beaumont and Co., accountants, Huddersfield, for telephone wire and instrument.

Mr. Tetley (Wade and Co., Bradford) was for the Company, and Mr. F. A. Reed (Learoyd and Co.) for the defendants.

The case was originally brought in November last year, and had been adjourned from time to time.

His **Honour** now decided against the defendants on various points that had been raised.

Mr. Reed asked for liberty to appeal, on the ground that as between the parties there was no mutuality, and that there was no certainty as to the rent.

His **Honour** granted the application.

COMPANIES' MEETINGS AND REPORTS.

WEST INDIA AND PANAMA TELEGRAPH COMPANY, LIMITED.

The general meeting of this Company was held on Wednesday at Winchester House, E.C., Mr. C. W. Earle presiding.

In moving the adoption of the report the **Chairman** said the half-year under review was the better portion of the year, as it was the half-year in which the sugar crop in the West Indies was ready for shipment, and therefore it must always be expected that the second half of the year would not be so favourable in the way of traffic. For the half-year up to June last the Board were able to pay the largest dividend that had ever been paid. For the 25 years during which the Company had been in existence the dividend had never been so much as 1s. 6d. on the ordinary shares, and therefore what they were paying was so far satisfactory, although in comparison with what it ought to be it was very much the reverse. During the half-year there had been an increase in the receipts of £2,468 as compared with the corresponding period of the previous year, and there was an apparent increase of £332 in the expenses. The small increase in the total expenses was really in one item—the reserve for depreciation of ships, and there had been other small decreases. The Board were of the opinion that the rate of writing off for depreciation on that account was not sufficient, and that the reserve was not sufficiently high considering the age of the ships, and they had therefore written off £1,000 from that account. There was no doubt that the traffic of the half-year had been increased by exceptional circumstances. The political excitement in British Guiana had no doubt been the cause of some extra Government traffic, and to that they must therefore attribute some of the increased receipts. At the last meeting he called the attention of the shareholders to the Bermuda-Jamaica extension, which, it appeared, the Government were still very anxious to promote. The subject was brought before them particularly on that occasion, owing to a reply of Mr. Chamberlain in the House of Commons, in the course of which he stated that the Government were negotiating and were anxious to make that connection. It seemed that they were still anxious about it, but the difficulty was to serve the small traffic of the West Indies. Many of the Company's stations at the present time hardly ever sent a message, but they were compelled to be there owing to the Act originally passed and the obligations imposed upon the Company. The fact was that almost the whole use of the West India and Panama Company was Government service. The duty of the Company was to knit together the colonies and protect them from disaster and from rebellion such as they had before the telegraph existed in Jamaica. The receipts for the last five years had averaged £57,000 per annum. In the original prospectus, with which he might say the present Board had nothing to do, it was estimated that the traffic receipts would be £156,000 a year, and the shareholders could therefore easily see what had been the cause of the present unfortunate position of the Company. The question of the Bermuda-Jamaica cable was one that was always giving a great deal of anxiety, as in those matters there was always a danger of other people coming in with a low contract to perform the work. The promoter of a company agreed with a cable manufacturer to carry out the work, and then they put in the prospectus that the cable was subsidised by her Majesty's Government, so that people thought the 4 per cent. held out was as good as consols. The Treasury took the lowest offer that was made, and there was no guarantee whatever for the permanence of the undertaking. He looked with a considerable amount of alarm upon what was a new policy in this country, the proposals of the Government to subsidise at the expense of the ratepayers competition with enterprises such as theirs, and it was very damaging to the future enterprise of the country that such a state of things should exist.

The report was adopted and the dividend approved.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Seraing.—November 26 is the date for applications to the Provincial Authorities at Liège for a concession for making and working a tramway at Seraing.

West Looe.—The Parish Council invite tenders for the lighting of the place with gas, oil, or electricity. Full particulars from Mr. Wm. Hicks, hon. clerk, West Looe Parish Council. Tenders to be in by November 28.

Hanover.—Tenders will be received on November 28 for 5,170 telegraph posts for the Prussian Railways. Particulars for 50pf (6d.) from the office, Rechnungsbureau der Königl. Eisenbahn Direktion, Joachimstrasse 7, Hanover, Germany.

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s.) from the Generaldirektion, (Centralbureau) Grossh. Badischen, Staatseisenbahnen, Karlsruhe. Germany.

South Shields.—The Corporation require tenders for a steam alternator and a rectifier, and extension to switchboards. Tenders are to be delivered by November 23. Specifications, etc., can be obtained at the Borough Electrical Engineer's Office, West Holborn, South Shields, on and after November 9, on payment of £1. 1s. (returnable).

Hartlepool.—The British Electric Traction Company, Limited, of 1 and 2, Great Winchester-street, London, E.C., on behalf of the Hartlepool Electric Tramways Company, Limited, invite tenders for the construction of the permanent ways. Particulars, specifications, plans, and form of tender may be obtained from Mr. J. Vincent Kitchener, secretary, London, on deposit of £5, which will be returned on receipt of a bona fide tender.

Warrington.—The Cheshire Lines Committee are prepared to receive tenders for the supply during the year 1897 of telegraph materials, instruments, wire, etc. Patterns can be seen and specifications with forms of tender obtained upon application to Mr. S. Saxon Barton, storekeeper, Cheshire Lines, Warrington. Tenders, sealed and endorsed, to be sent to Mr. Glegge Thomas, secretary, addressed Cheshire Lines Stores Department, Warrington, not later than 10 a.m. on November 28.

Dublin.—Tenders are required for the supply of general stores and sundries during year ending December 31, 1897, for the Dublin United Tramways Company. Forms of tender (price 1s. each), conditions, and all information can be obtained and patterns seen at the Company's Offices, 9, Upper Sackville-street, Dublin, until the 30th inst. Tenders, sealed and marked outside "Tender for Stores," and addressed to the Chairman, to be lodged with Mr. Wm. Anderson, secretary, by 30th inst.

Bury.—The Corporation are prepared to receive tenders for the wiring of the municipal offices, Bank-street and Parson's lane, Bury. Copy of specification and form of tender may be obtained on application at the office of the Borough Engineer, and on payment of a deposit of 10s. 6d., which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed respectively "Wiring—Bank-street," "Wiring—Parson's-lane," to be delivered at the office of Mr. John Haslam, town clerk, on or before noon on November 30.

Hanley.—The Corporation require tenders for air-compressors (alternative arrangements driven by steam and by electric motors), and alternating-current electric motors at the sewerage works. Full particulars, specifications, bills of quantities, and forms of tender may be obtained at the office of Mr. Joseph Lobley, borough engineer and surveyor, Town Hall, Hanley. Contracts will only be given to firms paying the standard rate of wages. Sealed and endorsed tenders must be sent to the Borough Engineer before Monday night, 30th inst.

Deptford.—The Commissioners of Baths and Wash-houses for the parish of St. Paul, Deptford, invite tenders for proposed electrical installation at the public baths, now in course of erection. Specification, form of tender, and particulars may be obtained at the offices of the architect, Mr. Thomas Dinwiddy, Greenwich, and 5, Whitehall, S.W., on payment of £5 deposit, to be returned on receipt of a bona fide tender. Sealed tenders to be delivered to Mr. Arthur Huntley, clerk, Vestry Offices, 20, Tanner's-hill, Deptford, before 4 p.m. on 30th inst.

Greenhithe. — The Greenhithe and Knockholt Lighting Inspectors require tenders for lighting, cleaning, and extinguishing the lamps in the said district from December 1 next to November 30, 1897, both inclusive (except the months of June and July) from sunset to 1 a.m., for either one, two, or three years at the option of the inspectors. Tenders to state the price per lamp and the proposed method of lighting, and to be addressed to the Lighting Inspectors, Railway Hotel, Greenhithe, and delivered there before 8 p.m. on 24th inst. Mr. A. H. Walter, clerk.

Copenhagen.—Provided the City Council will vote for spending the necessary amount, an electric station is to be built in Vesterbro, Copenhagen, and tenders are invited for the delivery of (1) boilers, (2) mechanical and electrical plant, and (3) network, in accordance with the description. Conditions and plans to be had upon application to the Electrical Station, 30, Gothersgade, Copenhagen. For each specification a fee of 50 kroner is charged, which is returned on acceptance of the tender. Tenders will be received at the office of the fourth division of the Magistracy until December 4 at 12 noon.

York.—The directors of the North-Eastern Railway require tenders for the undermentioned articles, in such quantities as they may require, during the six months ending June 30, 1897, delivered carriage paid at the company's telegraph stores at York: (1) telegraph apparatus; (2) telegraph wires and line stores. Payment for each month's delivery will be made at the end of three clear months, or in cash, less 2½ per cent. discount. Forms of tender may be obtained on application to Mr. Graves, Telegraph Department, York, and tenders must be sent in to the secretary, Mr. C. N. Wilkinson, at York, sealed and marked "Tender for Telegraph Stores," not later than noon on Monday, November 23.

Monmouth.—The Town Council require tenders for the following: (1) machinery (consisting of turbines, alternators, steam-engines, boilers, electric motors, sewage pumps, etc.); (3) cast-iron pumping main; (4) electric lighting mains. Plans may be seen on and after 19th inst. on application to Messrs. Bramwell and Harris, engineers, 5, Great George-street, Westminster, S.W., or to the Town Clerk, Monmouth, from either of whom may be obtained, on deposit of £2. 2s. (to be returned on receipt of a bona fide tender), a printed form of specification and tender for either contract. Tenders, on the prescribed form, must be delivered with the specification attached (enclosed in a sealed envelope), endorsed "Sewage-Disposal, Tender for No. —," and addressed to Mr. T. R. Oakley, town clerk, Monmouth, by 12 noon on November 23.

York.—The Corporation invite tenders—(Section A) supply and erection complete of plant in a central electric lighting station; (Section B) supply, laying, and connecting complete of a system of mains; (Section C) supply, erection, and connection of arc lamps; (Section D) running the whole system for a period of years. The whole work is to be in accordance with the specifications and drawings prepared by Prof. Alexr. B. W. Kennedy, M.I.C.E., the consulting electrical engineer to the Corporation of York. Firms willing to undertake the whole or any section of above work may obtain copies of the specifications and drawings on application to Mr. William Giles, acting town clerk Guildhall, York, and on making a deposit of £2. 2s., which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed "Electric Lighting," to be delivered by 30th inst.

Maryborough (Ireland).—Tenders are invited for the supply and erection of an electric light installation at Maryborough District Lunatic Asylum by the Commissioners for the Control of Lunatic Asylums. Tenders should be sent in a sealed envelope, endorsed outside "Tender for Electric Lighting, Maryborough Asylum," and addressed to the Secretary, Board of Control, Customs House, Dublin, and should be accompanied by a separate sealed envelope similarly addressed and endorsed, containing the detailed estimate, by 10 a.m. on 23rd inst. Forms of tenders and copies of specification will be issued on application to the Office of the Board of Control of Lunatic Asylums, Customs House, Dublin, on deposit of £3. 3s., which will be returned to all persons who have sent in bona fide tenders. Plans can be seen at the office of the electrical engineer, Mr. Walter Leake, 35, Dame-street, Dublin.

Southampton.—The Corporation invite tenders for the supply and laying of (*a*) insulated electric mains, (*b*) conduits and drawing-in boxes. Specifications and forms of tender can be obtained on and after 20th inst. at the Municipal Offices, Southampton, or at the offices of the engineers, Messrs. Kincaid, Waller, and Manville, 29, Great George-street, Westminster, on payment of a fee of £3. 3s., which sum will be returned on receipt of a bona fide tender. The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each branch of the trade. The contractor whose tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties for the fulfilment of contract. Sealed tenders, endorsed "Electricity Supply, Tender for Contract No. 2," must be sent to Mr. George B. Nalder, town clerk, Municipal Offices, Southampton, at or before 12 noon on December 4.

Ayr.—The Electric Lighting Committee require tenders for the supply and erection of the following plant (the whole bound up in one specification, price £2. 2s., returnable on receipt of a bona fide tender): (Section A) boiler-house plant—two Lancashire boilers and fittings, mechanical stokers, extensions to economiser, feed-pump, steam and exhaust pipes, valves, etc.; (B) engine-house plant—two 200-kilowatt steam alternators and condenser; (C) underground work—cables and culverts. Tenderers are at liberty to tender for either section, but not for part of a section. The ground plans of plant and specification, with terms and conditions of tenders and contract, may be obtained at the offices of Mr. Robert Hammond, the consulting engineer to the Corporation, Ormond House, Great Trinity-lane, London, E.C., on payment of £2. 2s. for each copy, which sum will be refunded on the return of the specification filled up with a bona fide tender. Tenders, sealed and marked "Tender for Electric Lighting," must be addressed to Mr. A. G. Young, town clerk, Council-chambers, Ayr, N.B., and be delivered by November 25.

Southampton.—The Corporation require tenders for the erection of buildings for an electric generating station, including engine-house, boiler-house, pump-room, and offices, chimney shaft and flues with accessories thereto, to be situated on the ground belonging to the Corporation, comprising and adjoining the present electric light station between Back-of-the-Walls and Canal-walk. Specifications, quantities, and form of tender can be obtained and the drawings can be seen at the Municipal Offices, Southampton, or at the offices of the engineers, Messrs. Kincaid, Waller, and Manville, 29, Great George-street, Westminster, on payment of a fee of £3. 3s., which sum will be returned on receipt of

Digitized by Google

a bona fide tender. The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each branch of the trade. The contractor whose tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties for the fulfilment of contract. Sealed tenders, endorsed "Electricity Supply, Tender for Contract No. 1," must be sent to Mr. George B. Nalder, town clerk, Municipal Offices, Southampton, at or before 12 noon on December 4.

West Ham.—The Town Council require tenders for the supply of the following: four steam alternators and exciters; surface condenser and pumps; station switchboard, etc.; high and low tension mains, etc.; transformers, sub-stations, etc.; instruments; arc lamps, posts, etc.; crane. Plans of the suggested arrangements, specification, form of tender, and further particulars may be obtained at the office of Mr. John J. Steinitz, borough electrical engineer, Town Hall, Stratford, E., on the deposit of a £5 Bank of England note, which will be returned on receipt of a bona fide tender. Tenders, endorsed "Tender for Machinery, etc.," to be sent to Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham, by 4 p.m. on November 24. The contractor will be required to enter into a bond, with two sureties, for the performance of contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

RESULTS OF TENDERS.

St. Pancras.—The Vestry have accepted the tender of Mr. T. E. Kershaw for supplying and erecting the additional arc-lamp pillars at £8. 5s. each.

Blackpool.—The Electric Lighting and Tramways Committee have accepted the tender of Messrs. Askam Bros. and Wilson for the centre channel for the Station-road tramway.

BUSINESS NOTES.

Devizes.—It is proposed to instal the electric light in the Wilts County Lunatic Asylum.

Mexico.—There is a scheme on foot to furnish electric power to the city from peat beds nine miles distant.

British Electric Traction Company, Limited.—Letters of allotment in this Company have been posted.

Wilmslow.—The Local Authority intend to apply to the Board of Trade for an electric lighting provisional order.

Personal.—Mr. Henry F. Lewis has retired from the position as manager to the London Electric Omnibus, Limited.

Rangoon.—The Municipality have recommended an expenditure of about £250 for an experimental lighting station.

Burton.—The Town Council are applying to the Local Government Board for power to light the library with electricity.

The Jandus Arc Lamp.—Messrs. Drake and Gorham inform us that the demand for this lamp is growing tremendously.

Leeds.—The City Council have decided to promote a Bill in Parliament to construct and work new tramways in the city.

Paisley.—The Corporation have agreed to acquire the site offered by Messrs. Kirkwood, Baird, and Co. as an electric station.

Buenos Ayres.—The report of the Board of the Central Produce Market states that the electric light has been provided in No. 8 block.

Battersea.—The Vestry have decided to borrow £5,000 for the electric lighting of the town hall, municipal buildings, and public library.

Farnworth.—At the District Council meeting the question of electric traction and electric lighting was referred to a sub-committee.

Simla.—We learn that the tenders for the electric lighting scheme have been received, and probably by this time the selection has been made.

Hull.—Mr. Skinner has been appointed chairman of the Corporation Electric Lighting Committee and Mr. Millington as deputy chairman.

Birmingham.—The City Council have decided to spend £10,143 in providing an electric light installation at the new meat market and slaughter-house.

Withington.—The Urban District Council have given notice that they are applying to the Board of Trade for a provisional order to supply electricity.

Luton.—Councillors Green, Cumberland, Ellery, Wilkinson, Smith, Harman, Cain, and Warren have been appointed the Electric Lighting Committee.

Ventnor.—The Local Authority intend to apply to the Board of Trade for a provisional order to supply electricity under the Electric Lighting Acts in their district.

West India and Panama Telegraph Company.—For the two weeks ended November 15 the receipts were £2,337, as against £2,134 for the corresponding period of 1895.

Aston Manor.—At the monthly meeting of the District Council sanction was received from the Local Government Board for a loan of £350 for electric lighting (additional plant).

Ealing.—The surveyor reported at the District Council meeting that the number of private lamps connected with the mains was now 9,160, and there were 150 more applied for.

Eastern and South African Telegraph Company.—Numbers are published of 5 per cent. first mortgage debentures of this Company, drawn for payment at par on January 1 next.

Cork.—The Lord Chancellor of Ireland has approved the tramway scheme of the Cork Electric Tramway Company, Limited. The lines will be seven or eight miles long.

Manchester.—The City Council have approved the promotion in the next session of Parliament of a Bill seeking authority to work the tramway system by the use of electric or other power.

Lancaster.—The Electricity Committee has been appointed as follows: Aldermen Kitchen, Smith and Bell; Councillors Preston, Hall, Storey, Leeming, Atkinson, Heald, Warriner, Huntington, and Little.

Indian Import Duties.—It is notified in the *Gazette of India* that machinery for the generation of electricity for purposes of lighting—namely, dynamos and connections—are exempted from import duty.

Cromer.—The Urban District Council have resolved not to proceed any further with regard to the provisional order on account of the cost of obtaining it being so great. The Clerk said it would cost £300.

Eccles.—The Town Hall and Electric Lighting Committee has been constituted as follows: Messrs. Alderman Kendall and Wilkinson; Messrs. Councillors Broughton, Corner, Mort, Oldfield, Pearson, and Plews.

Kensington.—At the Vestry meeting several questions were asked as to whether the Vestry could not utilise the house refuse to produce electricity for the supply of motor power for the dust, slop, and water vans.

Derby.—It was stated at the Town Council meeting that the Council were supplying lamps to those that wished to have them, but they were not supplying lamp fittings to the detriment of the tradesmen in the town.

Worcester.—At a special meeting of the City Council it was decided, owing to the development of the electric light in the city, to put in another cable from the generating station to the city, at a cost of £1,338.

Yeovil Motor Car and Cycle Company, Limited.—This Company has been registered, with a capital of £1,000 in £1 shares, to carry on the business of carriage and van builders, motorcar, and cycle manufacturers, etc.

Liverpool.—The City Council have decided to promote a Bill in Parliament to enable the Corporation to purchase the tramways, which are now in the hands of a company. The motive power has not yet been decided upon.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended November 15 amounted to £1,143, as compared with £1,028 in the corresponding week of the previous year, being an increase of £115.

Camberwell.—The Baths Committee reported at the Vestry meeting that above 45 cells of the electric accumulators required renewing at an estimated cost of 48s. each cell, and they recommended that tenders be advertised for.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended November 13 were £1,875. 6s. 3d., compared with £1 938 16s. 7d. for the corresponding period of last year, being a decrease of £63. 10s. 4d.

Aberdeen.—The Gas and Electric Lighting Committee has been appointed as follows: Councillor Johnston (convener), Lord Provost Mearns, Bailie Young, Councillors Boddie, Croll, Fleming, Gray, Maitland, Bain, Sangster, and Skinner.

Eastbourne.—The Lighting and General Purposes Committee has been appointed for the year as follows: the Mayor, Aldermen Burt, Pocock, and Sutton, and Councillors Bradford, Breach, Job, Newman, Pearce, Rowe, Simmons, and Wright.

Beccles.—At the Town Council meeting Councillor King moved for a special committee to report on the present system of public lighting and the desirability of adopting the electric light. Councillor Buck seconded, and the resolution was carried.

Westralian Electric Lighting and Supply Company.—The Municipal Council of Coolgardie have decided that the number of arc lamps in the town shall be increased from eight to twenty, and a further contract with this company has been accepted.

Maidenhead.—The Lighting Committee of the Town Council have been reappointed, with the addition of Messrs. Tilly and Pearce, and they are meeting this week so that expression may be given to the wishes of the town in regard to public lighting.

Continental Water and Electrical Power Syndicate, Limited. This Company has been registered, with a capital of £26,000 in £1 shares, primarily to adopt and carry into effect two several agreements, the further objects being sufficiently indicated by the title.

British Electric Traction Company.—Letters of allotment in this Company have been posted. We understand the public did not respond very freely, but the Electric and General Investment Company and their financial friends have provided the necessary capital.

Argentine.—The Government of Mendoza has granted a concession for providing that city with electric light and power, making use of the fall of the river. Electric cars are also to be run in the city. The concession is for 99 years, after which period the whole of the plant will become the property of the Local Government.

Digitized by Google

Maryport.—The electric light has gained a footing in this town, and the premises of Mr. H. Nixon, watchmaker and jeweller, of Crosby-street, have just been provided with an installation driven by a "Demon" gas-engine, on the Otto principle, of 1¾ b.h.p.

Cumberland.—Messrs. George Wilson and Co., Anchor Electric Works, Aberdare, have just completed a dynamo capable of supplying 300 c.p. for the electric lighting of the works of the Whitehaven Hematite Iron and Steel Company, Cleator Moor, Cumberland.

Llanelly.—At a meeting of the Chamber of Commerce many complaints were made as to the state of the gas lighting, and Mr. Wm. Bowen said it was his intention to move a resolution calling upon the Council to do all they could to introduce electric lighting into the town.

Ulverston.—The Rural District Council have resolved that the consent of the Council to the application of the Windermere and District Electric Lighting Company for an extension of time within which to make the necessary deposit under the order should not be granted.

New Carbide Syndicate, Limited.—This Company has been registered, with a capital of £2,400 in £10 shares, to acquire, develop, and turn to account a patent for the manufacture of carbide of calcium or other chemicals used in the manufacture of acetylene gas, etc.

O. Berend and Co., Limited.—This Company has been registered, with a capital of £20,000 in £1 shares, to enter into an agreement with O. Berend and Co., and to carry on in all or any of their respective branches the businesses of electrical, mechanical, and general engineers, etc.

Bexhill.—The Urban Council have decided to apply for a provisional order to supply the electric light, but have agreed to withdraw from proceeding with their application if power was given them to purchase within 14 years the undertaking which a company has decided to establish.

City and South London Railway.—The returns for the week ended November 15 were £1,078, compared with £958 for the corresponding period of last year, being an increase of £120. The total receipts for the half-year 1896 were £18,825, compared with £17,616 last year, being an increase of £1,209.

Shaftesbury.—The Belle Vue Ironworks have recently been fitted with the necessary appliances for lighting by electricity. The electric wires and lamps and the necessary machinery have been laid throughout the several workshops and sheds by Mr. Charles Farris, a son of the proprietor.

Exeter.—When the City Council were considering the electric lighting question they addressed a number of queries to 55 other municipalities where electric light was in use or being installed. The replies have been printed and bound and form a most useful book of reference with regard to that particular subject.

Watford.—Mr. H. H. Richardson, solicitor to the Ratepayers' Association, points out in reference to "Dogberry's" paragraph in the *City Press* that the introduction of the electric light into Watford is due to the foresight and energy of Mr. A E Pridmore, C.C., who is a leading member of the Watford Town Council.

Birkenhead.—The Town Council have appointed the Gas, Water, and Electrical Committee as follows: Aldermen Bloor, Getley, Lees, Rawcliffe; Councillors Bennett, Fiddes, Goodwin, Hazlehurst, Illingworth, B. Jones, J. M. Kelly, Lilwall, M'Gaul, Oates, W. Pearson, and the chairman of the Finance Committee.

Batley.—The Mayor (Alderman B. P. Nettleton), in thanking the Town Council for his re-election, said that as the electric light had been introduced into as many as 13 mills, some arrangements should be made whereby those only who assisted in the making of the profits by the consumption of gas should have the benefits of the profits.

Personal.—We understand that Mr. W. Worby Beaumont, M.I.C.E., who has for some years been identified with the joint editorship of the *Engineer*, resigned his editorial position some time ago in order that he might hereafter devote himself entirely to his consulting engineering practice at his offices in the Outer Temple, 222, Strand.

Nice.—According to the wish expressed by Mr. Dosse, Queen Victoria's director of Continental journeys, the Municipality have authorised the electric tramway company to remove the rails from the Avenue Victoria and to replace them on the eastern road, thus diverting the traffic from the vicinity of the western wing of the Hotel Cimiez.

Whitehaven.—At the Town Council meeting the Water and Lighting Committee reported that Messrs. Siemens had begun again to lay the new cables, starting at Solway View and working downwards and crosswise. Councillor Musgrave moved the confirmation of the minutes, which was seconded by Councillor Barr, and agreed to.

Edison and Swan United Electric Light Company, Limited. An extraordinary general meeting of the Company will be held at the Cannon-street Hotel, E.C., on Tuesday, November 24, 1896, at 12 noon, to consider the question of amalgamating with the Manchester Edison-Swan Company, Limited, and also the raising of new debenture stock.

Carlisle.—Application is to be made in the ensuing session of Parliament for powers enabling tramways to be laid in the city. The initiative is being taken by a Birmingham syndicate, and it is understood that the service will embrace Stanwix, Botcherby, and other suburbs, and the principal streets leading from the centre of the city to them.

Leatherhead Electric Lighting and Power Company, Limited. This Company has been registered, with a capital of £1,000 in £5 shares, to carry on the business of suppliers of electric light, heat, and power, as electricians, electrical and mechanical engineers, fitters, machinists, etc.

Armstrong-Dove Motor Syndicate, Limited.—This syndicate has been registered, with a capital of £6,000 in £10 shares, to enter into an agreement with T. Armstrong and L. Dove, and to carry on the business of motor manufacturers, electricians, cycle manufacturers, carriage builders, engineers, machinists, fitters, founders, wire-drawers, tube makers, etc.

Roller Bearings.—The Roller Bearings Company are executing orders for the Liverpool Overhead Company and various tramway and motorcar companies. Arrangements have also been made for fitting the express carriages in connection with the circular railway which it is proposed to construct and equip in connection with the Brussels Exhibition of 1897.

Hammersmith.—Mr. Searle stated at the Vestry meeting that in two years' time he hoped the arrangements for the introduction of electric lighting into the parish would be completed. He was convinced that the scheme would pay its expenses, and the cost of the light would not be prohibitory. In fact, the charges would compare favourably with the price of gas.

Copper Statistics.—Statistics furnished by Messrs. Henry R. Merton and Co. show that the total stocks on November 15 were 35,597 tons, against 35,441 tons on October 31 last, 34,077 tons on October 15, and 50,383 tons on October 31, 1895. The totals include the quantities advised by mail and cable, being respectively 4,250 tons, 4,100 tons, 3,650 tons, and 3,400 tons.

Change of Address.—Mr. J. A. Blackwood, secretary to the Fowler-Waring Cables Company, Limited, informs us their registered address for the future will be 110, Fenchurch-street, E.C. This change of premises has become necessary to meet the demands of a largely increased business in electrical cables and the addition of the new indiarubber department.

Rottingdean Electric Lighting and Power Company, Limited. — This Company has been registered, with a capital of £1,000 in £5 shares, to generate, produce, store, accumulate, and distribute electricity, electromotive force, or other similar agency, and to carry on the business of electricians, mechanical engineers, and electrical apparatus manufacturers.

Walton-on-Thames Electric Lighting and Power Company, Limited.—This Company has been registered, with a capital of £1,000 in £5 shares, to carry on the business of suppliers of electricity, as electricians, mechanical engineers, electrical apparatus manufacturers, etc., and to use or manufacture and put up telephones, telegraphs, electric bells, phonographs, etc.

Wigan.—The Gas and Electric Lighting Committee of the Town Council has been appointed as follows: chairman, Alderman Holmes; vice-chairman, Alderman Gee; the Mayor, the ex-Mayor, Messrs. Ackerley, Alker, Ashton, Booth, Gaskell, Farrimond, Clarke, Hilton, J. Johnson, McQuaid, Millington, Segrave, Richards, Riddlesworth, Riley, Walker, and Woods.

Traffic Syndicate, Limited.—This Company has been registered, with a capital of £10,000 in £1 shares, to promote the interests of the industry connected with the placing of cabs and all kinds of electrically or mechanically propelled vehicles on the common roads, and to carry on the business of electricians, mechanical engineers, machinists, fitters, founders, millwrights, etc.

Fire at Asbestos Works.—A serious fire occurred on Tuesday morning in a branch of the United Asbestos Company's premises at 302, West Ferry-road, Millwall, E. One building, used as a manufactory, and in which large quantities of raw materials were stored, was completely destroyed. The company wish to make it known that the fire will not stop business or the execution of orders.

Chester.—At the County Council meeting a notice from the Altrincham Electric Supply, Limited, under Section 12 (*a*) of the Ashton upon-Mersey Electric Lighting Order of 1896 of the intention of the company, after the expiration of one month from the date of the notice, to lay electric light mains in the area covered by the order was disapproved on the ground of incompletion of the plans.

Bromley.—A letter was read at the Urban District Council meeting from Mr. H. Podger, in reference to the proposal of the Council to transfer their electric lighting provisional order to a private syndicate, asking that the opinion of the ratepayers should be first obtained, as was done at Croydon, as to whether the District Council should carry out the scheme or transfer it to a syndicate.

Keswick.—Mr. J. H. Brodie writes to the *West Cumberland Times* pointing out that his letter to the Urban District Council was to enquire if the Council were prepared to treat for the sale, lease, or other disposition of the provisional order recently obtained for the supply of electricity, and not, as stated in the local paper, enquiring if the Council were prepared to treat for the purchase of the gasworks.

Middlesbrough.—At a special meeting of the Streets Committee of the Corporation the application of the Imperial Tramways Company to adopt the electric tram system and to extend their lines in different parts of the town was fully considered, and the following resolution was adopted: "That no further extension of the tramways by a private company be allowed within the borough of Middlesbrough."

Tunbridge Wells.—Several councillors seemed to be in a great hurry at the last meeting of the Town Council to have the electric light still more widely used for street-lighting, but the

Digitized by Google

Lighting Committee pointed out that at present the system of putting electric lamps in the gas lamps was only on trial, though they believed it would turn out a great success. The Lighting Committee was reappointed.

Bangor.—The Electric Lighting Committee reported at the Town Council meeting that the solicitors to the Penrhyn estate offered, providing the town clerk would given an undertaking, that 5 per cent. interest should be paid on the amount of the purchase-money, the completion of the purchase to remain in abeyance for the present. The town clerk had given such an undertaking. The report was adopted.

Blackpool.—The Electric Lighting and Tramway Committee reported at the Town Council meeting that Mr. Nisbett, of the Electric Free Wiring Syndicate, had attended in reference to a scheme of house-wiring for electric lighting. The Electric Lighting and Tramways Committee was appointed as follows: the Mayor, Aldermen Cardwell and Bickerstaffe; Councillors Brodie, Grime, Bickerstaffe, Heap, Smith, and Wainwright.

Dublin.—The directors of the Dublin and Wicklow Railway propose to convert their line into an electric one and to run branches and offshoots through different parts of the counties of Wicklow, Wexford, and Carlow. The tramways company which previously bought up the Southern electric line are about to promote a Bill to enable them to run electric trams from the Rathmines, Rathgar, and Pembroke townships to the sea.

Leicester.—The Town Council have appointed the Gas and Electric Lighting Committee as follows: Mr. Bennion, Mr. Billings, Mr. Bruce, Mr. J. T. Clarke, Alderman Coleman, Mr. Edmands, Mr. Edwards, Mr. Faire, Mr. Flin, Alderman Lennard, Mr. Orton, Mr. Payne, Mr. Pochin, Mr. Rowlett, Mr. Smith, Mr. Spurway, Alderman Wood, Mr. H. H. Woolley, Mr. Joseph H. Woolley, Mr. Orson Wright, and Mr. T. Watson Wright.

Kingswood.—The question of engaging an expert to advise the District Council *re* the proposed purchase of the electric light apparatus, etc , again came up for discussion at the last meeting. The recommendation from the Lighting Committee was that an expert should be employed. The chairman said what they required was an expert to look at the plant and give his opinion to the Council on the whole thing. The recommendation was adopted.

Ashton.—The following gentlemen compose the Electric Lighting Committee: the Mayor, Aldermen Heginbottom, Hilton, Siddall, and Wilson, Councillors Andrew. Catlow Cooke, Hall, Hallam, Kelsall (deputy chairman), A. E. Mellor (chairman), Newton, Phillips, and Shaw. The draft agreement between the Corporation and the British Electric (Pioneer) Company relative to the supply of power to the tramway company is to be settled by counsel.

Flamborough.—At a meeting of the Parish Council Mr. E. Dunn (chairman) proposed: "That this Council approve of a proposed electric railway from Bridlington to Flamborough and believe if such a scheme be carried out will meet a great want and confer lasting benefits on the inhabitants of the village, and be a great accommodation to the general public who might wish to visit the place." Mr. Rawnsley seconded. The resolution was carried unanimously.

London Lighting Extensions.—The committee of the London County Council have passed notices of extensions from the Charing Cross and Strand Company (Blackmore-street and Endell-street, etc), from the House-to-House Company (Neville-street, Hollywood-road, and Wrights lane), from the Notting Hill Company (Bedford-gardens), from St. Pancras Vestry (Fitzroy street), and from the Hampstead Vestry (several streets, including Fitzjohn's-avenue and Adelaide-road).

Harrogate.—At the Town Council meeting the Lighting Committee was appointed as follows: the Mayor, Alderman Fortune, Hammond, Hudson, and Ward; Councillors Chippendale, Milling, Morrison, Myrtle, Scholes, Simpson, and Thwaites. The electrical engineer read a report as to the cost of an electric motor for crushing oats and cutting chaff at the town's yard, and it was resolved that an electrical motor and an oat-crusher and chaff-cutter be purchased at an estimated cost of £155.

Electrical Sanitation for Bombay.—The Municipality have had under consideration for some months the adoption of the Hermite process in that town. The report of their engineer, Mr. Hewett, who was recently in England and inspected the working of the Netley Hospital plant, was so favourable that they have now voted the funds for a considerable installation, and Messrs. Paterson and Cooper have received instructions to prepare the necessary machinery for shipment early in December.

Coseley.—At a special meeting of the District Council an engineer of the British Electrical Traction Company attended, and stated that the company were entering into negotiations for revolutionising the tramways in South Staffordshire by obtaining power to adopt overhead electric traction in lieu of steam. It was proposed to spend a million of money in reconstructing and extending the tramway, and it is believed the undertaking will prove remunerative, as by means of electricity a 10 minutes' service can be guaranteed.

Coventry.—The electric tramways company's annual supper was held last week. Mr. Councillor West presided, and an attendance of nearly 70 included Messrs. T. R. Whitehead (manager), G. F. Cowan (secretary), A. Hughes, R. Growse G. E. Watmough, H. J. Wimshurst, W. H. Cantrill, W. Browne, Inspector Green, etc. The toast list, which was a short one, included the loyal toasts, "The City Authorities," and "Success to the Coventry Electric Tramways, Limited." An enjoyable musical programme was arranged.

Glasgow.—The system of electric clocks which has been under the consideration of the Corporation for some considerable time was inaugurated this week. The system was originated and perfected by Prof. Becker, of Glasgow Observatory, from which the clocks will be regulated. There will be three circuits, one being placed in the Municipal Buildings in George-square. In due time the area will be extended, and the intention of the Corporation is to erect some 200 or 300 dials at the corners of the leading streets. The outlying districts will also be included.

Appointments Vacant.—The Electric Lighting Committee of the Hull Corporation are prepared to take one improver into their electric light works for a period of two years, at a premium of £30. All information can be obtained on application to the borough electrical engineer, electric light station, Dagger-lane, Hull —The Corporation of Bristol have a vacancy for an improver in their electric light station. Premium, £100. Applicants must have had experience in mechanical engineering. Particulars from Mr. Faraday Proctor, city electrical engineer.

Walsall.—The total number of consumers supplied on October 31 was 71. The total units generated at the station during the month of October was 13,069. The total output from the main generators was 12 287 units. The net income for the month was £174. 15s. 3d. The salary of Mr. Wyllie, the borough electrical engineer, has been increased from £150 to £200 per annum. The Electric Lighting Committee has been appointed as follows: Aldermen Baker, Brownhill, Evans, Lindop, Marshall, Newman, and Roper, Councillors Brownhill, Noake, Powell, W. Smith, and C. C. Walker.

Bristol.—The Bristol Tramways Company are about to make application to Parliament for the necessary powers to authorise the extension of their system as well as the adoption of electric traction on the whole of the present lines. The proposed extensions and adaptation of the old lines to electricity will involve an outlay of about £400,000, in connection with which a large proportion of the capital already spent, amounting to upwards of £300,000, will practically be wiped out of existence. The Corporation want to supply the electricity and the company want to supply their own.

Barrow.—Councillor Smith made a long statement at the County Borough Council meeting in support of his proposition that a separate committee should be appointed to deal with all the duties relating to the question of electric lighting. He argued strongly in favour of the introduction of the electric light, and reviewed the history of the movement from its commencement in the town. His speech was followed by a still longer discussion, but in the end his motion was lost by one vote, 11 voting for and 12 against. The Corporation are in possession of a provisional order which expires on July 5 next.

Llandudno.—At a meeting of the District Council the plans of Messrs. Dickenson, of Birmingham, for an electric tramway connecting Llandudno, Colwyn Bay, and Conway, came up for discussion Mr. Thomas moved the Council decline to consider the plans. He objected to Llandudno becoming like Blackpool and Douglas. Mr. Williams seconded. Mr. Hughes moved an amendment that the Council favourably consider the plans. He considered that tramways would benefit the whole district, and hoped to see the scheme carried out. Mr. Conway seconded. The resolution was carried by 11 votes to 3 for the amendment.

London Electrical Cab Company.—With a capital of £150,000, in £1 shares, the London Electrical Cab Company, Limited, has been formed to work and let out on hire in London electrically-propelled cabs. The prospectus states that the Company will work under a sole license from the British Motor Syndicate for the use of their patents in the metropolitan area, at a royalty of £4 per cab per annum, and will contract with the Great Horseless Carriage Company for their manufacture as required. The price to be paid for the license from the British Motor Syndicate is £50,000, in shares or cash, in addition to the royalty of £4 per cab per annum.

Ashton-upon-Mersey.—At the meeting of the Council a long discussion took place on the subject of the proposed tramways from Stretford along the Manchester-road to Peel Causeway. The chairman, Mr. H. V. Kilvert, moved: "That this Council is of opinion that any tramways on the high road would be distinctly injurious to the district, and is, therefore, opposed to either of the suggested schemes." Mr. A. Lawson seconded the resolution, which was adopted without discussion, and it was further agreed to send a copy of it to Dr. E. J. Sidebotham, the local representative on the Cheshire County Council, requesting him to urge the Council to actively oppose both schemes.

Monmouth.—At the meeting of the Town Council, the ex-Mayor reminded the Council that the contract with the gas company expired at the end of the year, and it would be necessary to consider how long it should be extended into the next year. The contract was an annual one. In view of this he had written to Messrs. Bramwell and Harris enquiring when there would be a probability of the electric light being in working order, and they had replied that with favourable progress it ought to be in operation by March next. Under those circumstances he would suggest that the gas contract be continued for six months, with the option of renewal for another six, and that the gas company be written to respecting terms. The suggestion was accepted.

Sheffield.—Gas has been superseded by electric light at the Cutlers' Hall. A committee of the Cutlers' Company was appointed some time ago to carry out the change, and they adopted the plans of Mr. S. V. Clirehugh, A.M.I.C.E , M.I.E.E., of Manchester, and placed the contract in the hands of Messrs. Verity, Limited,

Digitized by Google

also of Manchester and of London. The whole of the lights in this part of the building will be controlled from a switchboard in the entrance to the Trade Marks Registry. Outside the hall, in Church-street, two large arc lamps are being fixed. Mr. Clirehugh has superintended the carrying out of his plans, and Mr. Charles S. Northcote, engineer and manager, has looked after the putting in of the installation on behalf of Messrs. Verity.

Cheltenham.—Colonel Marsh, R E., has held an enquiry into an application made by the Corporation for the sanction of the Local Government Board to the borrowing of £2,620 for the purposes of electric light extensions. It was explained that the money was required principally to meet demands for the electric light service beyond the districts contemplated in the estimates when the loan for £23,000 was obtained, though none of the proposed extensions would be outside the compulsory area. Alderman Norman said the output from the electric works now represented about £70 a week, and that the undertaking was expected to make a profit shortly. Mr. Kilgour (the electrical engineer to the Corporation) gave details of the extensions. There was no opposition to the application.

Bilbao.—A communication, dated October 28 last, has been received at the Foreign Office from Mr. G. S. Smith, her Majesty's Consul at Bilbao, reporting that a great extension of the use of electricity is going on in that province, but the British firms seem to take no part in it. Two electric tramways are likely in a short time to be made, and if any British firm desires to be given the contract they would do well to look into the matter without delay. The projected lines are (*a*) from Bilbao to Durango, about 18 miles long (the promoters are a private company); (*b*) from Zumuarraga to Zumaya, a distance of some 18 miles (permission for its construction is being sought by the Alcaldes of Azpeitia and Azcoitia, and it is proposed that the line shall be undertaken by a private company not yet formed).

Belfast.—Councillor Andrews, J.P., reported at the meeting of the Electric Committee that he had waited upon the Improvement Committee relative to the acquisition of the site at present occupied as a stoneyard for the proposed new station, and had arranged for a meeting the following day of representatives of all the committees interested in the yard accommodation with a view to the best arrangement being made for the requirements of all. Applications for supply of current for a large number of lamps were received and granted, and business not of public interest was disposed of. The Library Committee have agreed that Mr. M'Cowen, the electrical engineer, should draw up a specification in order that public tenders for the lighting of the library buildings by electricity might be invited.

Bournemouth.—The Bournemouth and District Electric Supply Company, Limited, have given notice of their intention to apply to the Board of Trade for a provisional order empowering them to produce, store, and supply electricity, electrical energy, and power within the municipal borough of Poole and the district of the Branksome Urban Sanitary Authority, and to break up various public and private thoroughfares as may be necessary for the carrying out of their work. It is proposed that electric lines shall within two years be laid down along the whole of the Poole and Bournemouth road and the High-street. The Town Council Lighting Committee has been appointed as follows: Alderman Cutler, Mr. Beckett, Mr. Gunning, Mr. Hawker, Dr. Kinsey-Morgan, Mr. Tuson, and Mr. Youngman.

Taunton.—Mr. H. W. Couzens, borough electrician, reported at the Town Council meeting that during the past quarter there had been considerable extensions and additions to the electric light undertaking, and they had connected up 10 new consumers and an aggregate of 200 lamps of 16 c.p. The Local Government Board enquiry for the additional loan had also been held, and after its conclusion the inspector visited the works and expressed his satisfaction with what he saw. They had fixed and lighted up the major portion of the lamps ordered in the Staplegrove road, effecting a marked economy in the first cost by utilising the old overhead wires for the purpose. The lighting up of the remainder was compulsorily delayed until the Great Western Railway Company gave their permission to cross their bridge at Fairwater.

Tunstall.—The clerk to the Urban District Council (Mr. A. P. Llewellyn) reported at the last meeting that he had lodged a memorial with the Board of Trade against the transfer of the Potteries Extension Tramways Order, 1896, from the promoters to the British Electric Traction (Pioneer) Company, but he had since ascertained that the company's financial position was considered satisfactory, he had received payment of the costs incurred by the Council when the order was promoted, and, from a letter the secretary of the company had written the Board of Trade, it appeared the company were quite willing to take over the obligations of the promoters under the agreement with the Council of July 1. It was decided that as soon as this agreement was transferred to the company the Council would be able to formally consent to the vesting of the order in the Pioneer Company.

Dundee.—At the Town Council Treasurer Ritchie moved that they promote a Bill in the next session of Parliament to enable the Gas Commissioners to borrow additional money, to extend the electric lighting area, and for other matters considered necessary. He remarked that they had until the month of March to prepare the Bill, and the notice which he proposed should be so wide that they could introduce anything they liked into the Bill. Ex-Provost Ballingall seconded, remarking that while there was a general demand for electric light they could do nothing in the way of meeting it until they got powers for extending the area. Messrs. D. J. M'Kinnon and James Perrin opposed the proposal, pointing out that the motion to proceed with the Bill had been rescinded at the concluding meeting of the last Council. After further discussion it was agreed by 18 votes to 9 to proceed with the promotion of the new Corporation Bill.

The New Electrical Carriage.—In the presence of a large number of people the first electrically-propelled carriage of the London Electric Cab Company was started from the Royal Hotel, Blackfriars, at 12.30 on Monday for the City. In the carriage were the Earl of Fingall, Mr. Frank Gardner, Mr. Davison Dalziel, and Mr. H. Mulliner, while Mr. Bersey, the inventor of this particular system, was on the box. The carriage, which attracted considerable attention, was driven down Queen Victoria-street, past the Mansion House, and round the Bank into Throgmorton-street, passing easily through the crowded traffic. In Throgmorton-street the members of the Stock Exchange turned out *en masse* to give the new vehicle a greeting. Those who were in the carriage spoke highly of the ease and facility with which it was guided through the crowded streets, and testified to the entire absence of any vibration.

Wolverhampton.—Notices have been posted in various parts of the Black Country and other places to the effect that application is intended to be made to Parliament in the ensuing session for an Act under the name or title of the Birmingham, Wolverhampton, and District Tramways, to authorise the construction of tramways in the parishes of Wolverhampton, Sedgley, Bushbury, Tettenhall, Upper Penn, Bilston, Darlaston, Wednesbury, Dudley, Kingswinford, Rowley Regis, Amblecote, West Bromwich, Handsworth, Harborne, and Smethwick, and that it is proposed to lay such tramways, or some part or parts thereof, along the road or street, or part of the road or street, in which those notices are posted. Plans of the proposed tramways will be deposited at the offices of the different public authorities on or before the 30th inst. The authorities concerned have already been approached on the subject, and further negotiations are proceeding.

Dudley.—At the Town Council meeting Alderman Bagott moved that application be made to the Board of Trade for a provisional order to enable the Council to supply the town with electricity for lighting and other purposes. Regarding the matter he mentioned the interview with Mr. Sellon, engineer for the tramway syndicate, who had told the Public Works Committee that if the Corporation supplied the electricity the syndicate would be a large consumer. The tramway amalgamation would be a most important matter for the town and particularly for Netherton. Mr. James Turner seconded. Councillor Taylor thought it would be better to purchase and municipalise the gasworks than to spend £24,000 on electric lighting. Alderman Bagott observed that towns which had their own gasworks, notably Walsall, were also adopting the electric light. If the Corporation did not supply the electric light the tramway syndicate would. The motion was carried.

Bradford.—The mayor (Mr. T. Speight) has been appointed chairman of the Gas and Electricity Committee, with Mr. W. E. Aykroyd as deputy-chairman. The funeral of Mr. Robt. Silk, who had been connected with the electricity works of the Corporation since their inception, took place this week at Undercliffe Cemetery. The deceased came from Siemens's works at Woolwich, and was known as a most skilful maker of "joints" Mr. Silk contracted a cold three weeks ago, and died on November 12. The coffin was covered with wreaths from the Electricity Committee, the officials at the town hall, and the staff of the electricity station. Among the mourners were Mr. A. H. Gibbings (electrical engineer), Mr. S. Dalton (assistant engineer), Mr. James Copperthwaite (chief clerk), Mr. F. Kershaw, Mr. J. Batten (street and drainage department), and Mr. W. Dryburgh. About 60 Corporation employés headed the funeral cortége.

Extension of Electric Lighting in the Metropolis.—The London Electric Supply Corporation have decided to apply to the Board of Trade for power to extend their area of supply to the south of Westminster Bridge, Parliament-square, and Victoria-street in Westminster; and to enable them to carry the scheme into effect, they propose to ask for powers to interfere with the tramway of the London Tramways Company in Vauxhall-road. The Fulham Vestry have given notice that they will next month apply to the Board of Trade for powers to supply their district. In laying their electric lines they propose to pass over, along, across, or under railways belonging to the Metropolitan, the Metropolitan District, the London and South Western, the Great Western, the London and the North Western, and the Midland Railway Companies. The Blackheath and Greenwich District Electric Light Company are proposing to extend their area of supply to the whole parish of Greenwich, as well as to the parishes of Charlton, Eltham, Kidbrook, Lee, and Lewisham.

Dover.—Councillor Edwin asked at the meeting of the Town Council when the report from the officers in respect to the tramways would be ready. The Town Clerk said they were only waiting to draw up the report, having got all the parts, and they hoped to present it shortly. Mr. Morley Fletcher's experimental vessel with apparatus for utilising the force of the sea waves as a source of power has been now some time in Dover Bay. Up to the present what has been worked is a small pumping plant. It is suggested, however, that in the case of generating an electric current, such as would be required to light a lightship or lighthouse, the motor would deliver on to the vessel a hydraulic supply under pressure, which, passing through a system of receivers and turbines, would drive the dynamo or generator. It is stated that the inventor's firm has already disposed of the British patent rights to a company entitled the Morley Fletcher Wave Power System, Limited, and the company have entered into a contract with Messrs. Maudslay, Sons, and Field, engineers, of London, for the construction of a very large motor plant of Mr.

Digitized by Google

Morley Fletcher's design which is to be delivered on completion at Dover.

New Mutual Telephone Company, Limited. — This Company has been formed for the purpose of supplying within Manchester, Salford, and district an independent telephone service. The scheme was started by several gentlemen in Manchester. Before any fresh telephone service can be started it will be necessary to obtain a license from the Post Office, and according to a Treasury minute dated May 23, 1892, "no application will be entertained unless a formal resolution in its favour has been passed by the corporation or other municipal authority, and evidence given that there is sufficient capital subscribed to carry out the undertaking." The directors and members of the syndicate feel confident that these conditions will be fulfilled, and that the necessary license will be obtained; but if the license be not obtained, all the preliminary expenses will be borne by the syndicate, and all moneys paid by subscribers for shares in the present Company will (as soon as the necessary resolutions for winding up the Company voluntarily have been passed) be returned to them in full. The capital is £250,000 in shares of £5 each, of which 20,000 shares are now being issued.

Newington, S.E.—At the meeting of the Vestry Mr. Chandler asked if it was a fact that the Commissioners of the Public Baths and Wash-houses had given out the contract for the installation of the electric light to the baths and wash-houses, and, if so, to whom had such contract been given? Further, were clauses providing for the payment of the trade union rate of wages and observance of trade union hours inserted in such contract, and had the contractor power to sub-let his contract? In reply, the Clerk said that the contract for the engineering work had been let to Messrs. Clarke and Son, of 49, Moorgate-street, with the usual clauses as regarded wages, hours, and sub-letting. Mr. Chandler gave notice that he would move that the committee be requested to enquire as to whether the firm in question actually paid the trade union rates and observed the trade union hours. At the same meeting of the Vestry a long discussion took place upon the electric lighting question. The Electric Lighting Committee recommended the Vestry to issue the statutory notices of their intention to apply for a provisional order. An amendment that the question should not be put was lost, and the recommendation was agreed to.

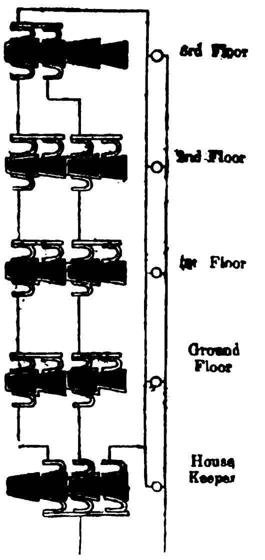
Islington.—A communication was received at the meeting of the Vestry from the Finance Committee of the London County Council with reference to the application of loans to the extent of £31,000 for electric lighting, which stated that the committee recommended the Council to sanction a loan of £24,000 on account. A letter was also read from the Council solicitor stating that interest on the loan would be charged at the rate of £2. 17s. 6d. per cent., and that the repayment would be spread over 42 years. Mr. Goodman said there would be no difficulty in getting the other £7,000. The delay and difficulty which had occurred arose from the fact that the Vestry had neglected to supply certain particulars. Mr. Stonelake asked, considering that the Shoreditch Vestry were contemplating the adoption of the electric lighting and laying mains along New North-road, whether the Electric Lighting Committee would consider the advisability of extending their system from Highbury-corner along Canonbury-road and New North-road to meet the Shoreditch boundary. Mr. Lambert said the committee would have to carry out the work they had in hand before undertaking new work. They were, however, in the hands of the Vestry.

Weston-super-Mare.—A meeting of the Urban District Council has been held for the purpose of considering and reporting upon an application having reference to the posting of notices in certain streets relative to the construction of a proposed tramway within the district. The Chairman explained that the meeting had been convened in compliance with a request from Mr. Brereton, C.E., for the purpose of giving instructions as to the posting of notices in relation to a proposed tramway along the streets within the district, as required by the Standing Orders of Parliament. Mr. Brereton explained that it was proposed to apply to Parliament for a Bill to authorise the construction of an electric tramway following the route stated. The Clerk stated that, failing any directions of the Council as to the posting of notices, the promoters would be authorised to post such notices along the route as they might consider best. The chairman (Mr. Harvey) proposed, and Mr. Gill seconded, a resolution recommending that the promoters of the proposed tramway be allowed to post the necessary notices in the streets along the proposed route, and the same was unanimously adopted. A special meeting of the Council was subsequently held, when the report and recommendations of the committee were adopted.

Colchester.—At the meeting of the Town Council the Electric Light Works Committee reported that they had inspected, in conjunction with Colonel Skinner, R.E., the corrugated iron building and the engine and dynamo for temporarily supplying electric light required for the new military hospital, and they expressed their satisfaction therewith. The Borough Surveyor reported that he and Mr. Kuner had inspected the north railway station, and that he considered 194 16-c.p. lamps would be needed and that the cost of laying the wires and providing lamps would not be less than £180. The town clerk was desired to send a copy of the report to the Great Eastern Railway Company, and state that the committee would be prepared to supply current at 6d. per unit provided the Eastern Counties' Asylum authorities agreed to take the light for the asylum building. The report was adopted. The Lighting Committee was appointed as follows: The Mayor, Aldermen Sanders and Wicks, Councillors Argent, Asten, Barritt, Bear, Clamp, J. F. Goodey, Littlebury, Moore, Peck, and Penney. The following were appointed on the Electric Light Works Special Committee: The Mayor, Aldermen Elwes and Wicks, Councillors Wilson, Marriage, Grimes, Peck, J. F. Goodey, Barritt, Argent, and Nash.

Morecambe.—Messrs. Lee, Harper, W. R. Brown, H. Baxter, and Miller have been appointed a sub-committee to look through the plans, specifications, and conditions relating to the electric light undertaking, to give such instructions as they consider advisable, and generally to supervise the carrying out of the work. Mr. Parker, electrical engineer, has met the Council with reference to the electric light scheme, and the subject was discussed in committee. In accordance with a resolution previously passed authorising the clerk to apply for a provisional order for the Council to purchase the electric light undertaking, it was resolved that Mr. Tilley, the clerk, on behalf of the Council, appoint Messrs. Hargreaves and Co. as parliamentary agents in the matter. Colonel John Ord Hasted, R.E., has held a Local Government Board enquiry with regard to applications made by the Council for sanction to borrow £59,200 for various works of improvement. These included £26,000 for the purchase of a portion of the undertaking of the Morecambe Electric Light and Power Company, and for works of electric lighting. The system proposed was described by Mr. Parker as having been adopted at Oxford, various parts of London, Liverpool, Brighton, Crystal Palace, Wolverhampton, and Walsall. The Morecambe district being a scattered one, in an almost continuous line, he was of opinion no other system would be found to answer. Mr. Jowett, secretary to the electric light company, stated that what the Council proposed to purchase for £3 897 had cost the company over £9,000. Mr. Loraine, barrister (instructed by Messrs. Toulmin, Ward, and Carruthers, solicitors, Liverpool), representing several property owners; Mr. Oglethorpe, representing Mr. Clark; and Mr. Sewart, representing the Rev. C. T. Royds; and Messrs. Fisher, landowners, although favourable to the scheme, strongly objected to the site selected for the electrical works as being utterly unsuitable, the means of access inadequate, and the works calculated to depreciate the value of adjacent property.

New Catalogue.—We have received direct from Berlin an English edition of the catalogue issued by the Allgemeine Elektricitäts-Gesellschaft. The main contents of it are similar to those of the catalogue of the Electrical Company, of Charing Cross-road. Information as to comparative weights of three-phase and direct-current motors is worthy of being abstracted. Thus a 40-b.h.p. motor of the three-phase type, running at 315 revolutions at 50 frequency, weighs about 3,000lb. A multipolar motor, direct current, of practically the same output at the same speed, weighs 5,150lb. This saving in weight in favour of the three-phase system is a great argument in favour of the type, especially when coupled with greater simplicity in working. The prices, as listed, show that the three-phase motors are cheaper than those worked by direct current. In the above case the saving is about 15 per cent. The adjoining diagram of switches and connections for staircase lighting, found further on in the catalogue, may be of interest to our readers. It will be noticed that with the "Royal" types of switches employed, the whole of the lights can be turned on or off on either landing at any time. The convenience of this arrangement on a long staircase repays for the extra cost of installing the same.



St Pancras.—At the meeting of the Vestry, which we briefly reported last week, Mr. E. Cox, chairman of the Electricity Committee, submitted an important report from the committee, which stated that they were unanimously agreed that the best means for preventing any of the thoroughfares lighted by arc lamps being left in total darkness through any interruption in the supply, will be to rearrange the whole of the present high-tension arc lamp circuits and connect every alternate lamp to the low-tension mains. The estimated expenditure for carrying out the foregoing improvements was £2,615. 15s., and this the Vestry agreed to. In consequence of the low-tension mains being laid in some thoroughfares on one side of the street only, and the demand for supply being greater than the present mains were capable of carrying, the committee recommended the laying of additional mains in various districts, at a further estimated expenditure of £3,966. The committee further stated that they thought it advisable that, beyond the thoroughfares to be lighted by arc lamps already sanctioned by the Vestry, the following districts should be added—viz., Haverstock-hill to the parish boundary, Fortess-road to the parish boundary, and along Highgate-road as far as Gordon House-road. The committee were given to understand that the Hampstead Vestry were proposing to light that part of Haverstock-hill situated in their parish, and negotiations were pending to mutually light the parts where the two parishes adjoin. The Islington Vestry were also contemplating lighting the Junction-road by arc lamps up to the Boston. In view of these extensions by the

Digitized by Google

neighbouring parishes, it would be a distinct public advantage, apart from local considerations, that the lighting should be continuous, and thus avoid the necessary short breaks which would exist if the lighting was not extended to the points indicated. The cost of lighting these thoroughfares by arc lamps running half from the high and half from the low tension mains would be £2,100, and the committee recommended that sanction be given for carrying out the work. This was carried.

Incandescent Lamps at the "Empire."—Reference has already been made to the adoption of the "improved" electric incandescent lamp at the Empire Palace Theatre, and the lamp itself has been fully described in these columns. In addition, however, to the lighting of the auditorium and stage, there are some novel effects carried out in the ballet of "Monte Cristo" which are worth notice. By means of specially designed lamps of the company's type there is an illuminated waterfall in the second act, but the main display is in the cave scene. Here there are, firstly, a set of 108 pendant lanterns representing gems of different colours, each of which is composed of several lamps, over 600 being in operation. But the main novelty is in the production of electrical effects on the dresses and properties of 24 "coryphées" and 10 men dancers, each of whom carries an average of 100 miniature improved electric lamps specially shaped to suit the designs of the dresses. The interesting feature of this is that since it would be impossible to light such a number of lamps by means of current produced, as has been done heretofore, from accumulator cells carried by the dancers, special means were devised by Mr. Fanta by which the dancers' dresses are put in direct contact with the current from the mains of the Metropolitan Supply Company, but reduced to such a voltage that all danger of shock is avoided. This is done by a carpet or stage cloth, by means of which the current is conveyed to the shoes of the dancers or to wands carried by them, and the effect when a line of dancers breaks into sudden light is very striking. In the "Apotheosis" of the first act the combination of miniature lamps (over 7,000 in number) is made to represent a diamond throne, and jewellery in the form of crescents, tiaras, pearl festoons, lovers' bows, stars, crowns, etc.; the lamps in this case being constructed on the model of cut diamonds and round or oval pearls, and, finally, the whole number of 34 dancers with illuminated dresses are grouped in the back ground after having performed their dances unimpeded. The whole of the electrical effects are the work of Mr. Fanta, of the Improved Electric Glow Lamp Company, Limited, in conjunction with Mr. A. H. Walton, the Empire Company's consulting electrical engineer.

Swansea.—A special statutory meeting of the County Borough Council has been held to consider the adviseability of promoting a Bill in Parliament for the purchase of the tramways and the erection of electric lighting works, with a dust destructor in combination. Councillor Martin moved a resolution sanctioning the promotion of the Bill in Parliament. He said they would purchase the tramway system, and absolutely pay nothing for it. The consideration they offered was in the advancement of money to pay off mortgage debt, and to adapt the plant to electricity. The company undertook to return that money in 30 years and to pay interest plus ½ per cent. on the amount, and at the end of that period to give up the system to the Corporation. He did not see how they could get better terms. It might be asked what advantage the terms of the Corporation might be to the company. There was a substantial advantage, and he gave statistics to prove the increased value of tramway companies' shares after the introduction of electricity as a motive power. While ratepayers of Swansea got such a grand bargain, and from eight to nine years in advance of the statutory period enabling them to consider doing it, there was the additional advantage that while they could now light the town by electricity at a substantial profit, they could as a Corporation, with the tramways as a customer for surplus electrical power, be certain of an enormous profit. It had been said that electric lighting at Cardiff, Newport, and Bristol was a failure, but it was not the opinion of Bristol, Newport, and Cardiff people that their electric schemes were failures. He wished Swansea not to take notice of letters written by people interested in the gas company, and when the people saw such strenuous efforts made against electricity by the gas company they should see that the company feared that it would suffer to the advantage of the public. It had been urged by the opponents of the scheme that the cost of electricity must be 2d. per unit, but he showed that that was the cost as supplied to the customers, but Mr. Preece and Mr. Swinburne—two of the greatest authorities—said it could be generated at a farthing. It was proposed by the tramway company to take a million units, and with the present electric scheme the Corporation could supply it without adding a penny in wages, increasing the plant, and yet give the 12,800 lamps the plant provided for. The revenue from the tramway company for the electricity it would require would clear all the cost of the Swansea electrical station, and all that the Corporation would have to do would be to pay interest on capital and sinking fund. Instead of selling electricity to private consumers at 6d., as had been proposed, they would be able to sell it at 3d., and most likely 2d., with a considerable profit. Mr. Lindley seconded. He gave his personal experience of the success of the electric tramcars at Bristol, and said the fact that Swansea was enabled to add to its electric lighting the sale of a day load to the tramway company which ensured such great profits had made the town the envy of other towns not similarly situated. A vote was then taken, when the 21 members present all voted for the scheme, and this being a clear majority of the Council the scheme was declared carried. The Mayor announced that the Bill would proceed in Parliament.

Kingston.—Councillor Collings, in moving the approval of the minutes of the Lighting and Market Committee at the Town Council meeting, said he was disappointed at the last meeting of the Council, when some members of the committee were absent and one member apparently altered his mind in regard to one item of business, in consequence of which the recommendation of the committee was not accepted by the Council. He said then as he said now, that if that represented the policy of the Corporation he could no longer act as chairman of the committee. He wished the members to understand that they could not stop in this electric lighting undertaking. There were two courses open to the Corporation, but the third one of stopping was not open, and could not be open. For instance, only on Saturday evening the electrical engineer came to him and asked for permission to give certain orders to Messrs. Siemens for additional cable which was necessary for the purpose of making connection to two or three properties. There was first of all an application from the owners and occupiers of some new shops in Fife-road, and to supply them the cable must be extended from the entrance to White's factory in that road. Then there was an application from Mr. Edgell, the clerk to the Guardians, for the light to be laid on to the offices of the Guardians, which also required more cable. Again, it was about settled that St. Raphael's Roman Catholic Church would be lighted with electricity by the Countess of Mexborough, for which also cable was needed. The electrical engineer said the cost of the cable he wished to order would be £50 or £60, but in the present temper of the Council he did not feel disposed to take the responsibility of sanctioning the outlay. From September 1 to the present time they had received applications for connections representing 990 additional lamps. The number already fixed and applied for was 6,740. Mr. Preece told them a long time ago that the installation in its present condition was only adapted for 7,000 lamps, and they were already within 260 of that number. But Mr. Preece, in giving his estimate of 7,000, calculated that the average number in use at one time was only half the number of lamps fixed. But so large a proportion of those in Kingston were shop lamps that considerably more than half were running at one time. Therefore they were in the position that the machinery they had was only barely adequate to the present demand, and before they could go on connecting up new customers they must face the necessity for the provision of a new machine, engine, and boiler, and consequent extension of the engine and boiler house. He moved the approval of the minutes, and he hoped that would carry with it sooner or later that which he thought was its only logical outcome—an increased salary to the borough electrical engineer, and a further expenditure of capital necessary for the extension of the works, in order to meet the demands for the light created by the very success of the works. Councillor Salmon seconded, and deprecated the idea of selling the undertaking to a private company now that it gave every promise of success. It might cost £50,000 or £60,000, but by that time he had no doubt it would be a thoroughly paying concern. The motion was carried after a brief discussion.

Croydon.—A Local Government Board enquiry has been held by Mr. G. W. Willcocks into the application of the Town Council to borrow £10,000 for the electric lighting of the borough under the Electric Lighting Act of 1882. There was no opposition. The Town Clerk read the resolution of the Council on April 27, 1896, and stated that the amount required was divided into two distinct sums of £5,000 each. The first was made up of extras on the original estimate, certain works having cost more than they estimated for. Additional plant and additional works had been found necessary on that account. The additional plant put up included an expenditure of £2,675 for arc lighting, that being for the lighting of the streets in the centre of the borough, and £1,250, the cost of the land on which the central station was built. This land was exactly three acres, was situated in Factory-lane, and was purchased freehold. The reason that the amount for this land was not included in the original estimate was that the Corporation were already owners of land in Factory-lane, which they thought they could utilise for the purpose, but subsequently found that they must retain this land for the purpose for which it had been originally acquired—viz., for allotments and roads depôt. He said nearly the whole of the amount of this work was now in hand, and the reason why they had not applied to the Board of Trade for this amount before was that these were absolutely essential extras for the proper equipment of the scheme. It was almost impossible to know what the cost would be until it was completed. It was necessary that if the arc lamps were to be obtained by the burgesses during the ensuing winter that they should be proceeded with without delay. There was an advantage in giving the contract to the present contractors, and it was more advantageous to arrange the contract in the summer rather than to wait for the winter. If the enquiry had been held a fortnight earlier the arc lamps would not have been completed. The other £5,000 was the estimated sum required to carry out extensions to portions of the district outside the compulsory area. These extensions were requisitioned by burgesses who required to have the light. Alderman Miller, the chairman of the Electric Lighting Sub-Committee, said he had been a member of the Council since the incorporation of the borough in 1883. On November 20, 1895, the Local Government Board sanctioned the borrowing of £27,500 for the purpose of lighting the borough with electric light. The station could not have been worked unless the additional sums had been spent when they were spent. They had 50 applications for the supply of light within the compulsory area, representing an equivalent of 5,089 lamps. These applications had been received within the last four weeks. About 28 applicants only had been connected up. He had had verbal applications for another 1,000 lamps. The original estimate included the laying of no

Digitized by Google

mains outside the compulsory area, and that was the most desirable part of the town to lay the light in. There would be a guarantee of at least 10 per cent. from those who wished to benefit by the extensions to cover a portion of the cost of laying the mains Prof. Kennedy, consulting engineer said he prepared the original estimate of £27,500, and also the supplementary estimate. There were 40 arc lamps to be supplied, and 40 posts were required to carry these. He produced plans to show how these were to be placed. These were obtained at contract price, and the cables were purchased at schedule price, at so much per yard. The water for the central station would be brought from the River Wandle by means of pipes laid through the recreation and allotment grounds. It was expected that the central station would be much nearer the Wandle than it actually was. They did not intend to carry out any of the extensions without the guarantee. Formal evidence was then taken, and the enquiry concluded.

PROVISIONAL PATENTS, 1896.

NOVEMBER 9.

25079. Improvements in and in connection with conduits and collectors for electric tramways and the like. Charles Herbert Gadsby, 102, Park road, Loughborough.

25121. Improvements in locking gear for electrical switches. Louis Frank Awde, 19, Fleet-street, London.

25123. Improvements in incandescent electric lamps. William Aubert, jun., 22, Southampton-buildings, Chancery-lane, London.

25126. Improvements in arc lamps. Alexander Pflüger, 37, Chancery lane, London.

NOVEMBER 10.

25143. Improvements in or relating to electric arc lamps. Richard Joseph Crowley and Edward Burton Payne 104, Colmore row, Birmingham.

25170. Loud-speaking long-distance telephone. Paul de Kilduchevsky, 53, Chancery-lane, London.

25214. Improvements in electric light arc lamps. Andrew Casey, 18, Fulham place, Paddington, London.

25234. Multiple fuse block and switch. Edwin Heber Montgomery and Mathias Thommes, 46, Lincoln's-inn-fields, London. (Complete specification.)

25242. Improvements in electrical discharge apparatus. Reginald Belfield, 322, High Holborn, London. (Alexander Jay Wurts and Charles B. Skinner, United States)

25251. Improvements in or connected with incandescent electric lamp fittings. Albert Vandam and Frederick Harrison 47, Lincoln's-inn-fields, London.

NOVEMBER 11.

25290. An electric light meter. John Francis de Bauw, 9, New Broad-street, London (Complete specification.)

25293. Improvements in combined motors and electric generators. James Atkinson, The Woodlands, Marple, Cheshire.

25323. Improvements in electric motor regulators. William Arnold-Anthony, 36 Chancery-lane, London.

25343. An improvement in electric locks for railway point and signal levers. Edward Tyer, 28, Southampton-buildings, Chancery-lane, London.

25345. Improvements in communicating electrical energy to vehicles and apparatus for that purpose. Siemens Bros. and Co., Limited, and Alfred Mills Taylor, 28, Southampton-buildings, Chancery-lane, London.

25346. An automatic brake for an electric motor. Siemens Bros. and Co., Limited, and George Sylvester Grimston, 28, Southampton-buildings, Chancery-lane, London.

25360. Improvements relating to the coating, covering, or amalgamating of metals with metals and of any other substances with metals and other materials by the aid of electricity, and to apparatus therefor. Frederick Hall Snyder, 11, Southampton-buildings, Chancery-lane London. (Complete specification.)

25365. An improved electrode for secondary batteries. Henry Woodward, 53, Chancery-lane, London.

25370. Improvements in electric incandescent lamps or their connections or holders. Frederick Roberts Pope, 6, Lord street, Liverpool.

NOVEMBER 12.

25481. Improvements in electric pendants. Heinrich Kray, 40, Chancery-lane, London.

25482. Improvements in or relating to induction coils. Stanislaus Szubert, 40, Chancery-lane, London.

NOVEMBER 13.

25500. Improvements in or connected with electric lampholders, sockets, and the like. John Benjamin Verity, Plume Works, Aston, Birmingham.

25541. Improved vibration brake-spring for gas, electric, or other lighting. George May, 5, Hanover-street, London.

25560. Improvements in or relating to electric arc lamps or lighting apparatus. John Smith, 11, Southampton-buildings, Chancery-lane, London,

25577. Improvements in electrical transmitters and indicators for indicating and recording motion. Robert Mann Lowne, 23, Southampton-buildings, Chancery-lane, London.

25601. Improvements in the cells or boxes of electric batteries. John Miles Moffat, 11, Southampton-buildings, Chancery-lane, London.

NOVEMBER 14.

25631. Improvements in the means employed in the electrolytic production of the chlorates of sodium and potassium. Thomas Parker, Prince's-chambers, Wolverhampton.

25644. Improvements in type-printing telegraphic apparatus. Frederick Herbert William Higgins, 18, Southampton-buildings, Chancery-lane, London.

25652. Improvements in Gramme ring armatures. Roslyn Holiday and John Freeman, 3, Burlington-arcade, Barnsley.

25701. Improvements in or connected with secondary batteries. Joseph Horsnell May and Frank King, 47, Lincoln's-inn-fields London.

SPECIFICATIONS PUBLISHED.

1895.

22450. Incandescent electric lamps. Burnet.

22686. Automatic electromagnetic interrupter for protecting electrical installations. Abel (Compagnie pour la Fabrication des Compteurs et Materiel d'Usines à Gaz).

23670. Methods of lighting by electric arc lamps. Guérin.

1896.

1144. Electrodes for electrolytical purposes. Heraeus.

1237. Electric incandescent lamps. Robertson.

2197. Telephones. Imray. (La Société Anonyme pour le Transmission de la Force par l'Electricité.)

12250. Plates for secondary galvanic batteries and a method of producing the same. Marschner.

15129. Process and apparatus for effecting electrolysis. Golby. (Arlt.)

19301. Storage batteries. Preiss.

20796. Electric railways. Lake. (Lundell.)

NOTES.

Science on the Plate River.—The Argentine Scientific Society, to which, says the *Boletin de la Unión Industrial*, the country owes thanks for many good services, intends to celebrate its fiftieth anniversary by holding a "Latin-American" scientific congress at Buenos Ayres

New Edition.—We have received from Cassell and Co. vol. i. of the new, revised, and enlarged edition of Prof. W. E. Ayrton's "Practical Electricity." This is the second issue of the rewritten edition of 1896, and we hope to notice further some of the new features shortly.

Chesterfield and Midland Engineers. — The Chesterfield Institution is to join the Midland Institute of Mining, Civil, and Mechanical Engineers in their excursion to the South Carr borings at Idlestrop, near Doncaster, to-morrow (Saturday). The party leave Doncaster by the 2.10 train.

American Publications for Europe.—From the *Street Railway Review* (Chicago) we have received a type-written letter, marked "dictated to phonograph," to say that the *Review* is going to start a regular foreign edition. It will come out quarterly, and the Americans being before us in the adoption of electric tramways, it is supposed that what they have done and are doing will not be without interest to European workers in the same field

Rail Wear.—The American *Engineering News* wants to know why an electric car should be more severe on the rails than a steam locomotive ? The first question we should be inclined to ask is, Is it ? And our contemporary is by no means certain as to how the question should be answered. "Perhaps the fact that on a railway in a paved streets the joints are let alone until their condition becomes so bad as to compel the removal of the paving to make repairs has something to do with the troubles experienced."

The Cantor Lectures.—The first of the Cantor lectures of the season at the Society of Arts, Adelphi, was given on Monday night by Prof. Vivian B. Lewes. The subject of the course is the use of gas for domestic lighting. The lecturer referred to the improvements which have been made in the measurement of light during the last 50 or 60 years. The photometer now in use gave very fair results. But sperm candles, as the standard of illumination, had very grave defects; yet, though they had been the butt of all committees which had been appointed upon the subject, they were still with us.

Institution of Civil Engineers.—At the ordinary meeting on Tuesday, November 24, Mr. J. Wolfe Barry, C.B., F.R.S., the president, in the chair, a paper on "The Bacterial Purification of Water," by Dr. Percy Frankland, F.R.S., was read, in which the author dealt with the more important advances in the subject since he brought it before the institution 10 years ago. The paper is to be discussed next Tuesday. There will be a students' meeting on Friday, December 4, at 8 p.m. An address will be given by Mr. J. Wolfe Barry, C.B., F.R.S. (president), and a paper read on "Railway Signalling" by Mr. D. W. Kinnour.

Imperial Institute.—Prof. J. W. Judd, dean of the Royal College of Science, lecturing at the Imperial Institute on "Rubies, Natural and Artificial," said that the ruby retained its position as embodying the highest value in the smallest compass. So far as production was concerned this seemed likely to continue, but then the rage for rubies might not last. The natural gems might be superseded by artificial ones, for already small rubies, and, indeed, tiny precious stones of nearly all kinds but the topaz and the tourmaline, had been made. These will be a curiously humble couple to survive when all the rest are discarded, because everyone that wants them can have them.

Dundee Institute.—There being no exhibition of pictures in the art galleries this season, the council of the Dundee Institute of Architecture, Science, and Art has decided that there should be, instead of a conversazione, a dinner and "at home" on Thursday, December 10, at 6.30 p.m., in the Queen's Hotel, Nethergate. Mr. Leslie Ower, president, will take the chair. Arrangements have been made for the accommodation of members coming from a distance. The following are the fixtures for the session: December 17, lecture by A. M'Gibbon, "A Gothic Renaissance"; February 4, exhibition of drawings; March 18, lecture by J. A. Williamson; April 22, exhibition of drawings; June 30, annual business meeting.

Cable to Iceland.—The *Glasgow Herald* has published an interview with Dr. Jon Stefansson on the subject of a proposal for telegraphic communication with Iceland. Dr. Jon Stefansson, an Icelander by birth, a Dane by education, and for the present a resident in England, occupies his spare time as an unofficial ambassador in the interests of his native land. He holds strong views respecting the natural resources of Iceland and their remunerative possibilities. The Icelanders have been consistently patriotic since the time that Thangbrand got into trouble for denying that Iceland is the fairest land that the sun doth shine upon, but a bad soil and a worse climate do not hold out much hope for business enough to warrant a cable. Reykjavik market reports will hardly keep it going.

The Pacific Cable.—According to news received at New York from Honolulu, the Hawaiian Government has rejected a petition to extend for a year the option of Mr. Spaulding and his associates, which expires shortly, for the laying of a Pacific cable. Mr. Foster, former United States Secretary of State, is at Honolulu looking after the interests of the American Cable Company and Americans in general. Meanwhile our own Cable Conference has held another sitting, and doubtless is considering these and similar things. But as the conference has decided not to give the Press any information as to what it is doing and when the cable-laying is to be got to, it seems scarcely worth to make a note of it every time it is seen that Lord Selborne has met the Colonial delegates at the Colonial Office.

Scottish Engineers.—The second general meeting of the fortieth session of the Institution of Engineers and Shipbuilders in Scotland was held on Tuesday night in the hall of the Philosophical Society at Glasgow, Sir William Arrol, M.P., presiding. A paper by Mr. Alexander Morton on "The Maximum Elasticity and Density of Steam" was discussed. The premiums of books were awarded to Mr. J. M. Gale, M.I.C.E., and Mr. W. Carlisle Wallace for their respective papers on "The Extension of the Loch Katrine Waterworks" and "Electrical Transmission in Shipyards and on Board Merchant Steamers;" while Prof. W. H. Watkinson was the recipient of the award of engravings for his paper on "Water-Tube Boilers." Afterwards a paper by Mr. Sinclair Couper on "Internal Corrosion in Steam-Boilers" was read, and another was contributed by Prof. Archd. Barr, D.Sc., on "Some Lecture-Room and Laboratory Appliances."

Overhead Wires in Spain.—Regulations for electrical installations which make use of the public land—*i.e.*, are not confined to private property, but pass through streets, etc.—have been published in *Electron*. Copper cables must be used unless permission to use other metals is obtained from Government. Wires must be insulated unless the department responsible specially

Digitized by Google

agrees to allow bare ones. Posts or supports must be of wood or iron unless the department allows them to be of some other material. The wires shall cross roads at a height of eight metres (say 26ft.) or more if circumstances require it in the judgment of the Ministry. The maximum distance between the posts shall be a hundred metres (say, 325ft.) but may be augmented to such an extent as the Minister thinks suitable. The insulators shall be of porcelain or some other material which in the judgment of the Minister produces the same result. That is all. There could hardly be less, and what there is can all be dispensed with by the Minister of the Interior, or whoever advises him. The erecters of overhead wires will doubtless consider them model rules.

Refining Plant.—A description of the electrolytic copper and silver refining plant of the Guggenheim Smelting Company at Perth Amboy, New Jersey, was given some time ago in the *American Electrician*. This plant has an annual capacity for about 10,000 tons of copper and 30,000oz. of silver. The copper cathode plates are electrolytically formed separately into thin shells and then placed in the regular copper-refining baths. The anodes weigh 275lb., and the electrolytic reduction of each requires about 24 days of 24 hours. The intensity of the current varies from seven to twenty amperes per square foot, the lower density being used with copper rich in precious metals. There are 360 tanks for copper refining, each containing 22 anodes in parallel. All the tanks are connected in series. The voltmeter at the switchboard registers from 117 to 120 volts, with 1,500 amperes. The Möbius process is used for silver refining. There are 48 silver-refining tanks, each of a capacity for from 600oz. to 700oz. of silver per 24 hours. Each tank has 24 anodes in parallel, and all the tanks are connected in series. The cathode consists of a silver belt which is always kept in motion and upon whose surface the silver is deposited from the anode and removed by scrapers located at one end of the tank. The surface of the belt is about ½in. below the lower surface of the cathodes and is made of a sheet of pure rolled silver 15in. wide, 31ft. long, and weighing about 40lb. Each of the anodes, which are 12in. by 3in. and 1in. thick, usually contains 100oz. of silver and from 3oz. to 8oz. of gold.

Forthcoming Events.—This (Friday) afternoon there is a meeting of the Physical Society at the rooms of the Chemical Society, Burlington House, at 5 p.m. (Captain Abney, F.R.S., on photographic shutters).—The Electro-Harmonic Society have a "Ladies' Night" in the evening (St. James's Hall Restaurant, 8 p.m.).—On Saturday, November 28, is the opening of the Brighton Seashore Railway; the arrangements are described in the "Business Notes." On the same day the Chesterfield Engineers and the Midland Mining Engineers have an excursion meeting at Doncaster. Monday, November 30, is the date of the anniversary meeting of the Royal Society at Burlington House, and the dinner at the Hôtel Métropole (7.30).—There is a students' meeting at the Institute of Civil Engineers, Great George-street, at 8 (Mr. Kinnour on signals), and on the same evening there is the second Cantor lecture at the Society of Arts (Prof. Lewes on gaslighting). On Tuesday, December 1, Major Flood Page addresses the London Chamber of Commerce on motorcarts (Botolph House, E.C., 3.30 p.m.). In the evening, the Institution of Civil Engineers have an ordinary meeting to discuss further the paper on "The Bacterial Purification of Water," by Percy F. Frankland, and at this meeting the monthly ballot for members will be taken. On Wednesday, December 2, at the Society of Arts meeting, Mr. W. A. S. Hewins, M.A., lectures on "The Teaching of Economics." Sir Owen Roberts will preside.—The Stanley Show begins at the Crystal Palace next Friday.

More "Electricity."—Certain facts which have come to the knowledge of the writer have shown him that the belief in the efficacy of the "dowsing" or divining rod for finding water is still much more widely spread than would be generally supposed, but the following, which is given in the words of a local contemporary whose reports are usually remarkably correct, is certainly surprising. The Marquis of Lorne was lecturing at Helensburgh on "Superstition," and after describing how the Highlanders had actually been so ignorant, even down to the time of Queen Anne, as to believe in the efficacy of charm stones, went on to deal with "water divination by means of the divining rod, and referred to many striking instances where the use of the twig had brought about the discovery of water in unlikely places. He was of opinion that it was quite within the bounds of possibility that the secret of the divining rod was to be found in electricity in the body of the expert striking down to the electrically charged water, although scientists would disclaim that water was charged with electricity. He had suggested the experiment of a receptive subject being led towards an electrical machine with the divining rod; and the subject, a young lady, being blindfolded, on being placed near to such a machine it was found that the rod immediately twisted round. Only one person in every five or ten thousand had the receptive power necessary for water definition." That the ordinary "educated" man should know nothing of the way the world works in which he lives is the fault of our system of education, but the lecturer in this case happens, among other things, to be the son of a duke who has laid claim to something more than a bowing acquaintance with science, and who is supposed to have studied the development of civilisation and the way in which erroneous beliefs originate. As to why people should prefer to assign anything they do not see the reason of to "electricity," rather than to medicine, heat, chemistry, kinematics, or anything else, that is one of the questions that seems likely to remain an insoluble mystery.

Boiler Explosions.—The report to the secretary of the Board of Trade on the working of the Boiler Explosions Acts, 1882 and 1890, has been issued. During the 12 months ending last midsummer 65 preliminary enquiries and 14 formal investigations were held under the provisions of the Boiler Explosions Acts. In 14 cases formal investigations were ordered, and in nine of these the owner or owners had to pay costs varying from £5 to £60. In one case the owner was killed by the explosion, and it was held that he had erred through ignorance in neglecting to have the boiler properly examined. That men who know better will "chance it" in a way not to be justified by pure reason seems always ignored. In the other cases no blame could be found with the owners or their servants. During the year under review 25 persons were killed and 48 were injured by boiler explosions which came under the notice of the Department, and out of the 79 cases dealt with 39 explosions occurred on board vessels and 40 on land, but these figures do not represent the relative proportions of explosions on land and explosions at sea. The opinion is expressed that, in view of the large number of steam-boilers in use in the United Kingdom, the percentage of cases in which the neglect shown was so great as to lead to a serious explosion was extremely small. The total number of cases attributed to the defective condition of the boiler or its fittings was 33, and of those due to the neglect or ignorance of

Digitized by Google

the boiler attendants 14. It would be useful if the cases of neglect were discriminated from the cases of "ignorance," though that is not by any means always possible. Moreover, there are boilers and boilers, and what are called by the Board explosions differ widely in their character and effects. If it should be shown that when certain classes of boilers go the destruction is widespread, while with others the damage is usually local and limited, the information would be valuable to many people. It is satisfactory to note that the report shows pretty clearly the hollow character of the contention that there would be an appreciable gain to public safety if boiler attendants were examined, certificated, and generally made a close trade of.

Motorcarts.—Mr. Harrington Moore has written to various papers to protest that there never was any race either from London to Brighton or back again. We never supposed there was, and therefore said little about the recorded "times." Nevertheless, it would appear beyond doubt that all motorcart owners have not been quite wise as to keeping always within the speed limit. From a business point of view it would be advisable for motorcarts to exhibit their ability in getting out of the way of other vehicles rather than to insist on their strict rights, or to blow a horn as though they expected everyone to clear the way before them. When people realise that they can be stopped quickly, they will cease to fear them. At present the popular mind is infected with ideas on the subject derived from the railway train. Mr. Ward's electric omnibus has been tried at Charing Cross, but the trial was not a success. It is stated, however, that this was the result of some foul play on the part of someone in charge of the yard. A lady has suggested that in building motor carriages the old lines of the horse-drawn vehicle should be abandoned, not followed. The writer is inclined to think so, too, but cannot go quite so far as Miss (or Mrs.) E. F. Fleet's motor "swan," which would be out of place anywhere but in a circus procession. The Queen of Spain is to have a motor carriage driven by Mr. Julian's batteries. News of some authentic trials of those batteries, with details of the length of run and its cost, would be more welcome to us. The *Liverpool Daily Courier* has burst into verse on the new means of locomotion. There are ten stanzas; we have only space for the last:

"To say that we've got to the top
Of invention is utter futility!
At Ubiquity only will stop
Electro-pan-Auto-mobility!"

Much is pardoned to the poet, even the last word, but the game which we thought played out of inventing new names for motorcarts has been started again. Mr. Sibley wants them called "autokinouns." The Greek of this is questionable, and according to the ordinary way of transliterating it would be "autocinun" in English. The Society of Arts discussion is the subject of another note.

Telegraphs in the Himalayas.—The report of Mr. Olphert, of the Kashmir Division of the Indian Government Telegraph Department, has been referred to in the *Bombay Gazette*. The report covers the past five years of his work mainly among the mountains of north Kashmir, and is one of many hardships and narrow escapes endured with great fortitude. In laying a line in the winter of 1892-93, between Srinagar and Kohala, Mr. Olphert was at Uri with his working party when the snowstorm commenced, and the snow lay nearly 3ft. deep on the ground when it stopped snowing. The party were in tents at the time; most of the tent ridgepoles were broken by the weight of snow, the cold was intense, and the coolies would not move. They said they would all die, and Mr. Olphert had to march the party down to Kohala by a road cut through conglomerate cliffs in many places, and with the stones in these cliffs, loosened by the frost and snow, falling out all day long on to the road below. They had to face the same danger coming back, but got into Srinagar without accident. The Kashmir officials "showed great appreciation of the work so long as it put them to no particular inconvenience." But when 8,000 coolies were applied for [one may, however, consider the feelings of a coolie asked to do work like the foregoing] to carry telegraph poles, only 50 were supplied, and the work was in consequence most disastrously delayed. The Kashmir coolie is superstitious, and if he believes an undertaking unlucky he will do his best to secure the fulfilment of his dreams. Mr. Olphert's men had a strong belief that a telegraph line could never be got over the Burzil Pass, and looked for the fulfilment of the prophecy, so the utmost difficulty in keeping them together was experienced. Work in Gilgit was also attended with great difficulty, but it was accomplished, and a line which was broken down five or six months every year is now replaced by one of decent permanence. When Mr. Olphert set to work he was assured on all sides that no aerial telegraph line could possibly stand on the passes, and he was strongly advised to lay a cable. All difficulties were, however, surmounted, and it has been proved possible to maintain telegraphic communication across the Kashmir passes in the very worst weather.

Forced Draught.—Now and again someone starts off to consider the difference between the interest on the capital expended in building a chimney shaft and the cost of the steam necessary to produce a forced draught. For examples of how it works in practice one would naturally look to America, where the traditions of permanency in building are less strong. Of course, it is where the demand for steam is intermittent that the advantage of a forced draught comes in. The following from a paper read before the American Street Railway Association by Mr. R. McCullough gives an idea of what is being done in the States in this direction. Much has been written about the electric locomotives in the Baltimore and Ohio Railroad's tunnel, but, so far as the writer knows, the way the boilers are worked in the power-house is new on this side of the Atlantic. Mr. McCullough says several of the large power-houses built during the last few years have abandoned the use of stacks for producing draught, and are operating by means of an induced draught produced by fans placed in the flue or short stack. In this case the stack is just high enough to clear the roof. This system has many advantages. First, there are no stacks to blow down or fall down, and this point is of special importance in a region subject to tornadoes. The second and most important advantage, however, is the absolute control which it affords in governing the fires, and this point will appeal especially to those power-houses subject to sudden and rapidly changing loads. As an illustration of this may be cited the power-house recently erected to operate the Belt Line tunnel road, in Baltimore, Md. A great part of the time there is no load on the power-house, as it is only operated when there is a freight train to be hauled through the tunnel. The manner in which the load is handled is as follows: The boiler-room is supplied with blowers in place of stacks, and a slow fire is kept constantly under each boiler. When a telegram is received that a freight train is approaching, the blower is started, and, on the arrival of the train, steam has been raised in sufficient quantity to supply the great demand put upon the boilers. This illustrates the extreme flexibility of the system, and it would be difficult to handle this load in any other manner. Economisers are operated with great efficiency in connection with an induced draught, as this system permits the flue gases to be robbed almost entirely of their heat, since it is not

Digitized by Google

necessary to have a large quantity of heat in the flue gases in order to create a proper draught.

Physics and Engineering at Glasgow.—The temporary laboratory which is being equipped for the use of the engineering department of Glasgow University pending the erection of new buildings was opened this week. A prominent part of the apparatus is a Crossley gas-engine of about 10 h.p., presented to the university by the committee of the Murdoch Memorial Fund, under the auspices of the North British Association of Gas Managers. The engine drives a dynamo which will supply current to a battery, and the installation will be used for the lighting of the laboratory as well as of the Bute and the Randolph halls by electricity. It will also drive an electric motor to provide power for the working of machinery to test the strength of metals. When the engineering laboratory is built, the engine will be given a permanent place there in connection with the generation of power. At the ceremony on Wednesday afternoon, which took place in the university court-room, there were present, among others, Principal Caird, who presided; Lord Kelvin, Sir William Arrol, M.P.; Prof. Jack, Prof. Barr, Prof. Byles, Mr. Andrew Stewart; Messrs. A. Bell, Dalkeith, and Dr. J. T. Bottomley, and others. In the course of the proceedings, Lord Kelvin said that, as Principal Caird had just pointed out, Murdoch had done great things for the whole world; and now, about 100 years after Murdoch introduced gas, its use for lighting was being largely superseded. The engine would be a perpetual memorial that gas had not completed its work, that it had done all that could be done in the way of lighting directly, but that it was now largely used for driving machines which produced lighting by electricity. He thought that the North British Association of Gas Managers might be very happy indeed in their prospects. Gas was doing more than ever it did in the way of lighting. It was likely to be more largely used as a motor, and however much might be done by electricity, he saw nothing but prosperity and augmented work for the gas manufacturers of the United Kingdom, and he might say also for the world. Prof. Barr, as representing the engineering department of the university, thought it was not at all inappropriate that a memorial of Murdoch should take the form of an apparatus which was more or less for the purpose of superseding gas as an illuminant. Murdoch was one of those characteristic inventors who was never satisfied with anything that was attained. Prof. Barr added that they were that day practically opening the small and temporary laboratory; but as the funds for the permanent laboratory were now available, he hoped the university court would in the very early future fix definitely on a site for the new buildings, and allow them to get forward with the erection of them.—The opening meeting of the Physical Society of Glasgow University took place last Friday night in the natural philosophy classroom, when the president (Dr. Magnus Maclean) gave his presidential address, choosing as his subject Röntgen rays, or, as he remarked, some of the physical and visible phenomena occurring on passing an electric discharge through gases at different densities from ordinary density down to the lowest we can obtain by the best mechanical means at our disposal. A large audience filled the lecture-room, and on the motion of Lord Kelvin, seconded by Dr. Macintyre, Dr. Maclean wa awarded a very hearty vote of thanks.

Yorkshire Student Engineers.—Last Saturday evening the third annual dinner of the Association of Yorkshire Students connected with the Institution of Civil Engineers was held at the Queen's Hotel, Leeds. About 60 gentlemen were present, including Mr. Arthur Greenwood (president), Mr. W. H. Preece, C.B., Mr. W. E. Garforth, Mr. A. T. Walker (vice-president of the association), Mr. E. R. S. Escott, Prof. Goodman, Prof. Grover, Prof. Ripper, Mr. J. McLaren, and Mr. Henry McLaren. There was a toast list of the usual kind, but what followed was more like a discussion on technical education. In proposing "The President and Institution of Civil Engineers," Mr. Walker observed that Lord Rosebery had lately proved to his own satisfaction that the Germans were very much ahead of us. Mr. Balfour had declared that we were very much behind in our understanding of the relations of science to industry. They all respected and admired Mr. Balfour very much, and he was delighted to find that after visiting one of the principal works in Sheffield Mr. Balfour modified his opinion and remarked that he was almost sorry for what he had uttered on that subject. Mr. W. H. Preece responded and alluded to the rapid growth and development of the Institution of Civil Engineers, which now had 6,907 members. They were all bound together by one universal principle—the principle of energy. One thing that helped to keep the institution together was the establishment of local associations such as their own, which, he understood, now numbered 298 members. Alluding to the advantages which students could gain by visiting engineering and other establishments, Mr. Preece observed that the Post Office authorities had tried their very best to make the new establishment in Leeds up-to-date, and however much they might have erred in telephone work—according to the newspapers—they had in Leeds a post office which was doing what no other post office in the world had done up to the present. In Leeds they were driving their pneumatic tubes by electrical power, and were even melting wax with the electric current. They had also made Leeds the centre of the whole telephone service of the country, so that telegraphically and telephonically it was becoming a most important centre. He so far agreed with Mr. Walker as to think a great deal too much was being made of the scientific advance of Germany and of the efforts the Germans were making to instruct their workpeople in technical matters. They had found in what way the English had beaten them in the past, and, like clever fellows, were trying to retrieve their mistakes. But it was not in technical education the Germans were beating us; it was in business habits—in enterprise. Everywhere he had found it was the commercial education of the Germans that was doing so much injury to our industry, and not their scientific abilities. In science and electrical developments we beat them hollow. In foreign markets where the German had the best of the Englishman, it was because he was better educated in commerce though not in science. If they wanted to impress technical education on manufactures they must start at both ends. The employer wanted just as much technical education as the workman, and sometimes a good deal more. Mr. E. R. S. Escott proposed "The Yorkshire Association of Students," and, in reply, the President said the primary object of the association was to give the Yorkshire students some of the advantages enjoyed by those who could attend the lectures in Westminster. Then there was more about technical education, Mr. Greenwood appearing to be in substantial agreement with Mr. Preece.

Society of Arts.—At the meeting of the Society of Arts on Wednesday evening Mr. W. Worby Beaumont read a paper on "Recent Developments in Mechanical Road Carriages." Sir Frederick Bramwell presided, and in introducing the lecturer said the subject was one in which he himself took an interest so long as 60 years ago. Mr. Beaumont's address was very long, and dealt with the

Digitized by Google

various types of carriages brought out. It can, therefore, hardly be summarised here. He, however, began by expressing a well-founded regret that the absurd legislative restrictions against travelling on public roads by mechanical means had so long been retained in this country. The result was that everything towards the construction of light motor vehicles had now to be commenced, while for a foreign trade other countries were now two years ahead of us. The new regulations had in general the assent of the motor-carriage building and using public, but there were some which were not defensible, in that they were of the nature of dictates to mechanical engineers on matters which they understood better than any outsider. On such structural details as reversing gear, brakes, and wheels they should be left to provide that which they, by past or coming experience, knew or would find to be best. The oil motorcart, particularly such as burned light oils, had come to the front in the trials up to the present, but Mr. Beaumont thought that was rather due to accidental and personal causes than to the inferior merits of the steam carriage. As to electric carriages, Mr. Beaumont dismissed them in a single sentence as simply a question of improvements in secondary batteries. The discussion that followed was interesting, some at least of the pioneers of the industry in the old days being present. Sir Frederick Bramwell began it. The idea of motorcarts had got a popular hold, and he thought it would run the usual course. There would be enthusiasm, premature work, a good many failures, some accidents, and the thing would fall into disrepute. Then it would be taken up again in a spirit of engineering, instead of one of company promoting, and it would be found that the method of locomotion was a valuable one. He was surprised to find that the pneumatic tyre would stand the wear and tear of traction work. Referring to the old days, Sir Frederick did not seem to think that engineers had made much advance in the matter during the long years of fallow. For his own part, had he the leisure and the money, he should like nothing better than to make a servile copy of Hancock's steam omnibus, which ran from Paddington to the Bank, and ask the present generation if they had done anything as good. The name of Mr. Walter Hancock was announced as the next speaker. This sounded alarming, but it was the nephew of the original Hancock. Mr. Sennett claimed for Perkins priority in many of the features of the Serpollet engine and generator. A sort of skirmish followed between Sir Frederick Bramwell and Mr. Sennett as to what Perkins's "tractor" was like. [A tractor is a sort of motor-thing that you tack on to a carriage to draw it instead of putting a horse in the shafts.] Ultimately Sir Frederick came out very much on the top, and it subsequently appeared that he had ridden behind the tractor and remembered all about it. It was a one-wheeled thing, in which the whole affair, including the boiler, went round. Mr. Terry spoke much, and Mr. De Vigne described his old "Fly-by-Night." The fault of this seemed to be that it was too heavy and went too fast for the nerves of our fathers and grandfathers. Moreover, it shocked the feelings of engineers by using steam at 150lb., or even 180lb. There seemed to be a general feeling that these old types might be consulted with advantage in designing new ones.

Technical Education.—At the Cutlers' Feast at Sheffield last week Mr. Arthur Balfour was the principal guest, and, in responding to the toast of "Her Majesty's Ministers," had something to say about the eternal technical education question. Mr. Balfour has suddenly become aware of the German expenditure upon technical and scientific instruction. A gentleman who has recently been visiting German institutions for training men in electrical science has told him that Germany has half a dozen of them, each better than anything we can show in this country. Also, the action of the State and the municipalities has been worthily seconded by German manufacturers, who spend large sums on research and keep large staffs of trained chemists and physicists engaged in work not directly profitable. The result is that he appears to have become a convert to the view that the smallest hint in developing any discovery, however slight, and making any advance, however small, may be of value. It was necessary, he said, to consider whether the example was not worth following. The idea that what is called technical instruction, by which was meant manual instruction, however good in itself, had anything whatever to do with the broad kind of education of which he was speaking, was quite as fallacious as the suggestion that education in the first three standards, leading up to the highest university training, was comparable to the manual education of which he spoke, and the technical education which he desired to see carried on. Elementary education was necessary to university education, but while education in the three R's led to knowledge, manual education, known as technical education, had really no connection with the scientific education to which he referred. He feared it might be said in some quarters that the relation between science and manufacture had not been thoroughly grasped. There might be some who still thought that the money spent upon abstract investigation was far removed from the practical needs of life, and that such abstract investigation had a very small effect on the well-being of the national commerce. He believed that those who held that view were profoundly mistaken. They had not followed the course of human knowledge or kept abreast with human progress. We had to learn a lesson which had perhaps come very easy to the Germans, but we ought at all events to learn it completely, and if we did that we should continue to hold that position which we had hitherto held unchallenged for British commerce and British industry, and we should be able to continue to claim throughout the world the supremacy which we had so long enjoyed and so well earned. As it is pretty well understood that the speaker is one day to govern this country, his conversion to something more than a philosophic doubt of the all-sufficiency of classics and literature for men of culture, and manual training for mere mechanics, may ultimately bear very practical fruit. There has also appeared a very characteristic letter in the *Times*. The anonymous correspondent applauds Mr. Balfour, but shows a complete inability to understand the importance and extent of both abstract and applied scientific knowledge, for he points with an air of conviction to the "instruction in science subjects and subjects of practical utility given in our evening continuation schools" as supplying the want to which Mr. Balfour calls attention. It will be seen from another note that Mr. Preece and others at an engineering students' dinner have been pointing out a view of the matter which might have been pressed home even more strongly. Mr. Preece says, in effect, that if the business man gets beaten by the Germans it is because he does not understand business, and not because he cannot get technical assistance. The business man assuredly does not understand the meaning of the technical education for which he is calling out. Mr. Preece's view is worth careful consideration, but worse than the business man is the irresponsible amateur who knows neither science nor business, and, as he is often found in very high places, he manages to decide how the money available for education shall be spent.

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 571.)

SINGLE LINES.

Another form of instrument in extensive use for single line work is Tyers's tablet instrument, three varieties of which are shown by Figs. 92-95. The electrical connections for the respective instruments are shown by the diagrams Figs. 92A, 93A, and 95A.

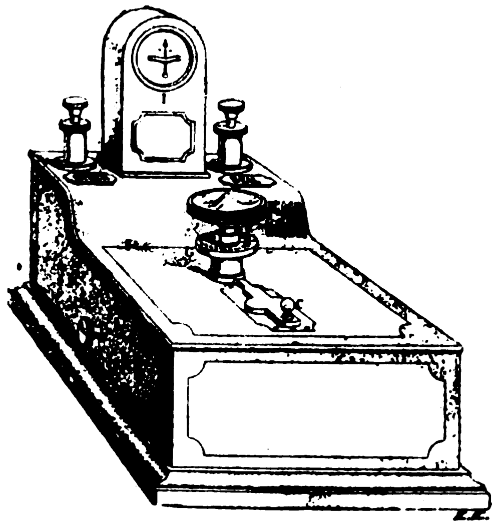

FIG. 92.

The "tablet," which constitutes the authority to proceed through the section, is usually an annulus of metal appropriately numbered and lettered in accordance with the section it is intended to represent. The tablets are placed in suitable receptacles in the body of the instrument, and the arrangement of the mechanism is such that only one

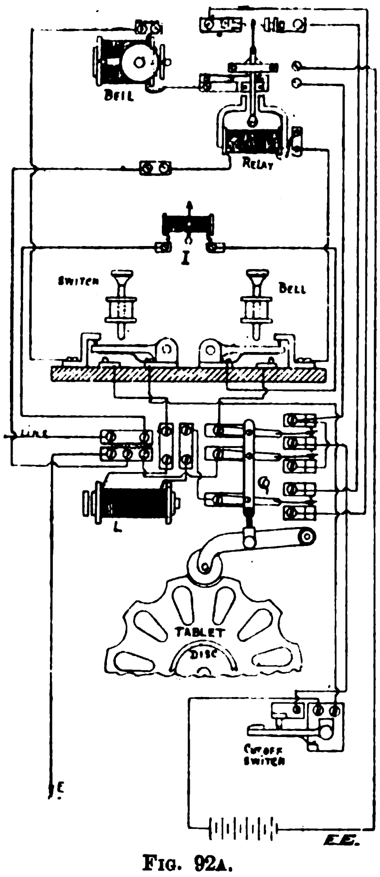

FIG. 92A.

tablet can be out at one time, and this removal can only be made after certain conditions have been complied with.

In the instrument shown by Figs. 92 and 92A the tablets are inserted in radial slots cut in a rotating disc, the motion of which is controlled by a pawl and ratchet wheel, the pawl in turn being operated by the locking electromagnet. The rotation of the tablet disc is effected by turning the knob, K, and movement of the disc actuates the commutator, Q, shown in Fig. 92A. The instrument is also provided with an indicator, I, a bell plunger, a switch plunger, a bell, a relay, and a small cut-off switch shown at the bottom of the diagram. Tablets are inserted or withdrawn at the opening covered by the cap, C (Fig. 92). The operation of withdrawing a staff, at A say, is carried out

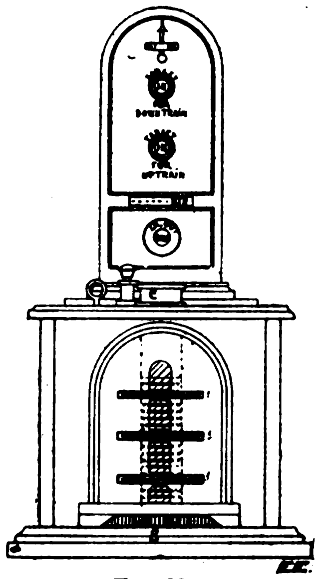

FIG. 93.

as follows, after the usual bell signals have been exchanged. A grasps the knob, K, and turns it as far as possible from left to right, and depresses the switch plunger, S. At the same time B depresses his bell plunger. Under these combined operations A's instrument is unlocked, and by turning the knob, K, from right to left he is able to bring a tablet into position under the cap, C. It is then only necessary to raise the latter in order to remove the tablet. The lifting of the cap, C, mechanically locks the rotating disc, so that

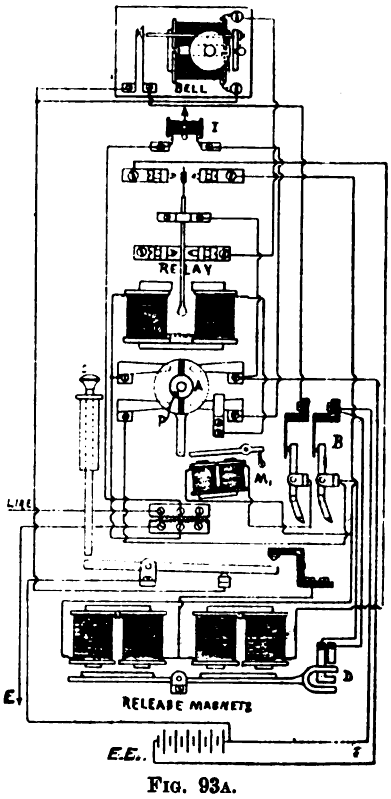

FIG. 93A.

only one tablet can be removed at a time, and this lock is only removed by placing C in its original position, when, of course, the instrument is again locked by the pawl and ratchet wheel.

Consideration of the diagram of connections will show

Digitized by Google

that the depression of S at A during the operation of unlocking the instrument at that place, simply provides a path for the local current set in action by the upper tongue of the relay making the proper contact for the completion of the local current through the locking magnet, L. As shown in Fig. 92, the proper point of contact is on the left relay. The current from the distant station, B, due to the depression of the bell plunger at that place, simply passes through the indicator and relay, but the actuation of the latter for the purpose of unlocking L, in conjunction with the simultaneous depression of S, depends upon the direction of the current sent from B. The direction of this current is controlled by the commutator, Q, and a glance at Fig. 92A will show that the release of either instrument depends upon the commutator occupying similar positions at both places.

Provision is made for disconnecting the local battery whenever a tablet is immediately under the cap, C. This is done by the tablet, when in position in the rotating disc, depressing the cut-off switch shown at the bottom of Fig. 92A. No signals can be sent under these circumstances, and for this reason it is necessary to turn the knob, K, from left to right after a tablet has been inserted before the clearing line or arrival signal can be sent to the rear station.

With this form of tablet instrument a tablet may be returned to the instrument from which it was taken, and

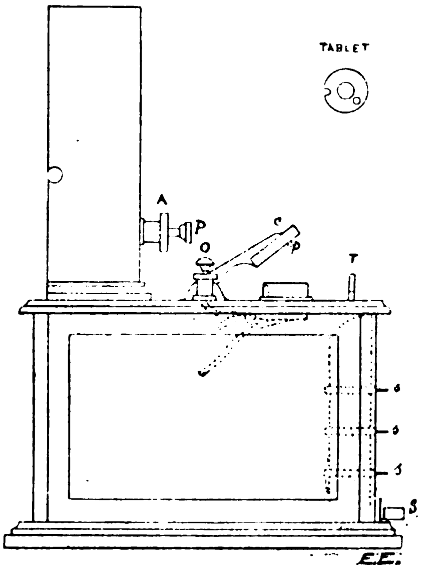

FIG. 94.

a tablet may therefore be withdrawn for local shunting purposes, involving use of part of the staff section only, without the necessity existing of conveying it to the opposite end of the section. One feature of this form of the tablet instrument is the absence of any indication of the condition of the line.

Figs. 93, 94, and 93A show another form of the tablet instrument. In this form tablets are inserted by raising the cap, C (Figs. 93 and 94), and withdrawn by pulling out the slide, S, at the bottom of the instrument. The tablets are contained in a hollow column above the slide, the lowest tablet fitting into a recess in the slide, and having its upper surface flush with that of the slide. A number of auxiliary slides, *s*, are provided to assist in supporting the tablets, which are lowered into the bottom slide as necessity arises. The positions of the tablets are visible from the front of the instrument, so that the approximate number available for use at any time may be observable in order that any transference of tablets rendered necessary by unbalanced traffic may be made in time to prevent delay. The bottom slide cannot be withdrawn from the instrument unless it contains a tablet.

The means used for preventing a tablet for one section being put into the instrument for another section are shown in Fig. 94, in which the cap, C, is shown raised for the insertion of a tablet. A radial slot is cut in the tablet, which, when the latter is put in the receiver fits into a projection for it, and necessitates the tablet being placed in one particular position when in the receiver. In addition to the slot, a small hole is formed in the tablet into which the pin, *p*, shown on the cap, projects. This pin must pass through the hole in the tablet before the cap can be placed down, which must be done before the lower plate on which the tablet rests can be released. By forming the hole in the tablet at different points relatively to the slot, and fixing the pin, *p*, on the cap in positions to suit, any tablet other than one intended for that instrument will prevent the cap from being placed in the position necessary to release the lower plate or receiver. When the cap is in its position for releasing the receiver the weight of the tablet depresses the lower plate, and the tablet falls off it and falls into the column shown by the dotted lines in Fig. 94. The locking shown between the cap, C, and the receiver plate is diagrammatic only.

The electrical part of the instrument is shown by the diagram Fig. 93A. It consists of a two-part commutator, bell plunger, relay, indicator, bell (which also acts as a relay), unlocking plunger, electromagnetic commutator lock, slide-releasing magnets. The operation of releasing a tablet is very similar to that described in connection with the instrument shown by Fig. 92. The switch, O, is depressed at the station at which the tablet is required, and the bell plunger is depressed at the distant station. The current from the distant station simply actuates the relay and indicator, and the former, in conjunction with the unlocking switch, provides a path for a local current through one or other of the releasing coils. A second local current is set up by the plunger attached to the bell armature, which passes through the electromagnet controlling the commutator. The withdrawal of the slide breaks the two spring contacts at B, and these remain broken during the whole time the slide is out. One of these contacts breaks the circuit through the commutator electromagnet, M_1, and the other contact breaks the battery circuit to the commutator and the bell plunger. An auxiliary circuit, however, is provided at D for the latter, and is closed by the armature of the releasing electromagnets. The lower indication "in" "out" is actuated mechanically by the turning of the commutator at that place; the upper indication is operated by the current, sent from the distant station, through the relay, after the commutator has been turned from its normal position.

The construction of this instrument is such as to prevent a tablet being returned to the instrument from which it has been taken. The tablet must be taken to the opposite end of the section. It cannot, therefore, be used for local purposes only.

(To be continued.)

THE PRINCIPLES OF ALTERNATE-CURRENT WORKING.*

BY ALFRED HAY, B.Sc.(EDIN.), A.I.E.E.

(Continued from page 570.)

102. When two circuits are so placed relatively to each other that a current flowing in one of them produces a magnetic flux through the other, we say that there is *mutual inductance* between the circuits. For example, if we have two coils of wire, A and B (Fig. 72), one of which, A, may be connected to a battery, and the other, B, is permanently connected to a galvanometer, G; then by closing the circuit of A we poke a certain number of lines through B, thus giving rise to an induced E.M.F. in B and (since the circuit is closed) current through the galvanometer. The current is, of course, only momentary, and ceases as soon as the current in A has become steady (Art. 23). If the circuit is now broken, the lines due to the current in A are removed from B, and we get a momentary deflection of the galvanometer in the opposite direction.

By altering the position of B, we can increase or diminish the galvanometer deflection due to the making or breaking of the circuit A. In particular, a number of positions may

* Based on a series of evening lectures delivered at the University College, Liverpool.

Digitized by Google

be found for which there is *no deflection* when the circuit A is either made or broken. It will be found that in such positions the planes of the coils are mutually perpendicular, as shown in Fig. 73. For any such position, the magnetic lines proceeding from A run in a direction parallel to the plane of B, and therefore do not thread themselves through B. Hence the starting or stopping of a current in A does not give rise to any induced E.M.F. in B. When this is the case, we say that the two circuits are devoid of mutual inductance.

103. In order to investigate the effects produced by the mutual inductance of two circuits, it becomes necessary to adopt a unit in terms of which this quantity may be measured. Before doing so, however, we shall prove the following important proposition :

If two circuits, A and B, are so placed relatively to each other that a current i in A gives rise to N lines through B, then a current i in B will give rise to N lines through A.

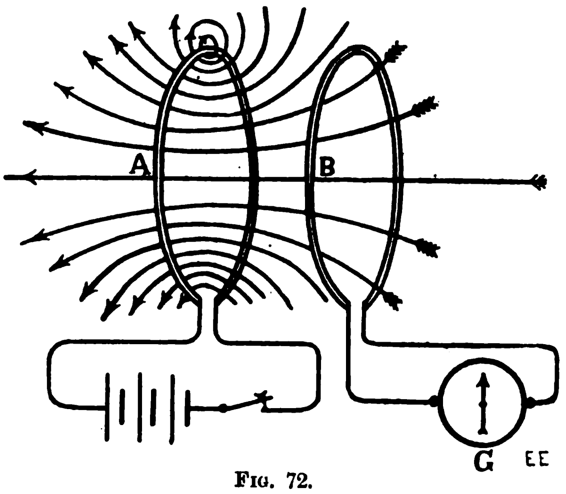

Fig. 72.

Let us suppose that the number of lines through A due to a current i in B is N′. Let the current in each circuit be maintained constant and equal to i, and let the circuit B be gradually moved away from A, until it has travelled so far away from A that practically the whole of the lines through it due to the current in A have disappeared. In moving the circuit B away from A, a certain amount of work will obviously be done, for during its motion the circuit B is cutting lines proceeding from A, and this gives rise to a counter E.M.F. in B, so that work must be spent in maintaining the current against the counter E.M.F.* The circuit B has a current i flowing in it, and in moving it away from A we have caused it to cut N magnetic lines. Hence by Art. 32 the work done in separating the circuits is N i.

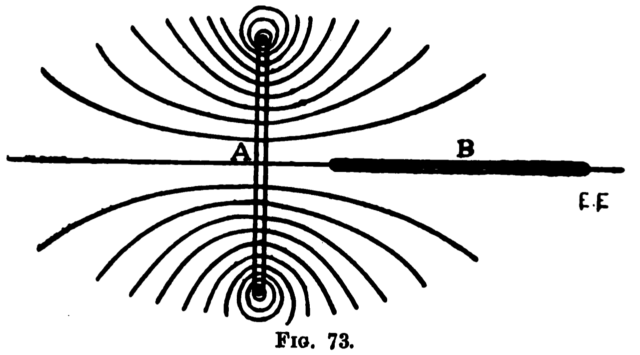

Fig. 73.

Let us next suppose that instead of moving B we keep B fixed, and move A to a very great distance. The work done will in this case be N′ i.

But the work done in moving B away from A must obviously be the same as that done in moving A away from B, since for any given distance between the two circuits the force exerted by A on B must equal that exerted by B on A. Hence we must have

$$N\,i = N'\,i,$$

or

$$N = N',$$

which establishes the proposition stated above.

104. Using this result, we define the *mutual inductance* (or *coefficient of mutual induction*) between two circuits as follows :

The mutual inductance of two circuits is the magnetic flux through one of them due to unit current in the other.

105. We are now in a position to investigate the establishment of a current under a steady impressed E.M.F. in a circuit which, besides having (self) inductance, has also mutual inductance.

Referring to Fig. 74, let us suppose that a steady E.M.F. of amount E is applied to the circuit A, of resistance r_1, and inductance L_1. Let the resistance and inductance of B be r_2 and L_2 respectively, and let the mutual inductance of the two circuits be M. The problem is to find the law of growth of the current in A.

Let i_1 and i_2 stand for the instantaneous values of the currents in the circuits A and B respectively, and let i_1' and i_2' stand for their rates of change (Art. 33). Consider, in the first place, the various E.M.F.'s which we have in the circuit A. These are: (*a*) the $r_1\,i_1$ E.M.F., which is required to maintain the current i_1 through the resistance r_1; (*b*) the $L_1\,i_1'$ E.M.F. required to balance the counter E.M.F. due to the inductance of the circuit; (*c*) the $M\,i_2'$ E.M.F., which is required to balance the induced E.M.F. in A *due to the variation of the current in B*; (*d*) the impressed E.M.F., E. This latter must obviously be equal to the sum of the former three, so that

$$r_1\,i_1 + L_1\,i_1' + M\,i_2' = E \quad . \quad . \quad . \quad (\alpha)$$

Similarly, in the circuit B we have the three E.M.F.'s $r_2\,i_2$, $L_2\,i_2'$, and $M\,i_1'$. Since there is no impressed E.M.F. in B, we have

$$r_2\,i_2 + L_2\,i_2' + M\,i_1' = 0 \quad . \quad . \quad . \quad (\beta)$$

If the values of i_1 and i_2 at any instant are known, then we can calculate the corresponding values of i_1' and i_2' from the above equations. For, multiplying equation (α) by L_2, and equation (β) by M_1 and subtracting the latter from the former, we find

$$i_1' = \frac{L_2\,E + M\,r_2\,i_2 - L_2\,r_1\,i_1}{L_1\,L_2 - M^2}.$$

Substituting this value for i_1' in equation (β), we get

$$i_2' = -\frac{M\,E - M\,r_1\,i_1 + L_1\,r_2\,i_2}{L_1\,L_2 - M^2}.$$

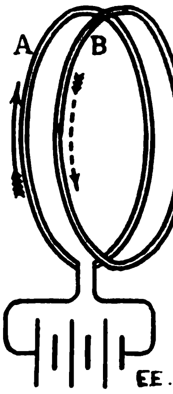

Fig. 74.

106. By using the above equations, and applying a step-by-step process similar to that used in Art. 36, we are able to draw approximately the curves showing the growth of the current i_1 in circuit A, and the growth and decay of the current i_2 in circuit B. We proceed to illustrate the method by a numerical example.

Let an E.M.F. of 100 volts be applied to a circuit of resistance 10 ohms and inductance ·05 henry, another circuit, of resistance equal to five ohms, and inductance 0·4 henry, being placed in the neighbourhood of the first

* If we suppose that the fields due to the two currents oppose each other. But if they have the same direction, then the E.M.F. induced in B during the motion will be an adjuvant E.M.F., and will assist the current, so that work will be given to B and not spent upon it as in the first case.

Digitized by Google

circuit and in such a position that the mutual inductance is ·02 henry. Substituting these values in the expressions for i_1' and i_2' obtained above, we get

$$\left.\begin{aligned} i_1' &= 2{,}500 + 62{\cdot}5\, i_2 - 250\, i_1 \\ i_2' &= -\,(1{,}250 - 125\, i_1 + 156{\cdot}25\, i_2) \end{aligned}\right\} \quad . \quad (\gamma)$$

At the commencement, when the time $t = 0$, we have $i_1 = 0$, and $i_2 = 0$, so that the initial rates of current growth in the two circuits are $i_1' = 2{,}500$ and $i_2' = -1{,}250$. We shall assume that these rates of growth remain constant until i_1 reaches, say, $\frac{1}{20}$th of its steady value—*i.e.*, ·5 ampere. Since i_1 grows at the rate of 2,500 amperes per second, the time taken by i_1 to reach a value of ·5 ampere will be $\frac{\cdot 5}{2{,}500} = \cdot 0002$ second. At the same time, the current i_2 has been growing at the rate of $-1{,}250$ amperes per second, and, therefore, the value reached by it at the end of the ·0002 second is $-1{,}250 \times \cdot 0002 = -\cdot 25$ ampere. At the end of that interval, we take into account the fact that the rates of growth of the two currents do not remain constant, and, using the values $i_1 = \cdot 5$ and $i_2 = -\cdot 25$, we calculate from equations (γ) the new rates of growth. We thus get

$$i_1' = 2{,}500 - 62{\cdot}5 \times \cdot 25 - 250 \times \cdot 5 = 2{,}359 \text{ approximately,}$$

and $i_2' = -(1{,}250 - 125 \times \cdot 5 - 156{\cdot}25 \times \cdot 25) = -1{,}148$ approximately.

As before, we suppose that these new rates of growth remain constant until i_1 has again increased by ·5 ampere. This will take $\frac{\cdot 5}{2{,}359} = \cdot 000212$ second approximately. During the same time, i_2 will have increased by $-1{,}148 \times \cdot 000212 = -\cdot 243$ ampere. Corresponding, therefore, to $t = \cdot 0002 + \cdot 000212 = \cdot 000412$ second, we have the values $i_1 = 1$ and $i_2 = \cdot 493$. Substituting these new values of i_1 and i_2 in equations (γ) we once more calculate the corresponding values of i_1' and i_2', etc.

Proceeding in this way, we obtain the following set of values :

$t =$	0	·0002	·000412	·000637	000878	·001135	·001413
$i_1 =$	0	·5	1·0	1·5	2·0	2 5	3·0
$i_2 =$	0	– ·55	– ·493	– ·727	– ·957	– 1·18	– 1·39
$t =$	·001713	·00204	00240	·00280	·00325	·00376	·00435
$i_1 =$	3·5	4·0	4·5	5·0	5 5	6·0	6·5
$i_2 =$	– 1·59	– 1·77	– 1·94	– 2 09	– 2 22	– 2·33	– 2·41
$t =$	·00504	·00588	·00694	·00386	01047	01423	—
$i_1 =$	7 0	7·5	8·0	8·5	9 0	9·5	10
$i_2 =$	– 2·44	– 2·43	– 2 37	– 2·20	– 1·87	– 1·27	—

Using this table, we may plot the curves showing the growth of the current i_1 to its steady value of 10 amperes, and the growth and decay of the current i_2. These curves are shown in Fig. 75. The student will find it instructive to compare Fig. 75 with Fig. 26, Art. 36, which shows the rise of current in the circuit A when there is no mutual inductance. For the sake of convenience, the curve of Fig. 26 is reproduced (dotted) in Fig. 75. The student will at once notice that one of the effects of mutual inductance is to *accelerate the initial growth of the current.* Starting from the origin, the two curves *diverge*, then for a time run almost parallel to each other; after that they begin to *converge*, and ultimately the dotted curve *crosses* the full line one, so that at a certain instant (corresponding to a considerable fraction of the steady value of the current) the current will have the same value, whether mutual inductance be present or absent. Beyond this point the current will grow more rapidly if mutual inductance is absent.

107. The above results might have been predicted from the following purely physical considerations. When an E.M.F. is applied to the circuit A (Fig. 74), then, as soon as a current makes its appearance in the circuit, it induces a current in the circuit B, the direction of this induced current being that of the dotted arrow. The induced current in B reacts on A, and induces in A an *adjuvant* E.M.F., thus accelerating the growth of the current. This goes on so long as the current in B is increasing numerically. A stage, however, is soon reached when the E.M.F. induced in B is too small to maintain the current, and the latter begins to decrease. During the decrease of the current in B an *opposing* E.M.F. is induced in A, which now *retards* the growth of the current. This fully explains the crossing of the two curves, and we see why it is that the growth of the current in a circuit is during its early stages

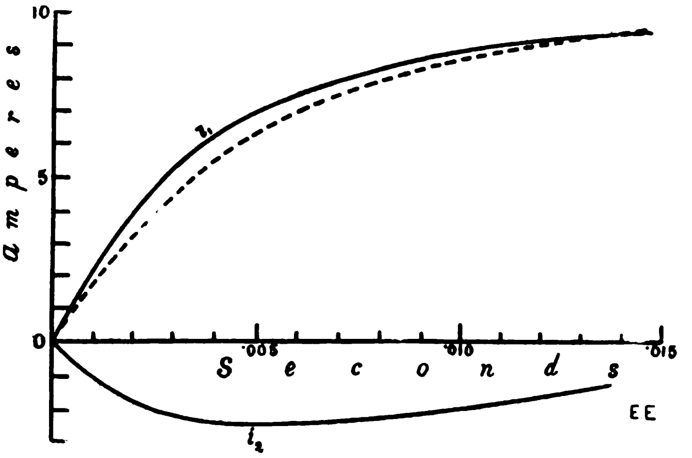

FIG. 75.

accelerated, and during its later stages *retarded*, by the presence of mutual inductance.

(*To be continued.*)

THE STORAGE BATTERY AT THE MANCHESTER CORPORATION ELECTRIC LIGHT WORKS.

A very considerable and valuable addition to the capacity of the Manchester Corporation electric light works has recently been made by means of a storage battery equipment. The battery is installed in the immediate vicinity of Hunt's Bank, at a distance of one mile from the central generating station, and is charged from the ordinary distributing mains of the existing five-wire system. At the battery sub-station a motor generator is employed to give the requisite addition to the ordinary pressure of supply that is necessary to overcome the back E.M.F. of the battery. The motor generator is designed to carry the mormal charging current of 300 amperes, and to raise it from 410 to 590 volts. The battery has been supplied and erected by the Chloride Electrical Storage Syndicate, Limited, Clifton Junction, Manchester, and consists of 224 cells, each containing 73 plates of their well-known "R" type. The containing cells are of stout sheet lead, and are carried on iron and timber stands, and the battery is insulated throughout by means of duplex oil insulators. The plates are supported in the cells by means of glass side plates or hangers, and separated from each other by solid glass rods. The frame of each plate is cast with an extension lug, which is homogeneously burnt with the corresponding lug of opposite polarity of the next cell on to a continuous lead T section, which runs between each cell, supported on porcelain oil insulators. The connection between tier and tier of cells is effected by means of solid copper rods where the same are carried overhead, and by means of vulcanised rubber covered cables encased in lead where carried beneath the floors. The entire battery is subdivided into four distinct batteries, each consisting of 56 cells, and is coupled on to the five-wire network of mains. Each of the batteries so formed is again subdivided into two parts, one part consisting of the battery proper of 44 cells, the other, the regulating portion, consisting of 12 cells. The whole battery is erected in five archways under the main roadway, three of the archways containing the four main portions of subdivided battery, the fourth being employed to contain the four sets of regulating cells, while the fifth is devoted to the motor generator and switchboard arrangements.

In the accompanying views No. 1 shows the type of the

Digitized by Google

four main batteries, while No. 2 is a view of the general arrangement of the four sets of regulation cells. Twelve regulating cells are employed with each battery, the connections between which and the switchboard are made by means of solid copper rods carried round the wall on porcelain insulators fixed in iron supports, specially designed for the work by Mr. C. H. Wordingham, the Corporation electrical engineer, to whom is also due the general design and arrangement throughout.

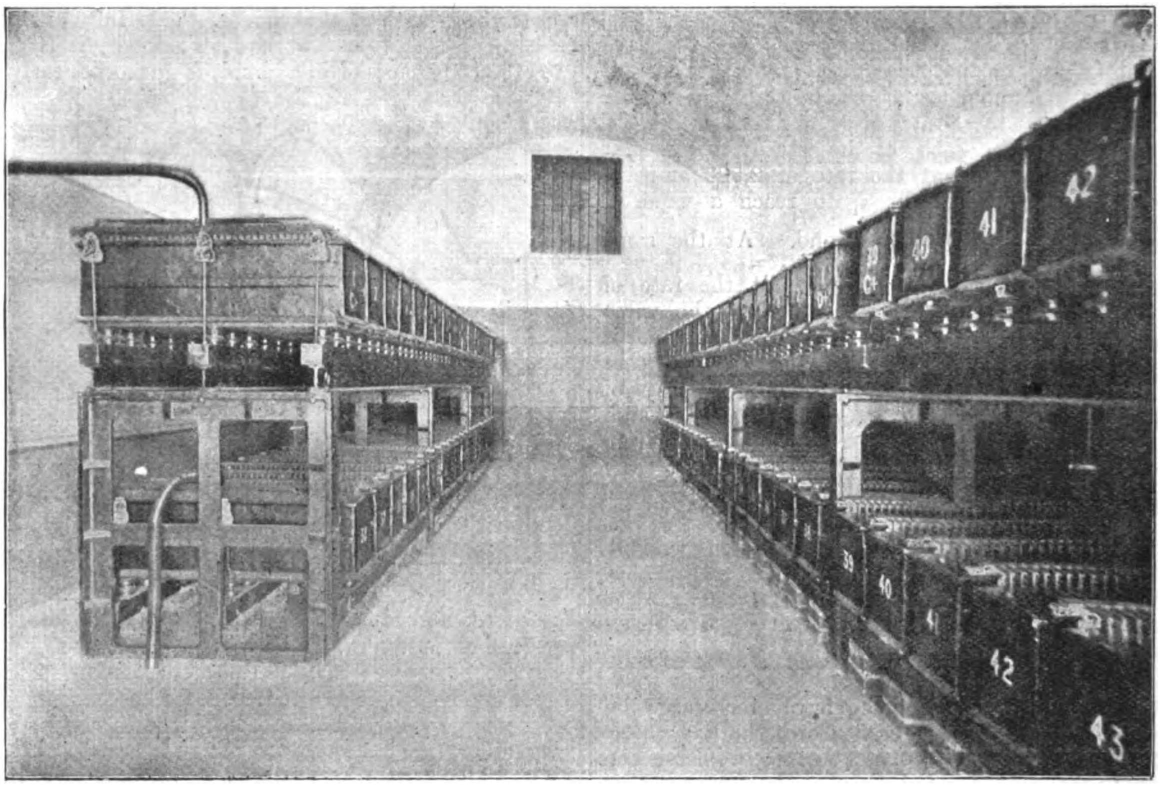

FIG. 1.—Main Battery, C and D.

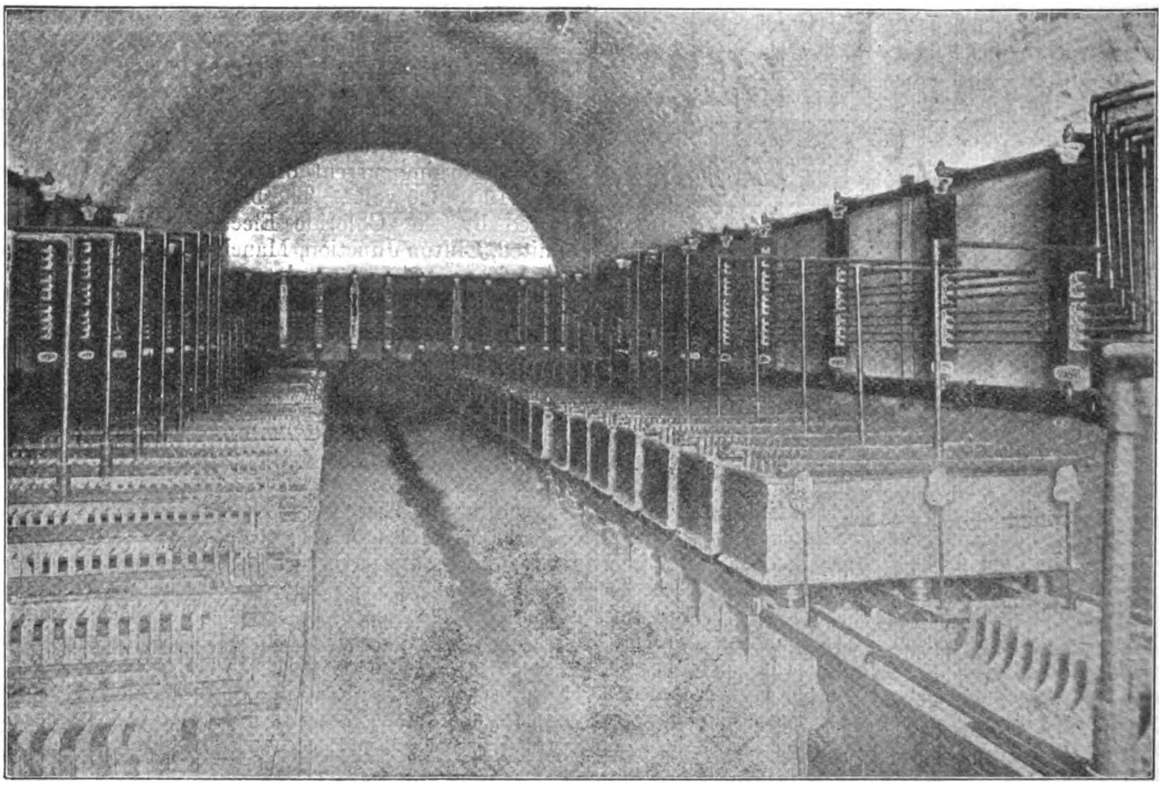

FIG. 2.—Regulation Cells of Batteries, A, B, C, and D.

The electrical details of this battery are as follows: The maximum rate of discharge is 600 amperes from each of the four batteries, or a total of 2,400 amperes at 100 volts delivered in the mains; the normal rate of discharge is 300 amperes from each battery, and under the latter conditions the total watt-hour capacity of the battery reaches one million and a quarter watt-hours. The normal charging current is 300 amperes. The above figures show what a valuable reserve the battery (the largest individual one, we are informed, in the United Kingdom) forms to the central station, and on more than one occasion since the battery was brought into operation at the end of last spring has its value been demonstrated.

The whole night load after midnight of the central station is taken by the battery, and has enabled the third shift of hands—viz., 10 p.m. to 6 a.m.—to be almost entirely dispensed with, while on Sundays relief is also given to the second shift, the battery taking the day load up to 4 p.m., in addition to the previous night load.

THE ELECTRIC LIGHTING OF THE GUARDIAN INSURANCE COMPANY'S OFFICES.

The new buildings of the Guardian Insurance Company are a splendid example of modern architecture, and every detail in their construction shows careful forethought. The walls throughout the entire building are either covered with marble slabs or tiled, and the whole of the floors are fireproof. The electric lighting of buildings so decorated is no easy matter, as alterations cannot be made after completion. The work in this instance has been carried out under the able direction of Messrs. Handcock and Dykes, consulting engineers, of 5, Victoria-street, to whom we are indebted for the following particulars. The system adopted throughout the building is that of drawing well-insulated wires into iron pipes buried behind the tiles or marble facings. The chief feature in the system is, however, the arrangement of these pipes so that the wires can at any time be withdrawn and replaced should the necessity arise. The supply for some 350 lamps is taken from the mains of the City of London Electric Lighting Company. This number of lights necessitated the connection to the three-wire distribution network, and three-wire circuits are run throughout the building. In this way balance is obtained in each department, and no large room is connected to only one side of the system. The company's mains enter in the basement and terminate in a fuse-box. The engineers have provided near this place a three-pole switch of the Edison-Swan type, and three fuses. These fuses are of such section that should a short-circuit occur they would go before the company's fuse, and hence the supply would not be wholly cut off. They and the switch are contained in an iron box, with glass front, which will be kept locked, but the plate-glass front can be broken in an emergency should the attendant be away. From this point the two outside wires are led through an iron pipe to the main circuit-board. The central wire is, however, branched off at the lift. There are eight circuits on each outside wire on this circuit distributing board, one circuit on each side going to the same department. The fuses are covered with handsome embossed bronze cases lined with asbestos, which are held in place by thumb-screws. The circuits for the whole of the office lights are controlled from this board, but the lights on the staircases and in the caretaker's room are on a separate circuit-board on the top floor. In this way the whole of the circuit switches can be turned off at a fixed time each night to prevent an odd lamp being left burning. From this main board the circuit wires go back to the lift, where they ascend in a 3½in. pipe. The mains to each floor or department, as the case may be, are taken to fuse-boards, also of the Ediswan type, and there split up into small circuits, each carrying six lamps as a maximum. On these boards fuses are inserted in both wires, and no individual fuses are used anywhere in the building.

The iron pipe system is continuous throughout, the pipes being uninsulated, but treated with Angus Smith's composition. Draw-boxes are placed at every acute angle and over every ceiling light. These boxes are generally circular in form, and are of cast iron. The pipes are screwed into them, and the covers are simply dropped in. These covers are in all prominent positions, fitted with either inlaid mosaics or wood to match the floors. As will be gathered from the above, few joints are required in the insulated wires leaving the fuse-boards. The joints necessary are all vulcanised, and with this and the use of the best classes of wire, an insulation resistance considerably higher than that required by the company has been obtained. This is an exceedingly good result when considered with the fact that the iron pipes are earthed. The pipes were all put in first, and after the walls and floors had been finished the wires were drawn in. This complete system was first devised by the engineers for the Commercial Union Assurance Company's building, which was finished in May last.

Fittings.—The fittings used throughout this building are of a most substantial type, and several of the designs are entirely new. The desk standard (Fig. 1) was designed by the engineers specially for office lighting. The opal shade, together with the ground-glass disc under it, completely cover the lamp, so that the naked filament can never be seen. The result is a good dispersed light without the large contrasts which are bad for the eyesight. When the lamp has to be replaced, the brass ring supporting the shade is lowered by slacking off the screwnut

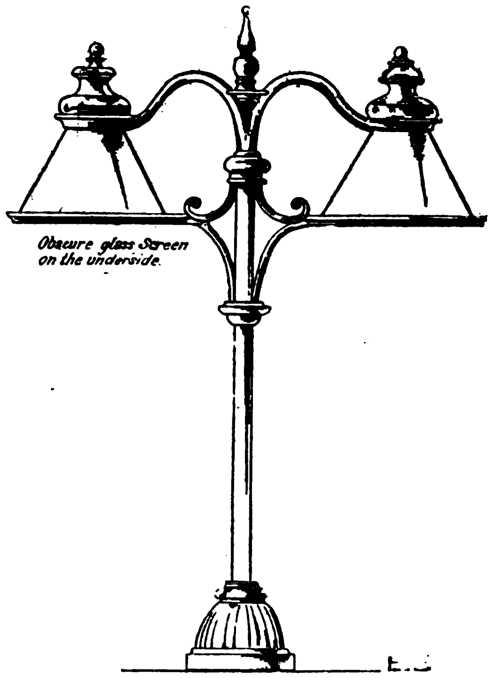

FIG. 1.—Two-Light Desk Fitting, with Opal Shade and Ground-Glass Screen.

on the column. The cone shade then is held up while the ring and ground-glass plate are turned round through 180deg. The lamp is then accessible, and the opal shade also comes away. These fittings are substantially cast in brass, the exteriors being bronzed. Two switches of the tumbler type in the base control the lamps. Single fittings of a similar type are used on some desks, and in every case the iron pipes are screwed to the base of the fittings. The switches on the walls controlling ceiling lights, as in Figs. 2 to 5, are also sunk in. The plates covering them and holding the tumblers are of embossed bronze work of special design. These go very well with tiled walls, being neat and unobtrusive. The switches throughout the corridors and in the various rooms are always arranged so that you can light up the space in front

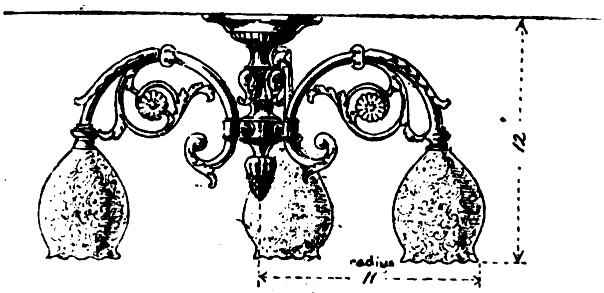

FIG. 2.—Bronze Fitting for Three Lights used in General Office.

before entering. All the fittings are bronzed—the better ones being supplied by Messrs. Perry and Co., of Grafton-street. The type of fitting used in the main offices to light from the ceiling is shown in Fig. 2, but the globe finally selected hardly surrounds the lamp quite as much as shown in the illustration.

Fig. 3 is of another type used in several places. In the Board-room this design is employed with five arms instead of three. Brackets to match (Fig. 4) are placed on the walls of this room. The single-light fitting (Fig. 5) is of the type most usually found in the waiting-rooms and in a few of the corridors. In the great majority of cases 8-c.p. lamps have been found sufficient. This is doubtless owing to the reflecting power of the tiled walls. In the basement and general lavatories, where a light is always required, a few 2½-c.p. lamps have been fixed, and

Digitized by Google

give quite sufficient light for all ordinary purposes. In the strong-room, portable hand lamps, similar to those used on board ship, are provided for convenience when searching amongst the stored records. In the basement, the iron pipes containing the conductors

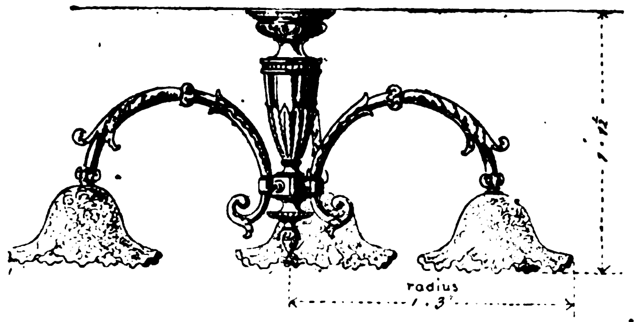

FIG. 3.—Type of Ceiling Fitting used in Board-room.

are secured to the surface of the walls. The staircase lighting is controlled by two switches—one at the bottom and one in the caretaker's quarters—so that the whole of the lamps can be turned on or off from either place. The contractors for the work are Messrs. Hayward Tyler and Co. The surveyor of the Guardian

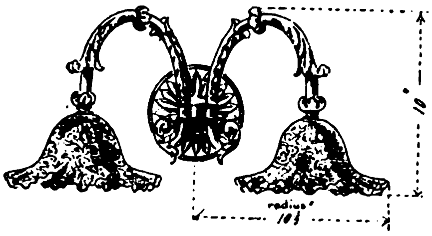

FIG. 4.—Two-Light Wall Bracket.

Company (Mr. Human) has taken a very active interest in the carrying out of the installation, being determined that no fault whatever should be found with the electric lighting of the head offices of the company. The

FIG. 5.—Single Light Fitting.

result of the efforts of all concerned are most pleasing, and we have no doubt but that the architect of the building, Mr. J. Macvicar Anderson, past-president, R.I.B.A., will endorse our opinion that the electric light contributes largely to the good effects of the architecture.

A NEW SYSTEM OF SERIES ARC LIGHTING.*

BY THOMAS SPENCER.

Anyone who has watched the development of arc lighting within recent years cannot have failed to notice the gradual, but radical, changes that have taken place in the methods of delivering light from a central station. Originally the idea seems to have been to break up the source of current supply into a great number of small units. Whether, from an engineering standpoint, this idea was a well-worked-out scheme, or simply the outgrowth of circumstances, is, I think, very easy to answer; for it is usual to begin on as small a scale as possible, so that, in case of failure, the financial loss will be as small as possible. These first attempts proving successful, the conservative feeling, which to a great extent accompanies the investment of money, caused a continuance in the course which had been found practical.

* A paper read before the Franklin Institute, September 22, 1896, and printed in the *Journal* of the institute for October.

Perhaps in no branch of the electrical industry is this so apparent as in that of arc lighting. However, at present there seems to be a general tendency towards a more economical system, as is attested by the number of large arc light dynamos that are now replacing the numerous small machines; further, by the rapid rise of arc lighting from constant-potential D.C. circuits, and also by the general interest manifested in alternating arc lighting. The last named, which, of course, signifies the use of constant potential, is the direction towards which everything seems to be tending, and will be the system most generally employed in the future, unless some efficient method of directly converting heat into electricity is discovered.

There is no question but that a station equipped with large units and supplying one kind of current—and that a current which can most easily be controlled—is the most efficient. Such is the alternating current. As far as the alternating arc lamp is concerned, it has some points which make it slightly inferior to the direct-current lamp; but experience has shown that these objections are not so serious as at first appeared.

Recently, attempts have been made to use a device by means of which the current is commutated into a fluctuating current, having always one direction, but not with conspicuous success. There are several such plants in England, I believe, and, from some of the criticisms, I should judge that the system is by no means as efficient as it should be to be generally introduced, especially in this country, where, I am sorry to say, a piece of apparatus is apt to fall into the hands of men who fail to give it even the most necessary care. As for the advantages gained by the use of such a device, there is no doubt but that the efficiency of the arc is improved. From my experience I

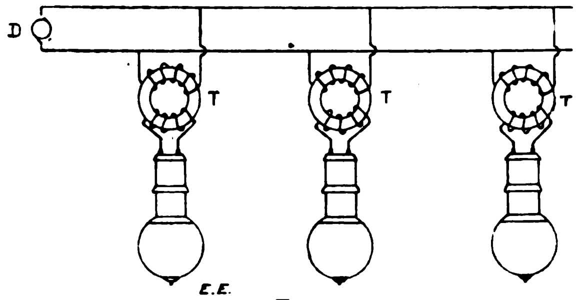

FIG. 1.

should judge that, as the current is a fluctuating one, the arc would still be noisy, although less so than the unrectified alternating current.

As I have said before, the objections to the alternating arc have not proved to be as serious as they at first appeared. There is a growing tendency towards the use of the alternating arc for all kinds of lighting, and this is especially marked in street-lighting. The system which up to the present time has been in use may be described as follows: Each lamp is burned separately from a 30 or 33-volt transformer (see Fig. 1). The amount of wire used in this system is not generally greater, and often less, than that required in the old direct-current series system. This system works very well and has many good features, perhaps the greatest of which are that each lamp is independent of the rest, and that the pressure on the lamp is low. Furthermore, the lamp has only one series spool of coarse wire, and is free from shunt spools and cut-outs.

There are a great many systems of this sort operating in this country, and some, I believe, have been introduced in England. The only objection to this plan is its high first cost, occasioned by the necessity of a separate transformer with each lamp. To overcome this objection and at the same time be in position to use the same kind of lamp, Mr. William Smith Horry has devised what he calls his "reactive system" of arc lighting, which I wish to bring before you this evening. Mr. Horry couples his lamps in series directly in the primary circuit, doing away with the separate transformers. Now anyone who has attempted to run arc lamps in series, which regulate only by variations in current—that is, have only a series spool—knows very well that they will not operate. The reason for this is readily

Digitized by Google

apparent. An arc lamp should depend for its regulation on something practically affected only by the burning of its own arc. This is evidently not the case with the current where lamps are put in series across a constant-potential circuit. In general, when lamps are run in series, we must regulate by the change of E.M.F. around the arc—that is, regulate with a shunt spool. A lamp, of course, similar to the regular series arc lamp might be used if it were provided with some device to keep the current constant, or a lamp similar to that used on street railway circuits could be devised, but in all of these cases we would have a much more complicated lamp than that used by Mr. Horry.

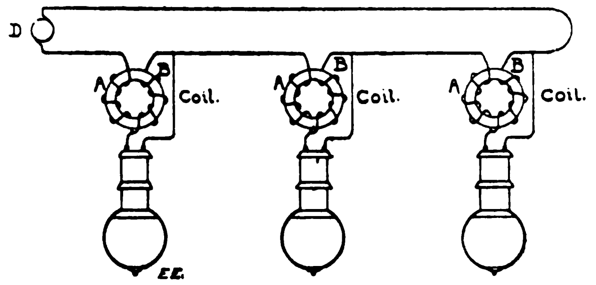

Fig. 2.

The principle governing Mr. Horry's system is briefly this: In shunt with each lamp is placed a small coil of the type known as auto-transformer (Fig. 2). The coil, A, is in series with the lamp, and B in shunt. With this device the current in the lamp will always be greater than that in the line. Considering the current in the line as constant, which is practically the case where a large number of lamps are in series, we must, as shown above, by some means outside of the lamp itself, cause a change in the current passing through the series spool of the lamp in order to enable the lamp to feed. This is accomplished by making the amount of iron in the coil small, so that it will soon become saturated and cause the coil to leak, lowering the pressure, which in turn decreases the current and feeds the lamp. This can be more easily understood in the following way. The relation

$$N_1^2 I_1^2 = N_2^2 \; I_2^2 + \left(\frac{l B}{4 \pi \mu a}\right)^2$$

in a transformer, where there is no leakage between the primary and secondary, is well known. (Fleming, "Alternating-Current Tranformer", vol. i., p. 273.) Here N_1 and I_1 are respectively the number of primary turns and the maximum current, and N_2 and I_2 represent the same for the secondary, B the maximum induction, μ the equivalent permeability, l the length of the magnetic circuit, and a its section.

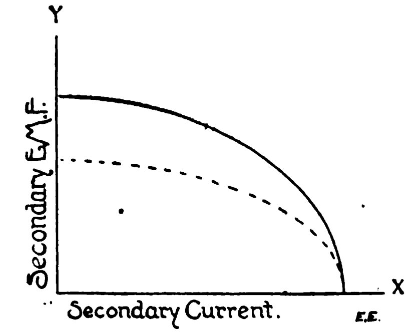

Fig 3.

Now, the secondary E.M.F. is directly proportional to B, or $B = K y$, where y is the secondary E.M.F. and K a constant. If in the first equation we write x for I_2, and substitute the value of B, we have

$$N_1^2 \, I_1^2 = N_2^2 \, x^2 + \left(\frac{l K y}{4 \pi \mu a}\right)^2,$$

$$\therefore 1 = \frac{x^2}{\left(\frac{N_1 I_1}{N_2}\right)^2} + \frac{y^2}{\left(\frac{4 \pi N_1 I_1}{K} \times \frac{\mu a}{l}\right)^2}$$

Now, if we suppose I_1 constant, and write

$$a = \frac{N_1 \, I_1}{N_2},$$

and

$$b = \frac{4 \pi N_1 \, I_1}{K}.$$

a and b being constants, we have

$$1 = \frac{x^2}{a^2} + \frac{y^2}{\left(b \times \frac{\mu a}{l}\right)^2}$$

This is easily recognised as the equation of an ellipse. Plotting this (Fig. 3), it is plain that when the current is small the E.M.F. varies very little with an increase of current—that is, it behaves in this region as a constant-potential circuit. Referring again to our last equation, we see that when

$$\frac{l}{\mu s}$$

becomes greater—that is, when the equivalent magnetic resistance becomes greater—the minor axis of the ellipse becomes smaller. This is accomplished, as before stated, by diminishing the amount of iron in the core of the coil, and, as a result, we will have a coil whose characteristic is an ellipse, as represented by the dotted lines. In this case the maximum E.M.F. will not be so large; but as the ellipse is nearly flat, there is a large region over which the coil produces practically constant potential.

There are few other features in this system worthy of mention. The coil is so proportioned that when the carbons are consumed, and the arc in consequence breaks, the whole current is forced through that portion in shunt with the lamp. The choking effect in the coil is about the same as the E.M.F. taken by the lamp when burning; in fact, it is so close to this that 30 per cent. of all the lamps in circuit may be put out without sensibly affecting the ampere-meter in the circuit. The coil then not only acts as a cut-out, but also as a regulator.

The advantage which this system shares with that in which lamps are run from separate transformers is that it is possible to run lamps of widely different candle-power on the same circuit, which is accomplished by changing the coil to conform with the lamp. In this particular, of course, it is an improvement over the ordinary series system, with shunt-coil regulation. The number of lamps which it is possible to run in series from a 1,000-volt circuit or transformer depends upon the candle-power of the lamps. The coils, as now constructed, will, in this case, take care of 29 2,000-c.p. lamps. Mr. Horry has also devised a switchboard to be worked in connection with a special transformer in such a way as to give varying primary E.M.F.'s, so that any number of lamps can be run in series within reasonable limits.

As for the practical working of this system, I would say that it is in use in several places in this country. As far as I know, it has been very satisfactory, and there is little doubt that a great future awaits it.

INSTITUTION OF ELECTRICAL ENGINEERS, Nov. 26.

At last night's meeting of the Institution the following candidates were balloted for:

Associates.—George Adams, 55, Victoria-street, Westminster, S.W.; Thomas W. Allan, 9, Smith-street, Kennington Park, S.W.; Robert W. H. M. Bland, "Fernagh," Whiteabbey, Belfast; Harold Vincent Bowen, 41, St. Mark's-road, Wolverhampton; Ivon Braby, Bushey Lodge, Teddington; Arthur F. Evans, P.O. Box 2153, Johannesburg; Thomas Bennett Groves, care of Messrs. F. and C. Osler, Old Court House-street, Calcutta; Herbert Hampton Hall, 20, Errol-street, Aigburth-road, Liverpool; William Harling, "Vine Grove," Eccles Old road, Pendleton; Herbert T. Marks, P.O. Box 1941, Johannesburg; William Edward Moore, Johannesburg; Charles Steers Peel, 4, Mansion House-buildings, London, E.C.; George Stobie, Durban, Natal; Andrew Sweet, 102, Hampstead-road, N.W.; Albert Edward Williamson, "Clevelands," Epsom-road, Guildford; James Cowan Woodburn, 2, Hughenden-terrace, Kelvinside, Glasgow; George Herbert Wyatt, Moouta, South Australia.

Students.—Alick James Newport Kenneth, 14, Hulme-street, Salford; Martin Amyas Shepstone, P.O. Box 1180, Johannesburg; Frank King Westbrook, 32, Abbey-road, St. John's Wood, N.W.

TO CORRESPONDENTS.

All Rights Reserved *Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.*

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	6s. 6d.	13s. 0d.
Other Places	4s. 11d.	9s. 9d.	19s. 6d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVII. of new series of "The Electrical Engineer" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

BRITISH BRAINS.

It is not often that "stupidity" writ large is admitted into the columns of the *Standard*, but for the singularity of argument a letter in its columns the other day takes the cake. Here is the letter:

"Sir,—The following fact may act as a warning to those who look at foreign progress in commerce as due to causes beyond the control of British brains. In a large Continental city tenders were lately invited for an electric plant. Agents, both English and foreign, tendered personally, and a German firm obtained the contract. One English house tendered, through its agent, with weights and measures calculated in pounds and yards, and when the agent was requested to turn his figures into decimal weights and measures he could not do so, and his tender could not even be considered. How long is British trade to be thus handicapped, not by the want of compulsory metric legislation, but by crass obstinacy (the word ignorance is out of the question in these days of Board schools, of course), which will not adapt itself to the requirements of the world's trade."

We think the crux of the letter is to be found in the words "he could not do it"; in other words, in his incapacity. To found an argument for the compulsory adoption of a system which, to say the least of it, has opponents whose knowledge is great and experience world wide, upon so slight a foundation, savours of recklessness. We who agree with the opponents of the metric system admit our "crass obstinacy" on the subject, whatever that may mean, and our objections will not be removed by the inability of this or that agent to do simple arithmetical calculations. Why did not the agent go to the nearest school and get a schoolboy or girl to work his little sums for him—that would have shown wisdom; but the above letter, probably written in great haste and without thought, does not show much wisdom. The exponents of the metric and decimal systems have run their hobby to a great length—so far, indeed, that a reaction has begun to set in. One point, however, which may appeal even to the pachyderms metrical is involved in the question whether the trade involving "pounds and yards" is less or greater than is involved in a trade under other systems of weights and measures. We have reason to believe the answer must be "greater." If so, the major is asked to give place to the minor. It seems incredible, however, that any agent selected to represent an English firm should be unable to reduce one set of weights and measures to another set of weights and measures.

TRADE ENTERPRISE.

The old method of gaining business by the personal recommendation of previous customers is without doubt a good method, but is rather too slow for the present times. Manufacturers of specialities wish to extend their connection more rapidly than can be done in this way. The generally accepted substitute is that of advertising, but we have lately come across other new ideas worthy of note, if only for their presumption. In two cases the articles pushed were special types of dynamo brushes, and we grieve to say that the inventors of the systems were German firms. The first maker forwards a sample brush of ventilating type, and claims great advantages for it. His prices are high, but whether the increased price is warranted by longer wear could only be ascertained after a lengthy trial. The gentleman concludes his

Digitized by Google

circular letter with the following postscript: "I shall feel greatly obliged if, when sending your trial order, you will give me the names of those firms which are known to you as being possessors of dynamos or motors, it being essential for me to enlarge my clientage in consequence of the extraordinarily trifling wear of my brushes." In other words, this enterprising gentleman will be pleased to use the name of his correspondent as a recommendation to other firms. In the other case a firm pushed a particular make of brush, but was willing to supply any other type. It asked the consumer to forward a sample of any type he preferred, so that a quotation might be given. A cheaper way of gaining knowledge of the English makes of brushes could hardly be devised.

CENTRAL-STATION TROUBLES.

There is a good deal of truth in the contention that more may often be learned from failures than from successes. In central-station work there are two sets of causes leading to failures—one set consisting of errors of design or workmanship, the other arising from causes which no ordinary person could foresee or guard against. It serves no good purpose in washing the dirty linen of bad design or workmanship in public, but it is extremely useful that every trouble from unforeseen causes should be published, so that those in charge may gradually tabulate all causes likely to give trouble. Take the case which gave Mr. Fincham, the electrical engineer at Carlow, a bad hour. He had been running satisfactorily for some three and a half hours when suddenly a short-circuit occurred, putting Carlow and Milford into darkness for an hour. The cause was ultimately found to be due to a mouse which had committed suicide by short-circuiting the terminals of the alternator mains. It was found with nose and tail burnt off, and body between the terminals. Possibly engineers of experience, in running over the causes likely to lead to a breakdown, might have thought of this; but we doubt it, and therefore record it. Rats and mice are troublesome customers, and it is difficult to guard against them; but when a failure occurs, the possibility that it may be due to their action must not be forgotten.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

MOTORCARS.

SIR,—Now that the Local Government Board regulations are out, and my assistance is no longer needed in connection with this matter, I have the time to make a few remarks with suggestions to the letters which appeared in a journal of October 31 last.

The British Motor Syndicate appear to accept the proposal I held out in a letter published in your previous issue of October 27. Nothing appears from the Great Horseless Carriage Company, and it would almost seem as if this company had fallen to the background, leaving the British Motor Syndicate to stand alone. A few lines of explanation to you might clear up the point. The British Motor Syndicate only meets my suggestions halfway, and to make the matter clearer I take this opportunity of stating my position in regard to the self-propelled traffic question, because my course of action has been misrepresented by many, judging by the newspaper cuttings which have come to hand.

I have always taken a keen interest in motor traffic, and so far back as the seventies I had two electric tricycles running, which were constructed here.

I was fortunate enough to obtain all the concessions asked for in personal interviews at headquarters. They were chiefly these: (1) definition of all unladen vehicles; (2) steam and smoke permitted due to temporary causes or accident; (3) the placing of light locomotives on even ground with horse traffic; (4) leaving question of construction and regulation to the Local Government Board; (5) taking all powers from the local authorities; (6) a drawn vehicle to be permitted. It will be admitted that the points mentioned are the making of the Act, and it was no easy matter to convince the Local Government Board on all points.

Then came the regulations. Here I did my best to render all assistance in my power, and gave up all the necessary time for the purpose. In order to clear up the petroleum question, I framed my evidence before the Parliamentary Committee in such a way as to indicate the safe lines on which to frame the regulations, and these have followed the course indicated—no small compliment to myself. In short, up to the date of the Act coming into force, my energies have been devoted to pushing the question to a successful issue, and keeping the public informed on the progress of the movement, also warning them not to invest money in motor carriage companies without circumspection. It would appear that, having dealt with the latter point, I am anxious to drive to the wall the new companies formed on principles which I regard unfair from a public point of view. This is not the fact. If these companies are prepared to sell their goods at fair values, and permit purchasers to import at a reasonable royalty, then I have little to say in regard to the companies as such. Indeed, in the interests of the shareholders, the patents purchased by these companies had best be kept out of the law courts, and fair profits are the only means to bring about such a result.

It might be enquired why I speak in this fashion concerning the new companies. I have received a vast number of applications for information regarding motor carriages, many being practically firm orders. Whenever special types were enquired for which I believed were held by the new companies, the writers were referred to those quarters, though with great hesitation, not being assured that the treatment would be fair after what I read on one of the prospectuses in regard to profits. If I am reassured on this matter, I shall know how to act in the future. My proposal is: fair prices, free permission to import, leaving the foreign manufacturer to pay 10 per cent. royalty for importation on the price actually paid by purchasers—*i.e.*, after discount, say, not exceeding 10 per cent. on the manufacturer's published price list. This would not hamper an ignorant purchaser who is unable or forgetful to examine patent right questions. If these points are agreed to, I am ready to refer enquirers and advise friends without feeling that an injury is being inflicted. Some have asked for petroleum-driven motors, others for steam, and I should refer them to suitable quarters to make their enquiries if satisfied in the manner mentioned.

Turning for a moment to the Motor Car Club: this club has for its president Mr. H. Lawson, a well-known company promoter, who must have spread desolation in his path, if his history given in the *New Saturday* of November 7 last is true. It is only natural that I could not follow such a man and join the club. It is to be regretted that the club should be left in financial hands, since it is unfair on many, if not most, of its members. The majority of the officers of the club are also connected with financial matters and company promotion. In my opinion the two should be kept quite distinct, in fairness to the new industry as well as to those who join the club, no doubt in ignorance of the facts mentioned. Much of the unpleasantness of the past would have been avoided had this been done, and many of the difficulties of the future can be removed.—

Yours, etc., DAVID SALOMONS.

Broomhill, Tunbridge Wells, November 20, 1896.

REVIEWS.

Alternating Currents and Alternate-Current Machinery. By D. C. Jackson and J. P. Jackson. The Macmillan Company. 14s. 6d. net.

This book is the second volume of the text-book on electromagnetism and the construction of dynamos. The matter was got together for a series of lectures, and contains most liberal extracts from the historical literature of the subject. The authors, however, claim to omit references to experiments which are of historical interest only. From the preface we learn "that a few additions have been made to the nomenclature. The most important of this is the introduction of the term 'active' to represent the component of pressure of E.M.F. in phase with current and to represent the working component of current." The authors think that "the introduction of this term removes the inconvenience of which Prof. S. P. Thompson bitterly complains caused by the use of the term 'effective' in the formally adopted meaning of $\sqrt{\text{mean}^2}$." We consider that the addition has complicated matters, and is most likely to confuse a student. Thus he has to grasp a conception that the effective current must be multiplied by the cosine of the angle of lag to be active. Also, the effective E.M.F. must be multiplied by the same cosine to give an active value. Yet the product of these two active values does not give power. Following the subject up, when a condenser is connected to an alternate E.M.F. practically no active values occur. Thus we consider the term "active" most misleading, and also do not see the need for an expression to indicate $\sqrt{\text{mean}^2} \times \cos\theta$— a quantity which is not measured independently. In all practical cases the effective E.M.F., the effective current, and the cosine of the angle of lag are required to be known separately. The first two chapters are devoted to the form of the pressure curves of alternators, and to a general classification of the different types of these machines. The types illustrated, diagrammatically or otherwise, are nearly all English designs now obsolete. In the third chapter self-induction and capacity are defined, and some of the phenomena connected are explained. It is herein that the authors discuss the term "active," and the following is their explanation: "The pressure which is effective in producing current may be called the active pressure, to distinguish it from the pressure which is impressed upon the circuit." The examples of the values of the self induction of various instruments in regular use will be helpful to the student, as giving some idea of what to look for in practice. The hints on the measurements of both self-induction and capacity are also taken from English sources. A chapter on diagrams for solving problems in alternate current working in circuits containing self-induction and capacity, or both, follows, and a few analytical methods are added. The information given under the heading of "The Magnetic Circuit of Alternators" is of use, and will repay careful reading. A due appreciation of what is to be expected from the alternator helps the student materially when learning the elements of design. The authors first lay down on general lines the limits to be observed in such matters as hysteresis loss, induction, ventilation, cooling surface, current density, magnetic leakage, etc., and then run through a typical design. It is a pity, however, that they do not give scale sketches of the design worked out to aid the student in following the dimensions. The rough approximate calculations of the self-induction are useful, but here no guides as to the value to be aimed at are given. As regards the Foucault currents in the cores, the authors point out that whereas the number of complete cycles in a direct-current dynamo is usually about 25, this number is largely exceeded in alternators. Hence more care must be taken to insulate the iron, and thinner iron should be used. The subject of excitation brings up the old question of using rectified currents for providing all or part of the energy for excitation. We are assured that the three largest firms in America are using such devices, but the well-known Ganz rectifier is the only one described. Chapter VI. deals with the characteristic regulation and curves. The authors have adopted the name "loss line" to represent a curve showing the drop in terminal pressure as the alternator load is varied. This is rather apt to be confused with a line representing the losses, which, of course, is a very different thing.

The parallel working of alternators is treated purely from the electrical side, although one is casually informed that an engine running with an irregular angular velocity does not assist matters. Hence the conclusions arrived at cannot be accepted without question, especially when the evidence on which the conclusion is based is gathered from conflicting sources. Thus the authors state that smooth parallel working requires that the armature impedance be reduced to a minimum. Practical experience in this country shows that the too rigid control of alternators with little impedance is most harmful. After an account of the various methods of testing alternators, we come to the chapters on transformers, which are commenced by an investigation of mutual induction. The data of different tests of transformers are convenient for reference, but the reader must always look to the date at which such tests are made. Thus Dr. Fleming's historical test of English transformers is given, although all the transformers in it are now obsolete. The rest of the volume is taken up with "power measurements in polyphase circuits," alternating-current motors, and polyphase transformers. The treatment of the motor question is not full, and yet the standard abstracts will be of great service to the student. The volume is well illustrated, and the collection of abstracts forming the bulk of the matter is valuable. We feel proud that the authors have taken the bulk of these abstracts from English sources.

The Metric System of Weights and Measures compared with the Imperial System. By Prof. W. H. Wagstaff, M.A. Whittaker and Co..

When a man has a hobby and is permitted to preach that hobby, then all his arguments tend in favour of that hobby. Evidently, Prof. Wagstaff is a sincere believer in the metric system. In his eyes it is perfect. To him Mr. Howard's example of our own system is a bit of finesse. Its solution is easy because of certain coincidences. He does not seem to realise that with the metric system he selects those examples which seem most to favour his argument. Thus, Mr. Howard does not stand alone in putting forward something simple on his side to give point to his contention. We candidly admit that we have never yet seen the all-absorbing beauty of the metric system. We agree with Mr. Howard that men find it easier to understand to think in fractions than in decimals of three, four or six places. Further, we have never yet found a suitable argument to convince us that inexact decimals are better than exact fractions. Those who talk about decimals and metric systems always contrive to imagine that practically men have nothing to do with thirds, sevenths, and so on, but always with halves and quarters. Usually, we find ordinary calculations, when made by men who have a good knowledge of arithmetic and may be, for all one knows, unacquainted with higher mathematics, are made in the simplest way—if that happens to be by vulgar fractions, then by that way; if it happens by decimals, then that way. The fact is, that in many instances a decimal system is simpler and more advantageous; but to argue from this that it must be universally simpler is nonsense. Our own system is full of anomalies. True, but it is possible to get rid of anomalies without a drastic change. The author, on pp. 35-6-7, gives a list of anomalies obtained from Mr. Kyle, not one of which has anything to do with our *system* of weights and measures It seems to us perfectly absurd to base an argument for the abolition of the "pound weight" upon a market custom which calls 16lb. of apples a peck and 9lb. of broad beans a peck. If Cornwall says we have a custom to call 224lb. of potatoes a bushel, and Nottingham says we have a custom to call 84lb. of potatoes a bushel, this may be an anomalous proceeding, but it has nothing to do with the abolition of the bushel or the pound. Uniformity may be excellent, but uniformity can be obtained without inflicting upon us the evils of changes of the system of weights and measures. When we saw the title of this book we certainly hoped for something of a totally different character. The whole is merely a summary of the argu-

Digitized by Google

ments used before the Select Committee by deputations and by various writers in favour of the metric system. As such a summary the work is a good one, but we trust the arguments in favour of the metric system will not prevail. Better attempt, in the first place, to get rid of some of the anomalous customs, which, we say, have really nothing to do with systems of weights and measures, but which really do exist, and to men not in a particular line of business appear as astounding survivals of "bad customs."

Manual of Electrical Undertakings. Compiled under the direction of EMILE GARCKE, M.I E.E , F.I.S First year. London: P. S. King and Co.

This book will be found very useful to many people connected with electrical companies. It contains a compendious account of the companies connected with telegraphy, telephony, electricity supply, electric traction, electrical manufacturing, some that cannot be classified under these heads, added to which is information relating to provisional orders, companies registered, officials of companies, etc. The introduction consists of a brief historical *résumé* of the various branches of the electrical industry. We feel little interest in either telegraph or telephone companies, but the reader will find the statistics as complete for these sections as is the case with what we may term the engineering section of the work. Probably many people will be surprised to read in the introduction that the capital subscribed for traction work is greater than that subscribed for "electricity supply"—that is, for lighting work—but they must not forget such enterprises as Central London, City and South London, Liverpool Overhead, South Staffordshire, Waterloo and City, etc., come under the head of traction, and some of these are expensive if not extensive works. The information generally given about a company is somewhat as follows: capital, powers, system, directors and officers, accounts at end of 1895, last dividend, previous dividends, and some of the details of the year's work. It will be seen that the information given is of a character constantly referred to. We quite understand the troublesome nature of getting, arranging, and correcting such a mass of statistics, and the impossibility of perfecting a book of this kind with its first issues. The editor and publisher also see this and deprecate harsh criticism. They need not have feared this, for any unbiassed examination will certainly prove that every effort has been made to ensure completeness and accuracy, and the object aimed at has been achieved within reasonable limits. We could wish that in any future issue the list of companies registered was made to show for each such company, not only the nominal capital and number of shares, but the capital subscribed, and in case of dead companies the subscribed capital that was lost. In the boom of 1882 no less than £23,228,000 was the sum of the capital of the companies registered. We know that only a part of this was subscribed, and the greater part subscribed was lost. Again, in the case of municipalities, the time during which the loan runs might be stated, as this is often of some importance. However, if we are not careful we shall give an impression of this book that would be incorrect. It is distinctly good, and so far as we have ascertained accurate, and decidedly wanted.

THE INSTITUTION DINNER.

The annual dinner of the Institution of Electrical Engineers was held at the Criterion on Wednesday last. Dr. John Hopkinson (president) was in the chair, being supported on his right by the Duke of Norfolk, the Postmaster-General. Amongst the other distinguished guests may be mentioned Mr. J. Wolfe Barry, C.B. (president of the Institution of Civil Engineers), Captain W. de W. Abney, R.E., C.B., F.R.S. (president of the Physical Society), Mr. E. Windon Richards (president of the Institution of Mechanical Engineers), Dr. E. Frankland, D.C.L., F.R.S. (foreign secretary of the Royal Society), Sir W. H. White, K.C.B., Mr. W. H. M. Christie (Astronomer Royal), the Marquis of Tweeddale, Prof. J. Dewar, F.R.S., Rear-Admiral W. J. L. Wharton, C.B., F.R.S., and Prof. Herkomer, R.A. During the dinner a band under the able direction of Mr. C. Thomas discoursed an excellent programme of music. Our appreciation of the entertainment was considerably enhanced by a neighbour on our right who, with a gift of prophecy, foretold the gist of speeches to come.

After the usual loyal toast, proposed by the PRESIDENT, and permission to smoke had been given, Prof. AYRTON rose to solve an old problem. He proposed "The Learned and Engineering Societies" He thought the juxtaposition of the two adjectives, "learned and engineering," was unhappy, as it raised a question as to whether an engineering society was not a learned society. After a few lucid explanations of similar intricate problems we were allowed to conclude that the adjectives were adjectives of quality and not of distinction. He thought that both the Institution of Civil Engineers and the Royal Society were to be most highly commended for the assistance given to their offspring. He referred to the fact that the Electrical Engineers had not yet a home of their own, and he hoped that when the time came for them to move from the parent society the goodwill would not be broken on parting. He also referred incidentally to a wish on the part of the Physical Society to co-operate in certain matters with the Institution of Electrical Engineers.

Dr. E. FRANKLAND, in responding for the Royal Society, acknowledged the interdependence between abstract and applied science. He was glad to see so many Fellows of the Royal Society taking prominent parts in the practical development of the electrical industry.

Mr. J. WOLFE BARRY said that the engineering profession was laying by a vast store of knowledge, thanks to the records of the various societies. The history of what had been accomplished in the past was most valuable to all, but perhaps the records of failures were even more useful. Thus the three engineering societies—Civil, Electrical, and Mechanical—had a gross membership of over 11,000, which showed the enormous number of trained men endeavouring to advance engineering knowledge.

Mr. ALEXANDER SIEMENS, in proposing the toast of "Our Guests," coupled with the name of the Duke of Norfolk, spoke of the financial aid required in the carrying out of large schemes. This assistance was most essential, as without it the knowledge of engineering and abstract science could not be attained. He was not so sure that the knitting of nations together by telegraphic communication was an unmixed blessing. He thought that some of the evils laid to the door of free trade were rather caused by the increased facility of communication.

The Duke of NORFOLK, in reply, said he believed people were better off when left alone; they were not benefited by being continually urged on. He was sorry to be responsible for much of that kind of thing. It might be thought that the Postmaster-General knew something of telegraphy, but those acquainted with English public life would not expect that. He felt it a great honour to be at the head of a department with a great work to carry out, and intimately connected with all scientific investigations and advances.

The Marquis of TWEEDDALE then proposed the toast of the evening, "The Institution," and in a short speech mentioned some of the uses to which electricity had been put.

Dr. J. HOPKINSON, the president, in responding, remarked that all present would agree that it was desirable for the world at large that the commercial supremacy of the British Empire should be maintained. That supremacy was initiated by our being the first to employ, on a large scale, the resources of coal at our disposal, and to-day it was maintained largely by the fact that coal was the basis of the means of communication and of most of our industries. If coal were to cease to be necessary for those purposes, would the Empire still maintain its commercial supremacy? He doubted it. In the Falls of Niagara there was a waste of more power than could be derived from all the coal that could be raised throughout the world, and they well knew that there were many other falls in the world than those of Niagara. He ventured to say that it would be the work of

Digitized by Google

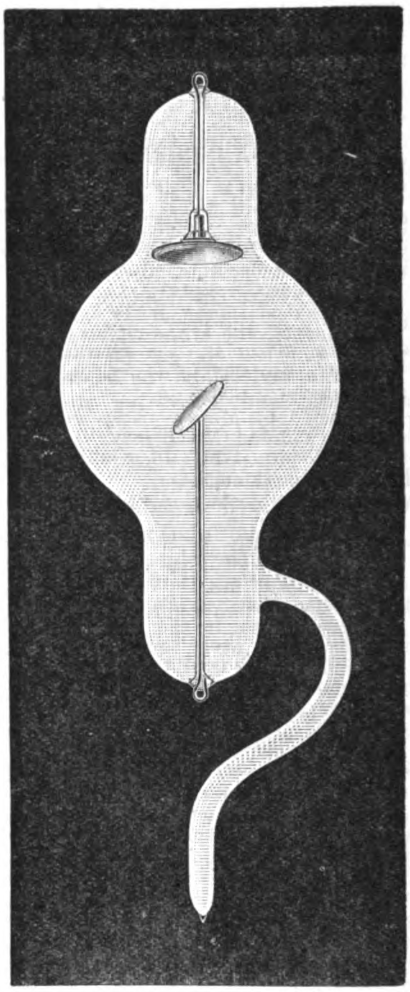
the engineer in future to utilise those falls for the acquisition and transmission of power for various purposes. He also referred to the comparative shrinkage of the earth, due to the increased facilities in rapid transit and communication.

The following is a complete list of those who were present:

Captain Abney, Mr. Addenbrooke, Mr. Alabaster, Mr. Albright, Mr. R. W. Allen, Mr. W. H. Allen, Mr. Andersen, Mr. Ansell, Mr. Ardron, Prof. Ayrton, Major Bagnold, Mr. Bailey, Lieutenant Bailey, Mr. Baldwin, Mr. Barr, Mr. Barry, Mr. Bathurst, Mr. Baylor, Mr. Bayly, Mr. Benedict, Mr. A. Berthgeil, Mr. E. Berthgeil, Mr. Biggs, Mr. Billington, Mr. G. Binswanger-Byng, Mr. M. Binswanger-Byng, Mr. Blackwell, Mr. Blenkarm, Mr. Blount, Captain Brett, Mr. Brockman, Mr. Bull, Mr. Carpmael, Mr. Carr, Mr. Christie, Mr. Clark, Mr. Clerk, Mr. Clirehugh, Mr. Cooper, Mr. Cluer, Captain Creak, Mr. Crompton, Mr. Crookes, Mr. Crowe, Mr. Cunynghame, Mr. Curra, Mr. D'Alton, Mr. Davis, Mr. Davies, Mr. Dawson, Mr. Devonshire, Prof. Dewar, Mr. Doherty, Mr. Down, Mr. E. Dowson, Mr. J. Dowson, Mr. Drake, Mr. Eck, Mr. Edmunds, Mr. Ellis, Mr. Epstein, Mr. Erskine, Mr. Esson, Mr. Fairfax, Mr. Fanta, Mr. Fawcus, Mr. Ferranti, Mr. Fleetwood, Prof. G. C. Foster, Dr. Frankland, Mr. Gabbett, Mr. de Galindez, Mr. Gaster, Mr. Gavey, Mr. Gibson, Mr. Gorham, Mr. Grindle, Mr. Grove, Mr. Hall, Mr. Hammond, Mr. Harrison, Mr. Hawkins, Mr. A. Heaviside, Mr. B. Heaviside, Prof. Herkomer, Mr. Hesse, Mr. Hibberdine, Mr. Hill, Mr. Hookey, Dr. Hopkinson, Prof. Housman, Mr. Howard, Mr. Hughes, Prof. Hughes, Mr. Ince, Mr. Jackson, Dr. Jackson, Mr. Jacob, Mr. J. Jenkin, Mr. T. C. Jenkin, Dr. Keith, Mr. Kempe, Mr. Kempster, Mr. Kolle, Mr. Lamb, Mr. Langdon, Mr. de Lattre, Major Leese, Mr. Lloyd, Mr. Lord, Mr. McDougall, Mr. Mackenzie, Mr. McMahon, Mr. Madgen, Sir H. Mance, Mr. Marsh, Mr. May, Captain Maunsell, Mr. Mavor, Mr. Meredith, Mr. Mordey, Mr. Mott, Mr. Morse, Mr. Mountain, the Duke of Norfolk, Mr. Offor, Mr. Cunliffe Owen, Mr. G. N. Partridge, Mr. G. W. Partridge, Mr. Parshall, Mr. Pearson, Prof. Perry, Mr. Phillips, Mr. Pomeroy, Mr. Preece, Mr. Rausch, Mr. T. Rawlins, Mr. W. Rawlins, Mr. Rawson, Mr. Reason, Mr. Reed, Mr. Reimers-Eonverg, Mr. Renshaw, Mr. Richards, Mr. Roberts, Mr. Robinson, Mr. Rosenthal, Mr. Samuelson, Mr. Sherrin, Mr. Siemens, Mr. Sinclair, Mr. Smith, Mr. F. Smith, Mr. Snell, Mr. C. E. Spagnoletti, Mr. J. E. Spagnoletti, Mr. H. C. Sparks, Mr. T. A. Sparks, Mr. C. P. Sparks, Mr. C. P. Sparks (friend), Mr. Stearn, Mr. Stewart, Mr. Still, Mr. Stothert, Mr. Mr. Stottner, Mr. Stroh, Captain Stuart, Mr. Stuart, Mr. Swan, Mr. Swinton, Prof. Thompson, Mr. Thomson, Mr. Tree, Mr. Trezise, Mr. Turrell, Marquis of Tweeddale, Mr. Walby, Mr. Wallace, Mr. Wallace Jones, Prof. Walmsley, Mr. Walpole, Mr. Ward, Mr. G. R. Webb, Mr. F. H. Webb, General Webber, Mr. Wharton, Admiral Wharton, Sir W. H. White, Mr. Wickham, Prof. Willis, Major Woodley, Mr. Wooler, Mr. Woods, Mr. Wordingham, Mr. Worsfold, Mr. Wright, Mr. Young.

TUBES FOR "X" RAY WORK.

The Edison-Swan United Electric Light Company, Limited, are now putting tubes for "X" ray experiments on the market. We illustrate herewith the form of these tubes, the quality of which is guaranteed by the previous experience of the company in similar work. The tubes can be had in several sizes from any of the showrooms of the company.



Edison-Swan "X" Ray Tube.

PHYSICAL SOCIETY, Nov. 13, 1896.

Captain Abney (President) in the Chair.

A paper on "**Some Experiments with Rontgen Radiation,**" by **Prof. Threlfall** and **Mr. Pollock**, was read, in the absence of the authors, by the **Secretary**. The authors described a form of Crookes's tube which, while it can be made by anyone capable of the most elementary glass-blowing, gives a plentiful supply of Röntgen rays. The results of their experiments may be summed up as follows: (1) The Röntgen radiation does not consist in the projection of gaseous matter, or if it does, the amount of such matter involved is extraordinarily small. (2) The Röntgen radiation does not consist in the projection of ether streams having a velocity above a couple of hundred metres per second; this is true whether the radiation takes place in air or in benzene. (3) The properties of the ether, regarded as determining the velocity of electromagnetic waves, are not greatly changed (*i.e.*, not at all within the experimental limits) by the Röntgen radiation, and this applies alike to the ether in air and in benzene. (4) A selenium cell composed of platinum electrodes and highly purified selenium is affected by Röntgen radiation to an extent which is comparable with the effect produced by diffused daylight. (5) No permanent or temporary E.M.F. is set up in a selenium cell by the Röntgen radiation. The authors have come to conclusion (1) by exposing an exhausted tube placed in parallel with a spark-gap so adjusted that the spark just passes over the gap rather than through the tube to the Röntgen radiation. They find that a vacuum tube in parallel with a spark-gap is very sensitive to changes in pressure within the tube. Conclusions (2) and (3) were arrived at by using Michelson's arrangements for the interference of two beams of light.

Mr. Shelford Bidwell said he had made some experiments on the effect of Röntgen rays on the resistance of selenium, but with a negative result, although he could have detected a much smaller change than that found by the authors. It might be that this difference was due to the tube, for in his experiment the radiation started from a platinum plate within the tube, while in the authors' arrangement the radiation starts from where the cathode rays strike the glass of the tube.

Prof. Silvanus Thompson said there were a number of points with reference to the Röntgen radiations which required clearing up. For instance, the suggestion that they were vortices in the ether had not been tested. Again, Lafay says that if the rays are passed through a metal screen which is charged with electricity, then the rays can be deflected by a magnet. He (Prof. Thompson) had not been able to repeat this experiment; neither had he that of Galitzin on the polarisation of the rays by tourmaline. The statement of Prof. J. J. Thomson that under the influence of the radiation paraffin became a conductor had not been satisfactorily proved. As to the wave-length, while some observers obtained values about one-tenth that of the extreme violet, another had obtained a value greater than that of the extreme red. Everyone who had worked with Crookes's tubes had found that the resistance is always greater for a spark in one direction than the other, and also varies with the battery power employed. Lenard, adopting Hertz's arrangement, used as anode a cylinder surrounding the cathode (a disc), the idea being that by using such a symmetrical arrangement the cathode radiation was more homogeneous. It might be advisable when seeking to produce homogeneous Röntgen rays to adopt such a symmetrical arrangement.

The **Chairman** said that since no selection was made with reference to the announcements which appear in the *Comptes Rendus*, it was frequently found that these announcements were wrong.

Digitized by Google

Mr. Bryan then read a paper by himself and Dr. Barton on **"The Absorption of Electrical Waves along Wires by a Terminal Bridge."** The authors employ for the generation of the oscillations an arrangement of the same description as that used by Bjerknes, the waves being propagated along two parallel wires about 116m. long. In order to measure the waves, they use a small electrometer with an uncharged needle. The resistances employed to form the bridge consist of pencil marks on ground glass. Bridges of three resistances have been examined, one having as nearly as may be the resistance necessary, according to Heaviside's theory, to give complete extinction of the reflected wave, and of the others one was of higher and the other of lower resistance. In each case the results confirm the theory, and it is thus experimentally proved that by using a bridge of this description the reflected train of waves can be completely extinguished.

Mr. Blakesley asked if the authors had made any allowance for the capacity of the wires.

Mr. Campbell asked if the resistances given were expressed in ohms or in electromagnetic units.

Mr. Bidwell asked if the authors had found that the pencil-trace resistances obeyed Ohm's law. He had found that if you balanced with one cell in the battery circuit, then on increasing the battery power to two cells the resistance altered.

Mr. Appleyard suggested that the variation was caused by the contacts at the ends not being good.

Mr. Campbell said the same variation occurred in the case of mixtures of clay and plumbago where the contacts were quite good.

Mr. Carter suggested electroplating the ends to give good contact.

Mr. Bryan, in his reply, said that they had not considered the question of capacity, and that in their case they did not require to know the resistance very accurately.

The society then adjourned till November 27.

LEGAL INTELLIGENCE.

CASE AGAINST THE DUBLIN CORPORATION.

In the Southern Divisional Police Court at Dublin, on November 23, a case was heard, before Mr. Byrne, Q.C., in which the Corporation of Dublin were summoned at the instance of Messrs. Oetzman and Co., Limited, for having, while being the undertakers within the meaning of the provisional order granted by the Board of Trade under the Electric Lighting Acts, 1882 to 1888, to the Corporation of Dublin, made default in supplying energy to the complainants, who are occupiers of premises at 61, Grafton-street. The summons also set out that the penalty for such default was £2 a day, and it was claimed that the default has extended over a period of 200 days.

Mr. R. Day (instructed by Messrs. Casey and Clay) appeared for Messrs. Oetzman; and Mr. Macinerney, Q.C. (instructed by Messrs. H. Bonass and Ignatius Rice), appeared for the Corporation.

Mr. Day having read the summons,

Mr. Macinerney said he objected to its reception unless the date of the alleged default was put in.

Mr. Day said, if necessary, he would have the summons amended and December 31, 1895, put in as the date. He proceeded to read Section 18 of the Dublin Electric Lighting Act, from which it appeared that the Corporation were bound to maintain the mains laid down in the streets mentioned in the second schedule appended, of which Grafton-street was one. He submitted, on the reading of this and other sections in the Act, that the inhabitants of the streets in this schedule had the first claim on the energy supplied by the Corporation. The twenty-fourth section provided that, whenever the undertakers made default in the supply of energy to persons whom they might be required to supply energy under the order, they should be liable to a penalty of 40s. for each default. The complainants had given the requisite notice to the Corporation that they required the supply, and the Corporation accepted that notice and promised repeatedly to supply the energy, but up to the present they had not done so. Counsel read correspondence that had passed between the complainants and the Corporation, commencing on January 11 1895, on the subject of the failure to supply the required energy. The Corporation, he said, definitely promised to have it ready for the horse show of 1895. Again, in answer to another application on November 4 the Corporation gave them a definite promise on November 13, 1895, in a letter signed by Mr. Henry Campbell, town clerk, which stated : "The Electric Lighting Committee are making such arrangements as will enable them by the end of the year to supply the electric current to you and many other applicants." This promise was not fulfilled, and the complainants wrote again pointing out that the failure to supply the electric current to them was most disastrous to their business, as they had a sale commencing on the 3rd proximo. A letter was received in reply from Mr. Campbell on January 12 in which he stated that "the Corporation have now commenced the work of making connections with their electrical mains. There were 52 applications received previous to yours, and some little delay must therefore take place before the necessary supply can be given to you." Complainants wrote again on the 24th pointing out that this was the first they had heard of the 52 previous applications. An answer was received acknowledging receipt of that letter on the 28th, and stating that it would be laid before the committee On January 31 they received an answer from the Corporation referring them to a previous letter. Complainants then wrote : "We are greatly astonished at the treatment we received at your hands in respect of the electric lighting question. We may safely claim that our numerous communications to you have been decidedly to the point," and they further asked for some definite understanding on the matter. On February 7, 1896, the Corporation replied : "The new connections are being made as fast as possible, and hope to allow you to have it within a fortnight." Nothing having been done, on August 4 complainants again wrote, strongly protesting against their treatment by the defendants, as it was now some 20 months since the first application was made, and threatening to place the matter in the hands of their solicitor. The Corporation, in reply, wrote on August 14, saying that they were anxious to do everything in their power for their firm and other firms, but under the circumstances must ask the kind indulgence of complainants for some time longer. They also pointed out that they were placed in a difficulty owing to the non-delivery of a new engine. On August 22 complainants again wrote, stating that the answer and explanation of the Corporation were very unsatisfactory. Counsel read further correspondence, from which it appeared that on August 29 the Corporation offered to supply 52 lights, but Messrs. Oetzman had refused to take any number less than 75 However, at a later date—October 7—they wrote, saying they would accept the 52 lights at once and the balance later on, but they did not succeed in getting them.

Mr. Macinerney, Q.C. : Because in the meantime we had given them to someone else.

Mr. Day having concluded the reading of the correspondence, said the complainants had come to the conclusion that the Corporation were merely trifling with them, and so they had brought the Corporation before the Court, claiming compensation for the loss that had been caused to them in their business. It was owing to the fact that the Corporation had extended their operations beyond the limited area specified in the schedule, and which was to have been a first charge on the energy, that they were left without the supply for their establishment

Mr. Byrne suggested that the case might be allowed to stand for a month, the Corporation undertaking in the meantime to supply the required energy.

Mr. Day said he understood it only took three hours to connect the installation of Messrs. Oetzman with the distributing mains.

Mr. Macinerney said the summons was brought to recover a penalty which, he submitted, could not be recovered. No one could be more anxious than the Corporation to spread the electric lighting area over a wider area, but, owing to circumstances, they were prevented from extending the supply. They would supply it to Messrs. Oetzman next Wednesday in the ordinary way, altogether regardless of the result of this proceeding. The notice that had been served by complainants was not a compliance with the section, and under it the penalties applied for could not be recovered.

Mr. Day admitted that, strictly speaking, they had not served the notice required by the Act, but he contended that the correspondence afforded sufficient ground for their proceeding as they had done in this case. The Corporation treated them for two years as persons who had made a proper application.

After further discussion, it was agreed to allow the case to stand for a week.

Mr. Macinerney said he wished it to be understood that the giving of the electric light to Messrs. Oetzman on the following Wednesday was only giving it to them in their turn, and had nothing to do with this case.

The case was adjourned for a week.

ACTION BY THE EDISON GENERAL ELECTRIC COMPANY.

In the Judicial Committee of the Privy Council, on November 21, before Lords Watson, Morris, Hobhouse, and Sir R. Couch, the case of the Edison General Electric Company *v.* the Westminster and Vancouver Tramway Company, the Bank of British Columbia, and others, was heard.

This was an appeal from a judgment of the Supreme Court of British Columbia, the appellants being the Edison General Electric Light Company, who sought to set aside a judgment of the Colonial Court in favour of the bank for a sum of 261,217dol., with the certificates registering the judgments against the lands of the tramway company. The Edison Company, who are the appellants, first brought the suit before a judge, who dismissed it with costs, and the same fate awaited an appeal to the Supreme Court. The suit was founded upon the first section of the Consolidated Statutes of British Columbia, which provides that if a person who is insolvent and by collusion with a creditor consents to a judgment in favour of a creditor which gives that creditor preference over others, such judgment shall be null and void. It was argued on behalf of the bank that the object of the judgment, as shown by the evidence, was to enable the bank to reconstruct and carry on the tramway company, and that there was no fraudulent intent, whereas there must be fraud to bring the case within the statute.

Sir R. Couch now read the judgment of the Court who sat when the case was argued—namely, Lords Hobhouse, Macnaghten, and Davey, and himself. Their Lordships held that it was not disputed that the tramway company was insolvent at the date in question, and that they had consented to the judgment. It was plain from the evidence that there was an agreement which amounted to collusion between the respondent bank and the tramway company, the effect of which was that the bank should have a judgment, and that their judgment should have priority to the appellants' judgment, the object being, as Mr. Ward said, that the bank should be in a position to protect the company and carry it on. The case, therefore, came within the provision of the section. As to fraud, the act of collusion for the purpose of giving priority to one creditor over another was treated by the statute as

Digitized by Google

a fraudulent act. Their lordships were therefore of opinion that the statute made the bank's judgment null and void and they would advise her Majesty to reverse the decree of the Supreme Court, and to declare the judgment in favour of the bank null and void, and to order the executions and certificates founded thereon to be set aside and cancelled, the costs of the suit, including costs of appeal to the Supreme Court, and the costs of this appeal, to be paid by the bank.

DISPUTED LIABILITY FOR ELECTRICAL WORK.

In the Westminster County Court, on November 25, before his Honour Judge Lumley Smith, Q.C., the case of Hooper *v.* Graves was heard.

The plaintiff, an electrical engineer, residing at Marylebone-road, sought to recover payment of a balance of account of £3. 15s. for electric lighting work done to the order of the defendant at his flat in Victoria street.

The **Defendant** admitted that the work was done, but contended that his wife was liable on her separate estate, as it was she who gave the order. He further contended that a good deal of the wiring had to be done over again, and that in any event the plaintiff's charge was excessive.

The **Plaintiff** denied taking any instructions from the wife, and his **Honour** gave judgment for the plaintiff for the full amount claimed with costs.

COMPANIES' MEETINGS AND REPORTS.

EDISON AND SWAN UNITED.

An extraordinary general meeting of the Edison and Swan United Electric Light Company, Limited, was held on Tuesday at the Cannon-street Hotel, E C., Mr. J. Staats Forbes presiding, to consider the resolutions for amalgamating with the Company the undertaking of the Manchester Edison-Swan Company.

The **Secretary** (Mr. Gover) read the resolutions as follows: "(1) That it is expedient to acquire and take over by way of amalgamation the undertaking of the Manchester Edison Swan Company, Limited. (2) That the draft agreement for the purpose expressed to be made between John Edwin Sharples, on behalf of the Manchester Edison Swan Company, Limited, of the one part, and this Company of the other part be and the same is hereby approved, and that the directors be and they are hereby authorised to execute an agreement in the terms of the said draft, and to carry the same into effect, with full power to assent to any modifications therein which they think expedient in the interests of this Company, either before or after the execution thereof. (3) That the directors be and they are hereby authorised, upon the adoption of the said agreement by the liquidator of the Manchester Edison-Swan Company Limited, with the sanction of a special resolution of the said company, to appoint Mr. W. P. James Fawcus, one of the directors of the said company, to be a director of this Company. (4) That for the purpose of redeeming the existing 4½ per cent. debenture stock, and providing for the extension of the business, the directors be and they are hereby authorised to create and issue perpetual debenture stock of the nominal amount of £350,000, carrying interest at the rate of 4 per cent. per annum, and redeemable at the option of the Company at 110, and to be constituted and secured by trust deed in such form and manner as the directors think expedient. (5) That the directors be and they are hereby authorised to issue any of the said new debenture stock at such times and upon such conditions as they may think fit, in exchange for any of the existing debenture stock, or otherwise as they may approve."

The **Chairman**, in moving the adoption of the resolutions, referred to the history of the establishment of the Manchester Company. It was not a proposal to buy out certain people, or to give them so many sovereigns for their business and their goodwill. The Manchester Company had been, so to speak, licensees of the parent company, the bargain having been that, in consideration of paying £13,000 to the Edison and Swan Company and purchasing all their lamps from that company, the Manchester Company were to trade in their own way on their own account in a limited area, from which the Edison and Swan Company were themselves restrained from trading. That agreement was made in the "dark ages"—at any rate of electric lighting—and the course things had taken had not been quite what was then anticipated. Owing to this, added to the fact that the agreement was very complicated, questions kept on arising until the patents expired, when the Manchester Company claimed the right to do what they chose both in and out of their area, and the Edison and Swan Company did the same. The competition bade fair to damage both of them, and therefore they thought it wiser to see whether their differences could not be adjusted by uniting their interests. This was the underlying principle of the proposed agreement, which was the outcome of a great deal of correspondence and negotiation. The Manchester Company had £30,000 in the lamp and lamp-fitting business, and on this amount they had paid a dividend (5 per cent.) for some years. In addition, the Manchester Company had a concession for an electric lighting business which was now being carried on at Altrincham. They seemed to be doing very well with this part of the business, on which they had also expended £30,000, which had been raised by loans. The Altrincham business had been going on for two years, and it bade fair to be profitable. When negotiations were being carried on, the Manchester Company had increased from 3,000 or 4,000 to 10,000 lamps, and during the last four or five months the 10,000 had increased to 14,000. The Manchester Company would have preferred to take £30,000 from the Company and go out, but the Edison and Swan Company preferred that they should remain partners with them; and eventually the Manchester people agreed to take £30,000 in the Company's shares and to accept debenture stock which it was proposed to issue for their £30,000 of loans. If carried out, the agreement would make the Manchester Company not only partners with this Company, but would also bring them a business which was already fairly profitable, and which could be made more profitable, and it would also remove the dangers of competition. The bargain made with the Manchester Company was based on that company's last balance-sheet, subject to correction up to the date of transfer. On their several undertakings they made a gross profit last year of £7,491, and the Edison and Swan Company had satisfied themselves respecting the correctness of this statement. They proposed to hand over to the Manchester Company 10,000 of their £5 shares with £3 each paid up in exchange for the Manchester Company's 20,000 £1. 10s. shares paid, leaving these shares saddled with a liability for calls of £2 each, like the Edison and Swan Company's own A shares. With respect to the proposed issue of debenture stock, they were now encumbered with a debenture debt of £100,000, which, however, was redeemable at six months' notice. It was more advantageous in the interests of the shareholders for them to issue debenture stock than to call up the unpaid capital, because their shares with £3 paid on them were quoted at a discount. They ought not to be, because they had been paying pretty regularly for some years a dividend of 5 per cent., but the fact remained, and it was therefore not expedient to call up capital to be immediately quoted at a discount. In the resolutions reference was made to creating and issuing £250,000 of debenture stock, but they did not want anything like this amount. It was, however, an advantage to create at once a stock with equal rights of sufficient amount for their purposes. If the resolutions were approved, they intended to give notice to redeem the £100,000 of debenture stock outstanding, but to invite the holders of it to exchange into the proposed 4 per cent. stock. The uncalled capital in the ordinary shares increased the value of the debentures, but if any of the shareholders disliked the liability to a call the Board had power, and were willing to exercise it, of relieving them of that liability by taking payment in full. They could not, however, give them 5 per cent. for the money when they could borrow it at less, but equitable terms might be arranged.

Mr. Killingworth Hedges referred to the Manchester Company having done installation work and derived some considerable profit from it. That was a point to be considered, because the Edison-Swan Company could not undertake such work without going into competition with their best customers for lamps and fittings. As to the central-station work, the Company once undertook it, but dropped it as inexpedient. He would have liked more details as to Altrincham. They knew such work was only for a period, and not for all time, and the conditions of the local authority as to surrender or purchase were sometimes very severe. That greatly affected its value to take over. He would also like to ask what became of the B shares.

The **Chairman** said that Mr. Fawcus was at the Manchester meeting—this was fixed for the same day—or no doubt he would have had something to say in reply to Mr. Hedges on behalf of the business that had been undertaken. It was the intention of the Company as heretofore to keep clear of installation work, but as to current generating (central station) work there might be places beneath the notice of the great companies which it would be worth their while to undertake. The B shares had never more than a nominal value, and would be dropped. It simplified the accounts, and came to the same thing as regarded profits.

Mr. Hedges again enforced the necessity of not undertaking any work which would put the Company on bad terms with electrical engineering firms.

After some further questions on points of detail had been answered, the **Earl of Lichfield** seconded the resolution. He believed he was the only director who was on the original Board, who were responsible for the agreement which the chairman had said was made in the dark ages. At the time it was made it seemed a very desirable agreement, the idea then being to have a quantity of subsidiary companies. Fortunately, perhaps, it had turned out differently and he strongly recommended the resolutions proposed.

The resolutions were carried unanimously, and the meeting ended with the usual votes of thanks.

MANCHESTER EDISON-SWAN ELECTRIC LIGHTING COMPANY, LIMITED.

An extraordinary general meeting of this Company was held at the Memorial Hall Liverpool, on Tuesday for the purpose of considering a resolution for the adoption of a provisional agreement for the amalgamation of the Company with the Edison and Swan United Electric Light Company, Limited.

A copy of the provisional agreement was read by **Mr. Parkinson**, solicitor to the Company.

Mr Vernon K. Armitage, chairman of the Company, in moving its adoption, said the agreement was simplicity itself. The parent company were to give to the Manchester Company, subject to certain conditions as to debentures, etc., one £5 share of £3 paid up in return for two of their shares of £5 each, 30s. each paid up, and for that they were to take over the whole of the undertaking,

Digitized by Google

relieving them of all their liabilities and taking over all their assets. One of several advantages which the amalgamation would secure was that it would prevent the annoyance caused to the shareholders by the continual fluctuations in the value of their shares on the Stock Exchange. Those fluctuations had been due not to changes in the intrinsic value of the shares, but to the fact that large holders of the shares died, and that executors or trustees, feeling it undesirable to continue to hold shares of which so large an amount remained uncalled up, sold out at any figure. The amalgamation with a large company would undoubtedly conduce to the stability of the shares on the Stock Exchange. The amalgamation would also be of service in the way of enabling the business to be carried on in Manchester on the lines which the directors had hitherto regarded as the most desirable. He regarded the proposed amalgamation as a very wise proposal, and hoped it would be agreed to unanimously.

The motion was seconded by **Mr. F. B. Ross** and unanimously adopted.

BROCKIE-PELL ARC LAMP COMPANY, LIMITED.

The statutory general meeting of the Brockie-Pell Arc Lamp Company, Limited, was held on Tuesday at the offices, 97, Queen Victoria-street, E.C., Lord Suffield presiding.

There was no resolution, but the **Chairman** said the Company went to allotment on August 14 last, and before doing this the directors were careful to see that the full working capital was secured. The directors set to work with the one view before them of manufacturing the lamps under the patents. Their engineer, Mr. Brockie, had designed special appliances and machinery which would ensure the rapid and accurate production of a better article than had hitherto been supplied to the public. The intention was to adopt a strictly interchangeable system in every part in the lamps of their make. All arrangements were being pushed on as rapidly as possible, and some of the machinery had already been delivered, while the remainder was now in transit. The directors had secured suitable manufacturing premises in Finsbury, and as the demand for the lamps was increasing, and the outlook for the future business was promising, they had, in taking these premises, borne in mind the probable extension of the Company's trade. Mr. Brockie and Mr. Pell had become permanently associated with the Company, and were giving their careful and constant attention to the many details incidental to the Company's business. The Board were taking into consideration the question of dealing with the foreign patents of the Company, which should prove a valuable asset.

Mr. Squibb asked whether the Board had taken any steps to obtain a quotation on the Stock Exchange

The **Chairman** replied in the negative, and the **Solicitor** (Mr. Crisp) said the reason was that the vendors' shares were too large a proportion, amounting to more than one-third of the capital.

In reply to **Mr. Bailey, Mr. Bennett Pell** said there were several contracts in hand, some being very important ones. Taking the places abroad first, there was the city of Durban, the capital of Natal; then another was being carried out at Johannesburg at the present moment. They had recently sent out a large number of lamps to a well-known mining company, the Mount Morgan, in Queensland, and several had been supplied to mines in South Africa. A very large number had been supplied in one way and another abroad. At home there was a contract for lighting the streets of Chester, a contract for an extension of lighting in South Shields, and another one for an extension of lighting in Taunton. In London there was one being carried out in a large district in the West end (Hammersmith) and the upper part of Regent-street, which had been recently lighted with their lamps; in fact, it was only completed last week Then there was a large district in the East-end—Shoreditch. Other contracts were under consideration at the present moment. Of course there were a large number of lamps besides, which had been supplied to various people, and they had recently been delivering lamps to some of the railway and dock companies.

After some conversation a vote of thanks to the Chairman was carried.

CONTINENTAL METROPOLITAN TRAMWAYS COMPANY, LIMITED.

An extraordinary general meeting of this Company was held on Tuesday at the Cannon-street Hotel, E.C., Mr. B. H. Van Tromp presiding.

The object of the meeting was to consider a resolution for winding-up the Company voluntarily under the provisions of the Companies' Acts, 1862 and 1867, and appointing Messrs. B. H. Van Tromp, G. Richardson, C. M. Davidson, and J. H. H. Duncan liquidators.

The **Chairman**, in moving a resolution to the above effect, said the Board had formulated a scheme for what they considered a fair and equitable division of the purchase-money, and they would, of course, take care to put in evidence, by affidavit of himself or the secretary, the result of the appeal which had been made to the shareholders. This would show the Court that the shareholders were practically almost unanimous with respect to the scheme. The purchase-money for the undertaking had been paid to the hour, and within a few hours of its receipt he and Mr. Richardson attended at the bank and deposited the money on thoroughly good security at interest which he thought was now carrying 3¼ per cent. The amount was nearly £400,000, and, therefore, it was producing at the rate of £12,000 a year, even at 3 per cent. They intended at the earliest possible moment to call a meeting to confirm the resolution now proposed, so that they might take the question before the Court immediately after the Christmas holidays. He hoped the Court would confirm the directors' scheme, but the question was whether under the articles of association they would have the power to do so.

After some consideration as to what would happen if that was not done, the resolution was seconded by **Mr. Richardson**, who said the sympathies of the directors were entirely in favour of the preference and preferred ordinary shareholders

Mr. Birks hoped the position of the ordinary shareholders would be properly represented to the Court.

The resolution was then carried unanimously.

ANGLO-FRENCH MOTOR CARRIAGE COMPANY, LIMITED.

The statutory general meeting of this Company was held on Tuesday at Winchester House, E.C., Mr. E. B. Ellice-Clark presiding.

The **Chairman** said negotiations were proceeding for acquiring a factory in France and the Company had already taken premises in Birmingham. There was no resolution except a vote of thanks

CONTRACTS FOR ELECTRICAL SUPPLIES

CONTRACTS OPEN.

Posen.—Tenders will be received on December 4 for 430 telegraph posts for the State Railways Particulars 50pfg. (6d.). Address, Königl. Eisenbahn Direktion Rechnungsbureau, St. Martin 40, Posen.

Brussels.—Tenders will be received at the Hôtel de Ville, Brussels, on December 11 for the supply of pipes and of some other stores necessary for the Municipal Electric Lighting Department during the forthcoming year.

Valdevenas (Spain).—Offers will be received at Valdeveñas, in the province of Ciudad Real, on November 29 for the erection of a town electric lighting station, etc. Application is presumably to the Local Authorities, but no additional details are to hand up to the present.

Paris.—The French Telegraphic Authorities will receive tenders at 103 Rue de Grenelle, for telephonic cables, cotton and lead sheathed, and for transport of telegraphic materials. The date is December 8, but application to tender must be made at once (November 28).

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s) from the Generaldirektion, (Centralbureau) Grossh. Badischen, Staatseisenbahnen, Karlsruhe, Germany.

Dublin.—Tenders are required for the supply of general stores and sundries during year ending December 31, 1897, for the Dublin United Tramways Company. Forms of tender (price 1s. each), conditions, and all information can be obtained and patterns seen at the Company's Offices, 9, Upper Sackville-street, Dublin, until the 30th inst. Tenders, sealed and marked outside "Tender for Stores," and addressed to the Chairman, to be lodged with Mr. Wm. Anderson, secretary, by 30th inst.

Bury.—The Corporation are prepared to receive tenders for the wiring of the municipal offices, Bank-street and Parson's lane, Bury Copy of specification and form of tender may be obtained on application at the office of the Borough Engineer, and on payment of a deposit of 10s. 6d, which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed respectively "Wiring—Bank-street," "Wiring—Parson's-lane," to be delivered at the office of Mr. John Haslam, town clerk, on or before noon on November 30.

Hanley.—The Corporation require tenders for air-compressors (alternative arrangements driven by steam and by electric motors), and alternating-current electric motors at the sewerage works. Full particulars, specifications, bills of quantities, and forms of tender may be obtained at the office of Mr. Joseph Lobley, borough engineer and surveyor, Town Hall, Hanley. Contracts will only be given to firms paying the standard rate of wages Sealed and endorsed tenders must be sent to the Borough Engineer before Monday night, 30th inst.

Deptford.—The Commissioners of Baths and Wash-houses for the parish of St. Paul, Deptford, invite tenders for proposed electrical installation at the public baths, now in course of erection. Specification, form of tender, and particulars may be obtained at the offices of the architect, Mr. Thomas Dinwiddy, Greenwich, and 5, Whitehall, S W., on payment of £5 deposit, to be returned on receipt of a bona fide tender. Sealed tenders to be delivered to Mr. Arthur Huntley, clerk, Vestry Offices, 20, Tanner's-hill, Deptford, before 4 p.m. on 30th inst.

Copenhagen.—Provided the City Council will vote for spending the necessary amount, an electric station is to be built in Vesterbro, Copenhagen, and tenders are invited for the delivery of (1) boilers, (2) mechanical and electrical plant, and (3) network, in accordance with the description. Conditions and plans to be had upon application to the Electrical Station, 30, Gothersgade, Copenhagen. For each specification a fee of 50 kroner is charged, which is returned on acceptance of the tender. Tenders will be received at the office of the fourth division of the Magistracy until December 4 at 12 noon.

Digitized by Google

London, N.—The Great Northern Railway Directors are prepared to receive tenders for the supply of new and the purchase of old stores for 12 months from January 1 next. A list of the contracts, and separate forms of tender for each contract, may be obtained on application to Mr. Martin, the stores superintendent, Doncaster, by whom every information will be furnished. The patterns of telegraph and electric lighting material will be exhibited at the Telegraph Stores, Retford, and the company's samples and patterns cannot be sent to contractors for inspection. Tenders addressed to the Stores Committee, marked on the outside with a description of the stores tendered for, must be sent to the Company's Offices at King's Cross, in the envelopes specially provided, so as to be received not later than 10 a.m. on December 5.

York.—The Corporation invite tenders—(Section A) supply and erection complete of plant in a central electric lighting station; (Section B) supply, laying, and connecting complete of a system of mains; (Section C) supply, erection, and connection of arc lamps; (Section D) running the whole system for a period of years. The whole work is to be in accordance with the specifications and drawings prepared by Prof. Alexr. B. W. Kennedy, M.I.C.E., the consulting electrical engineer to the Corporation of York. Firms willing to undertake the whole or any section of above work may obtain copies of the specifications and drawings on application to Mr. William Giles, acting town clerk, Guildhall, York, and on making a deposit of £2. 2s., which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed "Electric Lighting," to be delivered by 30th inst.

Southampton.—The Corporation invite tenders for the supply and laying of (*a*) insulated electric mains, (*b*) conduits and drawing-in boxes. Specifications and forms of tender can be obtained at the Municipal Offices, Southampton, or at the offices of the engineers, Messrs. Kincaid, Waller, and Manville, 29, Great George-street, Westminster, on payment of a fee of £3 3s., which sum will be returned on receipt of a bona fide tender. The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each branch of the trade. The contractor whose tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties for the fulfilment of contract. Sealed tenders, endorsed "Electricity Supply, Tender for Contract No. 2," must be sent to Mr. George B. Nalder, town clerk, Municipal Offices, Southampton, at or before 12 noon on December 4.

Southampton.—The Corporation require tenders for the erection of buildings for an electric generating station, including engine-house, boiler-house, pump-room, and offices, chimney shaft and flues with accessories thereto, to be situated on the ground belonging to the Corporation, comprising and adjoining the present electric light station between Back-of-the-Walls and Canal-walk. Specifications, quantities, and form of tender can be obtained and the drawings can be seen at the Municipal Offices, Southampton, or at the offices of the engineers, Messrs. Kincaid, Waller, and Manville, 29, Great George-street, Westminster, on payment of a fee of £3. 3s., which sum will be returned on receipt of a bona fide tender. The contractor will be required to pay not less than the minimum standard rate of wages for the time being in each branch of the trade. The contractor whose tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties for the fulfilment of contract. Sealed tenders, endorsed "Electricity Supply, Tender for Contract No. 1," must be sent to Mr. George B. Nalder, town clerk, Municipal Offices, Southampton, at or before 12 noon on December 4.

RESULTS OF TENDERS.

Southampton.—For lighting the municipal offices and Guildhall by electricity, for the Corporation. Mr. J. H. Lee, electrical engineer:

	A.	B.	C.	D.
E. T. Fiford and Sons	£239	£131	£0 6 0	£1 9 0
A. Ford Lloyd and Co.	225	*105	0 5 0	1 0 0
F. Shalders	231	122	0 2 6	0 16 6
Sanby and Co.	*212	119	0 15 0	1 7 0

Electrical engineer's protecting tender, £354.

A. Municipal offices. B. Guildhall and police offices. C. Extra switches. D. Extra lights. * Accepted tenders.

BUSINESS NOTES.

Devonport.—The Corporation have adopted electrical fire-alarms in the town.

Western and Brazilian Telegraph Company.—For the past week the receipts were £2,720.

Bristol.—The proposed scheme for the extension of the tramways has been approved by the ratepayers.

Paris.—The Claret-Viulleumier system of electric traction, which was recently adopted, is reported to be giving great satisfaction.

Morecambe.—The Urban District Council have advertised their intention to apply to the Board of Trade for an electric lighting provisional order.

Harrogate.—The Corporation have decided to light the interior and exterior of the new lavatories being built opposite the Prospect Hotel with electricity.

Kingston.—The Corporation having erected some artisans' dwellings, they have decided to fit them up with the electric light and to include the charge for it in the rent.

Electric Light at Olympia.—"Olympia" has been offered for sale by auction, but no one would buy. It was mentioned that the electric light installation itself cost £30,000.

British Pioneers' Exhibition Syndicate, Limited.—This Company has been formed, with a capital of £10,000 in £1 shares, to acquire and carry on the British Industrial Exhibition.

St. George's, Hanover-square.—The work of rearranging and reinstalling the wiring at this church, where the recent fire took place, has been entrusted to Messrs. Drake and Gorham.

Ayr.—The Town Council have appointed a committee to consider a proposal to support a company which is prepared on certain conditions to construct a system of electrical tramways for the city.

Handsworth.—At the Urban District Council meeting, Mr. Haynes gave notice that at the next meeting of the Lighting Committee steps be taken by the Council to light Woodhouse with electric light.

Windsor.—Motorcars are to be excluded from the Long Walk, which is used by the Queen and the Royal Family when proceeding to and from Windsor Castle, Cumberland Lodge, and other places in the Great Park.

Hull.—Mr. R. Hammond, having reported generally in favour of the scheme proposed by the Electric Lighting Committee last June, that committee recommend the Council to empower them to carry it into effect.

Personal.—Mr. C. L. Heath, lecturer on engineering subjects at the Central Science Schools, Sheffield, has been appointed chief lecturer on engineering at the Hull Technical Schools at a salary of £250 per annum.

Electrolytic Plating Apparatus Company, Limited.—This Company has been registered, with a capital of £50,000 in £1 shares. The registered address is St. Paul's-chambers, The Bridge, Walsall, Staffordshire.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended November 22 amounted to £1,183, as compared with £1,067 in the corresponding week of the previous year, being an increase of £116.

Bury.—The Electric Lighting Committee consists of the following gentlemen: the Mayor; Aldermen Brierley, Hall, Hopkinson, and Parks; Councillors Ashworth, Butcher, Byrom, Collinge, Hall, Mellor, Pickup, and Ward.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended November 20 were £1,872. 7s. 6d., compared with £1 848 14s. 3d. for the corresponding period of last year, being an increase of £23. 8s. 3d.

Greenwich.—The Blackheath and Greenwich District Electric Light Company are proposing to extend their supply to the whole parish of Greenwich, as well as to those of Charlton, Eltham, Lee, and Lewisham, and the liberty of Kidbrook.

Ipswich.—An electric plant has been laid down at the sewage works for the purpose of electrolysing sea-water in connection with the treatment of the sewage. The parliamentary notice of the Corporation electric lighting scheme has been published.

Glossop.—A letter was read at the Town Council meeting from Mr. W. H. Druce, consulting engineer, Manchester, offering to supply the Council with an estimate of complete scheme for lighting the town with electric energy, but it was not entertained.

Electric Light in the City.—The *City Press* has published an article on this subject to show that not so much saving after all has been effected by the substitution of electric light for gas in the City, and that the original scheme was too ambitious.

Water Power from Small Streams.—In the mountainous districts of France and Switzerland the value of the innumerable small streams is becoming more and more recognised. Although for the most part small, these streams descend from a great height.

Threlkeld.—The electric light was turned on at the granite quarries for the first time last week. The plant comprises steam-engine and dynamo combined, capable of giving 12,000 c.p. The plant was erected under the supervision of Mr. W. Borlase, electrical engineer.

Coventry Machinists' Company, Limited.—This Company has been registered, with a capital of £100, in £1 shares, to carry on business as cycle, carriage, and motorcar manufacturers, india-rubber manufacturers and merchants, engineers, machinists, fitters and founders, wire-drawers, etc.

Flamborough.—Notice has been given that an application is intended to be made under the Light Railways Act, 1896, to the Light Railway Commissioners for an order to incorporate a company to work and maintain the proposed light railway. Electricity is proposed as the motive power.

City and South London Railway.—The returns for the week ended November 22 were £1,017, compared with £946 for the corresponding period of last year, being an increase of £71. The total receipts for the half-year 1896 were £19,842, compared with £18,562 last year, being an increase of £1,280.

Dover.—Holy Trinity Church is to be installed with the electric light, and contracts have already been entered into. The cost of the work will be about £100. The installation is to be completed before Christmas. It is proposed to carry the electric light mains through the streets on the Dover Castle Estate.

St. Bernard (Switzerland).—The proposed electric tunnel railway will be 60 kilometres long (rather more than 30 miles); it will join Aosta and Martigny; the tunnel will be only about a mile and a half in length, but the gradients are very severe. The cost of its construction is estimated at £1,600,000.

Digitized by Google

Penarth Tramways Syndicate, Limited.—This syndicate has been registered, with a capital of £4,000 in £10 shares, to obtain a provisional order for the construction of a tramway between Cardiff and Penarth, Glamorganshire, and to turn to account the same. Registered office: 124, Bute-street, Cardiff.

Dumfries —The Joint Committee of the county and burgh which administers the Weights and Measures Act have discussed a proposal to procure an autocar with which the inspector might make his journeys throughout the district, carrying the standard weights with him, but a final decision was not arrived at.

Newhaven (Sussex).—At the Rural District Council meeting a notification was read from the Local Government Board that an electric lighting company was applying for a provisional order for electric lighting at Rottingdean. It was stated that notice of such intention would be served on all the local bodies interested.

Michoacan and Pacific Railway Company, Limited.—This Company has been registered, with a capital of £60,000, in £10 shares, to acquire concessions granted, or to be granted, for railways, tramways, telegraphs, and telephones, and other works in the State of Michoacan, or elsewhere, in the Republic of Mexico.

Brazilian Submarine Telegraph Company, Limited.—The directors have declared an interim dividend of 3s. per share, or at the rate of 6 per cent. per annum, tax free, for the quarter ended September 30, payable on December 18. The transfer-books of this Company will be closed from December 11 to December 17, both days inclusive.

Max-Saturn Electrical Syndicate, Limited.—This syndicate has been registered, with a capital of £3,000 in £1 shares, to carry on the business of an electric power and light company in all its branches, and of electricians, mechanical engineers, suppliers of electricity, and electrical apparatus manufacturers. Registered office: 20, Ely-place, E.C.

Appointment Vacant.—There is a vacancy on the medical staff of the London Homœopathic Hospital, Bloomsbury, W.C, for a medical electrician. Applications and testimonials must be sent in for examination by the medical council not later than March 1, 1897, to Mr. G. A. Cross, secretary-superintendent, of whom further particulars can be obtained.

Isle of Thanet Light Railways (Electric) Company, Limited. This Company has just been registered, with a capital of £1,000 in £10 shares. Its object is to promote and obtain the necessary authority to make and maintain railways in Kent or elsewhere, and to carry on business as a tramway, omnibus, railway, and electric company.

Edison and Swan United Electric Light Company, Limited.—Mr. H. C. Gover writes to us: "Please kindly let me say for your information that this Company does not propose taking up 'installation work' This question is being put by some of our friends in connection with the absorption by this Company of the Manchester Edison-Swan Company."

Lancaster.—It was stated at the Town Council meeting that by the end of the financial year it was confidently expected that the electricity works would become a paying concern, and pleasure was expressed that the establishment of those works had not deteriorated the gasworks, which during the past six months also showed a satisfactory increase of profit.

Blackpool.—The Corporation have decided to spend £300,000 on promenade improvement scheme. Arc lights will be fixed upon what will be known as the Island footpath, and the whole roadway is to be illuminated with other electric lights, one of the fixtures of which will be ornamental brackets to carry the cable of the new overhead tramway system which is to be adopted.

Cheltenham.—Notification is given of an intended application to the Light Railway Commissioners for an order authorising the construction of a light railway from the Midland Station, Cheltenham, to the village of Winchcombe, Gloucester. It is stated that the proposed gauge of the line will not exceed 4ft. 8½in., and that "electricity, air, or other motive power," as may be agreed with the Corporation will be used.

Electric Driving of Drying Ovens.—At the briquette works of the Ilse Lignite Mine, near Bückgen, in the West Kottbus district, the Schulz drying-ovens, and also two new briquette presses, that make 120 revolutions per minute, have lately been driven by belt from electric motors of 50 h.p. and 75 h.p. The management is also taking into consideration the advisability of driving electrically the plate ovens for drying the coal-dust.

Newport.—The Corporation have given notice of intention to apply to Parliament for a batch of new powers in the next session. The Bill includes provision for raising additional money for extending the existing tramways to the docks, to Malpas, and along the Corporation-road on the east side of the river. Powers are sought to employ cables, steam, electricity, or oil as the propelling power, if it be thought necessary to supplant horses.

Testing Fees.—The London Commissioners of Sewers give notice of their intention to prescribe the undermentioned fees for the testing of consumers' wires and fittings agreeably to the provisions of No. 43 (A) of the regulations made by the Board of Trade under the Electric Lighting Act—viz., for a test not occupying more than two hours, 10s.; for a test taking more than two hours, a charge for the whole time absorbed in testing at the rate of 5s. per hour.

City and South London Railway. — The contract for the construction of the extension of the above electric railway has been placed with Messrs. John Mowlem and Co. The new lines will join the old portion on the south side of the Thames, and will run through to Moorgate-street, with two intermediate stations. The electric locomotives which have been so successful in constructing the Waterloo and City will also be used in this new work for hauling out the spoil.

Brussels Exhibition.—The secretary of the British Commission (Mr. J. Dredge) has issued a circular asking that all intending exhibitors should communicate with him at 35, Bedford-street, Strand, W.C., at once. Applications for space will be taken in order of date, and good positions cannot be promised after December 21. The charge is 5s. per square foot occupied. Full particulars as to transport, customs, etc., can be obtained on application to Mr. Dredge.

High Wycombe Electricity Supply Company, Limited.—This Company has been registered with a capital of £10,000 in £1 shares, to carry on in the borough of High Wycombe, Bucks, the business of an electric lighting and power company in all its branches; to enter into an agreement with the mayor, aldermen, and burgesses of the said borough, and to take over and exercise the lighting powers conferred by the Electric Lighting Orders Confirmation (No. 1) Act, 1894.

Rotherhithe.—The General Purposes Committee reported at the Vestry meeting that they had adjourned the consideration of the letter from Mr. S. Morse on behalf of the County of London and Brush Provincial Electric Lighting Company, Limited, and asked for the formal consent of the Vestry to their application to the Board of Trade for a provisional order to supply electric light in Rotherhithe. The committee desired to arrange an interview with the manager of the company.

Thornaby.—A special meeting of the Town Council has been held to consider an application from the tramways company for the reconstruction and extension of the tramways in the borough, and their working by electric traction. After some discussion it was agreed to consent to the application, subject to terms and conditions to be afterwards agreed upon, and providing the North Riding County Council consented to the laying of the lines down to Middlesbrough on the main road.

Bo'ness.—A deputation of shippers and traders has waited upon the Harbour Board urging them to have the electric light introduced at Bo'ness Docks. Mr. Conacher, general manager of the North British Railway Company, asked if the dock contractors would be prepared to consider a rearrangement of rates if the electric light were introduced. Mr. Welsh, representing Messrs. Denholm and Co., replied in the affirmative. After the deputation withdrew, it was agreed that a trial should first of all be made of incandescent-gas burners.

Leeds.—It is stated that the conference arranged to take place on Sunday next between the Yorkshire representatives of the linesmen in the employ of the National Telephone Company has been extended to all districts, it having been found that the proposals submitted to Mr. Smith, of Leeds, by Mr. Chambers, the provincial manager to the company, affected the men outside Yorkshire as closely as it concerned those within the county. Consequently the secretary of the local branch of the union has circularised the whole of the districts interested.

Rishton —In the minutes that were read at the District Council meeting it was stated that in committee some discussion had taken place as to electric communication in case of fire, and ultimately it had been resolved that a box with such connection, and with lever to the same, be placed on the footpath by Mr. Hanson's mill to work an alarm whistle at the mill, and that it be left to the subcommittee to make the arrangement. The minutes were confirmed, with the exception of the one referring to electric communication at Mr. Hanson's mill, which was referred back.

Worcester.—At the City Council meeting it was decided to instruct the engineer to fill up the spaces between the spokes of the pulley wheels of the electric motors with wood in two layers with felt between, and to substitute rubber for metal valves, at an estimated cost of £50, in order to stop the noise from the electric motors. The Electric Lighting Committee has been constituted as follows: the Mayor, the Chamberlain; Aldermen Williamson, Ernest Day, Holland, and Allsopp; Messrs. Joseph Cock, W. Caldicott, H. Day, Millington, Parker, Kay, Cook, and Rushton.

Waterloo and City Railway.—The constructional work on this line is being rapidly pushed forward by the contractors, John Mowlem and Co. We understand that one of the tunnels at Waterloo has now reached the surface, and that the other will soon see daylight. At the Queen Victoria-street end of the line a large single tube, 23ft. diameter, is being constructed to contain the siding, which has in this case to be placed some distance before the station. We understand that specifications for the electric locomotives and for the necessary generating plant will be issued to a few selected firms this week.

Wakefield.—The Corporation are offering to supply electricity to the Guardians of the union at a charge of 6d. per unit, with a rebate of 2d. per unit for all consumption beyond an average of two hours' use per day of the standard consumption as determined by the rebate indicator, with an undertaking that the annual payments shall not exceed the sum of £750 for the first two years. The Electric Lighting Committee has been appointed as follows: the Mayor; Aldermen Chapman and Sherwood; Councillors Atkinson, Bolton, Cradock, Fallas, J. W. Harrison, J. Nicholson, W. Rhodes, W. H. Smith, and Wigham.

Telegraph Wire.—The value of the export trade of this country in telegraph wire and apparatus connected therewith during October has been returned at no less than £162,054, as against £76,273 in the preceding month and only £39,769 in October last year. Although there is now no probability of the year's total

Digitized by Google

reaching that recorded in 1894, yet it will show a satisfactory increase over last year, the aggregate exports during the 10 months ending with October having amounted to £699,905, as compared with £423,206 in the corresponding period of last year, and £1,326,856 in the first 10 months of 1894.

Leigh (Lancs).—A notice has been posted in the principal thoroughfares stating that application is intended to be made to the Board of Trade in the ensuing session under the provisions of the Tramways Act (1870) for a provisional order to authorise the construction of tramways in the urban district of Atherton, the urban district of Leigh, and the rural parish of Lowton. The publication has aroused much interest, inasmuch as the committee appointed a fortnight ago by the District Council to consider the advisability of the Council themselves acquiring the powers to construct tramways have not yet issued their report.

Brighton.—The Lighting Committee reported at the Town Council meeting that they had instructed the town clerk to insure the property up to Christmas next at premiums at the rate of 7s. 6d. per cent. per annum for the buildings and contents (excluding the dynamos), and 21s. per annum for the dynamos. These minutes were confirmed on the motion of Councillor Galliers, who said it was the intention of the committee to go into the whole question of insurance, and bring up a report between now and Christmas. The Corporation have decided not to allow the National Telephone Company to lay their wires underground.

Cork.—At the meeting of the Guardians Mr. Coakley, C.E., submitted a report upon the lighting of the house with electricity. At present there are 574 lights in the house. In view of the new buildings proposed to be erected, he provided for 600 lights. The capital outlay would be £2,000. The working expenses would be as follows: £90 for extra coal burned, £40 for men's time, £30 for renewals of lamps, etc., and £20 for oil, waste, and sundries—total, £180 per annum. There would be no new buildings required. He proposed that a portion of the room at the back of the drying-room and boiler-house, called the mangling-room, be used for engines, dynamos, etc.

Brighton and Rottingdean Electric Railway.—The seashore railway is to be opened on Saturday by the Mayor of Brighton (Alderman Blaker), Board of Trade sanction having just been received. The company's engineer, Mr. St. George Moore, will meet the visitors on the platform at Victoria Station (Brighton line) on Saturday morning at 9 50 for the 10.5 train, and will supply the ticket for the railway journey. The car will start from Paston-place jetty at 12 o'clock, and after the journey has been made a luncheon will take place at the Madeira-road shelter hall. The arrangements are under the management of the secretary, Mr. F. J. Cully, 4, Chesham-place, Brighton.

Stockton.—The Rural District Council have had before them an application from the Middlesbrough Imperial Tramways Company for permission to reconstruct the tramlines in the Council's district, extending from Stockton borough to Norton village, and to work the cars on the electric trolley system. The proposal is to amalgamate the Middlesbrough and Stockton companies, and to carry the line from the terminus at Newport, Middlesbrough, to the terminus at Thornaby, thus making a continuous line from the Royal Exchange at Middlesbrough to Norton Green, *viâ* Thornaby and Stockton, and extending over a distance of about seven miles. The Council referred the matter to a committee for consideration.

British Blahnik Arc Light Company, Limited.—This Company has been registered, with a capital of £50,000 in £1 shares, primarily to adopt and carry into effect an agreement for the acquisition of certain letters patent, for improvements in arc lamps, and to develop and turn to account the same; and generally to carry out in all or any of their respective branches the businesses of manufacturing, dealing in, working or letting on hire arc or other electric lamps, or any apparatus, implements, or things used in connection therewith, or for the production, transmission, storage and use of electric and magnetic force, power, or current, whether under the said letters patent or otherwise. The registered office is 28, Victoria-street, S W.

Croydon.—At the meeting of the County Borough Council, the General Purposes Committee recommended that, in accordance with the provisions of Clause 7 of the conditions of the electric lighting contract, the Council do consent to the assignment of the agreement dated March 12, 1896, from the British Thomson-Houston, Limited, to the British Houston Company, Limited. The borough engineer presented a plan showing suggested lighting of Church-street and Surrey-street by arc lamps. The committee recommended that the lighting as suggested be carried out. Councillor Howard Martin asked what the cost of lighting Church-street and Surrey-street with arc lamps would be. Alderman Miller replied that it would be £85 per annum.

Central London Railway. — We understand that the leading electrical firms have been asked to tender for the electrical equipment of this railway. Considerable latitude has been left to the contractor in almost every department, but we understand that locomotives, and not motor carriages, are to be used. The number of these locomotives required to maintain the three-minute service can, of course, be reduced by an increase of speed, and hence the quantity is not rigidly specified, but will be between 30 and 40. We are very glad to note that the contracts for this work will be subject to a limited competition, and trust that the rivalry between the firms may result in the most perfect system of electric traction being used through the heart of London.

Bilbao.—The proposed tramway from Zumárraga to Zumaya is referred to in *El Noticiero Bilbaino* as an enterprise of great importance to the district, and one which will shortly be realised, to judge from the enthusiasm with which it has been taken up. According to *La Union Vascongada* the line will run from Zumárraga, along the highway through the villages of Azcoitia, Loyola, Azputia, and Cestona to Tracta, where it will be bifurcate. One branch will go to Zumaya, serving on the way some cement works, the other loop going round to Cestona. Propositions have already been made by German firms for undertaking the work. When completed this will be the third interurban electric line in Spain, the others being the Bilbao and Santurce and the Bilbao and Las Arenas lines.

Wealdstone.—At the Urban District Council meeting a letter was read from Messrs. Taylor and Field, electrical engineers, stating that the first-named had paid a visit to Wealdstone and thought it eminently suitable for a successful electric light undertaking. Owing to the increasing demand for land at Wealdstone by manufacturing firms, and the high price of gas, they thought they were justified in forming a favourable opinion of the financial future of such a concern. In conclusion, they suggested they should be allowed to survey the district and prepare an accurate report. Mr. Powell did not think they were prepared to consider the question at present. The clerk was instructed to acknowledge the receipt of the letter, and to state that the Council had at present no observations to make.

Motorcar Lectures.—A special course of four lectures on the design and construction of motors for autocars, or self-propelled carriages, will be given by Prof. Watkinson, Wh.Sc., M.I.M.E., M.I.E.E., A.I.N.A., on Thursday evenings, at eight o'clock, at the Science and Arts Buildings, 38, Bath-street, Glasgow. The lectures will be fully illustrated by wall diagrams and limelight views, and they will deal with the problems involved in the design of motors of minimum weight, and with the methods of preventing vibration in such motors. The relative merits of gas-engines, oil-engines, and steam-engines working in conjunction with water-tube boilers, will be fully discussed, and some reference will be made to other possible motors for the propulsion of carriages, cars, etc. The lectures are in connection with the Glasgow and West of Scotland Technical College.

Portsmouth.—The Corporation's electric light undertaking is proving a decided financial success, and the extensions at the works already decided on are expected to prove inadequate to the requirements of the near future. Statistics were laid before the Lighting Committee last week, from which it is estimated that the income for the year ending March 31 next will reach between £13,000 and £14 000, and that a clear profit of from £2,500 to £3,500 will remain after the payment of all charges for working, interest, and sinking fund. Directly after Christmas it is proposed to further reduce the price of the current to consumers by ½d. per unit, bringing it down to 4½d., and it is also intended to endeavour to get over any complaints as to bad lights (usually the result of defective lamps) by offering to exchange one new incandescent lamp for an old one for every 50 units consumed.

Motorcar for the Queen of Spain.—A private motor carriage has been built by Messrs. Thrupp and Maberly, of Oxford-street, for the Queen of Spain. The vehicle, which is of elegant design, is called an electric victoria. The body of the conveyance in no way differs from that of the ordinary horse victoria. Mr. Julien's patent primary batteries are used for driving power. Storing room for the energy has been found under the inside and box seats, and it is claimed by the patentee that there is sufficient to propel the carriage at the rate of 10 miles an hour for 100 hours. It is fitted with a differential gear, has a chain wheel, and is steered on a pivoted axle. The interior of the carriage, which presents a quiet but handsome appearance, is upholstered with a dark-blue morocco leather, body blue, fine lined red, whilst a panel bears the arms of Spain. The wheels are a vivid red, picked out with black.

Falmouth.—The Corporation have decided not to purchase the local gas and water works. The ratepayers were dead against it, and at the meeting the manager of the waterworks asked whether the Council had placed before the ratepayers such clear and distinct statements as showed that the purchase would without doubt result in a profit, and did members of the Council possess such experience and qualifications as made it safe to entrust them with such an enormous increase in their already onerous duties? Plymouth, with gas at 1s. 9d., was putting in electric light. Torquay, with gas not much dearer, was doing the same, and the cost was only to be £20,500 for a place five times as big as Falmouth. That sum was less than half what the Falmouth ratepayers were asked to pay. He had never heard of such blind folly. Was it not almost certain that electricity would supersede gas, and leave Falmouth in a few years with nothing for its outlay?

The Repair of the "Scotia."—At the request of Admiral Sir John Fisher, K.C.B., Controller of the Navy, the Admiral-Superintendent of Devonport Dockyard has had before him the officials of the ss. "Scotia," and informed them that the Telegraph Construction and Maintenance Company had expressed their entire satisfaction with the efficient and rapid manner in which the extensive repairs had been carried out. The compliment was much appreciated by the officials and also by the "Scotia's" working party of mechanics and labourers, to whom the expression of appreciation was subsequently conveyed. The whole of the "Scotia's" fore compartments was practically reconstructed, the material used being the specially-prepared nickel-steel plates intended for the new battleship "Ocean." In addition to the cost of labour and material the Admiralty charged the "Scotia's" owners £200 for docking and undocking the vessel and £20 a day for the use of the dock. She was in dock four weeks.

Shoreditch.—Out of 43 applications for the post of permanent resident electrical engineer to the Vestry, three names were

Digitized by Google

selected, and when they were put to the meeting eight votes were recorded to Mr. J. H. Tonge, of Preston, engineer and manager to the National Electricty Supply Company; 17 voted for Mr. H. Coles, who has in hand stations at Swansea, Pontypool, and Aberdare; and 59 votes were given for Mr. C. N. Russell (38 years), of Highgate, chief engineer of the electric light works, Grosvenor-road. The latter has had a large all-round experience, and was appointed by the Vestry. The Lighting Committee of the same Vestry reported that they had consi ered a notice from the County of London and Brush Provincial Electric Lighting Company of their intention to apply for a provisional order under the Electric Lighting Acts in respect of a portion of Shoreditch. On the recommendation of the committee the Vestry decided to oppose the application in so far as it was an extension of the agreement already entered into with the company. Sixteen tenders for the supply of electrical materials were received and sent to the Electric Lighting Committee.

Hastings.—Mr. L. Andrews, the engineer and manager of the electric lighting company, stated, in an interview with a representative of a local paper, that they could supply an equal amount of electric light as cheaply as gas, and he thought that the Corporation ought to take the advice of an expert. Enquiries had recently been made among their consumers, and the following were the results: 51 per cent. of their customers, using between them 4,860 8-c.p. lamps, testified that they consider electricity as cheap as gas, that they have no complaints to make about their supply, and that they have no reason to regret having it installed; 8 per cent. consider it dearer than gas; 4 per cent. have complaints to make; and under 2 per cent. regret having had it installed. Nearly all complaints had been traced to the following causes: first, the use of lamps of unsuitable size; second, bad arrangements of lamps; third, continued use of old and blackened lamps. A letter in one of the newspapers strongly advocates the adoption of electric light in the churches. The South-Eastern Railway Company are about to run an American car train, consisting of first, second, and third class saloon carriages, lighted by electricity and warmed throughout with hot-water pipes, between Hastings and London.

Omagh.—A meeting of the Board of Governors of the asylum has been specially convened to consider the question of lighting the asylum with electricity, which Mr. Owens, Local Government architect, had stated could be done for £140 less money than the present lighting of gas. Colonel Buchanan moved that the proposition to substitute paraffin-oil gas instead of coal-gas be not entertained by the Board. Mr. J. Brown seconded the motion, which was passed. Colonel Buchanan moved the following resolution, which was seconded by Colonel Lowry, and passed unanimously: "That the question of the electric lighting of the institution be deferred until the Board is better informed as to its advantages, and that the clerk be directed to ascertain from the asylums in Ireland that have adopted electric lighting, and from asylums in England, of nearly the same extent as this asylum, similarly lighted, the following information: (1) the cost of electric lighting per head of population of institution; (2) the annual cost of electric lighting per head; (3) a general statement of the opinion of the several Boards on the relative merits of electric lighting, as contrasted with other modes of illumination; (4) the annual cost of supervision, and such other information as will enable the Board to come to a decision on the matter."

Reading.—Mr. Clifton Robinson, managing director of the Reading Tramways Company, has addressed a long letter to the town clerk relating to proposed alterations in the company's system. In it he advocates the advantage of electric traction by the overhead trolley system. After mentioning instances where the system has been successful he cites the company's proposals. These comprise the reduction of the gauge of the lines to 3ft. 6in., in order that double lines may be introduced in most of the streets; the extension of the King's-road line to St. Peter's-road; the extension of the present Oxford-road tramway to the "Pond House"; the construction of a tramline from the Gosbrook-lane and South-street, Caversham, junction (*viâ* Friar-street, West-street, Bridge-street, and Southampton-street), to Christ Church-road at Whitley-crescent; the construction of a tramline from the King's-road line at Duke-street, *viâ* London-street to the junction of Mount Pleasant and Southampton-street; the equipment of all the lines with the trolley system of traction; and the introduction of halfpenny workmen's fares. The whole of the lines both as reconstructed and as newly laid, would be operated electrically on the trolley system, the wires being carried on ornamental iron standards and brackets along the streets and roadways, of like design and character to those generally in use throughout the world, and as seen in successful operation at Bristol, Dublin, Leeds, and Hartlepool, and as now under construction at Birmingham and other important cities.

Sedgley.—At a special meeting of the District Council to consider the proposed amalgamation of the Staffordshire Tramways, Mr. Sellon, the electrical engineer to the British Electric Traction Company, attended and explained that the company were negotiating for the purchase of the tramways throughout that district, including those on the South Staffordshire route, the Dudley, Sedgley, and Wolverhampton route, the Dudley, Brierley Hill, and Stourbridge route, and it was proposed that the cars on the whole of the routes should be propelled by overhead electric wires. In addition, it was proposed to provide branches from the Fighting Cocks, near to Wolverhampton, to Bilston, also from Dudley to Kingswinford, from Dudley to Netherton and Cradley Heath; and it was hoped later on to provide an extension to Lower Gornal under the Light Railways Act. It was proposed to apply for a Bill to enable them to unite the whole of the tramways. It was necessary that all the gauges should be uniform, but at present that on the Dudley, Sedgley, and Wolverhampton line was wider than that of the others. In the scheme it was proposed that there should be one terminus at Five Ways, Wolverhampton. They hoped to come to an arrangement with the Dudley and Wolverhampton authorities. Cars would run every 10 minutes, and generating stations would be made at those two places. In such a big scheme it was absolutely necessary that there should be a settled agreement as it was proposed to spend nearly a million of money.

Glasgow.—At the meeting of the Tramway Committee, the chairman, Mr. Walter Paton, stated that it was the first meeting at which the members had had an opportunity of welcoming Mr. Young, the general manager, since his return from America. He assured him that they all rejoiced to see him home again, and added that if he had anything to say about his tour of inspection they would be glad to hear him. Mr. Young thanked the committee for their cordial reception, and stated that he and his engineer, Mr. Clark, had spent five weeks in the United States visiting all the cities and towns, and seeing all that was to be seen in the way of mechanical traction. He said that he had found that the cable had latterly made no progress whatever; on the contrary, a number of cable lines had been converted so as to be used for electric traction. The application of electricity for purposes of tramway traffic had made enormous strides in recent years; indeed, throughout the States it was the only form of traction which was being universally adopted. Mr. Young further stated that he hoped to be able to present his report in the course of a fortnight. In the meantime he desired to say, generally, that in his opinion the overhead trolley system seemed to be much preferable to horse haulage. He had made special enquiries in regard to the danger to be apprehended from falling wires. As the result he had not been able to find that anyone had been injured from this. The mayors of some of the larger cities had stated that they regarded the trolley system as being freer from accident than horse traction.

Electric Omnibuses.—A private run of the first electrical omnibus of the London Electrical Omnibus Company, Limited, took place last week. It was discovered that the wires of the car had been tampered with, and Mr. Radcliffe Ward, the inventor of the system, stated that during 24 hours he had found the wires had been tampered with on three occasions, and the only conclusion he could arrive at was that it had been done maliciously. Mr. Ward, however, thought that he could run at slow speed, but after journeying from the Hotel Victoria to Whitehall it was considered that it would be better to postpone the trip until a later hour. It was, however, afterwards discovered that the damage done had been of such great extent that it would take some hours to put matters right. The car holds 26 persons, 12 inside and 14 outside. The wheels are small, made of wood, with iron tyres, and the car itself is on a bed of pneumatic cushions. The weight of the 'bus, irrespective of the cells, etc., is three tons, but there are 72 cells, each of which weighs 26lb., against 56lb., the weight of the cells in the omnibus constructed by Mr. Ward some years ago, in which he states he has travelled no less than 500 miles throughout the Metropolis at the average speed of seven miles per hour. The present omnibus, it is stated, is capable of running seven hours at the rate of five miles an hour, the maximum speed allowed by the Local Government Board regulations for cars of that weight. The company are offering three prizes to the amount of £150 for improved original and artistic designs for the shape and form of body for omnibuses and cabs suitable for the company's business.

Edinburgh.—Messrs. Cameron and Mackenzie gave notice of motion at the last meeting of the Town Council that it be remitted to the Lord Provost's Committee to consider the advisability of giving consideration to the more recent mechanical motors in view of the tramway extension to Portobello, and report. One of the largest installations of the electric light which has yet been introduced into the city is that which has just been fitted up in the General Post Office by Messrs. W. Barton and Sons, Forrest-road, Edinburgh. The installation includes 36 10 ampere arc lamps and 540 incandescent lamps. The arc lamps, which are of the Brockie-Pell double-carbon type, are of 2 000 c.p. each, and are connected four in series on a 230-volt circuit. The whole of the building has been lighted and wired for electric energy supplied at 460 volts, and provision has been made at the same time for any future extension of the premises. The switchboard, the largest connected to the Corporation mains in the city, is placed in the basement. It is built of six slabs of enamelled slate, 1¼in. thick, each separated by insulated fillets of vulcanised fibre. On this are mounted two ammeters and a voltmeter for indicating the quantity and pressure of the current, and 12 triple pole switches and fuses, each carrying 50 amperes, which control the main circuits. Eight sub-main switchboards are placed in the various sections of the building. A novel feature of the installation is the lighting of the public telephone-cabinets by an automatic switch concealed in the seat provided for the speaker at the instrument, by means of which the light is turned on when the telephone is being used.

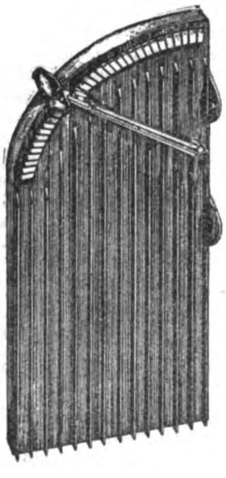
Minster.—Mr. West, on behalf of the Lighting Committee, laid before the Guardians at their last meeting the result of the investigations made by that committee for the purpose of ascertaining the practicability of adopting a system of electric lighting at the workhouse, instead of the present gas lighting. The information that came nearest their requirements was Sunnyside Asylum, Scotland, where they had 430 lights of 16 c.p. The cost there for installation was £1,800, with an annual cost of £244, and allowing 10 per cent. for depreciation. That was very low and very favour-

Digitized by Google

able to its adoption; but it should be pointed out that at Sunnyside coal was very cheap, the cost being only £41 per annum. Of course, coal would cost much more at Minster. As it was the wish of the committee that the question should be settled by the Board, he thought it only right that they should know what information had come to hand on the other side. They had received a letter, which was not exactly sought, from Mr. Valon, of Ramsgate, in which he recommended the adoption of incandescent burners, which they would find cheaper and more effective than electric light. Mr. West proceeded to give a list of institutions where electric light was in use and where the cost of gas was as low as 1s. 4½d. per 1,000. So far as the enquiries of the committee went, it seemed to them that the electric light could be installed at the workhouse at £1,500 or £2,000, and that the annual cost would come out at less than they were now paying for gas. On that data they asked the Board to decide the question. Ultimately it was decided to consider the question that day fortnight.

Electric Tramways in India.—The *Pioneer* of India says a point in the recent Government telegraph report which should attract notice is the reference to electric tramways in India. Calcutta is likely to have electric motive power on its tramlines sooner or later, and the experience gained down south should not be ignored. The tramway in Madras, the first of its kind in India, consists of three sections, one being worked on the conduit system, and the others on the overhead trolley plan. The conduits were tried first, but the difficulty of keeping them free from road refuse and water was found to be very great. Neither system, it appears, has materially disturbed the departmental telegraph or telephone circuits, nor was the testing apparatus affected prejudicially. But the telegraph companies working the traffic with the Farther East, and also the Oriental Telegraph Company, claimed protection from serious interference with their wires, due to the high currents used on the tramways. It was found that the interference was very real, and the tramway company had to pay for diversions of the telephone wires, which were re-aligned so as to escape the areas of disturbance. The Eastern Extension Cable Company also recovered the cost of relaying their cables in a pipe, which affords sufficient protection. The tramway company were not careful enough at first in putting up their overhead lines for the trolley system, and some of the Government telegraph wires were fixed at street crossings. This was a small matter, and the trouble was easily overcome. The Calcutta Municipality will doubtless see that all precautions are taken to safeguard the telegraph and telephone wires if electric traction in the tramways is introduced.

Catalogue.—We have received a catalogue of the iron-clad rheostats, stage-dimmers, motor-starting rheostats, etc., which are sold by the Stewart Electrical Syndicate, Limited, 103, New Oxford-street, London, W.C. The accompanying illustration is one of the theatre-dimmers. These are particularly designed for the limited space in the wings of a theatre, taking up no more room than the switch alone of the old-style dimmers. The throw of the switch is so proportioned that (where several dimmers are installed) any or all of the dimmers may be thrown in simultaneously. Large dimmers are made up of two or more plates connected in series, the terminals of the steps being brought to the contacts on the face-plate. They are in use at the Gaiety, London, and in the new theatre at Cork. Messrs. Stewart also send us a catalogue of the Stewart enclosed arc direct-current lamps. With these lamps carbons are furnished, after the first trimming, of only one standard length. This is due to the fact that the unconsumed portion of the upper carbon serves for the lower, after the first trimming, with a consequent saving of expense. Current consumption on the Stewart lamp is 4¾ amperes for best results.



Cardiff. — The Cardiff Tramways Company, Limited, are applying to Parliament for a provisional order authorising them to make certain extensions within the borough of Cardiff, and to double several portions of the existing lines. It is proposed to make a single line, with four passing-places, from a point north-east of Wordsworth-street, thence along the new street in course of construction between Newport-road and Clifton-street, and along Broadway to the present terminus near the Royal Oak Hotel. Another short line will connect the Newport-road and Grangetown systems by a tramway passing through Grove-road and Moira-place. It is proposed to make a double line, except for short distances, along Pearl-street and Splott-road to Moorland-road, East Moors, and another double line through Castle-road, Albany-road, and Wellfield-road, terminating at Wellfield-road at its junction with Ninian-road. A double line from Cowbridge-road, through Neville-street, Clare-street, Clare-road, Corporation-road, and terminating at Harrowby-street, at the Docks, is also contemplated, while the single line now terminating at Clive-road will be extended to Canton Park. Power is also sought to double several lengths of line in Cowbridge-road, St. Mary-street, Working-street, Bute-road, Newport-road, Custom House-street, and on the Cathays section. One of the clauses states that it is intended to employ electrical power, either by the overhead system or otherwise. At a meeting of the General Purposes Committee, communications were read from Messrs. Vachell and Co., solicitors, as to the proposed electric tramway between Cardiff and Penarth, asking for sanction of the Corporation to a provisional order for it. It was decided to send the letters to the Parliamentary Committee for consideration and report. Alderman Carey has been appointed chairman of the Lighting and Electrical Committee, with the Deputy-Mayor (Mr. Morgan Morgan) as vice-chairman.

Motorcart Competitions and Races.—It will be remembered that the proprietors of the *Engineer* offered five prizes ranging from 350 guineas to 100 guineas for mechanical road carriages, but that the competition was postponed to await the passing of the Light Locomotives Act. The rules for the competition have now been republished. The time of entry is next March, the preliminary trials will be at the Crystal Palace, and the final race about the end of May. Mr. C. Harrington Moore, hon. secretary to the Motor Car Club, writes from 40, Holborn-viaduct: "I am directed by Mr. Harry J. Lawson, the president, and by the committee of the Motor Car Club, to notify to you that it is the intention of the club to hold a great motorcar competition some time in May next year. The tests will be given on the point of design of the motorcar, consumption and cost of fuel, and other points, but the principal point will be speed, which we are of opinion affords the most satisfactory test as to the excellence of construction of a mechanical vehicle. It is proposed to offer for competition £2,000 in prizes. Notice of this competition is given thus early in order to enable English manufacturers to be prepared with their productions in good time. If sufficient entries are received the committee will confine the competition to British-made motor vehicles. In order to carry out this competition satisfactorily, the committee will require special ground within easy access of London, and containing at least a full, level, and straight mile. A special prize will be offered to the first mechanically-propelled vehicle which accomplishes a mile in a minute. Owners of racecourses and other large enclosed places are invited to communicate with me if they are prepared to co-operate in providing the necessary course. All communications on this subject should be addressed to me at the above address." Mr. Harry Lawson has, on behalf of the British Motor Syndicate, made a firm and substantial offer to the directors of the Epsom Grand Stand Association for the purpose of obtaining from time to time the use of the Epsom race track for motorcar races. A special feature will, in the event of terms being arranged, be made of a grand motor Derby at some suitable date in the month of May. It is stated that the scheme meets with serious opposition in some quarters.

Bradford.—Mr. A. H. Gibbings, the electrical engineer to the Corporation, has prepared a report for the Gas and Electricity Committee with reference to the proposal for the adoption of electricity as the motive power for tramways to Great Horton and to Bolton. The report shows that the Bolton line would have a length of a mile and 1,540 yards, while the Horton line would be two miles 1,500 yards in length. Mr. Gibbings deals exhaustively with the probable cost of working, the estimate being based to a certain extent upon the experiment tried some years ago with the overhead electric traction between Forster-square and the Grammar School. He points out that the Corporation possess many advantages now which they did not possess at that time. Amongst them are a working pressure of 500 volts instead of 300, the present central lighting station having sufficient power to drive a 10 minutes' service of three times the number of tramcars now running on all the systems in Bradford. While supplying current from the electricity works, the working of the tramways could, if desired, be entrusted to a private company; but it would be more profitable for the Corporation to themselves manage the whole of the working. The total cost of working a 15 minutes' service on the Horton route is estimated at 9·43d. per mile per car, and for a 10 minutes' service at 8·25d. The total capital cost for the Horton section is placed at £18,660, of which £2,000 is for sheds and offices, £1,600 for four cars at £400 each, and £15,060 for rails, cables, paving, etc. The length of the Bolton section being considerably less, the cost per mile per car is calculated to come out at 25 per cent. more than on the Horton section. If the two sections were worked conjointly the cost would probably be reduced to 8d. per mile per car. The additional capital required for a 10 minutes' service, as against a 15 minutes' service, would be small compared with the material reduction in the mileage cost. As for the effect on the electricity works a charge of 1½d. per unit would yield a profit of ½d. per unit, or an income of £277. 1s. 8d. on a sale of 133,000 units in the year, which would be gained without further expenditure on the works. The application of electricity to tramway traction, it is stated, opens up the possibility of a great reduction in the price charged for electricity for illumination purposes. The route proposed for the Horton tramway is by Morley-street, Easby-road, All Saints'-road, and Great Horton-road to the borough boundary at Horton Bank Top, with a loop line from the top of Easby-road, along Laisteridge-lane and Park-avenue to Great Horton-road. The report is decidedly favourable to the adoption of electricity for the proposed new sections of tramway.

Hampstead.—The Lighting Committee reported at the last meeting of the Vestry that they had given instruction for the charge of 10s. 6d. for each inspection of consumers' premises after the first test and inspection to be duly enforced. They had approved of the variations in the contract for the additions to the electric lighting station as set out in the letter from the architect dated October 30. They had instructed the vestry clerk to resist the claim, amounting to £11. 16s. 1d., made by Messrs. B. Dellagana and Co., Limited, for loss of time and delay of work by a failure of the supply of electric current to their branch in

Digitized by Google

Gayton-road, which they alleged to have been caused by a breakdown on the Vestry's main. They recommended that a low-tension main for the supply of electric current to Christ Church, Hampstead-square, be laid down at an estimated cost of £52. The report was adopted. Mr. Newton referred to the protest which appeared in a local paper from residents in Heath-street, and asked if any steps had been taken to light the whole of that thoroughfare, instead of a portion only, by electricity. The Chairman said that the Vestry had only recently decided upon a scheme for lighting a portion of Heath-street, with High-street and Haverstock-hill. It was unreasonable to expect the Vestry to entertain further projects before they saw if that already decided upon answered. Mr. Stone remarked that the residents of Heath-street could make application in the usual way. Mr. Jones asked if the Lighting Committee had considered whether anything could be done to utilise the dust destructor in the generation of electricity, as was done in some other places. Mr. Reed, chairman of the committee, said that the subject had been considered. He believed that the utilisation of dust destructors in this way was not altogether a success. A long and somewhat heated discussion took place on the following resolution, which was moved by Mr. McMillan, and seconded by Mr. Chandler: "That full details of the scheme for the extension of street electric lighting authorised at the last meeting of the Vestry be prepared by the Lighting Committee, and be submitted to the Vestry for approval." It was contended by several members that sufficient details had been furnished, but the motion was eventually carried, after the words "further particulars" had been substituted for "full details." Mr. McMillan intimated that he reserved the right, if the details furnished did not satisfy him, to call a special meeting to consider the subject of rescinding the motion passed at the previous meeting to light High-street, Heath-street (south of High-street), Rosslyn-hill, and Haverstock-hill with 28 arc lamps, at the estimated cost of £1,625, such sum including the necessary lamps, switches, cut-outs, lamp-posts, cable, engine, dynamo, with all necessary foundations and connections.

Hammersmith.—At a meeting of the London County Council the Finance Committee reported as follows: "We have considered an application from the Vestry of Hammersmith for the loan of £41,048 for electric lighting purposes. The Vestry purchased in July, 1895, the freehold of 57 Fulham Palace-road, upon which they are now erecting a boiler-house, engine house, chimney shaft, and other buildings necessary for the installation of the electric light, and they have to provide the necessary electric lighting plant. The Council's architect reports that he has examined the plans, specifications, and bills of quantities for the proposed buildings, and considers the estimated cost, £8,483. 4s. 1d., to be fair and reasonable, and the engineer reports that the cost of boilers, engines, dynamos, switchboards, rectifiers, piping, mains, arc lamp posts, lamps, and fittings is estimated at £30,431. 17s. 5d., in respect of which he can recommend at present a sum of £30,022 as reasonable for certain of the proposed plant and works. The Vestry have found it desirable to increase the area of the station, and have purchased an additional piece of ground adjoining that already acquired, at a cost of £307. 11s. 9d., and have also expended a sum of £100 beyond the £7,000 borrowed to purchase the original site, and this expenditure the valuer reports reasonable. We have eliminated from the amount (£41,046) applied for the sum of £2,111, a large part of which is for contingencies which may not arise, and which, if required, may be made the subject of a further advance. The present loan should therefore be limited to £38 935. We recommend: (*a*) That, subject to the Council hereafter giving its written consent under seal to the borrowing, and subject to all necessary consents and evidence being furnished to the satisfaction of the solicitor of the Council, the application of the Vestry of Hammersmith for a loan of £41,046 towards defraying the cost of an electric light installation in that parish, be granted to the extent of £38,935, on condition that the loan be taken up at once, interest being charged at the rate of £2. 17s. 6d. per cent. per annum, payable quarterly, on January 31, April 30, July 31, and October 31, in each year, and the principal being repaid by equal annual instalments on each 31st October, within a period of 42 years; that it be referred to the solicitor to take the necessary measures for completing the loan, and that the amount be advanced out of the consolidated loans fund. (*b*) That it be notified to the Vestry of Hammersmith that, as they have elected to spread the whole of the initial cost of the electric light installation over 42 years, the Council will decline to give its sanction to the raising of any loan to replace any of the plant and machinery which may be necessary during the currency of the loan, and will expect the Vestry to provide for all renewals required during that period out of a sinking fund to be provided or from maintenance account." This was agreed to.

Leith.—A statutory and special meeting of the Town Council has been held to consider the minute of a special committee on electric lighting. The minute stated that the streets to be included in the area of supply in which the undertakers—*i.e.*, the Town Council—propose that the electric lines or distributing mains for the purposes of general supply shall be laid down within a period to be specified in the order were as follows: Great Junction-street, North Junction-street, Portland-place, from No. 1 to No. 14 thereof; Mill-lane, Giles-street, from Sheriff-brae to Henderson-street; Henderson-street, from Giles-street to Tolbooth-wynd, at Shore; Tolbooth-wynd, Kirkgate, Charlotte-street, from Kirkgate to Constitution-street; Constitution-street, from Bernard-street to Duke-street; Bernard-street, Duke-street, Morton-street, Links, from Morton-street to Leith Academy; Leith-walk, from Duke-street to Pilrig-street, at burgh boundary. On the minute coming up for approval, Bailie Manclark moved its adoption. Councillor Kinnaird seconded. He thought the sooner the electric light was in Leith the better. He had spoken to several large shopkeepers who were simply waiting for it to be put in. He saw that Edinburgh, Glasgow, London, and other places commenced on a small scale, and he thought Leith might do the same thing. Bailie Manclark, in reply to Bailie Robertson, said the proposed streets were simply a trial. They had taken a reasonable area just now—the business part of the town—and afterwards the whole burgh might be included. In everyone of the streets proposed some people were going to take the light. Councillor Baxter said that at one time he was in favour of the electric light, provided that it could be had as cheaply, or nearly as cheaply, as in Edinburgh. From every source, however, he was led to believe that it was utterly impossible to provide the light for anything like the cost in Edinburgh. The Council was now asked to rush into this expenditure, estimated at £25,000, to light districts where it was a sheer impossibility that it could be taken up in such large quantities as to become remunerative. He asked if it was at all likely that shopkeepers would take up the light in certain of the streets specified. They had no guarantee that shopkeepers in certain streets would continue to take the light after it was in. Taking things all in all, there was a likelihood that they might get their fingers severely burnt on the question. They should delay, at all events, for a year, and allow the new members to make enquiry. They should go round and find out how many people were likely to take up the light. If Edinburgh were sincere in their amalgamation proposals, Edinburgh ought to offer them an installation of the light from their system when they asked for it. That was the kind of amalgamation he intended to go in for—amalgamation on every point that was likely to be of great advantage to Leith. He moved a direct negative to that minute. Mr. M'Kelvie seconded, and said he was convinced that they were not in a position to make the light a financial success. Mr. Mackie said there was no use in approaching Edinburgh in the sense that Mr. Baxter referred to at the close of his remarks, as they were not likely to meet with success. Bailie Gibson said that ultimately electric lighting was bound to be a paying concern in the burgh. The Provost said they had shown Edinburgh examples in adopting things that were to the advantage of the ratepayers. They did not lag behind any town. After further consideration the division was taken, when 13 voted for the approval of the minute and three against. At a conference between the Tramways Committee of the Corporation and the directors of the Edinburgh Street Tramways Company it was stated that the directors understood that the Corporation were more in favour of other motive power than cables, and that they had intended to bring for experiment one of the oil motorcars, but that difficulties had come in the way. The directors were satisfied that cabling was not in any sense the best possible means of dealing with the traffic in Leith. They had every hope that electricity would be much more satisfactory, but whatever suggestions were made by the Town Council would be fully considered. The feeling of the Council generally was that electricity by the overhead system would be best for Leith, and would admit of reasonable possibilities of the whole line being worked in that way if the directors or their engineers could guarantee that the Edinburgh cars could be made to run on the Leith lines by electricity. The directors promised to get the best possible advice as to such a scheme. It was agreed, before going further, to wait for the report from the tramway company as to the overhead electric system.

PROVISIONAL PATENTS, 1896.

NOVEMBER 16.

25729. Improvements in electric meters. Emile Batault, 21, Ely-place, Holborn-circus, London.

25786. Improvements in or relating to the strengthening of electric currents. Moriz Reichsritter von Leon, 322, High Holborn, London.

25798. Improvements in the manufacture or production of chlorates and hypochlorites of potassium and sodium by electrolysis and in apparatus therefor. James Greenwood, 4, South street, Finsbury, London.

25799. Improvements in the construction of electrodes for accumulators. Friedrich Wilhelm Schneider, 18, Buckingham-street, Strand, London. (Complete specification.)

25804. Improvements in the electrolytic production of zinc and alkalies. Dieffenbach, 28, Southampton-buildings, Chancery-lane, London. (Complete specification.)

NOVEMBER 17.

25844. Means for storing up the electricity generated by the application of the brakes to the wheels of motorcars or locomotives. Martin Ellis Thomas, William Fillmore Toops, James Monroe Hulen, Henry Lee Hendrick, Edward la rue Hendrick, and Robert Walter Hendrick, 89, Chancery-lane, London. (Complete specification.)

25895. Improvements in electric arc lamps. Alexander Bewicke Blackburn and George William Fairall, 47, Lincoln's-inn-fields, London.

25903. Improvements in controlling electric arcs. The British Thomson-Houston Company, Limited, 70, Chancery-lane, London. (Elihu Thomson, United States.) (Complete specification.)

Digitized by Google

25896. **Improved electric insulators** Charles William Six, 70, Palace-chambers Westminster, London.

25904. **Improvements in regulating polyphase circuits.** The British Thomson - Houston Company, Limited 70, Chancery-lane, London. (Albert H. Armstrong United States.) (Complete specification)

25906. **Improvements in contact systems for electric traction.** William Phillips Thompson, 6, Lord street, Liverpool. (Thomas Inman Coppin, South Africa.)

25943 **Improvements in or connected with portable electrical apparatus** J. Mayer, 40, Chancery - lane, London. (Complete specification.)

25948. **Improvements in electric accumulators and in the manner of their use.** Clovis Pierre François Clerc and Adolphe Georges Pingault, 111, Hatton-garden, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103 August 8, 1893 being date of application in Belgium.) (Complete specification.)

NOVEMBER 18.

25965. **Improvements in the electro-deposition of metals** John Boultbee Brooks and John Holt, 24, Temple-row, Birmingham.

25989. **Improvements in generating plant for producing alternately or simultaneously continuous and alternating currents of electricity,** George Adams, 55, Victoria-street Westminster, London.

26000. **Combination of electrolysis and Rontgen rays.** David Greville, 68, Jubilee-drive, Kensington, Liverpool

26003. **Improvements in electrically-propelled velocipedes, carriages, and other like vehicles.** Charles Adams-Randall, 63, Chancery-lane, London.

26009. **Improvements in and relating to electric light and current regulating switches** William Welford and Louis Héndlé Lynette avenue, Clapham Common, London.

26053. **Improvements in electric controllers.** William Henry Morgan, 18, Buckingham-street, Strand, London. (Complete specification.)

26059. **Improvements in electrodes.** Charles Cunningham Connor, 191, Fleet-street, London.

26061. **Improvements in electric clocks.** Hubert Henry Grenfell, 45 Southampton-buildings, Chancery-lane, London. (La Société Anonyme La Precision, Belgium.)

26069. **New or improved electrical lighting or igniting apparatus** Ernest Oldenburgh, 115, Cannon-street, London. (Complete specification.)

NOVEMBER 19.

26099. **Improvements in and connected with means for electrically lighting railway carriages.** Emil Dick, 4, Corporation-street, Manchester.

26100. **Improvements in and in connection with the manufacture of electrodes for secondary electric batteries.** Henry Leitner, 1, Broad-street-buildings, London. (Complete specification.)

26144. **An improved electric switch especially intended for controlling and regulating the speed of electric motors** Ernest Francis Moy, 433, Strand, London.

26155. **Improvod means for jointing electrical conductors.** Robert Cattley Jackson, 70, Chancery-lane London.

26164. **Improvements in electrodes for secondary or storage batteries.** Gerschon Joesel Epstein 47, Lincoln's-inn-fields, London.

NOVEMBER 20.

26200. **Improvements in electrically lighting incandescent and other gas burners.** Frederick Richard Boardman, 238, Tottenham Court-road, London.

26246. **Improvements in trolley mechanism for electric tramways.** Cie. de l'Industrie Electrique, 45 Southampton-buildings, Chancery-lane, London. (Date applied for under Patents, etc., Act, 1883, Sec. 103, May 16, 1896, being date of application in Switzerland)

26249. **Improvements in electrical heating apparatus.** Herbert John Dowsing, 28, Southampton-buildings, Chancery-lane, London.

26267. **Improvements in enamelling processes for electric heating apparatus.** Rookes Evelyn Bell Crompton and Edmund John Fox, 55, Chancery-lane, London.

26275 **An improvement in or relating to boxes for electric conduit wiring.** Charles Newton Russell, 166, Fleet-street, London.

26278. **Improvements in or relating to electric switches and controlling devices.** Joseph Slater Lewis, 322, High Holborn, London.

26281. **Improvements in or relating to the manufacture of metal sheets or strips by electro-deposition.** Karel Klic, 6, Lord-street, Liverpool. (Complete specification.)

26303. **Improvements in dynamo-electric machines.** William Lloyd Wise, 46, Lincoln's-inn fields, London. (Aktiebolaget de Lavals Angturbin, Sweden)

NOVEMBER 21.

26307. **Improvements in electric indicators** Frederick Charles Allsop, 97, Queen Victoria-street, London.

26313. **An automatic regulator for alternating or rectified currents.** Walter Langdon-Davies, 16, Red Lion-street, Clerkenwell, London.

26375 **Improvements in electrical trams and railways.** Theodor Petersen and William Douglas Reid, 24, Southampton-buildings, Chancery-lane, London.

26390. **A new motor device applicable to electrical apparatus.** William Jandus and John Brunswick Barton, 18, Southampton buildings Chancery-lane, London.

26419 **An improved primary battery.** Marie François Xavier Fuchs, 45, Southampton - buildings, Chancery - lane, London.

SPECIFICATIONS PUBLISHED.

1895.

20288. **Closed-conduit system of electric railways.** Hull.

20529 **Distribution of electricity over electric railways.** Cattori.

20542 **Apparatus for the electrolytic decomposition of liquids** Bell and Bell.

20600. **Electric incandescent or glow lamps.** Bott.

21357. **Telegraphy and telephony and electric relays for use therewith** Mercadier and Pierquin.

21657. **Submarine telegraph cables.** Crawford.

22717. **Telephonic apparatus.** Kotyra and Milde.

23864. **Telegraphic receivers, especially applicable for submarine telegraphy.** Piedfort.

1896.

533 **Automatic remontoir apparatus for Hughes's telegraph apparatus.** Siemens Bros. and Co., Limited. (Siemens and Halske)

1480. **Electric gas-lighting apparatus.** Brewer. (Farquharson and Root.)

4179. **Electric road vehicles actuated by electricity.** Machin.

8353. **Construction or arrangement of generator of electricity.** Aizr.

14020 **Electrically-propelled velocipedes** Clerc and Pingault.

16418. **Method of and means for automatically regulating arc lamps and other electrical apparatus** De Graaff.

19757. **The connection of constant-current dynamos to electric lamp circuits.** Lake (Black.)

20095. **Controlling and reversing switch for electromotors and similar uses.** Royce and Claremont.

NOTES.

Acetylene Safety Rules.—Regulations have been drawn up for the manufacture, storage, and use of acetylene in Paris, and will probably shortly come into force.

The Pacific Cable Conference. — The British, Canadian, and Australasian delegates to the Pacific Cable Conference have been having quite a number of meetings, but what they are doing remains a mystery, since the proceedings are strictly private. It is supposed that they are "taking evidence."

Northern Electrical Engineers.—The Northern Society of Electrical Engineers have their annual general meeting at the Palatine Hotel, Hunt's Bank, Manchester, on Monday, December 7, at 7.30 p.m. This will be followed by an ordinary meeting, at which a paper on "The Manufacture of Alkali and Bleach by Chemical and Electrolytic Methods" will be read by Mr. Bertram Blount, of London

Continuous Rails.—It is stated that at present there are in use in America from 150 to 200 miles of street railway track the joints of which have been all welded, either by the electrical or the "cast-welding" system, so that the rails are actually continuous. As to the success of this system, the testimony is rather conflicting; but it is obvious that the difficulties to be encountered are serious.

Metric System.—Lord Cromer does not see his way—according to a communication from the Foreign Office to the New Decimal Association—to make the metric system compulsory in Egypt, though it is practically already in use for most purposes of foreign trade and manufactures, and the entire supersession of the old native weights is probably merely a matter of time. Egypt has already a decimal coinage.

Remuneration.—Across the Atlantic, *Electricity* (New York) has been mocking at our Worcester Corporation wanting an "electrician in charge" at £90 per annum, and the Blackpool Corporation a mains superintendent at £2. 10s. a week. The payment is not princely, but to an American calculating the "living wage" on a basis of everything about twice as dear as in England, the amounts must seem particularly absurd.

Lightning Conductors.—The "lightning conductor question" still occupies a place in the columns of the *Centralblatt der Bauverwaltung.* The main question debated is the circumstances of the little understood induction stroke and also the range of protection afforded by a conductor. Prof. S. Moormann, writing from Gustemunde, contends strongly that with proper earths a good lightning conductor greatly increases the security of buildings in the neighbourhood under all circumstances. A proposition which, it may be ventured to say, few greatly doubted.

Asynchronous Motors.—It has been pointed out by Mr. Görges in Germany that there may be more than one possible speed for rotary-field motors. For instance, in the simplest example, with the winding on the armature round only one axis, the speed may tend to approximate either to synchronism or half speed, according to circumstances. This is considered as being an extreme case of a law applicable to all polyphase motors. The case referred to above has been taken advantage of practically. With other less simple arrangements, however, it will probably be found that the extra speeds are mostly theoretical only.

Electric Working on the Underground.—It may be worth noting that besides the "low-level" electric express line, which may or may not be proceeded with this session, the District Railway are seeking parliamentary powers to work their existing line by electricity. That this will be done eventually few doubt, and everybody hopes that it will be done speedily, but the difficulties are considerable, not only on account of the heavy character of the trains and their frequent stoppages, but also in regard to matters outside the province of the engineer, and due to the fact that there are something like half a dozen different companies running their trains over the line.

The Junior Engineers.—Mr. McDougall's paper on "Electric Central-Station Working," which was to have been read this (Friday) evening, is postponed to December 18. On Friday last a large number of the members of the institution paid a visit to the works of Messrs. John I. Thornycroft and Co., at Chiswick. They were received by Mr. John Thornycroft, jun., and dividing into small parties were shown over the various sections of the extensive works, and, at the conclusion of the visit, on the proposal of the chairman of the institution, Mr. H. B. Vorley, the thanks of the members were conveyed to Messrs. Thornycroft for the interesting afternoon which had been afforded them.

Cable Interruptions.—The official list of cable interruptions for last month (up to the 25th) given in the Berne *Journal Télégraphique* states that communications are still unrestored over the Puerto Plata and Martinique cable (failure last December), the Trans-continental African line beyond Mazoe (March 11), and the Salisbury and Umtali lines (July 11). The Columbian land lines which stopped working on July 4 are not open, nor is the Parà and Maranham cable, which failed on October 8. The Amazon Company's cable (May 4) has been got to work again as far as Parintins. The only other failures are some unimportant ones in Asia and the Malay Archipelago, which in no case exceeded one day's duration.

The Clydebank Cell. — Such a disproportionate amount of fuss has been made about the Clydebank (Macdonald) battery that it may be just as well to state briefly of what the combination consists. Beginning from the inside, it has in the middle a zinc rod in a solution of common salt, then the porous pot, and outside that a spiral of copper wire buried in cinders, the whole being bathed in a solution of copper sulphate and contained in an outer vessel or pot. The novelties are, of course, the cinders and the salt. Any electrician can pretty well judge what the cell is worth, but the above was the combination which caused such a very astute person as the editor of *Truth* to talk about two Scotch lads finding energy enough in a jam-pot to take a steamer across the Atlantic.

Electric Tramways.—The *Journal des Transports* has published some statistics which show the development of electric tramways in Europe during the past year, the number of lines in working order having increased from 70 to 111, while the total length of lines has gone up from 437½ miles to 564. As to length of line, Germany heads the list with a total length of 255 miles and has 857 motor vehicles, France is second with 82½ miles and 223 vehicles, while England is third with 67 miles and 168 vehicles, Switzerland coming fourth with 29½ miles and 86 vehicles. Bulgaria and Denmark are the only countries which have no line with electric traction. Of the 111 lines now being worked, 91 are on the overhead wire system, while nine have a central rail, eight accumulators, and three an underground conduit.

Telegraph Wire Contraction.—It is stated that on Monday morning telegraphic communication between London and Dover and the Continent, *viâ* Chatham, Sittingbourne, and Canterbury was entirely cut off for a short time, the whole of the wires snapping asunder

Digitized by Google

through frost. The breakages occurred at Newington, near Sittingbourne, "where, without the slightest warning, the wires, which had contracted through the action of the keen frost, snapped, and fell into the road." (The frost was not particularly keen, though it felt cold enough, but presumably the strong wind helped.) A strong party of Engineers from Dover repaired the damage. As described above, the breakage seems rather curious, as the thermometer temperature which determines metallic contraction was not nearly severe enough on the date to get outside the usual allowance.

Mr. Bose's Protest.—There has been during the week a curious sort of triangular dispute between the *Daily Chronicle*, *Pearson's Magazine*, and Mr. J. Chunder Bose, the complaint of the latter being that between them those two publications have been making him talk pretty considerable nonsense. We are inclined to think it is our big neighbour the *Daily Chronicle* that is most in fault; but anyhow it does not much matter, because everyone who has read Mr. Bose's British Association paper knows perfectly well that he is incapable of the ridiculous statements attributed to him, and so far as the general public is concerned all that would happen would be a general idea that Mr. Bose had "done something or other fresh with electricity." But it may well be a matter incomprehensible to an Indian why the popular Press should be content to display such stupendous ignorance on a subject on which information is so easily procurable as the various applications of electricity.

Filament Temperatures.—Mr. P. Janet has presented a note to the Paris Académie des Sciences on the application of Mr. Violle's results as to the law regulating the specific heat of carbon between 0 and 1,000 centigrade in order to obtain the temperature of an incandescent lamp filament. If the applied P.D. is varied slowly, the E^2/R and R curve gives the loss by radiation. Again, if an R and t curve (t is the time, the other letters have their usual signification) is made by measuring the change of resistance as the filament cools when the circuit is broken, from this, in conjunction with the other curve, a third curve can be deduced, the area of which gives the total radiation loss. Assuming the Violle formula, the only other quantities required are the mechanical equivalent of heat and the weight of the filament. No results of any attempt to apply this method are given. Moreover, it is very questionable whether a lamp filament could be relied upon to accurately follow the Violle law.

The Civil Engineers.—At the meeting of the Institution of Civil Engineers on Tuesday last, Mr. J. Wolfe Barry, C.B., F.R.S. (president), in the chair, it was announced that 18 associate members had been transferred to the class of members—viz., Messrs. J. Atkinson, C. R. L. M. Bonn, A. W. Brightmore, M.Sc., V. E. de B. De Broë, W. Henderson, T. H. B. Heslop, F. Kensington, P. G. Messent, H. F. Parshall, W. A. Legg, T. Roberts, J. A. Saner, H. B. Taylor, F.C.H., W. Taylor, J. Trump, W. C. Tyndale, G. B. Walker, and L. S. Zachariasen. At the same meeting it was reported that 96 candidates had been admitted as students. To-night (Friday), at 8 p.m., there is a students' meeting for an address by Mr. J. Wolfe Barry, C.B., F.R.S. (president), and a paper to be read ("Railway Signalling") by Mr. David W. Kinmont, Stud.Inst.C.E. On Tuesday, December 8, at the ordinary meeting, the papers to be read are: (1) "Tipping and Screening Coal," by Mr. James Rigg; (2) "Surface Plant at Kirkby Colliery," by Mr. Thos. Gillott, M.I.C.E.

Royal Society Dinner.—The Royal Society dinner on St. Andrew's Day was, as usual, a big affair. Lord Salisbury wrote that he could not come—"cogent reasons"—and Mr. Chamberlain was dining at Windsor. The Speaker responded to the toast of "The Legislature," which the president (Sir. J. Lister) said was the best on the face of the earth. He should be an authority on some kinds of constitutions, and he thinks the British Constitution is an excellent one. The American Ambassador proposed "The Society," and the President responded, and proposed "The Medallists." After some more about Röntgen rays, as a sort of supplement to the afternoon, he referred to Mr. Moissan's work and Prof. Grassi's discoveries as to the process of development in eels. Those investigations had cleared up a question which had long been a source of mystification to biologists. Mr. Henri Moissan responded (in French), and there were other speeches by Sir J. Lubbock, Lord Rayleigh, Prof. Rücker, and the Lord Mayor. The anniversary meeting of the society is the subject of another note.

The British Association.—The final meeting of the British Association Local Committee was held at Liverpool on Monday, the Lord Mayor in the chair. The final report of the executive said that the late meeting of the association was of unusual interest and importance. The attendance, though not so great as in Manchester or Newcastle, was 3,181, and the amount of money available for grants to committees for the advancement of science was greater than had been known for a number of years. The average attendance for the last 10 years had been 2,209, and the average amount of money distributed in grants £1,062, while at the recent meeting the amount of money distributed was £1,355. It was usually considered that a British Association meeting cost, roughly, £1 per head, but the Liverpool meeting cost only £2,625. The balance in the treasurer's hands was about £980, which the committee advised should be invested and the income therefrom paid to the Liverpool Marine Biology Committee for use in the publication of scientific proceedings and the prosecuting of scientific research. The report was adopted.

Physical Society.—At the meeting of the Physical Society on Friday, November 27, Prof. Rücker, vice-president, in the chair, the president (Captain Abney) described and exhibited some apparatus for giving diagrams of the efficiency of a photographic shutter. In addition to the "speed" of a shutter, which is concerned with the interval between the moments when the shutter admits the first and last rays of light, it is important to know the efficiency of the shutter, which may be defined as the ratio between the time integral of the aperture uncovered and the product of the maximum aperture and the time of exposure. The necessity of considering the "rebound" of the shutter and the fact that it must not always be assumed when working with shutters that the exposure should vary as the inverse square of the aperture on account of some shutters having a very small efficiency for oblique rays, were the main facts of practical importance brought out. At next Friday's meeting (December 11) the papers for discussion are "The Application of Physics and Mathematics to Seismology," by C. Chree, Sc.D.; and "Musical Tubes," by R. J. Rudd.

Forthcoming Events.—To-day (Friday) the Cycle Show opens at the Crystal Palace. There is also a students' meeting of the Institution of Civil Engineers for a paper on "Railway Signalling," by Mr. D. W. Kinmont.—On Monday, December 7, Prof. Lewes's third Cantor lecture on gas is delivered at the Society of Arts, and at Manchester the Northern Society of Electrical Engineers hear Mr. Blount's paper on electrolytic bleach and alkali production. This is also the opening day of the Smithfield Show.—On Tuesday there is a meeting of the Civil

Digitized by Google

Engineers (colliery plant; details are given in another note).—The Society of Arts meeting on Wednesday is for a paper on "Mining at Great Depths," by Bennett H. Brough, Assoc.R.S.M.; Prof. H. Bauerman, F.G.S., will preside (John-street, Adelphi, 8 p.m.).—On Thursday, December 10, is the annual general meeting of the Institution of Electrical Engineers (Civil Engineers', Great George-street, 8 p.m.).—On the same evening the Dundee Institute have their annual dinner at Dundee.—Next Friday, December 11, the Physical Society meet at Burlington House at 5 p.m. ("Seismology" and "Musical Tubes").

The Atlantic Telegraph Memorial.—The Executive Committee stated in their report that they had resolved: "(1) That a bust of the late Sir John Pender, at a cost not to exceed £500, be erected in the Imperial Institute or other suitable place; (2) that a sum of not less than £5,000 be placed in trust with the council of University College, London, to form an endowment fund for the maintenance of the electrical laboratory in that college, on the condition that the council name the laboratory the 'Pender Laboratory,' and the existing chair of electrical engineering the 'Pender Chair of Electrical Engineering'; (3) to endow a 'Pender Scholarship' in connection with electricity at Glasgow." On this coming up for confirmation by the full committee last Friday, the Chairman (the Marquis of Tweeddale) said he had got a letter from Lord Kelvin suggesting that a Pender medal in connection with electricity should be provided at Glasgow as well as a scholarship, and, on the motion of Mr. Underdown, Q.C., it was agreed that the third resolution be altered in accordance with this suggestion. On the proposition of the Chairman, seconded by Mr. J. C. Lamb, the three resolutions were then approved and adopted.

Ventilation of Armature Cores.—The American Siemens and Halske Electric Company have introduced a somewhat novel system of armature ventilation. The device is described by the *Electrical World*, and is fitted to the large ring cores of the type largely used by the Siemens firm. Between every two of the arms a hole is left in the core for ventilating purposes, and at equal distances from each other in the construction of the armature are ventilating spaces with which these ventilating holes communicate, and thus the surface cooled by the current of air is increased. The method of forcing the air into the holes is unique and different from that used on any other existing machine. Driven tightly in each hole is a pipe of precisely the same shape as a clay tobacco pipe, except that the internal dimensions are much larger. One set is turned in such a direction as to scoop the air as the armature rotates, and the other set, which is on the star side, is arranged to point outward, and the powerful draught caused by the centrifugal fan-action of the arms draws the heated air out, and there is thus maintained a constant circulation of air within the core of the armature. It would be interesting, though not specially to electrical engineers, to know what are found to be the best angles at which to set the in-draught and out-draught scoops.

Motorcarts.—Mr. G. H. Grant has been writing from Cambridge to protest against a motorcart race (on a racecourse, not on the roads) being held next May. He says it will be uninteresting. Probably; but that is for the public to decide. Moreover, he draws on his classical experience of chariot races to show that vehicle races must be dangerous. They have trotting matches in America without killing anyone. The real original first motorcart has been discovered by Miss (or Mrs.) Mary Dickes. It was invented in Paris in 1642, and went with "ressorts." Possibly these were not springs, and the machine certainly did not go. The Parisians were always an imaginative race. That the use of benzoline for motors by people who were not accustomed to its ways would result in accidents was pretty certain. The first took place on Monday. On its way to Liverpool from London a motorcar broke down at Whitchurch. It was taken to Messrs. Huxley for repairs, and when underneath the car one of their men accidentally turned the benzine tap with his shoulder while having a lighted candle in his hand. Assistance was at hand, but he was badly burned. The car was only slightly damaged. Hardened as they are to that sort of thing, the prospectus of the British Motor Syndicate has been too much for the City editors. They have gone for it with a unanimity which is hardly usual. Whosoever wishes to read more about motorcarts must seek it under the "Chamber of Commerce."

A Clerical Protest.—The Rev. P. Clementi Smith has written from the Rectory, St. Andrew's-hill, E.C., the following to the *Times*, and the *Times* has printed it, though, it is true, only in an odd corner: "We have narrowly escaped a very serious explosion at one of the largest electric transformer stations in the City, near the north entrance to St. Andrew's-by-the-Wardrobe, and immediately opposite my rectory. About mid-day so imminent was the danger that the police had to practically close the street to all desirous of passing up or down, and I, having gone for a short walk after morning service, was for a time unable to re-enter my house. The danger was caused by the hydraulic main bursting and flooding the electric transformer. Another foot of water and there would have been a fearful explosion. Not long ago there was an explosion near here, on Ludgate-hill, and there have been, and, I fear, are likely to be, similar explosions. Surely it is a fearful risk allowing these transformer stations to be in public thoroughfares." Could not someone inform the Rev. Mr. Clementi Smith that, desirous as it is for various reasons to keep water out of transformer sub-stations, in the matter of explosions it is gas, not water, that one has to look out for? Fortified with that knowledge, he would have been able to have set his parishioners a splendid example of the maintenance of an even mind during circumstances of severe peril—to the property and interests of the electric supply company.

Heterogeneity of Rontgen Rays.—Prof. Roiti has communicated to the Accademia dei Lincei some observations showing that there is a selective absorption of the Röntgen radiations when passed through metal foils of the same character as that produced by coloured media on ordinary light. It appears that if an attempt is made to determine the relative transparency of various metals to the rays, the results are in agreement with themselves only so long as foil of one kind of metal is used. If combinations of two or three metals are used as a screen, the results differ from what would be obtained by taking the sum of the opacities of the separate sheets, as judged by their effect on the fluorescent screen. Aluminium, brass, and tin were the metals experimented with. Further work in this direction is much wanted, not only on metals, but on substances of greater transparency and under specified conditions of voltage, vacuum, and description of tube that will allow of exact repetition. Until something like a "monochromatic" radiation is procured, it is simply waste of time to attempt wave-length measurements, either by diffraction methods or otherwise, with any of the fluorescent screens or sensitised plates already in use. The experiments of Mr. Porter and others with a Wimshurst machine as a ray generator would tend to show that radiations of a much greater penetrating power than the ordinary Röntgen rays can be produced, and that the range of the difference in character which would corre-

Digitized by Google

spond to variation of wave-length is really very considerable.

Temperature Inside a Geissler Tube.—Starting from the fact, which is obvious even to the unscientific person who has handled a chimney lamp, that gas at a temperature above red heat may emit absolutely no light whatever, it might easily be assumed that the temperature of the glowing residual gas in a Geissler or other vacuum tube was really very high indeed. E. Wiedemann and Hittorf, as well as Warburg, have stated cautiously that the temperature of the residual gas when emitting light was probably well below red heat, a conclusion which ought not to be very difficult to arrive at when the small total amount of heat emitted is considered. Mr. R. W. Wood has recently endeavoured to settle the matter definitely, and his results have been published in the *Physical Review*. In order to obtain the different temperatures in different parts of a stratified discharge he used a bolometer, consisting of a loop or spiral of very fine platino-iridium wire. The constant current was used from a 600-cell accumulator battery, and the tube was a Hittorf one. The details of the experiments and the results would occupy too much space to be set out here, but in every case it seems that the rise of temperature as measured in the way indicated is only a matter of from 2deg. to 40deg. C., according to the gas used and its pressure. The temperature is lower in the dark spaces than in the bright ones, so that it is clear that a part of what was measured was simply "light" measured as "heat." The method is not free from difficulties, but the results so far as they go support the contention that if it were only possible to use it a vacuum tube method would convert a greater proportion of electrical energy into light than any other means of electric lighting. Unfortunately, there seems little or no likelihood of it being or becoming possible.

Medals and Officers.—The Royal Society medals have been presented as follows: the Copley medal to Prof. Carl Gegenbaur, For. Mem. R.S. (received by Count H. Hatzfeldt, of the German Embassy), for his researches in comparative anatomy, and especially in the history of the vertebrate skeleton; the Rumford medal to Prof. Philipp Lenard, and also to Prof. Wilhelm Conrad Röntgen (received by Count H. Hatzfeldt), for their investigation of the phenomena produced outside a highly exhausted vacuum tube through which electrical discharge is taking place; a Royal medal to Sir Archibald Geikie, F.R.S., on account of the great value and importance of his many original contributions to geology; a Royal medal to Prof. Charles Vernon Boys, F.R.S., for his invention of quartz fibres and investigation of their properties, his improvement of the radiomicrometer and investigations with it, for developments in the art of instantaneous photography, and for his determination of the value of the constant of attraction; the Davy medal to Prof. Henri Moissan, Paris, for the isolation of fluorine and the use of the electric furnace in the preparation of refractory metals; the Darwin medal to Prof. Giovanni Battista Grassi (received by the Italian Ambassador). On this list foreigners can hardly complain that they are unfairly treated. The society have elected the officers and council for the ensuing year. The following is a list: President, Sir Joseph Lister, F.R.C.S., D.C.L.; treasurer, Sir John Evans, K.C.B., D.C.L., LL.D.; secretaries, Prof. Michael Foster, M.A., M.D., D.C.L., LL.D., and Prof. Arthur William Rücker, M.A., D.Sc.; foreign secretary, Edward Frankland, D.C.L., LL.D.; other members of the council, Prof. William Grylls Adams, M.A., Prof. Thomas Clifford Allbutt, M.D., Prof. Robert Bellamy Clifton, M.A., William Turner Thiselton Dyer, C.M.G., Prof. James Alfred Ewing, M.A., Lazarus Fletcher, M.A., Walter Holbrook Gaskell, M.D., Prof. Alfred George Greenhill, M.A., William Huggins, D.C.L., Prof. Charles Lapworth, LL.D., Major Percy Alexander MacMahon, R.A., Prof. Raphael Meldola, F.C.S., Prof. William Ramsay, Ph.D., Lord Walsingham, M.A., Prof. Walter Frank Raphael Weldon, M.A., and Admiral William James Lloyd Wharton, C.B.

The Arc in Gases.—Mr. W. A. Bone, Mr. D. S. Jerdan, and Mr. J. C. Cain have been investigating the chemical combinations produced by the arc in various gases. In view of the increased use of enclosed arcs, any investigations in this direction have some interest. From the results given in the *Proceedings* of the Chemical Society it would appear that in pure, dry hydrogen methane was formed, and acetylene, as well as other unsaturated hydrocarbons. There were small quantities of hydrocyanic acid. From the experiments, however, it would appear that the arc will decompose hydrocarbons as well as form them. When the electric arc is passed between carbon terminals in an atmosphere of hydrogen, acetylene and methane are both produced. Further, the rate of formation of these two gases is fairly rapid during the first 15 minutes of the experiment, after which the rate falls, and finally after about half an hour, a state of equilibrium between the hydrogen, acetylene, and methane is attained. This equilibrium depends to some extent on the voltage employed. These results led to the inference that methane and acetylene would both be decomposed by the electric arc, and that if the arc is passed long enough a similar state of equilibrium would be arrived at. This conclusion was fully borne out by subsequent experiments, in which pure acetylene or methane was subjected to the action of the electric arc passed between carbon terminals in the same apparatus as that employed in the experiments with hydrogen. Both methane and acetylene are easily decomposed by the electric arc; during the first 10 minutes of the experiment, the gas (methane or acetylene, as the case might be) was very rapidly resolved into its elements, large flakes of carbon were formed in the neighbourhood of the terminals, and fell to the surface of the mercury below; the gas in the globe underwent a great increase in volume, much greater than could be accounted for by the mere expansion of the gas by the heat of the arc. A smoky flame rose from the terminals and filled the upper part of the globe. At the end of about 10 minutes this extraordinary appearance subsided, after which the arc presented the same appearance as in the case of the hydrogen experiments. After the arc had passed for an hour, the experiment was stopped; samples of the gases were then collected and subsequently analysed. The principal product in each case was hydrogen with about 9 per cent. of acetylene, and small quantities of methane, nitrogen, and hydrocyanic acid. In the experiment with acetylene a minute quantity of naphthalene was also formed.

Royal Society.—The anniversary meeting was on Monday last (St. Andrew's Day). The president's (Sir J. Lister) address was in the main an historical review of the scientific events of the year. As a preliminary, however, it was stated that the council had been occupied with the consideration of the proposed standing orders relating to the conduct of the meetings and to the publications of the society, the object being to increase the interest of the meetings by giving greater freedom in the conduct of them and by enlarging the opportunities for discussion, and to obtain a more secure and at the same time more rapid judgment as to the value of communications made to the society, so that while the high standard of the *Philosophical Transactions* was retained, or even raised, greater rapidity in

Digitized by Google

the publication of them and of the *Proceedings* might be attained. One of the most important events of the past 12 months was the conference of delegates to consider the drawing up a complete catalogue of scientific literature. The president, further in his review, dealt at some length with the Röntgen radiations. Early in the past session the announcement of Röntgen's great discovery burst upon the world. Its wonderful applications to medicine and surgery attracted universal attention to it, and physicists everywhere had since been engaged in investigating the nature of the new rays. Perhaps no outcome of such enquiries had been more remarkable than the fact observed by Prof. J. J. Thomson, F.R.S., that the rays had the power of discharging electricity, both positive and negative, from a body surrounded by a non-conductor, a mass of paraffin wax, for example, behaving in their path for the time being like a conductor of electricity. [Prof. Silvanus Thompson says that paraffin and solid insulators generally do nothing of the sort.] It appeared that Lenard had before observed the discharge of both kinds of electricity through air by the rays with which he worked. Lenard's rays, however, differed from Röntgen's in being deflectable by a magnet, implying, in the opinion of most British physicists, that they were emanations of highly electrified particles of ponderable matter, while Röntgen's were regarded as vibrations in the ether. The question naturally arose whether Lenard might not have been working with a mixture of Röntgen's rays and his own. Very important researches had been made both by Lord Rayleigh and Prof. Ramsay into the physical properties of the new substance, helium, discovered by Prof. Ramsay in the previous session. Among their most striking results was the fact ascertained by Lord Rayleigh that the refractivity of helium was very much less than any previously known, being somewhere between three and four times less than that of hydrogen, the lowest that had before been observed, although helium had more than twice the density of hydrogen. And equally surprising was Prof. Ramsay's observation of the extraordinary distance through which electric sparks would strike through helium—viz., 250mm. or 300mm. at atmospheric pressure, as compared with 23mm. for oxygen and 39mm. for hydrogen. The density of helium appeared to vary slightly according to the mineral source from which it was obtained; and that circumstance seemed to give countenance to the opinion arrived at by Lockyer and also by Runge and Paschen, from spectroscopic investigation, that helium was not a perfectly pure gas. But whatever other gas or gases might be mixed with it, they must be as inert chemically as the main constituent, for all Prof. Ramsay's elaborate attempts to induce it, or any part of it, to combine with other bodies had entirely failed. Prof. Roberts-Austen, in the Bakerian lecture, had furnished evidence certain metals were capable of diffusing into each other, not only when one of them was in the state of fusion, but when both were solid.

The Chamber of Commerce.—On Tuesday Major Flood Page addressed the London Chamber of Commerce on the subject of "Motor Vehicles." Mr. W. H. Willans presided, and the council-room in Eastcheap was crowded. Major Flood Page has joined the ranks of the name-makers. Early in his address he brought out his particular fancy. It is "auto-motive." And after having joined a Greek pronoun to a Latin adjective to make an illegitimate English substantive, he called other people's inventions in the name way "hybrids." Major Flood Page criticised the Local Government Board regulations, but appeared to think that they would hardly be permanent. The speed regulations would prove unworkable even if it were possible to correctly estimate the speed. What would be the position of an electric omnibus limited to six miles an hour preceded and followed by ordinary 'buses going a little under seven miles? Two brakes were unnecessary. He protested against the action of the Chancellor of the Exchequer in inserting into the Act an iniquitous clause to the effect that after January 1 auto-motives should pay an additional duty of excise of two guineas for one ton, and of three guineas for two tons. That simply meant there would be two classes of omnibus, one paying 15s., the other £3. 18s. (Another objection not noticed was that this may tend to a weak and flimsy build in a certain class of vehicle in order to get it just under the taxable weight.) It was the old road authorities that killed the steam carriages which ran successfully years ago, and their modern successors had shown the same spirit in asking the Local Government Board for the most stringent regulations. (It is curious that these popularly elected bodies in no way reflect the popular opinion, which has been favourable to motorcarts throughout.) As to the future type of motor carriage, Major Flood Page said that in country districts he expected to see steam and petroleum employed, while he had confidence in the future of electricity as the propelling power in the towns. There was no branch of electricity in which improvements were going on so surely and so rapidly as they were in connection with secondary batteries. The development of auto-motives opened up a large field of commercial possibilities, and he thought they were destined to change the entire face of war. He believed that they would be used not only for transport but for artillery. (An artillery horse with a shot in it may be a nuisance till it is cut adrift, but it does not go off like a boiler.) Auto-motives had settled the question of light railways. Who would put down light railways at a cost of £2,000 or £3,000 per mile when the work could be done by auto-motives, which would be cheaper and just as efficient? Auto-motives would change, and ought to change, the entire position of the agricultural industry. Major Flood Page referred to the butter imports. The *Electrical Engineer* is not an agricultural journal, and therefore it is not necessary to discuss why the English agriculturist finds that he can import butter cheaper than he can grow it. One can easily agree that motor vehicles will prove of great service in country districts without assuming that they will be mainly laden with butter and eggs. Lastly, Major Flood Page believed that the final forms of motor vehicles were not yet invented, and urgently deprecated rash company speculation, which must result in the loss of money. Mr. B. Redwood began the discussion, and was followed by Mr. A. R. Sennett, who thought it waste of time to invent new names when it was simpler to prefix "motor" to the name of the particular kind of carriage that was referred to. (For once in a while we agree with Mr. Sennett.) Also, Mr. Sennett rather liked two brakes, a strong and a weak one; but his audacious defence of speculative companies on the plea that they did not cause an actual loss of money, but only took it out of one man's pocket and put it in another's, was hardly received with complete seriousness by the Chamber of Commerce of the greatest commercial city in the world. Mr. Jacobs said carriage-builders would design graceful and artistic shapes for the new vehicles as soon as the engineers had settled what the motor was to be; and Baron George de Reuter said that the experience of Paris, "where they are the worst drivers in the world," showed that the automobile was about a hundred times safer than the horse-drawn vehicle. Mr. Walter Hancock also spoke, but the Count de Torre Diaz, who was present, refused an invitation.

BRIGHTON TO ROTTINGDEAN.

In our issue of November 8 last year we gave an illustrated description of a unique railway then under construction. This railway, known as the Brighton and Rottingdean Seashore Electric Railway, was formally opened by the Mayor of Brighton on Saturday last. It will not be necessary, except to a brief extent, to recapitulate our description of November last year and that of Mr. R. St. George Moore's given in our issue of July 3 last. The pioneer electric tramway of Great Britain was that constructed by Mr. Magnus Volk at Brighton, and opened by the then mayor in 1883. This tramway commences at the Aquarium and ends at Paston-place groyne. At that early period of electric traction Mr. Volk often mentioned to the present writer other schemes for the use of electrical energy at Brighton—such as a lift from the Madeira-road to the road above; an extension of the tramway through a tunnel on to the Downs. These ideas have not been carried out, but another—the one just inaugurated—has. From Paston-place groyne to Rottingdean is a little over three miles. The foundation of the railway is upon chalk covered during a large part of the day by the sea, so that the work of construction was arduous, costly, and only carried on at low water. Besides these mechanical or engineering difficulties, others arose due to rights over the foreshore and changes in design found necessary in carrying out the work. All these difficulties have been overcome, and the line has been opened. The accompanying illustrations will give an idea of the car of this unique line as it will usually be seen. It is placed upon a platform supported by four hollow steel columns. The permanent way consists of two pairs of rails, the outside rails being 18ft. apart, while the weight carried is about 40 tons, so that the stability of the concern is very great Fig. 1 shows the car and a part of the station at the Paston-place groyne. It might be stated that the car will carry about 150 passengers, that the rate of travel is from six to eight miles an hour, the bottom of the car is some 24ft. above the rail level, and that it has sometimes to run through 16ft. to 18ft. of water. Fig. 2 shows the car a little further out from the station, the poles carrying the wires to convey current to the trolleys. Two 25-h.p. motors are used, and geared through the hollow steel columns to two sets of wheels.

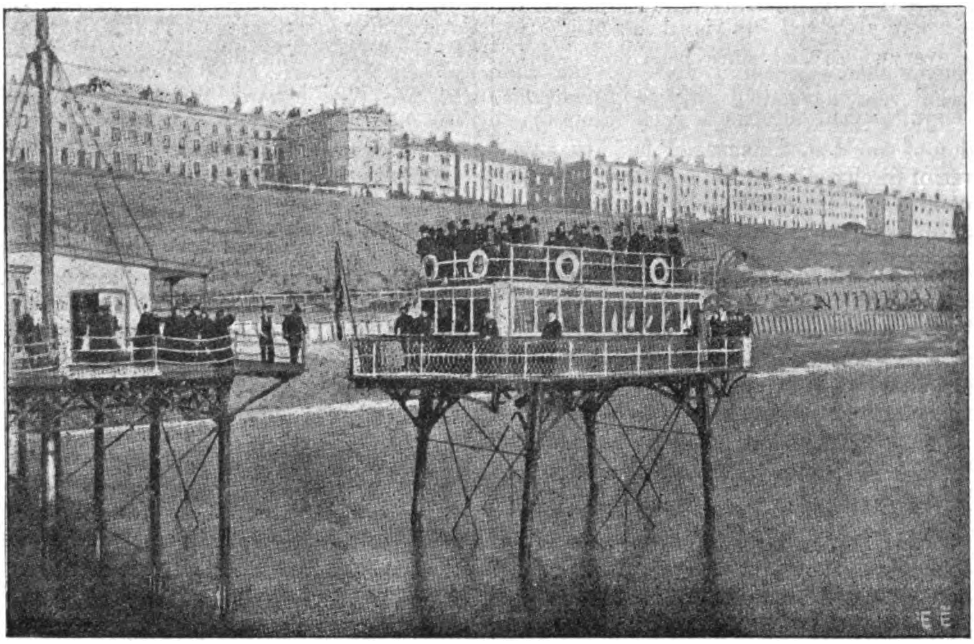

Fig. 1.

On Saturday last the Mayor, in his official robes, accompanied by the Lady Mayoress, the members for Brighton, most of the members of the Corporation, and several ladies and gentlemen invited to take part in the ceremony assembled to inaugurate the scheme within a few minutes of the appointed time. The Mayor turned a switch, the car started, and the railway was declared open. One of the members for Brighton, Mr. G. Loder, was taken a short distance, the car was reversed, and returned to the station to allow him to leave as he was unable to stay throughout the whole ceremony. Again the car started, ran steadily to Rottingdean, and returned to Brighton. The guests then proceeded to luncheon at the invitation of the directors of the company, Mr. E. O. Bleackley, the chairman of the company, occupying the chair. An excellent luncheon was served, and the toast list commenced with "The Queen"; then followed "The Mayor and Corporation," proposed by the Chairman and responded to by the Mayor. At the conclusion of his response the Mayor proposed the success of the new line, wishing it all success. All that was said on its behalf we cordially endorse. The next toast recognised the labours of the engineers, Mr. M. Volk and Mr. St. George Moore. Everyone agreed that to Mr. Volk the conception of this railway was due, and he is to be congratulated at having in some measure obtained credit for the labour he has devoted to the development of electric traction at Brighton He, with his colleague Mr. Moore, has had many a knotty problem to solve, many of which would have stopped an ordinary man; but Mr. Volk is not an ordinary man, otherwise there would have been

Fig. 2.

Digitized by Google

no opening ceremony. Each engineer having responded, the occasion was wound up by toasts to the Press and to the ladies. There were many points in the speeches to which we should like to refer, but, like other folks, reserve to ourselves the liberty of alluding to them at some future time.

ELECTRIC TRAIN-LIGHTING ON THE SOUTH-EASTERN RAILWAY.

The improvements made in rolling-stock on the main trunk lines in recent years have frequently been mentioned in our columns. The changes in design have been chiefly in the substitution of corridor carriages for the older single-compartment type. In these corridor carriages, however, the compartments are still provided to meet, we suppose, the English desire for isolation when travelling. As a result, the compartments, supposed to hold six passengers, three on either side, are not comfortable when full. It has been left for the South-Eastern Railway Company to go still further and abolish the compartment altogether. This company has provided a completely new train for the London-Hastings service modelled on the American vestibule type. This train will be run as an express to town and back each day for the benefit of City men living at Hastings and St. Leonards. It consists of two first-class carriages, one second, and three thirds. All the carriages, which are about 50ft. long, are supported on four-wheel bogies, with transverse springs, and are connected together by flexible vestibules. Thus, a passenger can walk from one end of the train to the other if necessary. The grouping of the seats in the first and second class carriages is varied according to the purpose for which they are devoted, but in the third the seats are placed transversely, provision being made for two passengers on one side of the gangway and one on the other. This gives most ample space for all, but somewhat reduces the carrying capacity. Thus a third-class carriage will provide accommodation for 38 passengers, while the first and second hold 24 each. The heating is effected by hot-water pipes placed all round the floors, and each carriage has its own heating apparatus. This consists of a slow-combustion stove of the Baker type, placed near the lavatory, which heats up a low-pressure boiler. The temperature is regulated by the attendant to be about 50deg. F. The ventilation provided consists of adjustable louvres, with ornamental glass panels placed between the alcove roof and the upper deck roof. The windows are arranged to open upwards, which is a distinct departure from the English practice. In the large compartment the regulation of these windows to suit the majority of the occupants is likely to provide, perhaps, the only objection to the new carriages. The main saloon in the first-class carriage is nearly 30ft. long, and is fitted chiefly with revolving chairs. In their present well-oiled condition these chairs are apt to revolve with the motion of the train unless the passenger takes a firm bearing for his feet. Polished oak is largely used in the decoration of this saloon, while the upper parts are covered with Lincrusta Walton.

One of the chief features, however, is the design of the electroliers, which are far more ornamental and useful than the now orthodox type. These are fixed to the upper deck roof, and consist of four polished brass scrolls clamped together and supporting two lamps each. The lamps are provided with iced shades, which give a good diffused light, so that one can read in any part of the carriages. The distribution of lamps is somewhat as follows: The main saloon above mentioned has eight 10-c.p. lamps, while the smoke-room adjoining has three. Lamps are also placed in all the lavatories and in the vestibules, so that about 16 lamps are required in the carriage. The other first-class car is divided into two saloon compartments. The roof panels consist of decorated Lincrusta Walton, and highly decorated side quarter panels of the same material are introduced, the other panels consisting of Hungarian ash, having bandings of Thuya veneer and oak. One saloon compartment is trimmed with old gold-coloured frise velvet of floral design, and the other one, which is similarly decorated, is trimmed with blue frise velvet. The second-class car is divided into three compartments. At one end of the car is a ladies' compartment, to seat four persons, which is trimmed in Louis XV. style. In the third-class cars the decorated work is carried out in solid oak, and carving is introduced in various places. A pleasing feature throughout the train is the introduction of many photographs of Hastings, St. Leonards, and neighbourhood. The lavatory accommodation throughout the train is ample, there being two lavatory compartments to each car.

Leaving, now, the general details of the train, we come to the electric lighting gear. This has been supplied by Messrs. J. Stone and Co. to meet the requirements specified by Mr. W. Lennard, the able telegraph engineer of the South-Eastern Railway Company. Mr. Lennard has had one of these electric lighting gears on trial for some time, and from the results of this experiment advised the adoption of the system for the new train. The general principles of the Stone apparatus, designed by Mr. A. B. Gill, were described in our issue of November 29, 1895, but in the present case some new details have been introduced. Each carriage is equipped with its own dynamo and accumulators, so that it is completely self-contained. The dynamo is driven by means of a 2½in. link belt from a pulley on one of the axles of the carriage. The novelty in the system is the means of getting constant voltage independent of the speed at which the train is going. Instead of allowing the speed of the dynamo to vary, and regulating the magnetic field to correct for this, the dynamo is suspended so that its weight gives the necessary tension to the belt. The weight of the machine and the torque on the armature then exactly balance each other at normal output. Any further effort causes the dynamo to be

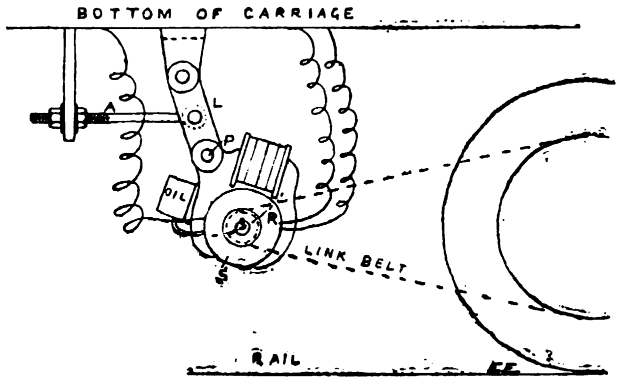

FIG 1.—Diagrammatic Sketch of the New Type of Stone's Train-Lighting Gear.

pulled nearer to the driving axle. This slackens the belt and allows it to slip over the dynamo pulley. Thus a condition of equilibrium is reached, and a further increase of speed is impossible. In the older types the dynamo was hinged directly on to the bottom of the carriage. Now the arrangement shown in Fig. 1 has been adopted, and the addition of the extra link, L, gives a greater range to the possible output. With this link in the dynamo hinges about the point P, the centre of the armature describing the arc, R. The rod, A, then provides means for shifting the position of the point of support, P, relatively to the centre of gravity of the dynamo. In this way the critical speed, and hence the output of the machine, can be varied easily; also any alteration due to stretching of the belt can be corrected without the somewhat lengthy process of taking out links. The general design of the dynamo itself can be seen from the illustration, but all the parts are encased in dust and damp proof covers. Arrangements are made in the case so that the armature connections are reversed with a reversal of direction of rotation. An automatic switch, worked by a small governor on the shaft, closes first the shunt circuit and then the main circuit as the speed increases to the normal. The inverse operation takes place as the train slows up. The accumulators, which are of ample capacity, are placed in two wood boxes under the carriage. One of these boxes is fixed on each side exactly under the centre of the carriage. The lids are easily reversed, giving ready access to the cells. There are 16 of these to each carriage, the plates being contained in teak boxes. The dynamos on these carriages

Digitized by Google

give about 35 amperes at full load. The lamps used throughout are of 10 c.p. at 30 volts.

The lamps in each carriage are controlled from the attendant's recess. A switch in this turns one-half or the whole of the lamps as may be required. In the daytime half the lamps only are burning, but the dynamos are then charging the batteries. Near the switch a small ammeter is fixed so that the current given by the dynamos at any time may be read. This indicates when the rod, A, needs to be tightened up. The bulk of the fittings used are of polished wrought brasswork, as mentioned above, and carry two lamps. In the smoking compartments there are a few single-light wall brackets of a similar type, and in the lavatory and vestibules a simple bronze bracket is used.

All concerned in the electric lighting of this new train are to be congratulated on the successful character of the work done. We are also pleased to note that the quantity of light is not varied with the class, but that the third-class carriages have the same number of lamps as the first. We understand that the Stone system of train-lighting is finding favour with railway engineers. This is shown by the fact that although it was only introduced last year, some 33 railway companies have tried it, while orders for 1,500 sets are now in course of execution. The new train will be much appreciated by the travelling public, and by its comfort will render the popular health resort of Hastings more accessible.

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 599.)

The latest form of the tablet instrument is shown by Fig. 95, and the electrical connections, in diagram, by Fig. 95A. In this form the electrical portion is confined to the unlocking of the commutator. Tablets are inserted and withdrawn by means of the slide shown at the bottom of the instrument. The operation of unlocking the instrument is performed by the distant station depressing the bell plunger for a specified time, during which the commutator is turned. A consideration of the diagram will show that, as in the other instruments described, the action of the current from the distant station is confined to the operation of the relay, and that the actions resulting in the release of the apparatus are due to the local current. It will, however, be noted that this instrument differs from the others in that the signalman at the station which requires a staff is not called upon to contribute in any way towards the completion of the path of the local releasing current. At the same time he is actively engaged in the operation at the same time as the signalman at the distant station, since he must complete his portion of the work during the time the bell plunger is being depressed at the distant station.

It is of considerable importance in tracing the action of these instruments that the movements required to release or insert staffs and their order be clearly understood. For this reason the following extracts describing the movements in their proper order are taken from official instructions.

"If a train or engine is at station A, and requires to proceed to station B, the signalman at A must give the proper 'Is line clear' signal to B, the signalman at B, having ascertained that the line is clear for the train to run upon, must repeat the signal; if not prepared to accept the train he must give one beat of the bell or gong. The signalman at A, after receiving the proper acknowledgment for accepting the train, must then give five rings: thus, 4—1, signifying 'Release tablet.' B must, provided the previous train has passed his box and there is no obstruction on the line upon which the approaching train is to run, repeat the signal back to A. The signalman at A must, if the old pattern of instrument is in use, press down the bell plunger and keep it down till the galvanometer needle rises to its normal position, which shows that the signalman at B is turning his lower disc; the signalman at A must then immediately release the bell plunger and press down the switch plunger, and keep it down till the upper disc is turned red, showing the word 'out,' then release the switch plunger, lift up the check, draw out the tablet slide, give one beat of the bell or gong, then give tablet to driver. The signalman at B must, after receiving the tablet from the driver, deposit it in the instrument, lettered side downwards; then give the 'Train arrived' signal to A and immediately turn the lower disc to white, showing the word 'in'; then press down bell plunger, holding same down for three seconds. The signalman at A

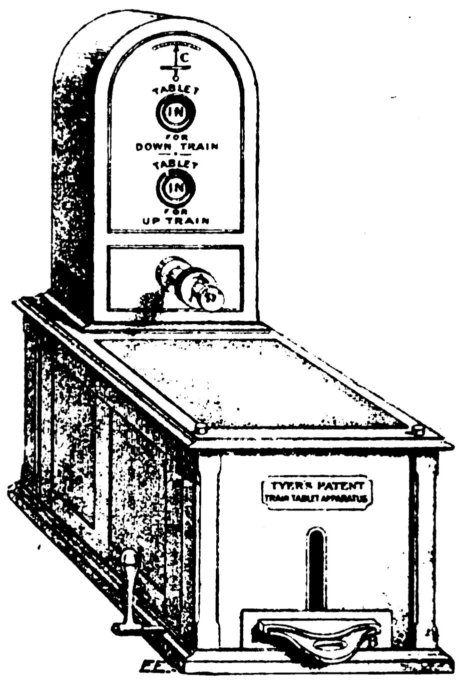

Fig. 95.

must, after receiving the 'Train arrived' signal from B, press down the switch plunger, holding down the same till the upper disc is turned to white showing the word 'in.' Both instruments will then be in their normal position." The instrument referred to in the above extract is shown by Figs. 93, 93A, and 94.

"If the new-pattern instruments are in use, the signalman at B, if prepared to accept the train, must, after

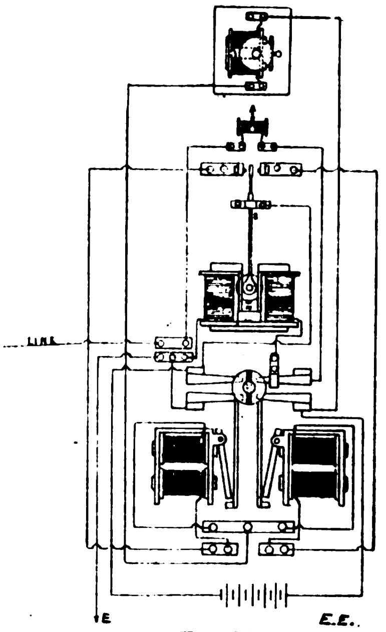

Fig. 95A.

acknowledging the signal, press down the bell plunger for three seconds; if not prepared to accept the train, he must give one beat of bell or gong. The signalman at A, after receiving the proper acknowledgment for accepting the train, must turn his lower disc commutator from right to left, showing the word 'out,' then draw out the tablet slide, give one beat of the bell or gong, then give the tablet to the driver. The signalman at B must, after receiving the

Digitized by Google

train tablet from the driver, withdraw his tablet slide empty, insert the tablet, lettered side downwards, push the slide home, raise and lower the switch lever on left-hand side of the instrument, then give acknowledgment of arrival signal. This will have the effect of reversing the upper disc at B from 'out' to 'in.' B will give one beat in reply, which will have the effect of reversing the lower disc at A. Both instruments will then be in their normal position." The instrument referred to in this extract is shown by Figs. 95 and 95A.

Consideration of the design of these instruments will show that the objects aimed at are precisely the same as those aimed at in the construction of the train staff instruments already described, although the means by which these objects are attained are, of course, entirely different in the two forms of instrument. The ultimate object is, of course, the conversion of the line between any two stations forming a section into an up or a down line as necessity requires and circumstances allow. Both forms of instrument are, in so far as their application is concerned, simply developments of the simpler single staff system which they have replaced, and rely for their advantages over the original system on the greater number of the symbols of authority to proceed which their design enables them to control effectively. No deviation from the fundamental principle of the original system is made; the only difference is that the authority to proceed through the section is available at either end as circumstances require. This, of course, is often a matter of great importance in reducing the delay to traffic to a minimum, but the rigid adherence to the original principle of staff working makes instruments such as the train staff or tablet unsuitable for working in conjunction with intermediate block sections, which, as has already been remarked, is of considerable use for facilitating the passage of traffic in one direction, where the single staff and ticket system is in use. With such systems as those described, block working as a safety device is unnecessary, owing to the absolute control established by the instruments over the staff or tablet used; indeed, such instruments themselves constitute a form of absolute block in that they rigidly impose a space limit between trains passing through the section they protect. At the same time the staff section constitutes the minimum length of block section, and the length of these determines the facility with which traffic can be handled under certain conditions.

It is questionable whether the rigid adherence to the principle of the simple staff shown by the design of the instruments described is really so necessary as it would appear to be. It will be noted that the line is converted into an up or a down section, as the case may be, *at the moment* the staff, tablet, or other recognised authority to proceed, *is withdrawn from the instrument.* Further, the design of the majority of the instruments is such that it is not *necessary* for the symbol to be conveyed to the opposite end of the section in order that the line may be made neutral, as is shown by the arrangements for supplying staffs or tablets for local shunting purposes, such staffs or tablets being returned to the instruments from which they were taken. The handing of the symbol to the driver for conveyance to the other end of the staff section is a relic of the requirements imposed by the original single staff system, in which the staff was absolutely necessary to the conversion of the line from a neutral state to an up or a down section as the case may be. With such instruments as those under consideration the conveyance of the symbol and its insertion in the other instrument is only necessary in consequence of their designs being modelled upon the requirements of the original staff system, and is really a serious disadvantage in that it leads, where the traffic does not balance, to the necessity for special transference of symbols from one point to another in order to allow of continuous working. In so far as possession of the staff or tablet constitutes the driver's authority to proceed, the use of the "ticket" in the single staff system shows that any subsidiary authority will suffice for his purpose so long as it is recognised. This is, of course, leaving out of consideration the fact that entrance to the section is controlled by the fixed mechanical signals in addition to the staff or its equivalent.

Further consideration on the lines indicated would show that with proper precautions a "staff and ticket" system, with one staff only at each end, in which the *staff* would never leave the station at which it is placed, and would be used only as a means to liberate a subsidiary authority of a similar nature to the ordinary "ticket," would appear to have many advantages. With such a system the line could be converted into up or down at will, and ordinary block working could be carried on in conjunction in order to facilitate the passage of a number of trains in the same direction, the number of trains proceeding in the same direction in any one *staff* section being determined by the number of intermediate block sections, these latter being in accordance with experience of the traffic on the line. Such a system as here outlined would not be difficult to devise, and would involve nothing extraordinary in the way of apparatus, whilst it would appear to meet all the requirements of single lines.

(To be continued.)

SOME NOTES ON THE COMPARATIVE COST OF SUPPLYING LIGHT BY GAS AND ELECTRICITY IN MANCHESTER.*

BY G. E. STEVENSON, M.I.C.E.

From time to time comparisons have been made between the cost of lighting by gas and by electricity, and much divergence of opinion has been expressed as to the relative value of the two methods of illumination. The chief obstacle in the way of arriving at an agreement on this matter has been the difficulty of determining upon a common basis for the calculations to be made. Indeed, to institute a full and exhaustive comparison is fraught with almost insuperable difficulties owing to the dissimilar nature of the elements to be considered. On the side of electric lighting would have to be considered the expense a consumer is put to in renewals of lamps, and the saving he would realise in regard to decorations. On the side of gas there would be the expense incurred in not extinguishing gaslights but leaving them turned down. For these considerations we have no definite data to base a comparison upon. I therefore propose to confine myself in this paper to the question of cost of supply, leaving out of consideration all advantages or disadvantages incurred on the consumer's premises.

On the subject of comparative cost some interesting information was given by Mr. W. R. Chester in his inaugural address to the Gas Institute this year, and if the basis of comparison which he adopted be accepted as correct, the results are very favourable to gas lighting. After careful consideration I am of opinion that the basis upon which Mr. Chester founded his comparison is a fair and reasonable one, and I propose to follow the same lines in dealing with the results obtained by the Manchester gas and electric light undertakings. I am, however, bound to tell you that this basis is objected to in the electric light department, for reasons to be hereafter explained.

The Corporation electric light station was started in 1893. The development of the undertaking has been very rapid, and it now ranks first in the list of provincial electric light installations. At the close of the last financial year the number of incandescent electric lamps supplied was 89,294 of 8 c.p., to which standard, for comparison with other undertakings, all lamps of larger size are reduced. There were, in addition, 806 arc lamps and 47 motors supplied with current from the conductors of the station. The total length of conductors was 113½ miles. The undertaking has been singularly successful financially, and in the last year of working a profit of £11,138 was realised, notwithstanding a reduction in the charge from the original price of 8d. per unit to 6d. per unit.

The generating plant originally put down was during the last year fully utilised. The area of supply comprises the best streets of the city and the majority of the largest consumers of light. The supply has not hitherto been

* Paper read before a meeting of the Manchester District Institution of Gas Engineers. Extracted from the *Journal of Gas Lighting.*

Digitized by Google

extended into second-rate or suburban districts. The conditions of consumption are very favourable. The average consumption of current works out to over 20 units per lamp per annum, and, on the basis of comparison which I have adopted, to about three times the average consumption of gas by the gas consumers. It is therefore evident that the Manchester electric light undertaking was during the last financial year in a most favourable position for carrying on the supply of electric energy economically, both as regards cost of production and charges on capital account.

In calculating the cost of supplying light by electricity, the basis taken is the equivalent in Board of Trade electrical units to 1,000 cubic feet of gas of the average illuminating power produced at the Manchester gasworks during the year over which the gas and electric light accounts simultaneously extend. The gas manufactured is tested twice a day at each of the stations, and the average of all the tests made is the figure which is published in the accounts of the gas department. This figure is 19·55 candles for the year ended March 31, 1896. The equivalent in electrical units is determined by the average rate of consumption of electric energy in incandescent lamps per candle-power of light given out. This is the crucial point in the basis of comparison. Mr. Chester took an average of four watts per candle per hour. This is a rate which has been regarded by electricians as a good average, and I think it is a fair one to take. There are lamps which yield a higher efficiency; and if these lamps were equally durable with those of lower grade, and if they retained their high efficiency, the argument in favour of taking the highest efficiency lamps as the standard would be a strong one. We have it on the authority of electricians that they do not comply with these requirements, and that, in fact, no electric incandescent lamps retain their initial efficiency permanently. As we are taking no account of renewals of lamps, and, moreover, not test the gas in high-efficiency burners, it would be unfair to take other than an average efficiency as the basis of our present calculations.

A Board of Trade unit being 1,000 watts, and four watts being consumed per candle per hour, it follows that one unit consumed per hour is productive of light equal to that of 250 sperm candles. One thousand cubic feet of 19·55 candle gas consumed in one hour in suitable burners, each burning at the rate of five cubic feet per hour, is productive of light equal to that of 3,910 candles. Dividing this figure by 250, we obtain a quotient of 15·62, which may be taken to be the equivalent for lighting purposes in electrical units of 1,000 cubic feet of Manchester gas. Now, if we take the total quantity of electric energy accounted for in units in the electric lighting accounts for the year, and divide that by 15·62, we shall get a quantity equivalent to thousands of cubic feet of gas sold; and with this quantity we can analyse the electric lighting accounts on the same lines as we do those of gas undertakings. Such an analysis has been prepared, and is here tabulated side by side with that of the gas accounts for the same year ended March 31, 1896.

Gas Lighting.	Per 1,000 cubic feet of gas sold. s.	d.	Electric Lighting.	Per equivalent of 1,000 cubic feet of gas. s.	d.
Manufacture—			Generation—		
Coal, less residuals	0	9.57	Coal	0	6·34
Purification	0	0·33	Oil, waste, water, etc...	0	2·31
Wages	0	2·74	Wages	0	4·79
Repairs and maintenance	0	4·30	Repairs and maintenance	0	7·78
	1	4·94		1	9·22
Distribution..............	0	1·66	Distribution..............	0	5·77
Management	0	1·94	Management	0	6·23
Rents, rates, and taxes.	0	1·78	Rents, rates, and taxes.	0	3·30
Law charges..............	0	0 01	Law charges..............	0	0·29
Bad debts.................	0	0·04	Bad debts.................	0	0·03
Net cost	1	10·37	Net cost	3	0·84
Interest and sinking fund	0	3·25	Interest and sinking fund	1	7·58
Total.................	2	1·62	Total.................	4	8·42
Revenue from sale of gas	2	3·90	Revenue from current..	6	5·76
Meter rents	0	0 33	Meter rents	0	1·84
Total.................	2	4·23	Total.................	6	7·60
Deduct expenses	2	1·62	Deduct expenses	4	8·42
Profit.................	0	2·61	Profit.................	1	11·18

From this statement it will be seen that the net cost of the gas sold per 1,000 cubic feet averaged 1s. 10·37d., while the net cost of its equivalent light value in electrical energy as consumed in incandescent lamps averaged 3s. 0·84d. Adding the charges for interest on capital, etc., we get 2s. 1·62d. for gas, and 4s. 8·42d. for electricity. The result is more favourable to the electric light than in the case of Nottingham, as the comparative cost is in the proportion of 1 for gas to 2·2 for electricity, instead of 1 to 2·73 as given Mr. Chester.

It will be noticed that the charges for interest and sinking fund are very much higher in the electric light than in the gas undertaking. The comparison is not quite "on all fours," owing to the large amount of capital which has been paid off by the gas undertaking by redemption during the long period of its existence. There is, however, no great disparity between the capital employed in the Manchester gas undertaking and that of other similar concerns, in proportion to the business done, for it is just equal to that employed by the South Metropolitan Gas Company, and but little less than at Birmingham, while it is considerably more than at Glasgow. Under any circumstances, however, the sum of 1s. 7·58d. per equivalent of 1,000 cubic feet of gas is a heavy charge on capital expenditure, and one that would not be incurred, or even approached, by any gas undertaking started at the present day in the kingdom.

The total light value of the electrical output for the year was equal to that of 115 million cubic feet of gas. A gasworks capable of supplying this annual quantity of gas in a populous district could be constructed, with mains, services, and meters complete, for £50,000, whereas £250,000 has been expended on the electric light installation. I do not mean to infer that the expenditure has been extravagant. So far is this from being the case that there probably is not another installation of the kind in the kingdom which has been established with so much regard to economy, as well as efficiency.

One item in the analysis demands our special attention—that is the cost of the coal. This is less by one-third, light for light realised, in the case of electricity than in that of gas. It would therefore appear to be true that more light may be obtained from coal by the indirect method of charging the potential energy of the coal upon electricity, than by directly raising the potential to a higher level in the form of gas. This is, however, only apparently the case, and is due to the imperfect and extravagant manner in which the energy of the gas is utilised.

A proof of this is that if the heat energy of gas be applied to produce light in the same manner as the energy of the electric current is made to produce it—viz., by rendering a suitable material incandescent—the superior energy of the gas is at once revealed. Another proof is that the heat energy of gas may, in its turn, be charged upon electricity by utilising it as motive power in a gas-engine and driving a dynamo therewith, when it will be found that 2½ times as much light is obtained from electric incandescent lamps supplied with current by this means than by burning the gas in standard test burners.

So far as manufacturing expenses go, gas has but little advantage over electricity; but when we come to distribution, we find a striking difference in favour of gas, due to the greater simplicity of the distributing plant, and the facility which gas affords for the transfer of energy to a distance at a minimum cost. Management is an item which, though proportionately high at present in the electric light accounts, is capable of reduction by extension of the business. The remaining items of expenditure are probably not capable of much alteration.

It is now proposed to extend the supply of electric current for lighting purposes into the suburbs of Manchester. I leave it to the electricians to decide whether such an extension is likely to place the electric light undertaking in a more favourable position as regards cost of production and distribution. That it will not tend towards a reduction in the capital charges is, I think, an opinion which may be safely expressed. There is no question of the practical possibility of a venture of this kind, if resolved upon; nor need the extension of the system cause us the slightest anxiety on the score of a possible diminution of the gas consumption. There is room for

Digitized by Google

both to live and thrive. Personally, I feel that in the gas department we are indebted to the establishment of the electric light, which not only assists us much on foggy days, but has given us time to put our house in order before being overwhelmed by the rush of increased consumption of gas that is now being experienced.

Discussion.

Mr. Stevenson said, before the discussion commenced, he should like to say that he had hoped their electrical engineer (Mr. C. H. Wordingham) would have been able to be present and take part in the discussion, but he was sorry he had been detained by a prior engagement. That gentleman had informed him in general terms of some of the criticisms he would have made on the paper. Mr. Wordingham principally objected to the basis of four watts per hour for the electricity and taking the gas at 19·55 candles. He said the average amount of light the consumers got out of their gas was not at all what was shown on testing; and he considered that 12 candles would be the proper illuminating power to take, which would be equal to 10 and not 15½ units. Of course, on this basis. the analysis would turn out to be very different. Mr. Wordingham also said that, if they were to take the gas as tested by the ordinary method, they ought to take as the basis of calculation the rate of consumption in the highest efficiency electric lamps, which he said was 2½ watts instead of four watts.

Mr. S. Glover (St. Helens) said the first thing to do was to thank Mr. Stevenson for giving them an opportunity of looking into the matter of the comparison of the cost of gas and electric light. Dealing at once with the method of using the energy produced, he could not help thinking that, as electrical engineers had gone to so much trouble to see that the force they generated was properly used in suitable lamps, it was a great discredit to gas engineers that they had not done more in the past to see that the energy they produced was properly utilised. He thought it would be quite right to take in each case the highest efficiency lamps, and not the ordinary method of burning gas, for purposes of comparison. It would be better to compare the electric energy used in incandescent lamps with the incandescent gas-burner. He could not understand Mr. Wordingham's objection to their taking the highest efficiency burners for comparison, as they knew the consumers in many cases only got 50 per cent. of the efficiency produced. His visit to Bradford had confirmed him in his idea that they ought to have taken a great deal more care that the consumers properly employed the energy with which they doubtless supplied them; and they had received a rebuke from the fact that the electrical engineers were now doing what gas men could have done years ago. The whole question had not been stated. There were many advantages to be derived from the use of electric light which they would be very foolish, if they wanted to be considered engineers, to ignore. They ought to enter the consumers' premises and take the thing in hand right up to the ultimate use of the gas, because it was owing to the peculiar advantages possessed by the electric light that people were willing to pay a higher price for it. Taking all the advantages that the electric light had, the initial cost was not the true cost to the consumer. That was what they would have to deal with, because the consumers would bring them to it in the future. They must follow both supplies of energy right up to the burner before they could say that they had done the whole of their duty. Therefore, they had to face the fact that the electric light works supplied the full energy right up to the lamp, and into the most beautifully decorated rooms, without throwing on the consumer a lot of additional cost for many things that were always charged against gas.

Mr. A. H. Gibbings (Bradford) said he was hardly prepared to say very much on the paper, as, unfortunately, he was not able to be present when it was read. The exigencies of his department had called him away that day, which was another illustration of how they had to be on the spot to meet every demand upon them. The gas industry had no doubt given electrical engineers a very great task to perform, because, having been in the field so long, their works had been established, and the public had become used to a certain price per annum for their illumination. If they went in for electric light, or oil, or whatever it was, they expected to get the same amount of illuminating power for the same cost, and if they did not get it for the same cost they expected the additional outlay to be made up by other advantages. It was only in this way that the electric light could be put forward as a competitor of gas. They had to compete with the advantages possessed by the electric light, such as the conditions under which it would be used, and the absence of noxious gases given off. This, of course, was somewhat beyond the scope of the paper, which seemed to take two standpoints—first, the cost of producing, and then the cost of supplying to the consumer. The relative cost taken of supplying to the consumer would be all right where both the electric light and the gas undertakings were working together under the same committee, but where a gas company were being attacked by a corporation with the electric light a different set of considerations arose. It was very nice to draw comparisons which were more interesting to the parties concerned than to the public itself. His idea of the proper method of drawing a comparison between the cost of gas and electricity was that they should, in the first place, take a standard gas-burner consuming so many cubic feet of gas per hour of a certain standard illuminating power. By the Board of Trade regulations they were bound to supply the electric light at a declared pressure, and were only allowed a variation of 4 per cent. If the lamps were good, it stood to reason that the consumer would get the illuminating power that he bargained for, but for the purpose of comparing the cost they should base their calculations on the cost of producing the standard light, not on the cost of producing gas generally, which might vary from 12 c.p. to 20 c.p. Electric light did not vary to anything like the same extent. Therefore he deprecated general statements, as being utterly beside the mark. He had tried to get out tables of the comparative cost of gas and electricity in different consumers' premises, and had been asked by one of the biggest consulting engineers in the country to supply him with the figures. In a town in North Wales he found that one consumer who had been paying £250 for his gas only paid £90 for the electric light, while another consumer who had paid £250 for the electric light only paid £80 for his gas. All these cases very largely depended, not on the accurate comparison of the number of lights that had been installed in the place of the gas lights, but very often on the ideas of the person who made the change. The tendency with electric light was for people to instal it with a much more lavish hand than they would ever think of putting in gas lights. He should like to have had an opportunity of going into the figures and examining them critically; and he intended to do so, because they would be of great interest to him personally. His own idea was that no comparison should be made unless it were based upon some theoretical standard which was equitable and indisputable in both cases.

Mr. Thomas Newbigging said it was only a matter of fairness that they should acknowledge the excellence of the paper which they had had from Mr. Stevenson. He had given them a very simple method of comparing the value of the two lights—gas and electricity—for which they were exceedingly obliged, and would find very useful. He would also like to acknowledge the exceedingly fair way in which Mr. Gibbings put the matter before them. They did not often have it stated so fairly from their point of view. There was a good deal in what Mr. Glover had said as to their having neglected their duty in not following the gas from the retort right up to the burner; but he believed it had been more the misfortune of the gas engineer that he had not been able to do so. An Englishman's house was his castle. They could not very well go in and order a consumer to use a certain burner; he picked up his burner from the first shop he called at in the street. It might be a good, bad, or indifferent burner. But there it was; and he exercised his own discretion, and pleased himself as to what he used. On the other hand, electricians had a much more costly "burner" to supply. It was a burner that could not be made by anyone, and the electricians had a chance—he would not say of insisting on their burners being used—but the consumer had no option. Therefore, he took the burner supplied to him, which was probably the best of its kind. In this way the electrician had a very great advantage. All the same, he (Mr. Newbigging) thought there should be a little more exertion on the part of gas managers to endeavour to get the consumers to use the burner which would develop the most light. In favour of electricity, he would like to say he did not agree with Mr. Stevenson's figure for the construction of a gasworks. He said that a gasworks capable of supplying 115 million cubic feet of gas could be constructed, with mains, services, and meters complete, for £50,000. This would work out to about £450 per million cubic feet. He did not agree with this, if it included the cost of the site and of the Act of Parliament—everything, from the very beginning and establishment of the company. That was not a sufficiently ample figure. Therefore, from his point of view, it was doing an injustice to electricity. Both the interest and the sinking fund would be more if it were a higher figure. When a works was established and in full going order, extensions could be made for £450 down to £350 per million; but to establish a works capable of producing 115 million cubic feet, if everything was done in proportion to the capital, would cost £63,000. In this way he would increase the figure for interest and sinking fund—he could not say how much, because he had not worked it out. Of course, the increase would be in favour of electric lighting.

Mr. Glover said Mr. Newbigging had evidently not been in a town where they were troubled with the "gas-burner man." However much an Englishman's house was his "castle," it was always liable to be besieged by the "burner man," who made the consumer pay as much for an inferior article as he could get an incandescent electric light for in these days. The foolish consumer, who had been left to flounder about for the right method of using the energy supplied him by the gas company, gave as much for a gas burner as he would have to pay for an electric lamp.

Mr. W. W. Hutchinson (Barnsley) testified to the excellence of Mr. Stevenson's paper. He said he hoped the author would have given a little more detail with regard to the application of gas-engines to produce electricity. Mr. Stevenson had stated that by the use of a gas-engine 2½ times as much light would be obtained as by the standard test burner usually employed. But he failed to follow up this conclusion by saying what the comparison was with incandescent burners and those which gave so much more light and were in general use at the present time. In this way he did an injustice to gas in the comparison. So far as he (Mr. Hutchinson) could grasp the figures, the electric light cost, practically speaking, twice as much as gas, even taking into account the correction that Mr. Newbigging had made with regard to the initial outlay for gasworks. He should like to know if Mr. Stevenson had any figures to put before them with regard to the relative cost to a consumer of supplying fair-sized premises with the electric light and with gas with, as near as possible, the same amount of illumination. There had lately been one or two cases in his

Digitized by Google

town, and, from the information he had obtained, he found that the most profitable way of supplying the electric light to moderate-sized premises was by using a gas-engine. He should be glad to know if Mr. Stevenson could give them any information on the point whether allowing the consumers an advantage in the shape of a reduced price for gas used in engines would be paving the way for the subsequent institution of electric lighting. So far as his information went, it was not so; but he should like to hear the latest information on the subject.

Mr. T. B. Ball (Rochdale) wished to make a remark with regard to the figure Mr. Stevenson had put before them, of 1s. 7d. for an equivalent of 1,000 cubic feet of gas as the proper charge for interest and sinking fund on an electric light installation. He could not help thinking what a load this was placing at once on electric light undertakings. It had yet to be proved that the onerous conditions which the Local Government Board insisted upon for the repayment of loans advanced to these undertakings were absolutely essential. If this very heavy charge of 1s. 7d., compared with 3d. per 1,000 cubic feet for gas, could be lightened—and he believed it would be very considerably lightened—it would be a great help to purveyors of electric light. It was a very serious item in the cost of electric lighting, and he could not help thinking it would be very materially reduced. One was driven to this conviction by the fact that private installations of electric light could be run much more economically than public installations. He believed some of his colleagues in Lancashire—those who had electric light installations in their towns—could endorse the statement that many large consumers of electric light had ceased to take their supply from the corporation because they found they could produce it much more economically themselves. This was a contingency which he thought all installations of electric light had to face. At the same time, Mr. Stevenson had told them that the total light-value of the electric light output in Manchester was equal to 115 million cubic feet of gas per annum, which was a very important factor of itself. The profit on 115 million cubic feet per annum would be a grateful addition to many exchequers; and, although it was deprecated that they should look upon the electric light as a rival, they could not get behind the fact that, to the extent of 115 million cubic feet, gas was supplanted by electricity in the case of Machester. They all of them, he presumed, had more or less experience of this sort of thing in most towns. The point he really wanted to make was that under existing circumstances the electric light installations had not quite as much free play as the gas undertakings had with reference to the expenditure and to the repayment of capital charges, and to that extent they were handicapped in their competition with gas supply.

Mr. Charles Wood (Bradford) said some of what he had intended to say had been covered by the previous speakers. As Mr. Gibbings had pointed out, the gas and electric light were worked on amicable lines at Bradford—there was practically no competition, and in this way they were able to come more accurately at the actual cost of the supply. He thought the basis of four watts per candle-hour for the lamps which they were supplying in Bradford to consumers free of charge was rather too much. The lamps which they were supplying averaged 3½ watts per candle for 1,000 hours. As electric current was supplied in Bradford at 5d. per unit, with the lamps thrown in, and the gas at practically 2s. per 1,000 cubic feet, the comparative cost of the two worked out at an average in a good many cases of something like double the expense in the case of electricity. But against this extra expense had to be set the advantages which, in the opinion of a good many people, were to be derived from the use of electricity in the saving of decorations and so on, and which more than made up for the additional cost. This was a point that was not to be lost sight of, and one which they would have to combat in the future.

Mr. S. Meunier (Stockport) said they had a fair amount of electric light in his town, but there was no public supply. With regard to the difference in the cost between generating one's own electric light by means of a gas engine and taking it from a central station, he should like to say that some time ago he was talking over this question with the electric light engineer to the London and North-Western Railway, who told him of an installation they had in Liverpool worked by a gas-engine—it was a mixed installation of arc and incandescent lighting. They had very carefully taken out the total working cost of their gas, and found that light for light the extra cost was equivalent to 3d. per 1,000 cubic feet more than they paid for the Liverpool gas. With regard to the comparisons generally made by electric light engineers, so far they had been between the best system of electric lighting and the worse system of gas Mr. Gibbings had been the first to propose something fair and square. In regard to gas, it was an extremely difficult matter to know what basis they were going to start from. Gas was very largely used not only in buildings, but it was practically the light adopted by the smaller dwellings. With the latter class they were troubled with the fact that gas had been used for a little over a hundred years; and every gas consumer thought he knew as much about how to burn gas as the gas engineer himself. The electric light people were, however, better situated. It was a new thing, and people wanting the electric light went to the engineers for advice in a way that he hoped they would come to the gas engineers. The consequence was they used good lamps and obtained the maximum efficiency from the light. Unfortunately, it was just the other way with gas. In spite of all attempts to dissuade people, they would stick to the old iron burners. They had had a little experience of the "burner man," mentioned by Mr. Glover, in Stockport, and they only wished they could get the same price for their burners as this individual got out of the customers for his. He had heard of cases where they charged 9d. apiece for the burners, and the consumption of gas had gone up 100 per cent. Then there was the influence of the plumber. People who were too busy to attend to the gas themselves, called in a plumber to set matters straight, who put on the burner the best way he could, the consequence being that the consumer suffered. He (Mr. Meunier) only brought these instances forward to show that the electric light industry was not labouring under the same difficult that gas engineers were. He still thought that so far they had not had a fair comparison between gas and electric light, and he should like to see some definite and reliable formula laid down.

Mr. R. Porter (Elland) said Mr. Stevenson had stated in his paper that the total light-value of the electrical output at Manchester for the past year was equal to that of 115 million cubic feet of gas; but he did not understand him to say that, if the electric light installation had never been started in Manchester, they would have been selling 115 millions more gas. They had heard a good deal about the advantages of electricity, but nothing about its disadvantages, other than the cost. One of the disadvantages he should like to hear something about, from those qualified to speak to it, was that of its effect on ventilation.

The President said he should like to say a word with regard to the figures Mr. Stevenson had placed before the meeting. Taking the figures of the net cost of producing gas and electricity, leaving out the interest and the sinking fund, the cost of making electricity was, on the showing of Mr. Stevenson (who they all agreed would be as fair as he could), only some 55 per cent. more than the cost of making gas. Of course, it would come to more if interest and sinking fund were included; but, as Mr. Ball pointed out, as the business increased and more favourable terms were obtained for repayment of capital, these items must of a certainty decrease. The figures divulged by the paper showed the enormous progress that electricians were making in reducing the cost of generating electricity. Only a few years ago the cost was looked upon as double and treble that of gas. But it was no longer so, and this should stimulate gas engineers to make renewed efforts to improve the cost of manufacture. As he pointed out in the early part of the year, they had to face the electric light, which, in his opinion, was a really serious matter. They were very much indebted to Mr. Stevenson for having brought the paper before them, as its usefulness would be apparent to all.

Mr. Stevenson, in reply, said he was afraid he should rather disappoint those who had asked questions of him when he said that, in entering into his reply, he should have to strike out in rather a different direction to that followed by the speakers. As soon as he went into the matter of the electric light accounts and their working at Manchester he saw that electricity was, as the president had just said, rapidly gaining on the heels of gas in the cost of production, and the question arose in his mind, was this final, or was there something behind by which they might turn the lever the other way, and show that there was a great deal to be done in the case of gas? While on the question of light-value (burning gas in ordinary gas-burners and getting light from electric incandescent lamps as supplied by electricians at the present day) there soon would be hardly any difference in cost involved, there was an enormous difference between the value of the gas and the electric current in regard to the heat energy. It occurred to him that this was the point which they had to drive at. Mr. Ball spoke about the interest and sinking fund at Manchester. He was not absolutely certain, but he thought 25 years was the period fixed. If electric light undertakings were being handicapped in relation to gas undertakings as regarded the period allowed for repayment, the Local Government Board were reducing the period for gas undertakings very much. They could not now borrow for gas undertakings for a longer period than 30 years, and they would probably be very soon put upon the same terms as the electric light undertakings. The latter might be extended to 30 or the gas companies be reduced to 25 years. The great point to consider was how properly to deal with the energy produced by the gas. Hitherto they had been expending it in a comparatively wasteful manner by consuming it in ordinary burners. It had been shown that 1,000 cubic feet of gas was equal in lighting value to 15½ electric units; but when they came to heat energy, 1,000 cubic feet of 19½-candle gas was equal to 12,000 units of electricity. This was something they could work upon. With incandescent gas-burners, they obtained about 16 candles per cubic foot, instead of four candles—at once a multiplication by four. There was no reason why these lines should not be followed up, and still greater utilisation of the energy obtained. When coal was carbonised for the purpose of making gas, something like 70 per cent. of its energy was got back again in the form of gas or in the coke and tar. But in producing the electric current by the consumption of coal in steam-boilers, the utilisation of the energy was very small, and the waste something enormous. They had to deal with boilers which gave 45 per cent. utilisation, if the coal were very good. There was a waste of 20 per cent. in the working of the dynamo, so that they only obtained about 80 per cent. of efficiency.

Mr. Gibbings: About 84 per cent.

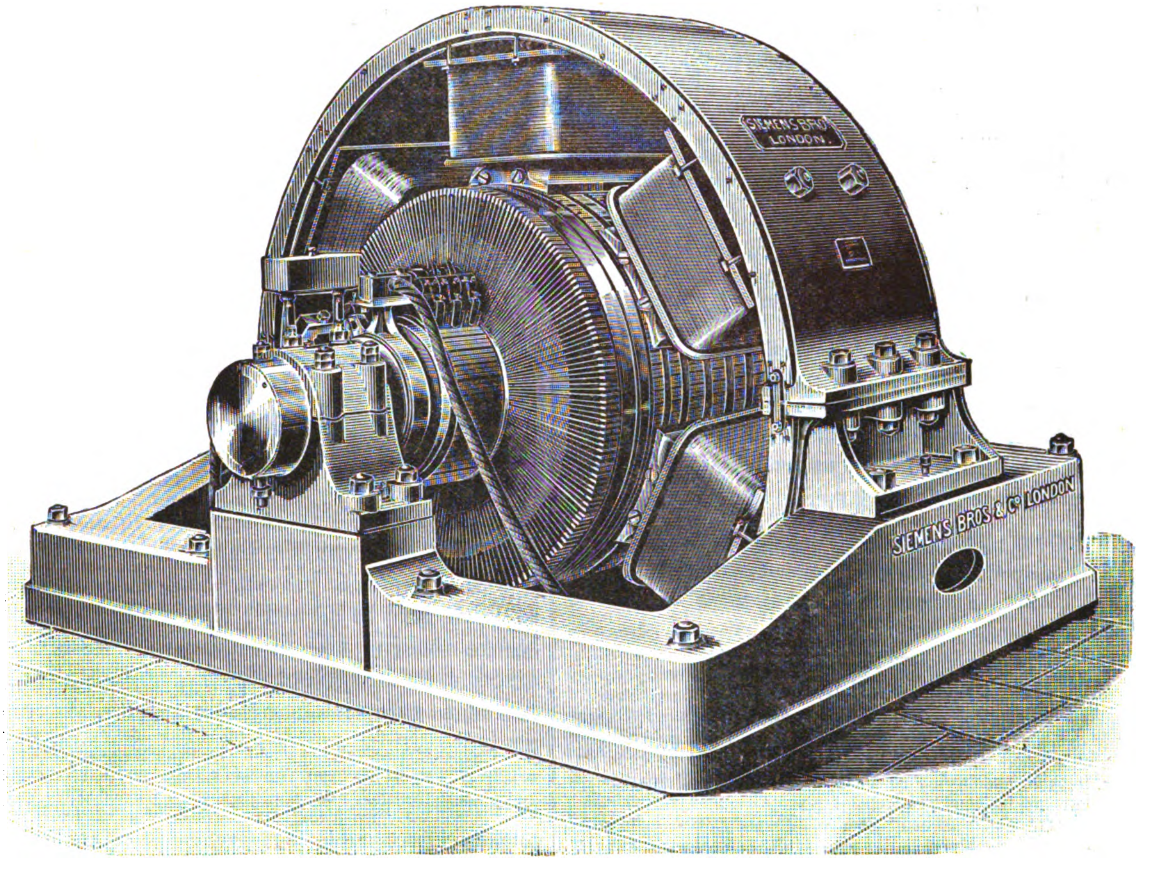
Mr. Stevenson, continuing, said 4½ per cent. of the energy of the coal could be put in the electric current, but it did not all get there, as against 70 per cent. in the case of gas. About 24 per cent. went into the gas, 35 or 37 per cent. into the coke, and something into the tar. There was no question that they would by-and-by have to deal with gas in a different way from what they were doing at present. He had not had time to go into the details of the comparative value of an electric light

Digitized by Google

installation driven by a gas-engine and one supplied from a station. In his paper he had dealt with the supply from a central station. There was no doubt whatever that, if they had moderately large premises, an installation could be worked more cheaply with gas-engines than from a station with a steam-engine. His calculation of 2½ times as much light being obtained from electric incandescent lamps by the use of gas-engines was theoretical. They knew how much a gas-engine took per horse-power, and they also knew what was the equivalent in watts of the horse-power, so that it was a very simple calculation to get at what would be obtained in the electric lamp. As to the dispute between himself and Mr. Wordingham as to the basis to go upon, there were higher efficiency lamps than four watts, and it was quite true that gas consumers used very inferior burners. But it was not true that these high-efficiency lamps could be relied upon for a long period, nor could one depend upon any number of lamps giving 3½ watts per candle at the end of 1,000 hours, having regard to the paper which Mr. Preece read at the recent British Association meeting at Liverpool. Mr. Preece gave a large number of series tests which he had made of electric lamps—for efficiency, duration, and so on. There was a group of 16-c.p. lamps which at the end of 1,000 hours gave an efficiency of 68·3 per cent., another gave 62·39 per cent., and the best group 83·7 per cent.—the general average being 73 per cent. Then he made an installation test, in which he kept 18 lamps going for 1,000 hours in nine groups of two lamps each in parallel. During this time there were as many as 11 of the lamps broken and replaced, and at the end of 1,000 hours the average illuminating power was 9·6 candles, and the average consumption at the finish was a little over five watts per candle per hour. They were justified in taking into account that electric lamps did not maintain their efficiency constantly, and, therefore, they could not be compared with gas-burners, which, whatever their original quality might be, once put into position would give the same result if supplied with gas of the same value. He quite agreed with Mr. Gibbings as to the necessity of taking some fixed and determined theoretical standard for making a comparison, and this was what he had endeavoured to do. Of course, he had taken it on the gas side, for the benefit of gas people—that was to say, he had reduced the lighting value of electric lamps to something understandable on the gas basis. But it would be quite as easy to bring the gas down to the electric light basis. It would only be a conversion of terms. The fair and reasonable average rate of consumption for the electric lamps must first of all be determined. He took it at four watts, which he thought a very fair average. He did not bring the paper forward with the view of setting up a triumph of gas over electricity on the point of cheapness. As he had said, there were many things to be taken into consideration which it was very difficult for them to do from their standpoint, unless they went into the consumers' premises and made their comparisons there. This would, of course, make it in the end more satisfactory for a consumer to pay more for an electric lamp than for a gas-burner. A friend of his in Manchester, to whom he showed his figures, remarked that they might be perfectly right and that the electric light did cost so much more in proportion to gas, but in many instances it would be cheaper to use the electric light—meaning that it would be more convenient and more satisfactory in many respects, and in many indirect ways bring an advantage from which they would reap benefit. He was much gratified with the discussion, and hoped it would lead them all to see what they could do with the intrinsic energy of gas.

BRADFORD ELECTRICITY WORKS.

Messrs. Siemens Bros. and Co. have lately supplied two 500-kilowatt continuous-current dynamos to the Bradford electricity works, and as in this instance they have departed from their usual construction, inasmuch as the machines are multipolar, a short description of the latter may be of interest. The two dynamos are exactly similar, and one of them is shown in the accompanying illustration. They are coupled directly to Willans engines, the output of each set being 750 amperes at 500 volts, and the speed 300 revolutions per minute.



Siemens' 500 K.W. Multipolar Dynamo as supplied to the Bradford Electricity Works.

The armature is a Siemens drum with stranded bar conductors. In this instance the diameter is nearly twice the length of the pole-pieces. The commutator has 211 segments, and there are two sets of brushes placed at 60deg. angular distance apart, each set consisting of three brushes. The armature resistance from brush to brush is less than one-hundredth of an ohm. The weight of the complete armature is 6½ tons.

There are six field magnets, arranged equidistant inside a heavy forged-iron ring, which forms the common yoke, and is 8ft. in diameter over all. The pole-pieces are rather more than 2ft. across, and the wire is wound on a wooden frame. All six magnet coils are connected in series, and have a total resistance of 41 ohms. They are connected in shunt to the armature, with an intercalated regulating switch and resistance. The whole ring of magnets weighs 11 tons, bringing up the weight of the whole dynamo, inclusive of bed-plate, to rather over 21 tons.

Advantage was taken of there being two similar machines to test them by the Hopkinson method, when the following efficiencies were measured: at quarter-load, 90½ per cent.; at half-load, 94¼ per cent.; at full load, 95½ per cent.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.		6 months.		12 months.
United Kingdom	3s. 3d.	...	6s. 6d.	...	13s. 0d.
Other Places	4s. 11d.	...	9s. 9d.	...	19s. 6d.

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVII. of new series of "THE ELECTRICAL ENGINEER" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

AS OTHERS SEE US.

We cannot always agree with the *Journal of Gas Lighting*, because generally it seems to select faults electrical for criticism and ignore all good points. Credit, however, must be given to our contemporary for its excellent report of the meeting of the Manchester District of Gas Engineers, and especially of the electrical paper read at that meeting and the discussion thereon—a report we have not hesitated to reproduce. In future, no doubt electrical journals will endeavour to be represented at such meetings. There is undoubtedly great antagonism between gas and electricity, but that is no reason why each should not give the other fair play. The rivals must fight the fight to the bitter end, and though for many reasons we think electricity will eventually win, the time of supremacy is not yet. At present, however, our object is to direct attention to Mr. Stevenson's paper. He attempts the impossible, but that is no reason why he and his readers should not learn something from his effort. The only comparison in the long run that will be effective is that made by the consumer, and he will decide, not only upon the length of his bill, but partially upon the indirect benefits which accrue from the use of electricity. The moral of Mr. Stevenson's paper is clear, and it is to show that such comparison as his cannot be made unless there is common ground for agreement. Everyone of his figures might well be disputed—all the vital figures were disputed. Thus Mr. Wordingham declines to accept as a fair comparison 19·55-candle gas and a four-watt-per-candle lamp. Certainly if we are to compare an ideal gas with an average filament consumption, the result is hardly fair. Make both ideal if you like, and get an ideal and valueless result. If both are to be real, then agree upon the facts before making the comparison. Again, two grave errors arise in the comparison of capital expenditure. A large proportion of the capital expenditure in central-station equipment and distribution is made with a view to future expansion, and as a matter of fact beyond dispute the ratepayers undertake a heavier first cost in order to prevent a future charge; hence the interest and sinking fund is out of all proportion in many cases to what it ought to be for these purposes of comparison. Besides this, as various speakers pointed out, the electrical industry has been handicapped in many directions by legal restrictions and regulations. Yet further, attention was wisely directed to the exaggerated amount of management cost in electrical undertakings. In most cases the present cost of management would be little increased even with the quadrupling of the business. Thus, in all these important items a very false impression is given by a comparison such as Mr. Stevenson makes. We are really only emphasising the opinions that were expressed during the discussion, which, we must say, seems to have been one of the best ever carried on at a meeting devoted to gas interests. There was no endeavour to palliate figures, but an expressed desire to get at the truth; to let gas engineers see exactly where they are, what they have to contend with, and to stimulate their energies by

a firm conviction that electricity is making great headway; that it is now produced more cheaply than it was; and that in future, with its more extensive development, they may expect it to be still more cheaply produced.

THE INSTITUTION.

We are not sure that the turmoil is over, that the new Council will suit everybody, or that the Institution can look back with pride upon the past twelvemonths' agitation. But for the present we will let that pass and make a suggestion. The election to membership is to us the point which demands the utmost care from the Council. We could wish that it might become an unwritten law, a custom, that every member contribute to the *Proceedings* of the Institution a thesis as a sign or proof of his being a suitable person to take part in the work of a learned technical society. We do not believe in the examination craze. Examination never was and never will be a proof of ability. But there should be something more than nomination required. The members have certain privileges; they should show in some way to the society that they are capable of appreciating the privileges and performing such duties as they may be called upon to undertake. It is all very well to point to books written, papers read, practical experience gained elsewhere, but the Institution should receive as well as confer benefits. The Royal Academician proves before and after election his ability—why not the member of the Institution? The Civil Engineers have also an unenforced law of a somewhat similar nature; and we cannot help thinking that if this idea found root with the Council of the Electrical Engineers, it would obviate the objection many feel that some members elected on the Council have never done anything for the Institution.

THE BRITISH MOTOR SYNDICATE, LIMITED.

The issue of the prospectus of this syndicate has been well timed to prevent expert criticism. It will be noticed that the list was opened on Monday and closed on Wednesday, so that none of the engineering papers could make comment on the details in protection of the public. We agree with the statement in the prospectus that there is a danger of the directors' statements being misunderstood, and quite expect that "surprising developments will shortly be announced." The syndicate claim to hold master patents so to be able to exact royalties from all manufacturers. It will, however, be noticed that the royalties and licenses already obtained come from subsidiary companies, and not from the outside manufacturers. That various patents have been acquired is true, but it will be seen that none of the patentees hold positions in the company. Their names are used, and in several cases used without consent, to get money from the public. No opinion as to validity of the patent rights is given, and from our knowledge of the development of prime movers we should see no possibility of master patents existing at the present time. The extravagant statements as to the prospects of the company refute themselves in the eyes of all technical men, and the lack of information as to how the premium of £2 per share is to be applied should keep the untechnical investors from placing their money in the hands of the gentlemen in question.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

PERSONAL.

Sir,—As statements relating to the British Motor Syndicate, Limited, have appeared in numerous papers which are misleading to the public, and may be of injury to me if the readiest inference from them is not contradicted, I beg you will allow me to say that the reference to my name coupled with the *Engineer* was without my knowledge or authority. The owners of the patents which were bought from me for the British Motor Syndicate or Great Horseless Carriage Company are of course free to publish the fact of their ownership, but the publication should be in a form unobjectionable to the patentee. The purchase above referred to having been settled as far as I am concerned, I have no interest in the syndicate or any other motor vehicle company beyond that of any engineer who takes particular interest in the subject of motor vehicles of all kinds and in the inventions concerning them. With regard to the reference to my editorial connection with the *Engineer*, which has been made the subject of notices by advertisement, I would like to be allowed to state that my final resignation took place in July in consequence of pressure of private practice, and therefore had no reference, as might be implied from the words used in the notices to which I allude, to the British Motor Syndicate.—Yours, etc.,

W. Worby Beaumont.

INSTITUTION OF ELECTRICAL ENGINEERS, Nov. 26.

Sir Henry Mance (president) in the chair.

The list of associates and students elected was given in our last issue. After formal business, the meeting proceeded to the further discussion of Mr. Gavey's paper on trunk telephones.

The **Chairman** (Sir H. Mance) said he would like to ask Mr. Gavey to give them any information he might possess as to the interference with telephone circuits due to electrical tramways. Information on the subject would be valuable to electrical engineers.

Mr. Gavey said, as he had stated in the introductory part of the paper, the way to safety from all kinds of disturbances was in the adoption of the twisted metallic loop. If the theoretical conditions he had indicated were attended to, the Department had found that immunity was secured, but there was no way of ensuring it with a single-wire circuit.

Mr. J. E. Kingsbury asked for information as to the preference for the cross or the twist system of wire arrangement when there were many wires. He thought that there should be unity of control in the telephone service, and also made some suggestions as to nomenclature. Mr. Gavey said "pegs," where other people said plugs. As he had adopted "jack," could he not see his way also to discard "peg" in favour of the other? He (Mr. Kingsbury) would also suggest the term "visual signal" instead of "visual indicator." Mr. Preece's method of making the act of taking the telephone off the hook send the signal was excellent, and was one of those things which in virtue of the merit of their simplicity would survive.

Mr. J. P. O'Gorman, in the spirit of a student and learner, would like to know the best dimensions for the copper between any two points. The Post Office used very large copper—some people said inexcusably large—but with the prospect of signalling across the Atlantic it might be justifiable. On the other hand, the Telephone Company used a small wire. There must be some size which was the best for a given distance.

Mr. C. J. Phillips said, in reference to the boards shown at the previous meeting, there was space to spare, and consequently the signals could be made of a large size. In many exchanges every atom of space was of importance, and in that case, instead of the visual indicator, small lamps might be used. These took up no more room than jacks, and were lit up by a relay actuated from the other end of the junction wire. These had been tried with success by the Telephone Company.

Mr. Campbell Swinton had a suggestion to make which was rather a matter of business management than a technical matter,

Digitized by Google

It was that, to avoid delay and expense, the Department should for a fixed fee undertake the task of making appointments to converse over the trunk lines – *i.e.*, if he said he wanted to converse with a man at Manchester they should communicate there and ring back to him as soon as the Manchester man was ready. The telegraph wires could be used for this if the trunks were occupied. At present it was generally the cheapest way to do this oneself by telegraphing a wish to speak at a fixed time, but that involved sending out to the nearest telegraph office.

Major-General Webber sent a long communication, which was read for him by Mr. Dane Sinclair. He called attention to the danger of allowing the analogy of the telegraph to influence the method of managing the telephone staff. In the one there was considerable clerical work, and the mechanical work was comparatively simple. In the other the communication was entirely automatic, and the arrangements necessary to get into communication were exceedingly complicated. It was amusing to hear of the Telephone Company agreeing to the alterations of the switchroom arrangements carried out by the Post Office. They, as the older hands, ought to have been the pioneers, and not to have to be instructed by comparative novices. Major-General Webber then went on to refer to the popularising of telephonic communication, and to his paper on the subject at the Ipswich meeting of the British Association last year. The main point was a suggestion that telephone subscribers should be divided into two classes, one who wanted to use the trunk wires and the other who did not. In the latter case the equipment might be cheaper.

Mr. Dane Sinclair, who was the next speaker, put aside a great portion of Major-General Webber's remarks as not relating to the subject of the paper. The permanent-current system would be right on expensive circuits bringing in a high revenue, but not necessarily on cheap short ones. With the permanent-current system used only for the trunk lines certain difficulties were avoided which would occur if it were used for both trunks and locals. As to commercial questions relating to charges he believed he could answer any unbiassed opponent, but that was not the question before them as electrical engineers.

Prof. W. E. Ayrton referred to the time when the investigation of practical problems in electrical work related almost entirely to telegraphy, and regretted that the demands of the heavier work had caused it to be so much put aside at the Institution. The telegraph was not less important now than in those days, but more important. Moreover, telephonic systems had no existence at all 15 years ago, and it might almost have been fancied that the proper discussion of all the problems involved in them would hardly leave the Institution an evening to spare for other matters. In reference to the part of the paper which dealt with electrostatic and electromagnetic disturbances, it had been investigated theoretically many years ago by Mr. Heaviside and by himself. In cases corresponding to telegraph practice say with four wires at distances of 1ft. and 1½ft. apart, vertically and horizontally, the capacity from wire to wire came out greater than the capacity from wire to earth, whereas Mr. Gavey's experiments gave it as only ·6 of the latter. He would therefore like further details as to how the experiments were made, and whether other wires were to earth or not. It was important to know the length of the circuits in the experiments between Cardiff, Swansea, and Newport. Mr. Gavey had found the electromagnetic disturbance was 30 times as great as the electrostatic. Obviously, that was a matter which depended on the distance. As to the electromagnetic disturbance, if a fixed current is sent and interrupted, by doubling the distance, say, the E.M.F. in the secondary would certainly be doubled, but so at the same time would be the resistance. Therefore if the instruments at the ends were neglected, the alteration in the length would not make much difference. On the other hand, with the electrostatic disturbance, not only in doubling the length was the skin of the condenser increased, but if the current was kept the same the E.M.F. was increased so that the average potential would be doubled. The disturbance, therefore, should increase with the distance. Another important point was the effect of the establishment of leaks upon the speed of signalling. Mr. Heaviside had referred to the effect of faults upon the speed of cables as early as 1879 in a paper in the *Philosophical Transactions*. The complete problem involving the capacity, self-induction, and resistance could be treated by Bessel functions, but when faults were introduced it got rather beyond their analysis, except that they knew that the introduction of faults must increase the speed.

Mr. W. H. Preece referred to the criticisms of the working of the telephones. These, by being transmitted from newspaper to newspaper, appeared to be immensely—perhaps a hundred times—more numerous than they really were. The Post Office cut them all out, but found they got many more compliments than complaints. The magnitude and difficulty of the work involved in the transfer of the trunk telephones to the Post Office had not been properly appreciated. It had really been very great, and the Department had spared no trouble to make their system as nearly perfect as possible. As to leaks in working, the existence of them did expedite the rate of working, except when the leaks were to earth through absolute faults in a cable. That exception was due to polarisation currents arising from electrolysis at the point of escape, and the result was a retardation. On overhead lines with porcelain insulators, if it were not so they would find the lines work quicker in wet weather when there is no electrostatic action than in dry, but they did not. It was possible, however, by putting in non-inductive leaks to obtain improved working. No direct experiments in that direction had been made by the Post Office with metallic circuits. At the British Association meeting Prof. Silvanus Thompson had called attention to the fact that a non-inductive resistance introduced between the two arms of a metallic loop might improve the rate of working. He (Mr. Preece) hoped in the course of the present or next session to bring them a paper on the subject of investigations, not only of the general effect of leakages, but upon the more important question of working telephones through submarine cables. On that matter he had started a hare, but the chase of it had not been very hotly followed up. In fact, he had come in for a great deal of hard speaking, for which he cared nothing at all. When he had worked the matter out he intended to bring it before the Institution in a paper, which he confidently anticipated would be followed by a warm discussion.

Mr. Gavey then replied. To Mr. Kingsbury's question, he might say that it was possible to use crosses in parallel wires 30 or 40 miles long, but when there were 30 or 40 wires it would be seen that the crosses became inconveniently numerous. The twist system was the best, and even then it was necessary to insert crosses occasionally to get a perfect balance. As to the question of unity of control, he was an executive officer and had nothing to do with questions of policy. He was quite indifferent on the subject of "plugs" or "pegs," but as to "visuals" in a switchroom all the signals must be "visual signals" of one kind or another, and some distinguishing word was necessary. In reply to Mr. O'Gorman, the gauge of wire would vary with the length of the circuit, but the least gauge adopted had been 150lb. wire, because in exceptional winters (say, once in 10 years) snowstorms occurred which would break down smaller gauges. Apart from that, 50lb. gauge wire would work satisfactorily for considerable distances. As Mr. Phillips had remarked, there was no reason for compression in the pattern of board adopted by the Post Office. And he was in agreement with him that something smaller might be desirable for a local service, but, though lamps looked very pretty, he feared they might prove uncertain. It was conceivable, if a filament got broken, it might be some time before the failure was noted. Mr. Swinton's suggestion, though not without advantage to the public, would necessitate reserving a certain part of the trunk lines for the purpose of making appointments, or would mean delay to others. The telephone lines were fully occupied during the busy portion of the day, and they, as a Government department, were bound to deal with all applicants absolutely in the order of application. The cost of special lines for the purpose of what Mr. Swinton wanted would be absolutely prohibitive. The task undertaken by the Department in taking up the management of the trunk lines was greater than was generally supposed and the Department would not stop until the telephonic system was as complete throughout the country as the telegraphic. Until everything was complete there must be occasions when members of the public would have to wait longer to get through than they thought right. Already in certain parts of the country the commercial business was practically carried on by telephone. In some of the large towns they had 3,000 to 4,000 conversations per diem, of which a very large proportion indeed were commercial. As to the engineers controlling the whole of the staff, the example of the great railways was against it. The engineer there did not think it worked against efficiency that he had no control over the booking clerk. He (Mr. Gavey) would greatly regret to see two classes of subscribers introduced as suggested by Major-General Webber. The inconvenience would be great and the saving insignificant—perhaps only £1 or 30s. on the original cost of the instruments. In reply to Prof Ayrton, the reduction factor of ·6 for the capacities was the result of experiments in which the other circuits were insulated and not put to earth, as the object was to obtain conditions similar to those of actual working. The observations were made between Cardiff and Swansea, and the current was put to earth at Newport and Haverfordwest. The reasons for that would be obvious. As to the electromagnetic effect, in making the experiment he was concerned only with the telegraphic and telephonic results, and used a reflecting galvanometer of several thousand ohms resistance, so that the resistance of the line was insignificant in comparison.

The Chairman thought that Mr. Swinton's suggestion of using the telegraph to help the telephone in getting through might be useful. As long ago as the sixties it was a common practice in the Persian Gulf to use sections of cable with a leak in the centre to obtain greater rapidity.

The next meeting is the annual general one (December 10).

The annual general meeting of the Institution will be held next Thursday, the 10th inst., when the new Council and officers will be elected. The list was given in our issue dated November 20, and as no other nominations have been made the gentlemen named will be elected. Hence this year the ballot is practically inoperative.

The following statement of accounts for the nine months ending September 30 will also be submitted to the meeting:

Receipts.	£	s.	d.
Annual subscriptions	2,402	16	6
Entrance fees	312	0	6
Publishing fund	1	1	0
Advertisements in the *Journal*	75	0	0
Dividends on investments—premium fund, £5. 4s. 3d.; telegraph jubilee fund, £3. 16s. 6d; life compositions, £86. 8s. 4d.; general fund, £124. 0s. 8d.	219	9	9
Interest—cash on deposit	0	18	2
	£3,011	5	11

Expenditure.	£	s.	d.
Salaries and clerical assistance	629	10	0
Accountants' fees	15	15	0
Shorthand reporter	34	13	0
Attendance, refreshments, and petty expenses connected with evening meetings	43	5	2
Printing, illustrating, and advertising *Journal*, and cost of abstracts, £617. 1s. 4d.; less cost of copies taken into stock, £57. 10s.	559	11	4
General printing and stationery	168	4	4
Insurance	9	15	0
Petty expenses connected with the library	0	10	6
Office rent, electric light, and firing	241	7	5
Postage of *Journal*, notices of meetings, etc.	239	15	1
General office expenses	38	2	6
Cost of illuminated address to Lord Kelvin	15	15	0
Petty expenses of local hon secretaries, etc.	1	12	2
Bank charges	0	17	11
Conversazione expenses (irrespective of printing and postage)	124	12	0
	£2,123	6	5
Balance carried to general fund, being excess of receipts over expenditure	887	19	6
	£3,011	5	11

The life compositions account shows investments amounting to £3,388, while the Salomons scholarship fund stands at £2,126. 19s. 3d. The building fund has now reached a grand total of £3,528. 4s. 2d., the amount £28. 4s. 2d. being the interest on investments, which has been placed to the capital account. The following is the general balance-sheet up to September 30, 1896:

Liabilities.	£	s.	d.	£	s.	d.
Premium fund				213	0	3
Telegraph jubilee fund				163	8	0
Life compositions—balance uninvested				58	18	2
Subscriptions received in advance—						
On account of 1897	£6	11	0			
On account of 1898	1	0	0			
On account of 1899	1	0	0			
				8	11	0
Salomons scholarship—balance of income account				43	15	2
Building fund—balance uninvested				28	4	2
General fund—balance as per last accounts	£3,279	18	9			
Add profit arising from transfer of investments to building fund taken at their value on July 6, 1896	221	1	5			
Add estimated value of books, etc., presented	40	0	0			
Add excess of receipts over expenditure (as above)	887	19	6			
				4,428	19	8
				£4,944	16	5

Assets.	£	s.	d.	£	s.	d.
Investments—premium fund				213	0	3
Investments—telegraph jubilee fund				163	8	0
Investments—general fund				2,308	10	7
Furniture as per last balance-sheet				200	0	0
Stock in hand of Institution *Journals* and Ronalds catalogues—as per last balance-sheet	£497	11	11			
Cost of additions in 1896	57	10	0			
	555	1	11			
Less amount realised during the current year	103	9	4			
				451	12	7
Books, pictures, etc. (other than the Ronalds Library)—as per last balance-sheet	1,093	0	0			
Add value of books and periodicals since purchased, and cost of binding	11	9	6			
Ditto, presented	40	0	0			
				1,144	9	6
Sundry debtors for advertisements in the *Journal*—viz., on account of 1895	2	0	0			
On account of 1896	75	0	0			
				77	0	0
Suspense account (Cooke's manuscripts)				49	6	11
Balance at bankers	£289	13	3			
Petty cash balance	47	15	4			
				337	8	7
				£4,944	16	5

The statement is signed by Messrs. Fred. Chas Danvers and A. Stroh, the honorary auditors, and is certified as correct by Messrs. Wagstaff Blundell, Biggs, and Co, chartered accountants.

National Traction Engine Owners' and Users' Association. The third annual general meeting of the association will be held (by permission of the Council of the Smithfield Club) in the Agricultural Hall, Islington, on Wednesday, December 9, at 4 p.m.

TORQUAY ELECTRIC LIGHTING SCHEME.

THE TENDERS.

A meeting of the Electric Lighting Committee of the Torquay Town Council was held on Monday, Alderman Kerswill presiding, for the purpose of receiving a report from the sub-committee appointed at a previous meeting, and to whom the tenders had been referred for consideration, with a view to recommendation being made by them to the committee, who in turn report to the Council. Mr. W. H. Trentham, consulting electrical engineer, was present. In response to the advertisements issued by the Corporation, 76 tenders were sent in by 48 firms for the supply and erection of the plant required for the municipal electricity works. The following is a full list of the tenders received:

Section A.—Boilers.

	£	s.	d.
Babcock and Wilcox*	£2,303	0	0
Brush Electrical Engineering Company	3,052	13	6
Crompton and Co.	2 366	0	0
Danks	2 616	10	0
Davey, Paxman, and Co.	2,951	15	0
Hornsby and Sons	2,400	0	0
Conrad Knap and Co.	2 488	10	0
New and Mayne	2,641	16	0
John Simpson	2,640	0	0
Tinkers, Limited	2,977	0	0
Fleming and Ferguson	4,999	0	0
Massingham	—		

* Recommended to the Council for acceptance.

Section B.—Steam Alternators.

	£	s.	d.
Brush Electrical Engineering Company	£9,976	16	0
Crompton and Co., Willans engines	9,455	0	0
Crompton and Co., Peache engines	8 738	0	0
Easton-Anderson, own engines	8,079	0	0
Easton-Anderson, Willans engines*	9,079	0	0
Ferranti and Co., own engines	11,229	0	0
Ferranti and Co., Willans engines	11,729	0	0
Johnson and Phillips, Peache engines	9,055	0	0
New and Mayne, Peache engines	7,455	10	0
Parsons steam-turbines	9,555	9	0
Siemens Bros and Co., Bellis engines	9 389	0	0
Siemens Bros. and Co., Willans engines	9 701	0	0

* Recommended to the Council for acceptance, the day-load plant being omitted.

Section C.—Switchboard.

	£	s.	d.
Brush Electrical Engineering Company	£838	16	0
Burbey	887	13	6
Crompton and Co.	563	0	0
Ferranti and Co.*	706	3	0
Johnson and Phillips	847	0	0
Manchester Edison-Swan Company	799	15	0
Massingham	698	10	0
New and Mayne	590	0	0
Siemens Bros. and Co.	892	0	0
White	860	3	0

* Recommended to the Council for acceptance.

Section D.—Mains.

	£	s.	d.
British Insulated Wire Company*	£7,165	3	6
Callender and Co., solid	8,568	6	4
Callender and Co, drawing-in system	9,151	17	10
Crompton and Co.	8 226	0	0
Fowler, Waring, and Co.	8,117	0	0
Glover and Co., solid system	8,712	12	1
Glover and Co. armoured and wood trough	7,550	0	0
Glover and Co., drawing-in system	8,857	6	3
New and Mayne	7,127	5	1
Siemens Bros. and Co.	9,216	0	0

* Recommended to the Council for acceptance.

Section E.—Transformers.

	10-kw.			20-kw.			30-kw.		
Brush Company	£61	5	0	£81	0	0	£100	2	0
Consolidated Telephone Company	57	0	0	72	17	6	81	3	3
Crompton and Co.	54	0	0	80	10	0	102	10	0
Electric Construction Co	43	10	0	69	0	0	92	0	0
Ferranti and Co.	85	10	0	115	10	0	141	10	0
J. Fowler and Co.	42	0	0	56	0	0	77	0	0
Glover and Co.	57	7	8	81	7	8	105	7	8
Johnson and Phillips	48	0	0	76	0	0	92	10	0
Manchester E. S. Co.	48	0	0	74	0	0	99	0	0
Nalder and Hilton*	50	0	0	74	0	0	90	0	0
New and Mayne	45	0	0	68	0	0	79	0	0
Parsons	52	0	0	76	0	0	100	0	0
Siemens Bros. and Co.	58	0	0	83	0	0	102	0	0

* Recommended to the Council for acceptance.

Section F.—Meters.—Average Prices.

British Thomson-Houston Company	£6 10 4
Chamberlain and Hookham	4 7 9
General Electric Company	5 0 0
New and Mayne	5 2 10
Westinghouse Company	5 2 4

No tender was recommended.

Section G.—Accumulators

	Accumulators.	Maintenance.
Chloride Storage Company	£543 0 0	£55
Electric Power Storage Company	480 0 0	60
Epstein Company	661 17 0	63
Lithanode Company	564 10 0	40
Massingham	498 17 6	38
New and Mayne	400 0 0	7½% 1st year; 10% 2nd & 3rd
Pescatore	494 0 0	£32
Pritchett and Gold	534 0 0	£15 for 3 years; 25 for 5 years; 30 for 7 years
Stephen Smith	872 3 9	£87

No tender was recommended.

Section H.—Crane.

Bedford Engineering Company	£131 0 0
R. C. Gibbins	113 10 0
Isles, Limited*	109 0 0
New and Mayne	171 0 0
Higginbottom	145 10 0
Southgate Engineering Company	215 0 0
Vaughan and Son	205 15 0
Waverley Engineering Company	135 0 0
Stephen Smith	225 0 0

* Recommended to the Council for acceptance.

Section I.—Builder.

S. Blatchford, Torquay, at schedule of prices.

The above tenders amount to a total of £19,312. 6s. 6d., exclusive of the "builder" section. The original estimate of Mr. Trentham, electrical engineer, was £22,300. The chimney at the central station will be built by the Corporation.

EDINBURGH LIGHTING.

The following is Prof. A. B. W. Kennedy's half-yearly report on the electric lighting of Edinburgh. It was dated October 31, and has been presented to the Council this week:

Prof. Kennedy reports that on October 8 and 9 he made a careful examination of the plant at work in the electric lighting station and of the mains. He found the plant had been properly maintained, and was in thoroughly good working order throughout. The larger dynamos and steam-engines were giving, every evening at full load, even a larger output than that which they were originally specified to give. He considered this a very satisfactory result to obtain in regular working. Of the new plant, two steam dynamos had been delivered and erected, and the second of them was running for the first time on the last day of his visit. These machines appeared to be quite satisfactory, but their delivery was very late, and they only just arrived in time to take up the load, which had increased extremely fast. A third steam dynamo had been delivered since his last visit, and a fourth was either now on its way or would be very shortly. With these four new machines the station running would no doubt be free from anxiety during the winter, but he was continuing to press the contractors for the remaining two machines. The new steam alternator and the motor alternator were still not delivered, and in spite of everything that he had found it possible to do, it might be some weeks before they received them. This had caused some inconvenience, and had limited the working of the high-tension part of the station. Three of the new boilers had been delivered at the time of his visit, but none of them were ready for use, and he had to press Mr. Sinclair very urgently in this matter, and to insist that he should at once put on a night shift to carry matters forward. In consequence of the unsatisfactory working of the batteries, he was compelled to take them entirely off the circuit early this year, and he put them into the hands of their makers in order to bring them into order. After many months it seemed that practically no progress had been made in this direction—that was to say, that although much had been done to the batteries, their condition was not improved. He was compelled, therefore, to take the matter out of the hands of the original contractors, and obtain some satisfactory battery plates from another firm. The battery, as thus reformed, was now nearly completed, and would be very shortly on the circuit again. The total cost of the alteration would practically be covered by the retention money of the Corporation. He found the mains in good order. The extensions to the mains were in great part carried out, but were not quite completed, although all the more difficult part of the work was now done. Five additional feeders, for which the copper had been laid, would probably be connected to the station in about a fortnight from now. As to the growth of the station, he had to report that it had been everything that could possibly have been anticipated. The total number of lamps had been almost exactly doubled in the 12 months, and no less than the equivalent of 2,670 lamps in addition to these were applied for and would be connected up as soon as they were ready. The maximum load also had almost doubled in the course of the year, and it was worth while noticing that on October 14 it was already no less than 18 per cent. in excess of the maximum load attained at all during 1895, which was 7,570 amperes on December 23. It was no doubt within the knowledge of the Council that the cost per unit sold during last year was lower in Edinburgh than in any other place of the United Kingdom, and he greatly hoped from the present working of the station that its costs might occupy a similar position next year again. The indications at present were, indeed, that they might again be able next year to make a substantial reduction in price, both in ordinary lighting and also in the charge for arc lamps. He was asked at the committee meeting on October 8 to deal with the question of the establishment of something like a laboratory in connection with the electric light station. This was no doubt not a very usual thing in connection with stations; but he had found facilities of this kind very convenient in connection with his work at Westminster, and he thought that a photometer and some other instruments and appliances might be of very considerable use in dealing with the questions which might more or less frequently arise in connection with work so large as conducted in Edinburgh. The fitting-up of any laboratory of this kind could hardly cost much less than £300. When they took possession of the ground to the south of the present station and completed the buildings on it, it would be a matter to be very seriously considered whether such a laboratory might not be established. But it was worth while to remember beforehand that they might be greatly bothered by inventors and would-be inventors of new lamps and of other "improvements" in electric apparatus, who would wish them practically to test their apparatus for them, and that Mr. Newington would have to be extremely rigid in the matter to make certain that no such use was made of the place, which would have to be worked only in such directions as might yield results of definite use to the Corporation. Although the laboratory, if established, would have to be under Mr. Newington's authority, yet it would be impossible for him to spare much time to be in it, and a fresh assistant would be wanted specially to look after it. Now that the winter was coming on, and their load increasing so very fast, entailing so much additional work in the station, he would suggest that the consideration of, or at any rate the carrying out of, this scheme should be deferred until the spring time, when it would have more chance of getting a fair start than any new department could very well have just at present.

THE DOVER TRAMWAY REPORT.

At the meeting of the Dover Town Council on Tuesday, November 24, the town clerk presented the following report prepared by the surveyor and himself:

Scope of Report.—On July 28 last the Council made an order that we should be instructed to present a report showing the relative duties and cost of the various modes of tramway traction. In reporting on the various modes of traction in use on street tramways, we would point out that we have omitted much well-known detail in referring to the various modes, which it would serve no good purpose to quote, but have stated in brief the conclusions arrived at from the actual practice of those corporations and public companies with whom we have been in communication.

Various Modes of Traction.—The various modes of traction that have been adopted in this country are horse, steam, cable, gas, and electric, and oil and compressed air have been tried, but have met with no success; superheated steam has been tried in Paris. Horse traction may be at once disposed of on account of its limited speed, the wear and tear of roads, fouling the streets, and cost of working. Statistics show the cost of this system to be about 9d. per car mile. The gradients would also be too steep here, particularly if the tramways are extended to the borough boundary. Steam-engines (under which head would come the Serpollet system of superheated steam) are excluded by the provisional order. This system, in any case, is very costly, and has the disadvantages of steam, smoke, dust, noise, and smell, in addition to its unsightliness, and the street space it occupies, and is now being generally condemned by the Board of Trade. The cable system, in which the cable is driven by stationary engines, has many disadvantages, although where a very quick service is maintained it approaches the overhead electric system in cheapness. The disadvantages are the heavy initial cost of construction, the power required to drive the cable alone with no cars attached, the stoppage of the whole service in case of a breakdown with the cable or machinery, inability to make up lost time in running and to back the cars when necessary, besides other considerations. The system, apart from these points, is unsuited to Dover on account of the limited service and comparatively light traffic at certain hours of the day. Oil has been tried experimentally, but has met with no favour. Compressed air has from time to time been tried, and at the present time there are trams running on this system in Paris, but it is not a financial success.

Gas and Electric Traction.—Having dealt with the foregoing systems, and discarded them—for reasons given—as being unfit to

Digitized by Google

recommend for your adoption, there are now the remaining systems of gas and electric traction to consider. It will be within the recollection of the committee that some weeks ago a letter was received from the Dover Gas Company, asking permission to tender in conjunction with the British Gas Traction Company, Limited, for the equipment and working of the tramways With this view, therefore, of comparing the cost of working a gas and an electric tramway, we sent to the Dover Gas Company and the Dover Electricity Supply Company the particulars and questions set out in Schedule 1. These particulars are, of course, not final or binding on you, but, with the exceptions hereinafter stated, they are those that we recommend for your favourable consideration. With the view of enabling you to compare the relative cost of these two systems of traction, we framed the questions on the basis that the contracting company would supply everything except men to act as conductors, and the laying and maintenance of the permanent way. There was also the additional reason that, in case you determined to adopt either of the answers received as a basis for negotiation you might think it right to frame a contract on the principle that the contracting company should be made responsible for efficiency in working, without being able to contend that any fault lay with the Corporation. We append the replies received as shown in Schedule 1 from (1) the British Gas Traction Company and (2) the Dover Electricity Supply Company. The comparative cost of establishing the two systems in the manner proposed would be as follows:

Gas.		*Electricity.*	
(*a*) Cars	£5,600	(*a*) Cars	£4,620
Trailers	660	Trailers	660
Machinery	1,750	Line equipment	7,500
Total	£8,010	Total	£12,780
(*b*) Cars	£5,250	(*b*) Cars	£4,200
Trailers	660	Trailers	660
Machinery	1,750	Line equipment	7,500
Total	£7,660	Total	£12,360

We have not included the cost of permanent way or conductors, which will be the same in both cases. The comparative annual cost of the two systems for the (*b*) cars would be as follows:

	Gas.	*Electricity.*
Interest on loan	£230	£371
Instalment	277	463
160,000 miles at 6d.	4,000	at 5d. 3,333
	£4,507	£4,167

Showing a saving on electricity of £340 per annum.

Gas Traction in Operation.—With the view of being able to report whether, as electricity is cheaper than gas, the latter has any such advantages over the former as would recommend its adoption, we visited the only gas tramway in England—viz., the St. Annes and Lytham Tramway, Blackpool. This tramway is not yet opened throughout its entire length, 3½ miles of the seven miles only being in use. The cars are constructed to carry 16 passengers inside and 24 outside, and weigh unloaded 7½ tons. They are fitted with a double-cylinder Otto gas-engine of 14 h.p., which is enclosed and hidden from view. Cylinders containing compressed gas for working the motors are placed under the seats and flooring of the cars. Ordinary coal-gas is compressed at a compressing station to 150lb. to the square inch, and stored in two gas-receivers. The cylinders in the cars are charged by means of an indiarubber pipe connected to the receivers. The cylinders contain about 300 cubic feet of gas, sufficient for a run of eight miles. The operation of charging occupies 1½ minutes. The quantity of gas used per car mile, including the motor and compressing plant, is 36 cubic feet. The machinery and gas-cylinders take up all available space under seats and floors, consequently there is no room to provide for the storage of gas for lighting, and this is done by oil lamps. There is a special gearing supplied to enable the cars to ascend gradients, but this is at the expense of speed. We may shortly sum up the advantages of gas tramways as follows: The sole advantage we were able to ascertain is, that a gas tramway carries its own motive power, and should any failure occur in the car no great obstruction to the traffic need occur. But it must not be forgotten that a breakdown might occur at a compressing station. The disadvantages of a gas-motor tram are: (*a*) longer time is taken in attaining full speed, and also in stopping; (*b*) the vibration of the cars; (*c*) the liability of smell from the exhaust; (*d*) slow speed at and special apparatus needed for steep gradients; (*e*) inability to provide gas illuminating power to the cars.

Electric Trams at Work.—We also inspected the electric tramways at Blackpool and Coventry. The former consist of about three miles of Holroyd Smith's open-conduit system, which has been in used for 12 years. There are many objections to this system at Blackpool, and much inconvenience is caused by sand and wet getting into the slot. It is an expensive system, and the officers and Corporation do not recommend it. The Coventry tramways have a length of seven miles of single line with passing places, commencing at the railway station and running through the city to Bedworth. The line, which is 3ft. 6in. gauge, was originally worked by steam, and is now taken over by the New Electrical Traction Company, Limited. The rails are left as they were, except that they have been bonded for the return of the electric current. The system of the line equipment employed is the overhead conductor. For the first half-mile from the station there, side suspension by means of poles with single brackets is adopted for suspending the electric cable, for the remainder of the length span wires are attached to rosettes on the buildings or to poles on either side of the road. The power station is situated about midway along the line. There are eight motorcars, seven in use and one kept in reserve. In addition to these there are two trailer cars, used on holidays and at busy times. The motorcars seat 48 passengers, 24 inside and 24 outside. They are run on a 12 minutes' service, from the railway station to the power station; and a half-hour service to Bedworth, four of the cars running through from the railway station to that place. The trams are run from 5 a m. till 12 midnight (19 hours), and the cost of working, including drivers, conductors, power, repairs to roads, plant, etc., and lighting by electricity is 5½d. per car mile. The company has not yet worked the tramways for a full year, but a dividend of 8 per cent. was earned during the first half-year. The population of Coventry is close on 50,000. The inspection of this tramway was particularly useful, inasmuch as the side suspension and span wire systems are both in use. The poles and single brackets are pleasing, and there is no objection to the appearance of them or the span wires. The general running of the cars is good, and the rapidity with which they get to full speed, or stop for one passenger, is a great consideration. The electric cable is over the centre of the track, which has some advantages over a system where it is at the side. The officers, both of the Corporation of Blackpool and the company at Coventry, particularly impressed upon us the desirability of commencing a new system of tramways with a full service, as they had found that traffic was created which would otherwise not be the case if one of a service at rarer intervals were adopted.

Overhead Electric Traction Recommended.—After mentioning the accumulator and the open and closed electric traction systems, neither of which they recommended, the report continues: We therefore recommend the overhead electric system as being most suitable, with the use of both poles with brackets, and span wires, as may hereafter be determined. In doing so, we wish to draw your attention to the action of other towns in this country. After many enquiries and inspecting tramways in this country and abroad, the committee appointed by the Glasgow Corporation, and by the Leeds Corporation, have recommended this system. It is in use in Dublin and Belfast, and there are being worked at Bristol four miles, Coventry seven miles, South Staffordshire Tramway Company 7½ miles, Isle of Man seven miles, and Hartlepool 2½ miles. In addition to these lines, there are in course of construction at North Staffordshire seven miles, and it is in contemplation to make 30 miles more in running through the towns of Langton, Fenton, Stoke on-Trent, Hanley, Burslem, and Newcastle-under-Lyme. In Manchester district a concession has been granted for 21 years of 6½ miles about to be constructed through the towns of Oldham, Ashton-under-Lyne, Denton, and Hyde. There are also three miles in course of construction at Hartlepool. The enquiries made by the various towns have led them to adopt the overhead electric system. It has proved itself to be the most efficient and the least costly, and the cars worked by it are capable of ascending gradients (as proved in actual practice) as steep as 1 in 7½. Any slight prejudice against the appearance of the poles and wires has speedily vanished when the lines have been in work. The joint report of the engineers of the boroughs of Stoke-upon-Trent and Burslem, and of the Urban District Council of Fenton, is in favour of the system. Referring to this report, Mr. Joseph Lobley, borough engineer of Hanley, writes: "I have had an opportunity of seeing the electric tramways at Havre, Leeds, Walsall, Portrush, and many cities in America, and thoroughly agree with the foregoing report. Although somewhat prejudiced in 1891 against the overhead wire system, I had not been in Boston 24 hours before I ceased to notice it as objectionable. I regard it as the only system that is practicable in this district."

An Expert's Opinion.—Having come to the conclusion that the overhead electric system is the best adapted for the tramways here, as well as the least expensive and most desirable in every way, in accordance with the authority given by the Council, we have obtained a report from Mr. Stephen Sellon, consulting civil and electrical engineer. Mr. Sellon, in his calculation, has dealt only with the smaller (*b*) cars. They can be run more frequently at less expense than the (*a*) cars. Mr. Sellon has calculated from the offer made by the Dover Electricity Supply Company, that their charge for electric power is 3⅝d. per car mile, and that he considers this excessive. Mr. Sellon has also calculated the cost if the Corporation were to erect their own power-house and construct and equip and work the tramways themselves, and he advises that, provided the Dover Electricity Supply Company will charge a moderate price and provide the suitable power plant, you cannot do better than take their supply of electric power. On comparing the result of entering into the agreement in the mode recommended with those suggested in the particulars sent to the company, Mr. Sellon shows the former method to be £516 per annum to the advantage of the Corporation. Under all the circumstances, we would recommend that you should construct the line and provide the electric equipment and cars and all labour in making the tramways, and that you should enter into negotiations with the Dover Electricity Supply Company on the basis of supply at a rate not exceeding 3d. per car mile for the (*b*) motorcars, with 1d. additional for trailers, on condition that they provide at their works the requisite power plant to your satisfaction, and agree to a sliding scale allowing a reduction in the price of a farthing per car mile for every 50,000 car miles per annum in excess of 160,000. Such an arrangement would allow of the extension of the tramways to the borough boundaries as well as to East Cliff. In making this recommendation we have left the

Digitized by Google

question of the details to be matters of further arrangement, and of course the contract entered into will have to be carefully framed, and the Dover Electricity Supply Company subject to penalties for any failure of electric power, etc.—We are, gentlemen, your obedient servants,

E. WOLLASTON KNOCKER, Town Clerk.
HENRY E. STILGOE, Borough Engineer.

The discussion on the above report was adjourned.

HACKNEY.

The following report on electric lighting and refuse destructors has been presented to the Hackney Vestry by Mr. F. Hastings Medhurst, B.Sc., M.I.E.E. :

Gentlemen,—Since your vestry clerk, Mr. Grocott, informed me by letter, on July 17, that your Electric Lighting Committee had resolved to entrust me with the preparation of a report on the question of a combined electric lighting and refuse-destructor scheme for Hackney, I have given the subject my most careful personal attention, and I have pleasure in submitting my conclusions for your consideration.

The two most important electrical systems in vogue in England are (1) high-tension alternating current with transformers in substations, and a low tension network of mains for private supply; and (2) low-tension direct current with accumulators.

In the former system the current is generated at high pressure (from 2,000 to 3,000 volts) and then reduced by the transformers to low pressure (100 to 220 volts). In the latter system the current is generated at low pressure, and supplied to the users direct. In one or two towns high-tension continuous current has been installed, though I cannot recommend this system for adoption at Hackney. As the mains are required to transmit electrical energy, which the consumer may, at his option, utilise in the form of light or in the form of power, and as the cross-section and cost of the cables are much greater for transmitting a large than a small number of amperes, it follows that it is more economical to transmit the energy in the condition of high volts and low amperes than as high amperes and proportionately low volts. Hence, the cost of a low-tension system for Hackney would be many thousands of pounds more than a high-tension alternating-current system, and I therefore strongly recommend the latter for adoption.

But whether it is advisable for you to erect electricity supply works at all must depend entirely upon commercial considerations. At the present time there are in the United Kingdom some 90 electric lighting works in operation or in course of construction, about half this number being in the possession of companies, and the remainder in the hands of the local authorities themselves. Most of the undertakings which belong to companies were founded from two to six years ago, whilst in more than one instance the local authorities have bought or are negotiating for the purchase of the companies' works. The Corporation of Liverpool, for example, have recently purchased the plant and business of the Liverpool Electric Supply Company for £400,000, a sum very considerably in excess of the original prime cost of the undertaking. Rather over three years ago, the London Vestry of St. Pancras erected electricity supply works, and last year there was a clear working profit of £7,233, or over 6½ per cent. on the capital outlay of £110,000. Interest and sinking fund together amounted to £5,479, so that there was a net profit of £1,754 after the payment of all working expenses, interest, and other charges. Several London vestries are at present considering the construction of electricity supply works, some in combination with refuse destructors. That this is the course which ought on economical as well as sanitary grounds, to be adopted in Hackney there can be no reasonable doubt. From figures kindly supplied to me by Dr. Warry, your medical officer of health, I have been enabled to compile the following table :

Year.	Loads of refuse.	Total cost. £ s. d.	Cost per load. s. d.
1892	40,010	7,441 13 3	3 8·6
1893	39,950	7,609 4 5	3 9·7
1894	38,226	8,327 13 9	4 4·3

The above figures relate to Hackney only, the amount and cost of refuse collected in the parish of Stoke Newington having been subtracted. The figures as they stand show plainly that the expense of collecting and disposing of the refuse of Hackney constitutes a by no means insignificant charge on the rates, though when I add that the cost in 1891 was only £3,976. 6s. 6d., and in 1890 £3,875. 16s. 5d., it will be readily understood that the question is one not merely of great but of increasing importance. During the months of April, May, June, July, August, and September of the present year, the price per load has averaged 5s. 10d., very much in excess of the average cost in 1894.

Refuse destructors are in operation (amongst other towns) in Bradford, Leeds, Manchester, Liverpool, Southampton, Oldham, Warrington, and in the London districts of St. Pancras, Whitechapel, Ealing, Battersea, and Hornsey, and, so far as I can ascertain, they are in every case giving the greatest satisfaction to the authorities. The cost of collecting the refuse—especially if the Vestry itself undertakes the collection, and a fairly central site be obtained for the destructor—cannot well exceed 2s. 9d. per load, whilst the cost of burning the refuse, exclusive of interest and sinking fund, is not likely to exceed 1s. 3d. per load. Both these estimates are based on results that have been actually attained in other places, and err, if at all, on the side of caution. Assuming, then, that 4s be the total expense per load of collection and destruction, it follows that the new and infinitely more sanitary method of disposing of the refuse would effect a saving of at least 4d. per load over the prices which obtained last year, and a saving of 1s. 10d. per load as compared with this year's expenses. When it is borne in mind that the cost per load is certainly not declining, I think that it will be generally admitted that an average saving of at least 1s. 9d. per load may be safely anticipated. On 40,000 loads per annum this would give an economy of £3,500 a year, as compared with the probable results that would follow the continuance of the present method. I shall presently write this £3,500 on the revenue or credit side of the hypothetical profit and loss account which I shall submit later. My observations have forced me to the conclusion that the average weight of a load of Hackney refuse is about one ton, though the actual weights differ within fairly wide limits.

In company with your Electric Lighting Committee (one of whom is chairman of the Sanitary Committee) I have visited the destructors in operation at Leeds, Oldham, Warrington, and Cambridge, whilst I have at other times and for purposes outside this report seen most of the other destructors at work in England. As a result, I am fully convinced that ashbin refuse ought always to be taken into serious consideration as a fuel for producing at least part of the steam that is required in the working of municipal electricity supply undertaking in cases where the combined scheme is from the commencement practicable. But it must be borne steadily in mind that the primary object and function of a refuse destructor is to reduce the refuse to the least possible weight and bulk, and to render thoroughly innocuous all the offensive gases given off by the drying and burning matter. To thoroughly accomplish these very essential requirements, forced draught should, in my opinion, be insisted on, so as to produce a mean temperature of not less than 1,800deg. F. and a minimum of 1,300deg. F. during the periods of clinkering and charging. Further, the fumes from the drying refuse on the hearth should be made to pass over the hottest part of the fire before escaping to the chimney. There can be no doubt that these objects can be attained, and that the destructor may, without detriment to its efficacy as an essentially sanitary contrivance, be erected in combination with boilers, so as to raise, by means of the hot products of combustion of the burning refuse, at least part of the steam required for electric lighting purposes. At Leeds, Warrington, Oldham, and Southampton the hot gases of the burning refuse are made to produce steam under pressure in ordinary boilers. But that average refuse is of a low calorific value I have absolutely no doubt, and I do not anticipate that at Hackney more than 1lb. of water will be evaporated from 212deg. F. per pound of refuse.

I am aware that some engineers anticipate much better results, but I cannot, from my personal experience, place confidence in expectations of too sanguine a character, whilst by adopting the very best possible arrangements you would be in a position to take full advantage of the results if my calculations should eventually be found to err on the side of pessimism. When the plant, which I shall immediately proceed to describe, is fully loaded, steam will have to be provided for about 640 h.p. for not more than three hours out of the twenty-four. Now, 15 cells will be easily capable of dealing with 40,000 tons of refuse per annum. I should, however, recommend you to erect a destructor of 18 cells, so as to have three spare cells. A battery of nine water-tube boilers should be erected so as to utilise to the best advantage the otherwise wasted heat of the destructors, but I calculate that the 15 cells will then only produce heat sufficient to raise steam for 480 h.p. The destructors will, however, be generating sufficient heat to produce 480 h.p. during the whole of the 24 hours, whilst the demand for steam is only likely to exceed 480 h.p for about three hours a day. During four hours it will probably be about 300 h.p., and during the balance of the 24 hours not more than 100 h.p. Now, the simplest way to obtain the additional 160 h.p. for the three hours of probable maximum demand would be to burn coal in some two or three of the boilers—*i e*, to mix coal with part of the refuse, or to so arrange the boilers so as to render possible independent stoking with coal in the ordinary boiler furnaces in case of need. The cost of coal for supplementing the refuse during the three hours of maximum load would be about £200 per annum; £200 capitalised at 5 per cent. represents a capital sum of £4,000. Mr. Druitt Halpin has invented a very ingenious method, called after him "the Halpin Thermal Storage System," whereby the steam produced during the daytime or time of light load may be stored in cylinders and used to supplement the boiler capacity during the hours of maximum load. But the capital cost of applying the system to the installation I propose for Hackney would not be appreciably less than £4,000, whilst I should prefer to see it in operation on a fairly large scale before recommending it for adoption. A battery of electric accumulators might be charged during the daytime and discharged at night during the hours of maximum load. But here again the capital outlay and the cost of maintaining the accumulators in good repair would not justify the expenditure, so that, taking everything into consideration, I should recommend mixing some of the refuse with coal or burning coal in some of the ordinary boiler furnaces for about three hours per day, though possibly this will not be necessary during the first year's working—*i e.*, till the demand for electricity is equivalent to almost the full capacity of the plant. In two or three years' time thermal storage will probably have been tried on a fairly large scale, and if successful in actual practice it may at some future time become advisable to introduce it at Hackney.

(*To be continued.*)

LEGAL INTELLIGENCE.

CLAIM FOR ELECTRICAL APPLIANCES.

In the Westminster County Court on December 1, before his Honour Judge Lumley Smith, Q.C., the case of Verity *v.* Webster was heard.

The plaintiffs are the well-known electrical engineers, and they sought to enforce payment of a judgment debt of £10 in respect of electrical appliances supplied to the order of the defendant.

Plaintiff's Representative said he had every reason to believe that the defendant was well able to pay the judgment debt, and he therefore asked that an order might be made for substantial instalments.

The **Debtor** appeared and said he had been ruined in his business, and was totally unable to pay. He had a wife and a large family, and was only earning 18s. a week.

His Honour said that if people indulged in the luxury of electric light they must pay for it, but in order to give defendant another chance he would make an order for payment of 5s. a month.

"ELECTRICAL APPRENTICES."

At the Thames Police Court on November 28, before Mr. Dickinson, a number of charges of obtaining money by false pretences were heard against Samuel Fynn, Commercial-road.

The prisoner was arrested on a warrant by Detective-sergeant Dicker.

Mr. Frayling prosecuted on behalf of the Director of Public Prosecutions; Mr. G. H. Young appeared for the defence.

Mr. Frayling said that the prisoner was charged with obtaining various sums varying from £15 to £40 by false pretences. He seemed to have started the frauds as far back as 1893. He described himself as an electrical engineer, and he used to advertise extensively for apprentices to learn that trade on payment of a premium. The advertisements attracted the attention of various people, in most cases superior mechanics, who approached him with a view to having their sons apprenticed. He represented that he had plenty of work, and carried on a good business, and said if the boys were articled to him for three years he would turn them out as first-class men. He would not only teach them electrical engineering, but, as he manufactured everything on the premises, boys would get an insight into the trade they would not obtain elsewhere. Each apprentice, when he went in, found some seven other boys there. They were taught nothing, as practically no electrical work was done, and they were put to the most menial occupations, such as cleaning the shop windows and filing pieces of iron. As a matter of fact, the prisoner was all the time in a very bad position. Scores of executions had been put in on the premises, and there were four bills of sale on the effects. It was evident that he obtained this money to help him along, and he considered that the prisoner had been guilty of the most heartless frauds, for not only had he taken the money, hard earned as it was, of these poor men, but he had caused the lads to waste the most valuable portion of their lives.

Charles Schmidt, a decorative artist, 38, Renard-road, Peckham, gave evidence as to apprenticing his son to the prisoner in March, 1895, on his payment of a sum of £30. The prisoner told him that his boy would learn more with him than with a large firm, as he would have an insight into every branch of the trade. His son had complained to him many times that he learnt nothing.

In cross-examination, the **Witness** said he knew his boy had been sent by the prisoner to an electrical engineer named Sax, but this was after witness had made a complaint at this court, and his application had been reported in the papers.

Edward Dudley Schmidt, son of the last witness, said that when he entered on his apprenticeship there were two lathes and three vices only on the premises, and a few tools, but not enough. There was a dynamo there, but no engine to work it. He spoke to Fynn about it, and was told by him that he was going to get an engine, but the dynamo itself was sold. The day he went in two of the apprentices were putting in a window and two others looking on. Besides filing a few tools, he had put up three electric bells and overhauled one telephone. He was taught nothing while he was there, and never had enough work to do.

Cross-examined: It was three months after he was there that he first complained of not having enough work. It was untrue to say that he was constantly at work. When he asked for it prisoner would pick something out of the window and tell him to polish it. Since he had been there he had received £15 out of the £30 back in wages.

Other evidence was given to a like effect, and the case was adjourned.

CASE AGAINST THE DUBLIN CORPORATION.

On December 1 the summons of Messrs. Oetzmann and Co. against the Dublin Corporation for failing to supply electric light to their premises, 61, Grafton-street, again came on for hearing in the Southern Police Court, before Mr. Byrne. We fully reported the first day's hearing in our last issue.

Mr. J. M. Day (instructed by Mr. Collins, Messrs. Casey and Clay), appeared for Oetzmann and Co.

Mr. Macinerney, Q.C., and Mr. P. White (instructed by Mr. Bonass and Mr. Rice) appeared for the Corporation.

Mr. Day said that since the case was adjourned, a week since, the only object his clients had in view in bringing the summons—that is, the procuring of an electric light supply—had been attained. That being all that was wanted he would drop the case, unless the Corporation applied for costs, which, under the circumstances, would be a most audacious proceeding.

Mr. Macinerney, Q.C., said that the last day the case was before the Court he stated that the electric light would be supplied in the ordinary course, and that had been done since. He asked that the summons be heard on its merits.

Mr. Byrne said he was asked to non-suit.

Mr. Macinerney said the plaintiffs had no case for a penalty, and he asked that the summons be dismissed in the ordinary way on the hearing of the case, and that costs be given to the Corporation, who had unfairly and improperly been put to expense.

Mr. Byrne said plaintiffs' complaint was that the Corporation did not supply them with electric lighting, and they submitted that the Corporation were liable to penalties not exceeding 40s a day for the long space of time intervening between January 1 of this year and the issuing of the summons. Plaintiffs relied on the twenty-fourth section of the Dublin Electric Lighting Provisional Order, confirmed by statute on June 27, 1892. The first step towards establishing liability to a penalty was to show that a requisition for a supply of electric energy under this order was served on the Corporation. The twenty-second section showed that that requisition should contain a certain specification of the premises in respect of which the supply was required; the maximum power required, and the day—not being an earlier day than a reasonable time after the date of the service of such notice—upon which such supply was required to commence. It was conceded that no notice was served containing these three requisites. But plaintiffs submitted that the Corporation, by the negotiations and correspondence which lasted between the parties from January 1, 1895, to the present month, were estopped from replying on this defect. In administering this penal statute there was no estoppel enabling him (Mr. Byrne) to dispense with the requisites and the provisional order for establishing a liability to penalties, and therefore, as the notice required under the provisional order was not served before the prosecution was commenced, he dismissed the summons, but without costs.

ACTION AGAINST THE DUBLIN TRAMWAY COMPANY.

On December 1, in the Nisi Prius Court, Dublin, before Mr. Justice Madden and a common jury, the case of Doyle *v.* the Dublin Southern District Tramways Company came on for hearing.

It was an action in which the plaintiff, Robert Doyle, an inspector of works in the sanitary department of the Corporation, sought to recover £500 damages in respect of injuries sustained by him through the alleged negligence of the defendants' servants while he was a passenger on one of the defendants' electric tramcars between Dalkey and Haddington-road. He also alleged that the defendants' tramway and plant were in a defective condition.

It appeared that on Sunday, June 28 last, he proceeded, accompanied by some friends, to Dalkey, where they remained for some time, and on the return journey the tramcar was forced and driven close up to an iron post, plaintiff was thrown against it, and in consequence sustained personal injury involving medical expense. The defendants traversed the alleged causes of action, and pleaded that it was owing to the negligence and improper conduct of the plaintiff that the alleged injuries were incurred. One of the defences was to the effect that their electric tramline was laid between iron poles erected in compliance with the Act of Parliament; that the position of the pole in question was determined by the authorities, not by the defendants; that the car in which plaintiff travelled was properly driven and conducted; and that the plaintiff, by the exercise of ordinary care, could have avoided the alleged injuries.

Mr. Dunbar Barton, Q.C., M.P., and Dr. Condon (instructed by Mr. Joseph Gleeson) appeared for the plaintiff; and Mr. D. B. Sullivan, Q.C., Mr. O'Shaughnessy, Q.C., and Mr. T. M. Healy, M.P. (instructed by Messrs. O'Connor and Dudley), for the defendants.

The jury found that the defendant company was guilty of negligence, that plaintiff could have avoided the consequences of the defendant company's negligence by the exercise of ordinary care, that the defendant company's negligence was the cause of the occurrence, and gave damages for the plaintiff, £10.

Mr. Sullivan, Q.C., submitted this was a verdict for the defendants, and **Mr. Barton, Q.C.**, argued *contra*.

Mr. Justice Madden gave judgment for the plaintiff for £10, but respited execution till after the defendant company, by a motion before the full Court, had ascertained the legal effect of the jury's finding.

MOTOR SYNDICATE LITIGATION.

In the Chancery Division, on December 1, before Mr. Justice Stirling, the case of Humber and Co. *v.* Thos. Humber and the British Motor Car Syndicate came on for hearing.

This was an application on behalf of the plaintiffs for an injunction to restrain the defendant Humber from acting as director or officer of the defendant syndicate, or in any business connected with the manufacture of cycles except on behalf of the plaintiff company, in breach of an agreement dated January last.

Counsel stated that an arrangement had been come to by which the motion would be allowed to stand till to-day (Friday), there

Digitized by Google

being no order on the motion, and defendant undertaking to pay the costs of the day.

On these terms his **Lordship** directed the motion to stand over.

LONDON HEALTH ELECTRICAL SYNDICATE.

In the Chancery Division, on December 2, Mr. Justice Vaughan Williams disposed of the petition of D. O Hearson, Limited, for an order for the compulsory winding-up of the London Health Electrical Institute, Limited, which was formed in 1892, when it was doing a turnover of £20,000 a year or thereabouts.

The debenture-holders resisted the petition on the ground that there were no assets; and it was also asserted that the majority of the unsecured creditors opposed the winding-up on the ground that if the company went into liquidation they would get nothing, while there was some hope if the business were continued.

His **Lordship** ultimately dismissed the petition.

CONTRACTS FOR ELECTRICAL SUPPLIES

CONTRACTS OPEN.

Bolton.—The Corporation require tenders for a new steam-boiler at the electricity works.

Essen.—Among other articles for supply by tender to the Prussian State Railway Authorities at Essen on December 17 are 1,000 battery zincs.

Denton. — Specifications and tenders are invited for electric light installation. Apply to Messrs. John Lever and Co., galloon manufacturers, Denton.

Berlin.—December 10 is the date for tenders for a supply of telegraph posts to the Prussian State Railways at Berlin. Particulars 50pfg (6d.), at Schöneberger Ufer 1-4, Berlin.

Saint-Yvon (France).—Tenders will be wanted on January 31 for an electric lighting installation (to replace 1,500 gas lights) at the lunatic asylum at Saint-Yvon, in the Seine Inferieure. Application to the asylum authorities.

Madrid.—Tenders are wanted by December 16 for the supply of 20 tons of telegraph wire (copper) for the Government Telegraphs. Application should be made to la Dirección general de Correos y Telegrafos, Madrid, Calle de Carretas 10.

Brussels.—Tenders will be received at the Hôtel de Ville, Brussels, on December 11 for the supply of pipes and of some other stores necessary for the Municipal Electric Lighting Department during the forthcoming year.

The Hague.—The Dutch Waterstaat Ministry want tenders on 11th inst. for a postal and telegraphic building at Bergen-op-Zoom, and on 18th inst. for the supply of zinc, iron, and copper stores for the telegraphic service in the forthcoming year.

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s.) from the Generaldirektion, (Centralbureau) Grossh. Badischen, Staatseisenbahnen, Karlsruhe, Germany.

Wakefield.—The Visiting Committee of the County Council invite tenders for the maintenance and renewal of the electrical recording stations, signals, bells, and telephones at the West Riding Asylum Wakefield. For further particulars, form of tender, and instructions apply to Mr. J. S. Banks, clerk of works. Sealed tenders, properly endorsed, to be forwarded to Mr. J. Vickers Edwards, county surveyor, Wakefield, by December 14.

Colwyn Bay.—The Urban District Council invite plans, particulars, and estimates, etc., for a scheme of electric lighting for their district, the powers for which they obtained last session. To the author of the scheme considered the best a premium of £30 will be paid, and in the event of the work being carried out such premium must be considered as part payment of the engineer's commission. To the author of the scheme considered second best a premium of £20 will be paid. Further information will be received on personal application to Mr. Wm. Jones, A.M.I C.E., the Council's surveyor. The schemes must be sent in not later than January 12, 1897. Further particulars are contained in an advertisement in another part of the paper.

RESULTS OF TENDERS.

London.—The London School Board have accepted the offer of Messrs. J. Amos and Son to purchase a 60-ampere battery for £20.

Schneidemuhl (Germany).—For the supply of iron lattice telegraph masts for block signalling on the State Railways at Schneidemuhl on November 5, 15 firms from various parts of Germany, tendered at prices ranging from 412 marks to 178 marks according to conditions.

Cardiff.—The Corporation have accepted the following tender for the supply of steam coal for the electric lighting station during half year ending June 30, 1897: Park Coal Company, Cardiff, North Navigation 6ft. vein washed pea nuts 7s. 8d. per ton delivered at G.W.R. siding, 7s. 2d. delivered at Corporation siding.

BUSINESS NOTES.

Personal.—Mr. Gilbert Lloyd, electrical engineer, has taken offices at 60, Broad-street, Bristol.

Central School of Arts and Crafts.—The new premises in Regent-street are lighted throughout by electricity.

Rathmines.—At a meeting of ratepayers the resolution approving of the proposed tramways was lost. A poll is to be taken.

Another Motor Company. — The English Serpollet Motor Syndicate, Limited, has been registered with a capital of £100,000 in £1 shares.

Ealing.—The Electric Lighting Committee reported at the District Council meeting that the number of 8-c.p. lamps now applied for was 9,344.

Graylingwell.—The West Sussex County Council are going to convert the farmhouse into an asylum and extend the electric light to it, at a cost of £200.

Walsall.—The electric lighting of the shops between the bridge and St. Matthew's Church is regarded as a great improvement, and is giving every satisfaction.

Electric Railway Cricket Club.—To celebrate this club's 1895 season a dinner and concert was held at The Horns, Kennington. About 70 guests were present. Mr. C. T. Jenkins presided.

The London Tramways Scheme.—The Finance Committee reported at the London County Council meeting that they found it impossible to bring up their report on this subject before the 8th inst.

Hoyland.—On the question of lighting the township by electricity, the Urban District Council have agreed to engage Mr. Hammond to get up a report and submit to them as soon as convenient.

Preston.—The electric lighting of the town is not giving universal satisfaction judging from the remarks at the Town Council meeting, but the matter is receiving the attention of the Lighting Committee.

Poole.—The Board of Guardians have given consent to the Assessment Committee to appear as respondents in the Bournemouth District Electric Light Company's appeal against rates in the Wimborne division.

Chelsea.—The Vestry have instructed the surveyor to include in his report on street-lighting a statement of the cost of lighting Oakley street with electricity by way of an experiment, using, if possible, the present standards.

Fenton.—The Urban District Council have approved the design submitted by Mr. Sellon of the pole proposed for working the tramways by electricity, subject to its being generally adopted by the other authorities concerned.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended November 29 amounted to £1,148, as compared with £1,020 in the corresponding week of the previous year, being an increase of £128.

Explosion in France.—A serious boiler explosion occurred at an electric-light carbon factory at Nanterre on Tuesday. The building was completely destroyed, and four persons were killed. The damage is estimated at £18,000.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended November 27 were £1,917. 4s. 7d., compared with £1 677 17s. 7d. for the corresponding period of last year, being an increase of £239. 7s.

Nottingham.—At the meeting of the Town Council next Monday the expediency of promoting a Bill empowering the Corporation to work tramways by animal power, electricity, steam, or any mechanical power will be discussed.

Kensington.—It was reported at the Vestry meeting that, during the month of September, 21 miles 1,480 yards of overhead wires and 430 yards cable (containing 104 wires) were fixed, 915 yards wire had been removed, and two poles renewed.

Windermere.—The Urban District Council have agreed that the 18 electric lamps on the road to Troutbeck Bridge shall be lighted an hour before sunset and extinguished at 10.45 p.m., and not to be lighted at all when there was sufficient moonlight.

Flamborough. — At the Rural District Council meeting a communication with respect to the projected electric light railway, was referred to a special committee of the Flamborough councillors with Colonel Lloyd-Greame and the chairman.

Catalogue.—We have received a most useful and copiously illustrated catalogue from Messrs. Carrick and Ritchie, hydraulic engineers, Edinburgh, of their improved turbines and other water motors for the utilisation of water for electricity and other power.

Kirkby Stephen.—The North-Eastern Railway Company are about to introduce the electric light at the station. The requisite power will be derived from a turbine in the bed of the River Eden, and it is thought that the company may also pump water from the river.

Chelmsford.—The Lighting Committee reported at the Town Council meeting that they could not recommend the Council to light Crane court, as suggested by the Rev. H. A. Lake (rector of Chelmsford), as the court was a private road. The report was adopted.

East Stow.—The Rural District Council propose to put down machinery for the water supply, and it is stated that it is possible

Digitized by Google

to have an electric current from Stowupland, which would obviate the necessity of having an engine or a man, the expense of the current being £5 or £6 a year.

Holborn.—At the meeting of the Board of Works the application of the Charing Cross and Strand Electricity Supply Corporation for consent to a proposed provisional order for supply of electric energy to that part of the Holborn district west of Gray's-inn-road was sent to the Works Committee.

Waterloo and City Railway.—It is stated that next year must be very considerably advanced before the first practicable car will find itself in a position to navigate either tunnel, but it may be reasonably hoped that the closing months of 1897 will see the Waterloo and City in full operation.

City and South London Railway.—The returns for the week ended November 29 were £1,054, compared with £988 for the corresponding period of last year, being an increase of £66. The total receipts for the half-year 1896 were £20,895, compared with £19,549 last year, being an increase of £1,346.

Kirkby-in-Ashfield.—The question of lighting the parish with electricity was discussed at the District Council meeting, and the Chairman stated that from information he had it would cost £12,000. The clerk was eventually instructed to ask Mr. Furse, of Nottingham, for a rough estimate.

Gorton.—The Urban District Council have decided to oppose any extension of electric lighting in the Council's district by the Manchester Corporation, and to take action with Denton and other authorities with the object of obtaining a reduction in the price of gas charged by the Corporation to the out townships.

Electrical Railway Signalling.—The *Railway Supplies Journal* gives an account of a new signalling apparatus invented by Mr. Thomas Ainsley, of Durham, and Mr. Michael Watson of Newcastle. When danger is signalled the train makes a contact and sounds a gong, giving audible warning to the driver or guard.

Lancaster.—Mr, Councillor Hall is the chairman of the Electricity Committee for the ensuing year, and Mr. Councillor Jackson is the chairman of the Lighting Committee. The mains are to be extended along Balmoral-road to St. Peter's new schools; and China-lane and Church-street are also to be lighted with arc lamps

The Newcastle Exhibition.—In connection with the proposed electrical and engineering exhibition to be held early next year on the Pandon Dene area, Northumberland-road, Newcastle, the date of opening has been fixed for February 8 next, and the exhibition will on that day be opened with ceremony by the Mayor.

London Lighting Extensions.—The London County Council have sanctioned notices of extensions from the Charing Cross and Strand Electricity Supply Corporation, the Notting Hill Electric Lighting Company, the County of London and Brush Provincial Electric Lighting Company, and the Metropolitan Electric Supply Company.

Rottingdean and Ovingdean and District Electric Lighting Company.—This Company have published notice of their intention to apply to the Board of Trade for a provisional order to supply electricity in the townships of Rottingdean, Ovingdean, and Woodendean, within the district of the Rural District Council of Newhaven Union.

Bradford.—A destructive fire occurred last week in Forster-square, in a huge triangular building occupied by several large firms. The block is directly opposite the General Post Office, and is seven storeys high. The damage is estimated at £100,000. The fire destroyed a large number of Government telephone wires and American cables to the General Post Office.

Commercial Cable Company.—This Company have declared a quarterly dividend of 1¾ per cent. on the capital stock and a bonus of 1 per cent. payable January 1. A special meeting of the shareholders of the Company is called for December 22 at the Company's offices in New York. The transfer books will be closed at noon on 26th inst. and reopened on the morning of January 2.

Walton-on-Thames.—The Walton-on-Thames Electric Lighting and Power Company, Limited, have published notice of their application to the Board of Trade to enable them to supply electricity for public and private purposes in the townships of Walton-on-Thames, Hersham, and Oatlands, in the district of the Urban District Council of Walton-on-Thames, and other purposes.

Anglo-American Telegraph Company. — The Marquis of Tweeddale and Sir Albert J. Leppoc Cappel, K.C.I.E., have retired from the direction of the Anglo-American Telegraph Company, and Sir Gerald Fitzgerald, K.C.M.G., and Mr. Robert A. Benson have been elected to fill the vacancies on the Board thereby created. Mr. F. A. Bevan has been elected chairman of the Board.

Telegraph Extension in the Highlands.—The Postmaster General, by a letter dated 23rd ult., has informed Mr. J. G. Weir, M.P., "that the post office at Stockinish will be opened for the transaction of telegraph business on the 25th inst." This completes the five telegraph extensions effected out of the £1,000 grant in the current vote for telegraph extensions in the Highlands and Islands.

St. Helens.—The Corporation will shortly have completed the laying of the electric light mains in the streets. The plant has cost £10,000, and the Corporation will charge 6d. per unit to begin with. The whole of the plant has been laid down under the superintendence of Mr. Samuel Glover, the manager of the gas and lighting department, and Mr. Robert Hammond is the consulting electrical engineer.

Dewsbury.—At the meeting of the Town Council, a letter was read from the secretary to the Electric Lighting Extension Syndicate asking whether the Corporation would enter into an agreement for the supply of electric energy to the syndicate, such energy to be distributed by them through penny-in-the-slot meters. The application was not entertained.

Glasgow.—Mr. Primrose, in moving the approval of the minutes of the Watching and Lighting Committee at the meeting of the Police Department, called attention to the number of fires reported as having occurred during the month from defective electric lighting installation. It would be desirable, on the threshold probably of the enlarged use of electricity, that attention should be given to the perfectness of installation.

Appointment Vacant.—The Corporation of Derby are advertising in our columns for an assistant engineer at the electricity works. Salary commencing at £3. 3s. per week. Applications, stating age, with not less than two recent testimonials, marked "Assistant Engineer," to be addressed to Mr. J. E. Stewart, engineer and manager, Derby Corporation Electricity Works, Sowter road, Derby, by Saturday, December 12, 1896.

Electric Tramways in the United Kingdom.—At present the electric tramways and railways in the United Kingdom aggregate, says the *Railway World*, a track length of 173·25 miles. Without exception each of the undertakings is proving a success, and experience proves conclusively that there is no reason why electric traction, as soon as the public see the facts as they actually are, should not prove as great a boon in Britain as it is in America.

An Omission.—In the description which appeared in our last issue of the electric light installation at the Guardian Assurance Company's new building we accidentally omitted one important fact The whole of the desk fittings illustrated as Fig. 1 and of the wall brackets to match were manufactured and supplied by Messrs. J. W. Singer and Sons, of Frome, Somerset. These fittings are most satisfactory, both as regards finish and general design.

Municipal Electricity Exhibition at Bradford.—The Mayor of Bradford (Mr. T. Speight) on Wednesday opened an exhibition of electrical plant, motors, cooking and lighting apparatus, etc., at the Swan-arcade, Bradford. The exhibition has been promoted by the Corporation, and its object is to show what developments have taken place in the science of electricity, and more particularly to do something in the direction of popularising the use of the current for motive power.

Swindon.—At the quarterly meeting of the Wilts Standing Joint Committee the Accounts Committee recommended that the agreement with the National Telephone Company for connecting the Swindon police stations by telephone should be accepted. The agreement was to provide two instruments and keep them in working order for the sum of £6. 10s. per annum for a term of five years. The agreement was accepted, and the clerk was given power to take the necessary steps for completing it.

Greenwich.—At the meeting of the District Board of Works Mr. R. S. Jackson moved that it be referred to the Greenwich Committee to consider the application by the Blackheath and Greenwich District Electric Light Company Limited, for a provisional order to supply electricity, etc., within the parish of Greenwich, and to report to the Board as to the desirableness of making representations to the Board of Trade or bringing before that Board any objection respecting such application. This was carried.

Luton.—A communication was read at the Rural District Council meeting from the National Telephone Company asking the Council to reconsider their decision of charging the company 2s. 6d. per annum for each pole erected along the Green Way to the Totternhoe Lime Kilns. Mr. Taylor (district manager) attended before the Council and explained in detail the position of affairs. Mr. Coles gave notice of motion to rescind the previous resolution of the Council, and that the company be charged a quit rent of 1s. 6d. per pole.

Hull.—At the Town Council meeting Mr. Skinner said that, in the hope that the electric lighting extension scheme would be adopted at the next meeting of the Town Council, he thought, in order to facilitate the carrying out of the scheme, they might forestall the Council by appointing some committees to make enquiries They had lost very much time, and it would seriously militate against the pecuniary results at the end of the year. A committee was chosen to make enquiries as to types of machinery, and another to report as to sites for sub-stations.

Hammersmith.—A letter was read at the Vestry meeting from the Metropolitan District Railway Company, stating that the proposed sub-electric railway, if constructed, will emerge to the surface at Earl's Court, with the intention of making it possible for trains to and from places beyond that station to be worked *viâ* the new line; and that with this information before them the Vestry will probably consider it unnecessary to further press their desire upon the directors for a deputation to wait upon them. The Vestry decided to acknowledge this communication.

Bray (co. Wicklow). — The Electric Tramways Company, Limited, have given notice of their intention to apply to the Lord-Lieutenant in Council, through the Bray Township Commissioners, at the time of the next spring assizes, for an Order in Council to authorise the construction and maintenance of various tramway lines in the township of Bray, the townlands of Bray Commons, Ravenswell, and Cork Great. The gauge of all tramways is intended to be 3ft. 6in. It is proposed to use electricity as the motive power, but other mechanical or animal power will be authorised.

Digitized by Google

Tonbridge.—The Urban District Council have given notice of their intention to apply to the Board of Trade for an electric lighting provisional order. The following are the names of the streets in which it is proposed that electric lines should be laid laid down within a specified time—namely, Quarry-hill from the corner of Brook-street to the Railway Bridge, the Railway Bridge, High-street, London-road from High-street to west end of Dry-hill Park-road, Shipbourne-road from High-street to east end of Dry-hill Park-road, Dry-hill-road, Dry-hill Park-crescent, and Dry-hill Park-road.

Pembroke.—At the meeting of the Town Commissioners a letter was read from the Rathmines Commissioners expressing regret at the conclusion arrived at by the Pembroke Commissioners in reference to the right of the people of Rathmines township to obtain a tramline to Ballsbridge and the sea. The letter stated that the Rathmines Commissioners were willing to carry out the construction of the line in any way that would meet the approval of the Pembroke Board, and on such terms as to user as would be reasonable. Mr. Vernon said it might be better to wait and see what they did at that day's meeting.

Newington, S.E.—At the meeting of the Vestry, Mr. Chandler moved that the Baths Commissioners be requested to ascertain whether the firm to whom the contract for the installation of electric light to the baths and wash-houses had been given paid trade union wages and observed the trade union hours of labour. Mr. Newman seconded the motion, which was carried. The Clerk said he intended at some future meeting to ask the Vestry to have the installation at the baths carried out under the supervision of their own special expert. Otherwise they might get an installation which would upset their larger scheme.

Wakefield.—At the meeting of the Board of Guardians, Mr. Hall stated, in regard to the electric lighting of the proposed new infirmary, that it would have been very desirable to have handed over that part of the work to the Corporation, but unfortunately they could do it themselves at less than half the cost, and therefore they would not be justified, however anxious they might be as to the success of the Corporation's scheme, in asking them to supply the electric light when they could supply themselves at a much cheaper rate. It was a very singular thing that the Corporation asked 6d. per unit, whereas they could provide the light for 2d. per unit.

Cheltenham.—Notification is given of an intended application to the Light Railway Commissioners for an order authorising the construction of a light railway from the Midland Station, Cheltenham, to the village of Winchcombe. It is stated that the proposed gauge of the line will not exceed 4ft. 8½in., and that "electricity, air, and other motive power," as may be agreed with the Corporation, will be used. At the meeting of the Town Council Alderman Drew gave notice of a motion for the rescinding of minutes allowing the gauge of the proposed electric tramway to be 4ft. 8½in., and of its amendment so as to permit a gauge of 3ft. 6in. only.

Bristol.—The tramway company have just propounded a scheme for the extension of their system to various suburbs of the city, and the general application of electricity as the motive power. The proposals have aroused opposition in some of the districts affected, mainly from the fact that it is intended to introduce the overhead trolley system of electrical traction. At present there are about 16 miles of tramways in the city, which have cost £300,000 to construct, and it is proposed to add 11 miles and relay the old parts at a cost of £400,000. The Corporation, it is expected, will agree to the plan, provided they are allowed to supply the electrical power.

Lanark.—At the meeting of the Middle Ward District Committee of the County Council the Chairman stated, with regard to the lighting of Cambuslang, that the committee thought they would be able to supply electric lighting to that district as cheaply and satisfactorily as gas. The committee were looking into the matter, and therefore were unable to say yet that this would be accomplished. It appeared to them there was no hurry, as nothing could be done this year. They were proceeding cautiously, and were not rushing into the venture without seeing their way clearly. He hoped and believed that electricity would be the future illuminant for Cambuslang.

Plymouth.—Some important experiments took place a few days ago to test the efficiency of a new system of electric search-lights which have been fixed at various points guarding the entrance to the port and dockyard. The six vessels comprising the Devonport torpedo-boat destroyer flotilla proceeded at five o'clock into Plymouth Sound, and returned under cover of darkness through the area defended by the powerful lights. The vessels were clearly seen from the electric light stations, and minute observations of the movements of the flotilla were recorded by the staff of officers of the Royal Artillery and Royal Engineers.

The Copper Trade.—Though the mid-November statistics showed a small increase in the visible stock of the metal, those for the complete month indicate that consumption has once more headed supply. The deliveries for the month reached the high total of 20,915 tons—a figure only once attained before, while the arrivals were 20,253 tons—a record figure. The stocks are consequently 662 tons less than on October 31. The imports from North America to Europe exceeded all previous totals, being 11,458 tons, besides which the 1,024 tons from Spain and Portugal, the 1,950 tons from Chili, and the 1,100 tons from Australia look very small indeed.

Japan.—The application of electricity to practical use has rapidly advanced in Japan, and regulations have been issued by the Minister of State for Communications for the control of the various projects being carried out. The *Indian Engineer* remarks that there is an evident boom in telephones, which are being extended to all parts of the country. In fact, in the matter of telegraphs and telephones it is probable that in some respects Japan is further advanced than Britain. The Japanese have despatched a commission of electrical experts to America for the purpose of studying all the most recent developments in that country, so that they may be utilised in Japan.

Peterborough.—The following resolution was carried at the Town Council meeting: "That it is advisable to convert the premises in Queen-street, purchased for an electric light station, to other purposes of the Corporation, unless within three months a satisfactory application is received from some person or company to acquire the same in order to supply electric light." Last June the Local Government Board decided not to sanction the scheme projected by the Corporation. The premises in Queen-street cost nearly £2,000. Several statements are being made in the town as to firms coming forward to treat for the provisional order, and it is even suggested that the gas company should take it up, but nothing definite has yet been made public.

Dover.—At the Town Council meeting Councillor G. Mowll said the electric light company had erected a new heading to one of the columns in the Market-square. If the Council decided to have it the sooner the better, as it would take at least four weeks to make the lamps for Biggin-street. Alderman Peake remarked that the new lamps hardly seemed to have such big carbons as the old ones. Councillor Mackenzie produced a photograph of the lamps at Portsmouth, which had a couple of incandescent electric lamps on the side, to be used instead of the arc lamps after midnight. He believed that if such a form was approved of in Dover the company would make a substantial reduction from the £30 a lamp. On the suggestion of Councillor G. Mowll, it was decided that the town clerk should forward the photograph to the electric light company, and ask what reduction they would be prepared to allow.

Torquay.—At the Town Council meeting Mr. Kerswill moved the adoption of the Electric Lighting Committee's report on the tenders for the plant required at the electricity works and which tenders we publish in another column. Mr. W. S. Thomas, in seconding, hoped all would now work together to make the installation of the light a success. Mr. Pickard desired to know if it was necessary to spend the whole £20,000 involved in the tenders at the outset? Mr. Glanfield advocated wiring only the compulsory area for the present and leaving the outside districts until there was a demand from them. In reply to Mr. Appleton, it was stated that the works would be complete in nine months. Mr. Shrubb said the whole scheme would be upset if Mr. Glanfield's suggestion were carried out, and the Town Clerk pointed out that the Council had already decided to carry the works beyond the compulsory area. The motion was unanimously carried.

St. Martin's, W.C.—At the meeting of the Vestry a long report was submitted from the Lighting Committee as to the proposed electric lighting of Coventry-street, and their recommendation was agreed to on the condition that the proposed refuge near Oxendon-street should be shifted so as to throw a light down that street, but it would be dangerous to shift the position of the refuge opposite to the Haymarket. It is proposed that the refuges shall be 4ft. in width in the middle, with the guard posts brought out flush with the kerb. The committee stated that they did not think any objection would be raised by the electric companies having powers in the parish to the supplying of electric current by the St. James's and Pall Mall Company, and also that there had been sent a further letter from the St. James's Vestry forwarding copies of letters they had received from the two companies having powers within the parish stating that they did not object to such supply by the St. James's and Pall Mall Company.

Harrow.—The following from the electric lighting company was read at the Urban District Council meeting: "Dear Sir,—The directors considered your letter containing your Council's request to relay the whole top coating of the tar pavement where we break it up in laying our mains. In reply I beg to say that while we are fully aware of an obligation to make good the pavement, we have to the best of our belief done this everywhere, and we do not think we can be fairly be called upon to do more. If your Council wish to have the whole of the top coating relaid, we think that they should bear the cost of relaying the part not touched by our mains. On these terms we shall be happy to relay the whole. (Signed) C. Colbeck, chairman." Mr. Dell said he would like the Legal Committee to consider the point. He could not understand that they could have their footpaths spoiled without having any redress. Mr. Hawkins remarked that the company had their Act of Parliament, and knew what they were about. The matter was then referred to the Legal Committee.

Fulham.—The Electric Lighting and Dust Destructor Committee reported at the Vestry meeting that at their last meeting they had under consideration a scheme from the County of London and Brush Provincial Electric Lighting Company, stating that upon the grant of a provisional order to the Vestry they would be prepared to take a transfer of it upon the terms that the company should pay the costs of the Vestry incurred in obtaining the grant of the order and its transfer, the company undertaking to supply current into Fulham at the earliest moment at a commencing price not exceeding 7d. per unit and agreeing to reduce the price as soon as the demand is sufficient to enable them to do so, and that the company would also agree to give the local authority the right to purchase the undertaking so far as it is within the parish of Fulham any time after seven years from the commencement of the order at a price to be determined by arbitration under the Lands

Digitized by Google

Clauses Act. At present the committee were not prepared to recommend that the proposal be entertained.

New Metropolitan Electric Railways.—The new schemes for electric railways in the Metropolis include the "City and West-end," a project for a line from Hammersmith to Cannon-street. Another is called the "Brompton and Piccadilly circus," and a third is called the "West Suburban," being for a line from Praed-street to Willesden. Two of the electric lines sanctioned some years ago give notice of applying for extension of time to complete works. One of these is the Great Northern and City, sanctioned under its Acts of 1892 and 1895. The other is the Charing Cross, Euston, and Hampstead, which seeks to revive powers granted by its Acts of 1893 and 1895. It also intends to change its name. The Central London, now in course of construction, gives notice of a Bill for minor alterations of the original scheme. The London, Walthamstow, and Epping Forest publishes two notices. One is for the abandonment of the line and the release of the parliamentary deposit. The other is for extension of time for completion of works granted under its Acts of 1894 and 1895.

Allgemeine Elektricitats-Gesellschaft.—The Electrical Company, Limited, of Charing Cross-road, have sent us a copy of the annual report to June 30 last of their parent company—the Allgemeine Elektricitäts-Gesellschaft, of Berlin—which will go before the general meeting on December 5. The report refers to the enlargement of the company's capital and the new works. About 4,000 dynamos and motors have been turned out in the past year; these have an aggregate output of 74,000 h.p. The incandescent lamp trade has also improved, the increase in the output over the previous year amounting to 600,000 lamps. The company has now equipped 34 electric tramways, employing some 918 cars. From the report one quickly sees the advantage the firm has gained from a strong financial support, enabling to provide, in many cases, capital, as well as the necessary electrical apparatus. The accounts show gross profit of about £230,000 for the year, which, after providing liberally for depreciation, reserve fund, and other sundry items, allows a dividend of 13 per cent. on a capital of £1,100,000. We also note that the various valuable patents owned by this firm stand as an asset in the statements to the extent of 1s. only.

Telephone Communication.—At the Liverpool Chamber of Commerce, Mr. Bindloss said they had been in communication with the Post Office authorities on the question of trunk telephone communication, and he was pleased to be able to announce that they had got an extension of time from three to six minutes without any intermediate cutting off. The Chamber had also, in communication with other bodies, been able to effect a serious reduction in the cable rates to the East. The rate to Japan by the northern route was to be reduced from 8s. a word to 6s. 2d., and the Eastern Extension Telegraph Company also intended to make a reduction on the rate to Japan *viâ* Hong-Kong from 10s. 8d. to 8s. 6d. a word, but unfortunately that was not to take place for some time. The Eastern Telegraph Company had also notified these reductions to the far East to take effect on January 1: Malacca and Native States, to 5s. from 5s 7d; Singapore, to 5s. from 5s. 9d.; Labuan, to 5s. from 6s. 5d.; Java, to 5s. from 6s.; other islands of the Dutch Indies, to 5s. 5s. from 6s. 6d.; Cochin China, to 4s. 6d. from 5s 1d.; Annam, to 5s. 3d. from 5s. 10d.; Tonkin, to 5s. 6d. from 6s. 3d.; Siam (*viâ* Singapore), to 5s. from 5s. 7d.; Seychelles (*viâ* Suez and Aden), to 5s. from 7s. 3d; Mauritius, to 5s. from 8s. 9d.

Stoke.—The Town Council have approved the design of pole submitted by the British Pioneer Company, Limited, for erection in the streets for the purpose of electric traction equipment, subject to an alteration in base made by the borough surveyor. The report of the Tramway Sub-Committee was adopted at the last meeting. This stated that the town clerk laid before the committee the notice of proposed transfer of the undertaking from the old promoters to the British Electric Pioneer Company, Limited, and also certain correspondence between local authorities and parliamentary agents, and after discussion it was resolved that the town clerk having informed the committee that formal notice of objection to the proposed transfer had been lodged, and after reading the correspondence between the local town clerks and parliamentary agents, and also a letter from the latter, saying that the solicitor to the promoters had called upon them and asked them to withdraw the notice, as it was very urgent, and also in view of the instruction of Council to combine with other towns in joint action, and such other towns having given their consent to the proposed transfer, "That the sanction of this Corporation be given to the proposed transfer forthwith, and that the town clerk be instructed to advise the parliamentary agents to withdraw the objections at once."

Bromley.—The General Purposes Committee reported at the Urban District Council meeting that with regard to the question of the electric lighting provisional order they regretted that owing to the absence of two members they were unable to obtain a full committee meeting, and under the circumstances would suggest to the Council that the question be referred to a special committee, which should be appointed at the present meeting. The Chairman, in moving the adoption of the report, said it was desirable—the provisional order being a matter of very great importance—that the committee should be strengthened, and he would like to move the addition of one or two members to the committee in order that the matter might be thoroughly dealt with. Mr. Mallett seconded. The subject of the electric lighting of Bromley was of the greatest importance, and should be dealt with by the strongest committee possible. Eventually the matter was referred to the whole Council in committee. Messrs. Waterer and Dickins wrote: "Electric lighting.—We beg to advise you that as nothing now remains in dealing with the transfer of the provisional order but the settlement of the conditions to be sanctioned by the Board of Trade, giving the Council powers to purchase the works, we have handed over the matter to Messrs. Edmundsons, who will act as engineers to the company, and to whom you will please communicate in future."

Edinburgh.—At the City Council meeting the Electric Lighting Committee submitted the report of the chief electrical engineer on the condition of the plant and mains and the working of the electric lighting station for the half year ending October 15. Mr. Mackenzie moved that the Council suspend the standing orders, and remit to the Electric Lighting Committee to procure the new machinery necessary for next year. They commenced the electric lighting on April 11, 1895, with 48 customers, and they had 2,200 lamps connected with it. The number of customers on May 15 this year was 452, and the number of lamps connected at that date was 58,600. Since then the number of consumers had been increased to 732, and the number of lamps connected with the system was now 82 830, with 6,290 more lamps applied for, so that they would soon have 90,000 lamps. The number of units sold from May 15 to November 26 last year was 308,280, as compared with 605,126 units for the corresponding period of this year. As far back as February of last year they had ordered six engines and dynamos and a number of boilers. The boilers were in position, but they had not been able yet to get the whole of the engines. It was proposed to spend about £15,000 on new machinery. He hoped the Council would be able to reduce the charge for electric lighting from 5d. to 4d. per unit, and from £18 to £16 per lamp. The motion was agreed to.

British Motor Syndicate.—The prospectus of the British Motor Syndicate, Limited, has been issued. The registered capital is £1,000,000 in £1 shares, and the present price is £3, payable 10s on application, £1. 10s. on allotment, and £1 one month after allotment. The shares are issued fully paid to the original inventors and patentees and their nominees controlling their interests in future improvements. The prospectus states that the proposals to buy from the syndicate licenses to form companies to build motorcars under their master patents, and the purchase-moneys to be paid to the syndicate in connection therewith, now exceed £800,000, which, being profit, are divisible upon completion amongst the shareholders. The prospectus has been the subject of much correspondence in the daily papers. Mr Henry Holt wrote to say that he gave no authority for the use of his name. Mr. Radcliffe Ward points out that the London Electric Omnibus Company's patents do not belong to the syndicate (the prospectus stated that the syndicate had a monopoly of the best patents); Mr. Frederic Prince also condemned the "ridiculous statement" that the syndicate possessed all the master patents; Mr. Robert Wilson (London manager) points out that the reference to Crossley Bros., Limited, in the prospectus was entirely unauthorised; the publisher of the *Engineer* says the reference to that journal was unauthorised; and Mr. Worby Beaumont says his name was unauthorised, and that he has no interest of any kind in the syndicate or any other similar business.

Leatherhead.—At the meeting of the Urban District Council the Clerk said he observed in the papers that application had been made to the Board of Trade by the Leatherhead Electric Lighting and Power Company for authority to supply electricity for public and private purposes in the district, in which they stated that they would lodge plans by December 21, and that every local or other public authority was entitled to lodge any objection or make any representation before January 15. He had received a letter from the secretary to the Leatherhead Gas Company stating that he was desired by his directors to inform the Council (in view of the recent notification respecting the formation of an electric lighting company) that they were engaged in the reconstruction of their company with the view of incorporating powers of lighting by electricity or by any other later illuminating invention. As it must be evident that they would have greater facilities and means for carrying out economically any better system of lighting that might be desired, they respectfully asked for such assistance in the matter as the Council could give. Mr. Howell said they ought to be satisfied with the standing and financial position of any electric lighting company. The Chairman said it would be very awkward if the company broke up the roads and had not the money to repair them. The Clerk suggested that application should be made to the Board of Trade for the right of pre-emption; that was, that the Council should after, say, 14 years from the time of installation have the right to buy up the company at a valuation. In reply to Mr. Heaver, the Clerk said that over and over again companies had transferred their powers to others. Dr. Davis said by the Electric Lighting Act the Council could consent or not. On the motion of Mr. Dearle, seconded by Mr. Howell, the clerk was directed to obtain a copy of the draft order, it being pointed out that the gas company would not now apply for an order until another year.

London.—At the meeting of the Commissioners of Sewers the Streets Committee presented a report relative to the expiration, at Christmas next, of the agreement in respect of the premises in the Wool Exchange, Basinghall-street, temporarily used as an electrical laboratory, and recommended that the tenancy be renewed for another year at a rental of £170. The report was agreed to. Mr. Gordon asked if the chairman of the Streets Committee would shortly issue a report on the subject of the private lighting, in consequence of the complaints which had been made by consumers. Almost everyone who had used the electric light had experienced, he said, great inconvenience, because of the frequent failures of the light. If the Commission had no control over the private lighting the Court should state so, and the consumers would then

Digitized by Google

know the position in which they were placed. Mr. Hudson said he was not prepared to make a statement in regard to the private supply, but he hoped the question of lighting the minor streets would soon be settled. Mr. Gordon then asked permission to question the electrical engineer (Mr. Voysey). Mr. Voysey said he would prefer to have time to consider that question, and answer it on another occasion. He was not aware that there had been any large number of complaints in regard to the private lighting—at least, they had not reached him. The consumers had the right to apply to him if the pressure of the current was unsatisfactory. Mr. Gordon, with permission, moved that the question should be referred to the electrical engineer with instructions to report. The Chairman said the solicitor held that the Commission had no control of the private lighting Mr. Gordon then moved that the subject should be referred to the Streets Committee to consider and report upon the remedies which the private consumers had at hand. Mr. Morton, in seconding the motion, said he hoped the private consumers would address their complaints to the Court, so that there would be no doubt as to whether they were satisfied or not. The motion was then adopted.

Wrexham.—The minutes of the Lighting Committee, read at the Town Council meeting, stated that the town clerk had received the following letter from the Rural District Council: "'Dear Sir,—Your letter of the 28th ult. was considered at a meeting of the District Council held on the 5th inst., and I was instructed to inform you that the Council object to the proposal to include in the powers of the provisional order, for which the Town Council are about to apply, the portions of Stansty and Broughton lying within the parliamentary borough of Wrexham. and the townships of Bersham. Erddig, Abenbury, and Acton.– Yours faithfully, J Oswell Bury, clerk.' Upon the above intimation, and as to the steps to be taken in proceeding with the application for a provisional order, limited to the municipal borough, he had seen the parliamentary agents (Messrs. Sharpe, Parker, and Co.), at Westminster, on the 6th inst., with instructions, and he now submitted a proof, forwarded by them, of the *Gazette* notice of intention to apply to the Board of Trade on or before December 21 next for a provisional order under the Electric Lighting Acts, 1882 and 1883. The further requirements of the Board of Trade, as to deposits, plans, copies of proposed order, etc., as stated in a letter dated the 9th inst. from the parliamentary agents, were laid before the committee It was recommended, on the motion of the Chairman, seconded by Mr. Pierce, that the print of the *Gazette* be approved, and that the Bridge-street compulsory area be limited, as mentioned in the draft notice, to that part lying between Brook-street and Bryn Issa. It was also recommended, on the motion of the Chairman, seconded by the ex-Mayor, that the notice be advertised on the 21st and 28th inst. in the local newspapers, and that the parliamentary agents and the town clerk take all such further steps as may be advised for obtaining the order for the borough." Mr. Palin moved, and Mr. Benson seconded, the adoption of the minutes. Mr. Thomas Jones asked if they had abandoned the intention of applying for power to go into the rural districts. The Town Clerk said that was so He had written to the clerk of the Rural District Council enquiring the grounds for objection, and he had replied that the grounds of objection were not stated in the resolution. The minutes were adopted.

Dudley.—At the Town Council meeting, Alderman G. Bagott proposed the adoption of the General Purposes Committee's report, which stated that Mr. Sellon, the engineer, and Mr. Millard, the solicitor, of the company which proposed to take over the tramways in the South Staffordshire district, had again attended for the purpose of giving further explanations, and after discussing the matter they decided to hold a special meeting to consider the whole question, and recommended that they be an executive committee to give consent to enter into all arrangements with the proposed company, such arrangements to be reported to the Council. Alderman Bagott remarked that he was glad to know that the necessary documents with regard to the proposed improved tramways in the district had been lodged with the Board of Trade. He ventured to say, as the result of the experience he had had in tramway work, that the proposed scheme was a grand one, and more especially for that borough, because Dudley would be the centre of almost all the tramways in the Black Country. When they considered that one tramway company — the Dudley and Stourbridge — carried something like 2,000,000 passengers in the course of the year, they might naturally expect that if they got all the proposed branch tramways running into the town it would represent a large addition to the trade and prosperity of the borough. Mr. Messiter said that the tramways scheme was a very important one and involved serious questions, including that of the introduction of the electric light into the borough, and for that reason he did not think it was advisable for the Council to give their sanction to the General Purposes Committee being an executive body in the matter, and moved as an amendment that the paragraph containing the recommendation be excluded. Mr. J. Hughes said that nothing tangible had yet been brought before the committee, and, as every vital point in the scheme would have to be discussed by the Council, he saw no objection to the recommendation. The Town Clerk (Mr. Warmington) said that two or three months would elapse before they were in possession of all the facts relating to the scheme, and it was quite certain, that so far as consent to it was concerned, it would have to begiven by the whole Council. After some further discussion, Alderman Bagott consented to the withdrawal of the paragraph containing the recommendation.

Newcastle.—The members of the City Lighting Committee, headed by the Mayor (Mr. John Goolden), the Sheriff (Mr. Beattie), and the chairman of the committee (Alderman J. Baxter-Ellis), visited Edinburgh on Monday. At the Royal Hotel, in Princes-street, they were entertained to luncheon by Councillor Gillespie, of Newcastle. The company were joined by the Lord Provost, the chairman of the Electric Lighting Committee of Edinburgh, and others After luncheon, the Mayor of Newcastle proposed the health of the Lord Provost, and other members of Edinburgh Corporation present. In the course of his remarks, he said the members of the City Lighting Committee of Newcastle had come to seek information respecting the electric lighting of Edinburgh. From what they had heard, they understood Edinburgh was far ahead of any other city in the kingdom with regard to electric lighting. The Lord Provost, in response, said he would be pleased to give the deputation all the information in his power regarding the city he had the honour to represent. The electric lighting was in the hands of the Corporation; also the gas. It was only recently they had gone in for lighting the streets by electricity; each large lamp entailing a cost to the Corporation of about £22 a year. The capital expenditure up to the present time was, roughly speaking, about £250,000, and the Corporation found it a lucrative investment, as well as a great convenience to the inhabitants of Edinburgh. The most satisfactory part was that it did not in any way diminish the consumption of gas, which was still on the increase. The Chairman of the Lighting Committee of Edinburgh also responded, after which the deputation proceeded to survey the electricity works, and also viewed the lighting of the streets. General surprise and satisfaction was expressed at what was witnessed. Full notes were taken by Mr Lawson, committee clerk of the Corporation, and also by Mr. Lamb, lamp inspector, and an exhaustive report will be presented to the Town Council. Reference was made to the shadows cast from lamps in Newcastle on the ground, whilst in Edinburgh this was obviated by changing the form of the lamps. It was also stated that the cost of each large lamp in Newcastle was about £42, and the general feeling seemed to be that the Newcastle Corporation should take the whole matter into their own hands, buy out the present companies, and supply the electric lighting themselves.

Brighton.—Electricity mains are to be laid in Southdown-avenue and Wakefield-road. The report of the Works Committee presented at yesterday's meeting of the Town Council contained the following: "A letter was read from Sir R. Hunter, solicitor to the Post Office, with further reference to the application of the Postmaster-General for permission to erect a line of overhead telegraph wires across Stanford-road to the Exeter-street Post Office, and a line of overhead wires in Ditchling-road, and applying for the consent of the Corporation to the carrying of an overhead line of wires on the railway over New England-road, Preston-road, and Beaconsfield-road and to the erection of posts in the public highway in a portion of Ditchling-road for the purpose of carrying a line of telegraph wires overhead. It was resolved that Sir Robert Hunter be informed that the committee are unable to recommend the Council to consent to the erection of any telegraph posts on the public highways in the borough. At another meeting on November 27 the committee again considered the letter from the solicitor to the Post Office on the subject of overhead telegraph wires, suggesting the alternative route put forward by the local engineering staff in September last. The committee passed the following resolutions: 'That the Council hereby consent to the erection of a line of overhead telegraphs across New England-road, Preston-road, and Beaconsfield-road, on the understanding that the Postmaster General is to make good any damage which may be done in the execution or maintenance of the work, and that it will not be necessary to erect any poles in the roads; that the Council will consent to the erection of an overhead telegraph line along the Ditchling-road from a point on the bridge carrying the said road over the Lewes branch railway line to the boundary of the borough, on condition that no poles for the purpose of carrying such telegraph line shall be placed upon the highway, except upon such portions thereof as are not enclosed by land occupied with buildings, and that any poles which may be erected on the highway shall be of such design and placed in such positions as shall be approved by the borough surveyor and subject to the further condition that the Postmaster-General will undertake to remove any pole or poles on the highway upon receiving notice from the Corporation so to do, such notice not to be given by the Corporation until, in their opinion, the erection of houses on the land abutting upon Ditchling-road renders the removal of such poles necessary.'"

Poplar.—At the meeting of the District Board of Works the clerk read the following letter from Mr. Sydney Morse, of 4, Fenchurch-avenue: "Dear Sir,—Referring to the notice served upon you in June last on behalf of the County of London and Brush Provincial Electric Lighting Company, Limited, I am now instructed to write and ask for formal consent of the Board of Works to the grant of a provisional order to my clients. I am instructed to add that my clients are prepared on condition of this consent being given to pay the costs incurred by the Board in obtaining their provisional order. It may be of importance to your Board to know that my clients will be prepared if the order is granted to them to supply electricity to private consumers for electric lighting at a commencing price of 7d. per unit, and for power purposes at 5d. per unit. They would also be prepared, if agreeable to the District Board, to make a contract for the supply of electricity for public lighting, provided a contract were made for a minimum of 10 all-night lamps on the basis of 3½d. per unit. We propose to include in our provisional order as compulsory area the streets comprised in schedule 2 of the order granted to your

Digitized by Google

Board. I shall be pleased to give any further information that may be required." Mr. Carpenter moved, and it was seconded, that the writer be informed that the Board intended doing its own electric lighting. Mr. Stephens said it seemed to him the Board were acting the part of a dog in the manger—they would not do it themselves or let anyone else. He moved the reference of the letter to the Works Committee. Mr. Dalton seconded that, and thought it was time the Board gave some definite opinion on the matter. For the past three or four years they had been standing in the way of anyone else coming into the district, and it was time now, if the Board could not undertake the matter, to give someone else the opportunity of doing it. Mr. Bussey said there had been delays, one of which was caused by the Board not knowing exactly what the London County Council purposed doing in regard to the lighting of Blackwall Tunnel, but as it was now found the Council would lay down their own installation, that obstacle to a settlement was removed. He felt the Board was in a much better position than any company to deal with the subject, and believed if it were dealt with in a whole-hearted manner, some benefit would accrue to the district. Eventually the matter was referred to the committee to whom had been referred the dust-destructor question.

Leeds.—A conference of representatives of telephone workers from various parts of England has been held at the office of the National Union of Gasworkers and General Labourers, Bond-place. Amongst the districts represented were London, Middlesbrough, Birmingham, Bristol, Lancashire, Leeds, Bradford, Huddersfield, Halifax, Dewsbury, and Hull. The object of the conference was to consider a proposal made by the National Telephone Company to establish a uniform working week of 52½ hours. In Yorkshire the working week is 52 hours, and the result of the adoption of the proposal would, therefore, in the case of Yorkshire workers, be to increase their weekly work by half an hour. On the other hand, the change would be an advantage to a large number of other workers. There is no urgent need for an immediate settlement of the question, as at the present season of the year it is impossible to work a full week, and after further considering the question in its various aspects it was decided to adjourn the conference for three weeks, to allow the delegates to consult their branches on certain points—viz., firstly, if they are prepared to accept 52½ hours per week as the standard if the company will arrange a system whereby the men shall not be called out in winter when it is impossible to work a full day; secondly, if they are prepared to support a movement for payment at the rate of time and a half for all overtime with the exception of Sunday, which is paid for at the rate of double time; and thirdly, that each district may forward in writing a method of dealing with what is known as "wet time." In explanation of these points it may be said that at present the men have to turn out at a regulation time every morning, whether the light permits work to be commenced or not. This leads to time being spent in public-houses which might otherwise be utilised at home, and it is believed that the company will favour any arrangement which will prevent the waste of time now common from this cause. On the question of overtime it may be observed that the men at present receive no extra pay for working at night or on Saturday afternoon. In regard to the third point, it appears that at present, if a man gets wet through in consequence of a storm coming on whilst he is at work, he is not allowed time to change his clothes, and if he goes home to do so it must be at his own expense. It is also the practice, when a storm prevents further work for the day, for the payment to be by the hour up to the time of stopping work, and there is a feeling that work cut short in this way might be counted by quarter or half days. About 4,000 men were represented at the conference.—A boy in the employ of Messrs. Laing, Wharton, and Down, electricians, was carrying a two-gallon bottle of black paint the other day, when from some cause or other it exploded. The boy said he was simply uncorking it, but it scorched his eyebrows and burnt his eyes so that he had to go to a doctor.

Islington.—The following report of the Electric Light Committee will be considered at the meeting of the Vestry to-day: ' On several occasions the committee have considered the question of the advisability of purchasing 44 46, and 48, Eden grove, and 1, Burnard-place, being the only houses abutting upon the electric lighting station site which have not been acquired by the Vestry, and have been in negotiation with the owners of such houses with a view to their purchase. In addition to the freehold interest therein, the four houses are held under a lease for 99 years from Midsummer, 1848, at a ground rent of £21 per annum for the four, which lease is subject to an underlease of 48, Eden-grove, for practically the same term at a ground rent of £6 per annum, which consequently reduces the ground rent of the four to £15. The lessee is now prepared to sell his interest in the houses subject to the underlease, and to give the Vestry vacant possession of 44 and 46, Eden-grove, and 1, Burnard-place, for the sum of £700 and his solicitor's costs according to scale, such offer being a substantial reduction in the price originally asked by him. There is every probability of the Vestry being able to acquire the other interests in the property at a reasonable cost, and in view of the fact that the site of such houses will shortly be required for further extensions to meet the increasing demand for electricity, that some cause of action against the Vestry may possibly accrue by reason of the extension buildings now being erected interfering with the access of light and air to the rear of such houses, and also to the fact that their acquisition will give the Vestry entirely uninterrupted frontages to Eden-grove and Burnard-place, the committee recommend (subject to the Vestry being enabled to acquire the freehold at a reasonable sum and to a good title being shown) that the lessee's offer be accepted and that the Finance Committee be authorised to apply for a loan to cover the purchase-money and costs." At the last meeting of the Vestry it was decided to fit the machine shop at the lighting station with the requisite tools and appliances at a cost of £250. As to the application for a loan of £25,000 for electric lighting purposes, Mr. Dryden said the London County Council seemed to get it into their heads that they were carrying out the electric lighting work. The Vestry were carrying out the work, the work was theirs, the risk was theirs, and they challenged the action of the London County Council. The London County Council had no right to see every detail of expenditure connected with the work. They wanted to come to the Vestry Hall and examine their books and vouchers. His committee denied their right to interfere so far; they resisted this encroachment upon their independence. If they were to submit to that they might as well discharge their officials and employ those of the London County Council. They did not want the assistance of the Council. They did not really want their money, but unfortunately they had to get their sanction to loans. He advised the Vestry to resist the London County Council. Although a sum of £25,000 was applied for, the London County Council agreed to lend £24,000. He recommended that that be accepted. Mr. Lambert seconded, and the motion was carried.

Private Bill Legislation.—The following are among the private Bills to be proceeded with in the ensuing session of Parliament. Plans have already been deposited, and the Bills themselves will be deposited later on. The appended list does not include measures which simply involve money powers, without works, or the transfers of undertakings (such as the London County Council Water Bills). As compared with last year the number of deposits shows an increase of 35, the actual figures being last year: railways 63, tramways 15, miscellaneous 66 provisional orders 77, electric lighting 37—total, 258; this year: railways 68, tramways 19, miscellaneous 60, provisional orders 91, electric light 55—total, 293. *Provisional Orders*: Blackpool Corporation (Tramways); Cardiff Tramways Extensions; Carlisle Tramways; Great Yarmouth and District Tramways; Huddersfield Corporation Tramways; Manchester Carriage and Tramways Company; Manchester Corporation Tramways; Middlesbrough, Stockton-on-Tees, and Thornaby Tramways; Morecambe Urban District Council Tramways; Moss Side Tramways; Penarth Tramways; Perth and District Tramways; Reading Tramways; Withington District Tramways: Yarmouth and Gorleston Tramways. *Railways*: Brompton and Piccadilly-circus Railway; City and West-end Railway; Central London Railway; Watford, Edgware, and London Railway; West Suburban Railway. *Tramways*: Bradford Corporation Tramways Improvement; Bristol Tramways; Birmingham (City of) Tramways; Bolton Tramways and Improvement; Birmingham, Wolverhampton, and District Tramways; Coventry Electric Tramways Extension; Dublin United Tramways (New Lines); Edinburgh Northern Tramways; Halifax Corporation Tramways; Hastings and St. Leonards Tramways; Leeds Corporation (Water, Tramways, and Improvement); Norwich Electric Tramways; North Metropolitan Tramways (No. 1); North Metropolitan Tramways (No. 2); Neath Corporation Tramways; Rathmines and Rathgar Township Tramways Improvement; Sheffield Corporation Street Widening and Tramways; Swansea Corporation Tramways; Weston-super-Mare Pier and Tramways. *Electric Lighting Provisional Orders*: Ambleside; Ballymena; Bangor Corporation; Barking Town; Bermondsey, Rotherhithe, and Newington; Bexhill (two); Blackheath and Greenwich; Brighouse Corporation; Bury St. Edmunds Corporation; County of London (East); County of London (Northern Extensions); Dorking Urban District Council; Droylsden; Darwen Corporation; Dundalk; Dudley Corporation; Denton; Epsom; Farnworth; Fulham (two); Garston; Hoylake and West Kirby; Ipswich Corporation; Kearsley; Llandrindod Wells; Leatherhead; Leith; Levenshulme; Lincoln; London Electric Supply Corporation (Westminster); Morecambe; Morleyside Corporation; Newmarket Urban District Council; Poole and Branksome; Prescot; Redditch Urban District; Reigate Corporation; Rottingdean and District; Ramsbottom; Southampton; Stretford; Swadlincote; Tonbridge; Ventnor; Wallasey Urban District Council; Walton-on-Thames; Wimbledon; Withington; Wrexham Corporation; Watford; Wilmslow Urban District Council.

PROVISIONAL PATENTS, 1896.

NOVEMBER 23.

26427. **Improvements in electrical wires.** Robert Brymer and John Todd, 70, Market-street, Manchester.

26452. **Improvements in electric storage batteries.** Percy Lowe Norrington, Abbotsfield, Mannamead, Plymouth.

26470 **Improvements in electrical reversing switches.** William Thomas Taylor, Bridge House, Staines.

26491. **Improvements in and relating to electric accumulators.** Ippolito Celestre, 322, High Holborn, London. (Complete specification.)

NOVEMBER 24.

26539. **Application of electricity for the thawing off of ice from cells and plates of refrigerating apparatus.** Samuel Taylor Parry, Princess-street, Chester.

26546. **Improvements in motor carriages and the adaptation of same to electrical advertising.** Eugen Sandow and Andrew George Adamson, 154, St. Vincent-street, Glasgow.

Digitized by Google

26565. **Electric lighting of bicycles, motor cars, etc.** Ida Marion Sutherst, Alliance Steel Foundry, South Bank, R.S.O.

26583. **Improvements in rail bonds for electric railways.** Vivian Bolton Douglas Cooper, Allan John Lawson, and Stephen Presscott White d'Alte Sellon, 70, Chancery-lane, London.

26597. **Improvements in and connected with joints and junctions for electrical conductors and conduits.** Carrington Riddell Gordon Smythe, 23, Leamington-road-villas, London.

26598. **Improvements in apparatus for preventing accidents by electrical tramcars.** Karl Puskas, 65, Chancery-lane, London.

26627. **Improvements in or relating to alternating-current systems of distribution and regulation.** Reginald Belfield, 322, High Holborn, London. (Benjamin G. Lamme and Ralph D. Mershon, United States.)

26677. **Improvements in electric switches for use in connection with electrically propelled vehicles and locomotives and for other purposes.** Albion Thomas Snell, Charles Edward Grove, and Arnold Frank Hills, 4, South-street, Finsbury, London.

NOVEMBER 25.

26737. **Improvements in and relating to electric batteries.** Hartley Fewson, 75, Landor-road, Stockwell, London.

26742. **Improvements in the construction and manufacture of spring-jack switches used in telephonic switchboards.** Daniel Sinclair and Frederick Alfred Stanley Wormull, Oxford-court, Cannon-street, London.

26774. **Improvements in conduit pipes for electric conductors.** Henry Edmunds, 47, Lincoln's-inn-fields London.

26776. **Improvements in devices for protecting electrical instruments or machinery from the effects of lightning or excessive voltage.** George Kemp and Edward Middlemiss, 45, Southampton-buildings, Chancery-lane, London.

NOVEMBER 26.

26811. **An improved method or means for the conversion of alternating into continuous or unidirectional currents.** Frank Michael Lewis and Bernard Page Scattergood, 30, Park-row, Leeds.

26828. **Improvements in electric accumulators or storage batteries and primary batteries.** John Dalrymple Bell, 121, West George-street, Glasgow.

26846. **Improvements in electric bell pushes or knobs.** Thomas Sanders, 77, Colmore-row, Birmingham.

26864. **An improved continuous-current machine operating by induction.** Max Brab, 70, Chancery-lane, London. (Complete specification.)

NOVEMBER 27.

23942a. **Improvements in electric switches.** Reginald Belfield, 322, High Holborn, London. (Alexander Jay Wurts, United States.) (Date claimed under Patents Rule 19, October 27, 1896.)

26911. **An automatic current and potential regulator.** New and Mayne, Limited, Palace-chambers, Westminster, London.

26947. **Improvements in electrical switches.** Max Byng and Francis George Bell, 73, St. Stephen's-road, Upton Park, London.

26965. **Improvements in means and apparatus for use in electrically lighting incandescent and other gas burners.** Frederick Richard Boardman, 55, Chancery-lane, London.

26969. **Improvements in frames for holding finely-divided mass such as the active material of electric accumulators.** Wilhelm Holzapfel, 433, Strand, London. (Complete specification.)

NOVEMBER 28.

27041. **Improvements in conduits for gas-pipes, electric wires or cables, and other analogous purposes.** William Sayer, Imperial-chambers, Albert-street, Derby.

27047. **Improvements in or connected with electric cable disconnecting boxes.** George Hinde Nisbett and William Boby, 15, Water-street, Liverpool. (Complete specification.)

27048. **An improved combined electric and hydraulic lift.** Percy Richard Julius Wallace, 55, Chancery-lane, London. (John Parkinson, United States.)

27049. **An improved combined electric and hydraulic elevator.** Percy Richard Julius Wallace, 55, Chancery-lane, London. (John Parkinson, United States.)

27053. **A new or improved insulator device for carrying vertical or similarly suspended electric cables.** Roslyn Holiday, 3, Burlington-arcade, Barnsley.

27128. **Improvements in electric tramways and railways.** Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (Riccardo Arno and Aristide Caramagna, Italy.) (Complete specification.)

27131. **Improvements in electrical apparatus for signalling to and from railway trains and locomotives.** Robert Burn, Alfred Charles Brown, and Leonard George Tate, 196, Green-lanes, Finsbury Park, London.

SPECIFICATIONS PUBLISHED.

1895.

18420. **Electrical apparatus for railway signalling.** Daniell.

22142. **Electric battery.** Falle.

22569. **Electric bell pushes.** Creasey and Breach.

22661. **Apparatus for indicating and recording electric supply.** Baron Kelvin.

22712. **Generating steam by means of electricity derived from dynamos driven by the steam generated.** Dunn and Dalrymple.

23097. **Electrical deposition of zinc.** Heathfield and Rawson.

23338. **Electric arc lamps.** Fisher.

23496. **Electric railways.** Belfield.

24471. **Devices for protecting electric circuits and apparatus from injury by excessive electrical potential due to lightning or other cause.** Fynn and Easton, Anderson, and Goolden, Limited.

24868. **Recording instruments for telegraphic and other purposes.** Baron Kelvin.

24888. **Hinges or joints for electrical purposes.** Goldring.

24892. **Regulators for dynamo-electric machines.** P. R. Jackson and Co., Limited, and Lewis.

24895. **Dynamo-electric machines.** P. R. Jackson and Co., Limited, and Lewis.

24949. **Electric arc lamps.** Allin.

1896.

64b. **Electric tramways or railways.** Krizik. (Date applied for under Patents Rule 19, January 1, 1896.)

879. **Electric measuring instruments.** Evershed and Vignoles, Limited, and Evershed.

7065. **Electric hammers and the like.** Lake. (Barnes and Skinner.)

17203. **Methods and means for electric regulation of power.** Gale and Thompson.

20505. **Electrodes for secondary voltaic batteries.** Imray. (Grindle.)

20600. **Electrodes for use in the production of the electric arc.** Deuther.

20601. **Electric furnaces.** Deuther.

20902. **Mechanism for electric arc lamps.** P. R. Jackson and Co., Limited, and Mensing.

21632. **Electric light fittings.** Donovan.

NOTES.

Lucium.—Mr. Crookes has been experimenting with salts of lucium, supplied to him by the patentee of that substance, and has come to the conclusion that it is not an element, but simply impure yttrium.

Obituary.—Mr. Francis Stradwick Harwood, superintendent of the Eastern Company's submarine telegraph station near Lisbon, died last Friday. He had resided in Portugal for over 25 years, and was much esteemed by the British community, the Portuguese authorities, and the numerous staff under his orders.

The Ionic Theory.—According to the results of H. Euler, given in the *Zeitschrift für Physikalische Chemie*, on warming a solution of benzoic acid the "ionisation" increases until 35deg. C. is reached, and then decreases. From this it is inferred that heat is absorbed by the change of the molecule into the ions at temperatures lower than 35deg., and evolved at higher temperatures. Meta-oxybenzoic acid has a maximum ionisation between 25deg. and 30deg.

Wireless Telegraphy.—It is stated in the *Shipping World* that the experiments in wireless telegraphy that Mr. W. H. Preece has been practising between the Penarth coastline and the signal stations on the Holms are to be resumed as soon as the weather permits. Last year Mr. Preece was enabled to interchange messages between the land near Lavernock Point and the lighthouse on the Flat Holm, and subsequently similarly successful efforts were carried out between the mainland of Lorne and the island of Mull.

Personal.—A dinner was given last Saturday at the Holborn Restaurant by the heads of the Ediswan sale departments to Mr. C. M. Downie in order to present him with a silver salver on the occasion of his resignation. Mr. Bishop (Birmingham) took the chair, Mr. Cox (Liverpool) the vice-chair, and complimentary speeches were made by Mr. Wheatley (London), Mr. Wyatt (Cardiff), Mr. Murray, Mr. Scarr, and others. Mr. Gover, the secretary to the Edison and Swan company, was unable to be present, but sent a telegram. The duties of secretary to the testimonial fund were performed by Mr. Scarr.

Foreign Patent Sales.—"With care and diligence one may be acquainted with the common law; but with the statutes, no man." The attention of owners and sellers of patent rights may therefore be called to the decision of the Court of Appeal that patent rights in New South Wales cannot be described as "property locally situate out of the United Kingdom" for the purpose of escaping duty under the head "conveyance on sale" in Section 1 of the Stamp Act, 1891. Patent rights, being "incorporeal," cannot be said to be "locally situate" anywhere. That is the theory, but neither the logic nor the justice of it are quite clear to the lay mind.

Exhibitions.—The Associated Chambers of Commerce have sent out a circular to the chambers informing them that Sir Stafford Northcote has been made the chairman of the commercial and industrial section of the Victorian Era Exhibition, 1897 (Earl's Court), and stating that its object is to bring together exhibits illustrative of the progress effected in different branches of British trade during her Majesty's reign as well as the present condition of the manufacturers of the United Kingdom. "It is understood," says the circular, "that exhibits which fulfil these conditions will be admitted free of charge for space." A meeting has also been held at the Mansion House, at which the Lord Mayor presided, to consider the steps to be taken to raise the necessary funds for securing an adequate representation of British art in the fine-art section of the forthcoming Brussels International Exhibition.

A Labour-Saving Appliance.—An American has invented an electrical door opener, and the Chicago *Electrical Journal* devotes more than two pages with three excellent illustrations and a diagram to explain how by stepping on the mat a contact is made which actuates mechanism causing the door to open. The complete installation includes a storage battery (110 volts), an electromotor with a worm gear, wires, switches, etc., besides the levers, pulleys, and other purely mechanical parts of the apparatus necessary to do the work. The cost of the arrangement is not stated, but our contemporary heads its article: "Successful Door Opener. The Hicks-Troy Mechanism of World's Fair Fame now Perfected and in Commercial Operation. Description of the Unique Mechanism." A captious critic might easily read that in a sense not intended. We know of old the American eye opener, but many of the American door openers we do not expect to see on this side of the Atlantic so long as a spring swing door can be successfully opened by a simple push.

Institution of Civil Engineers.—At the ordinary meeting last Tuesday Mr. John Wolfe Barry, C.B., F.R.S., the president, in the chair, two papers dealing with the treatment of coal at the surface of the pits were read. The first communication, on "Screening and Tipping Coal," by Mr. James Rigg, embodied an account of the various forms of screening and tipping machinery employed in recent practice. Great importance was now placed upon the preservation of coal from damage in loading, screening, and in transit. The rate of increase in the amount of coal raised in the United Kingdom for manufacturing purposes had greatly exceeded that for domestic use, so that the supply of coal per head of the population was now more than double its amount 33 years ago, while the population had barely increased 50 per cent. The second paper, by Mr. Thos. Gillott, M.I.C.E., was devoted to a description of "The Surface Plant at Kirkby Colliery." The papers will be for discussion next Tuesday, and, time permitting, a paper on "Steel Skeleton Construction in Chicago," by Mr. E. C. Shankland, M.I.C.E., will be read afterwards. There is a students' meeting on December 18 ("Well-Sinking," by Mr. Kitchen.)

Rontgen Radiations.—Prof. Silvanus Thompson says Röntgen radiations will not render solid insulators "leaky." If so, Prof. J. J. Thomson is wrong—and other people. But Prof. Oliver Lodge says that Prof. Silvanus Thompson is wrong, and that there is a distinct leak from a terminal buried in paraffin when the latter is under the influence of the rays. It is to be hoped that these eminent professors will settle the matter one way or the other, because it is so annoying for other people to frame theories or explanations founded on a particular fact and then to find that, after all, it is not true. As to gaseous insulators, Mr. M. A. Becquerel states that the invisible radiations from uranium salts will make them bad insulators just in the same way as the Röntgen rays. Further, Mr. Jean Perrin finds that the discharge in gases under the influence of the Röntgen rays is proportional to the absolute temperature, and independent of the pressure. (This would favour the idea that it is a dissociation phenomenon, and assimilate it to "ionisation" in a liquid.) Lastly, Prof. O. J. Lodge gives a useful hint in *Nature* to those who use a Wimshurst machine to produce the radiations. It is to remember that the machine will not work well when short-circuited.

The Metric System.—The Liverpool Chamber of Commerce has unanimously passed the usual resolution in

Digitized by Google

favour of the adoption of the metric system of weights and measures. The suggestion that the coinage should be decimalised by dividing the pound into thousandths has been revived. It will be held impossible for various reasons in England, but it has been carried out successfully in Egypt to the great convenience of those who dislike piastres and paras. Mr. Joseph Jonas has called attention to the fact that Watt (the great Watt) was the real inventor of a systematic decimalising of weights and measures, and publishes some interesting letters of Watt's on the subject. It is quite in accordance with custom for a thing to be invented in Britain and go to the Continent for adoption. When it has done that, those people who would not look at it in the first instance clamour for its importation. In this instance, as may be expected from its inventor, Watt's system would have worked out so as to give weights and measures of a much more convenient size than the metric system. In fact, it would seem that when the French took up the idea and carried it out, they more than half spoiled it with bad units and a pedantic nomenclature.

The Imperial Institute.—In the course of his lecture at the Imperial Institute last Monday on the subject of "The Diamond Mines of Kimberley," Mr. W. Crookes showed that if placed in highly-exhausted vacuum tubes, through which high-tension electric currents are passed, the diamonds from each of the South African mines possess a special characteristic phosphorescence. Under such conditions most South African diamonds shine with a bluish light. Diamonds from other localities shine with different colours, such as apricot, red, yellowish-green, or orange. We have known gentlemen who are usually described in South Africa as I.D.B.'s convicted, after pleading "found it in a spruit," on the ground that to an expert there is a difference in the colour of a mine and a river stone. Mr. Crookes's method carries the delicate question of identifying the origin of a stone yet a stage further. It is about one of the last ways in which one would have expected "high-vacuum" experiments to have a practical use. Mr. Crookes further said that large diamonds were not nearly so uncommon as was supposed. It is stated that the Imperial Institute authorities intend to commemorate the sixtieth year of the Queen's reign by holding an exhibition in connection with our national fisheries, and that the Duke of York has agreed to take an active share in the work of organisation.

Forthcoming Events.—To-day (Friday) the Physical Society meet at 5 p.m. at Burlington House ("Seismology" and "Musical Tubes").—There is also a meeting of the Astronomical Society.—To-morrow (Saturday) a meeting of Elmore's Copper Depositing Company has been announced (Cannon-street Hotel, 12 noon).—Monday (December 14) is the date for the Cantor lecture at the Society of Arts.—On Tuesday the Institution of Civil Engineers discuss last week's papers on colliery plant, etc., and if time permits take a paper by Mr. Shankland on "Steel Construction in Chicago" (Great George-street, 8 p.m.).—At the Wednesday meeting of the Society of Arts the subject is "The Chamber Music of Purcell, Handel, and Bach," by Arnold Dolmetsch (John-street, Adelphi, 8 p.m.). On the same evening (December 16) the Meteorological Society meet at 7.30 p.m. at the Institution of Civil Engineers, Great George-street, for papers on "An Attempt to determine Velocity Equivalents of Wind Forces estimated by Beaufort's Scale," by Richard H. Curtis, and on "The Winter Climate of Egypt," by H. E. Leigh Canney, M.D.—On Thursday there is a meeting of the Dundee Institute at Dundee.—Next Friday, December 18, at the Westminster Palace Hotel, the Junior Engineers take the paper on "Electric Central-Station Working," by Mr. P. W. McDougall, A.I.E.E., of Deptford, 8 p.m.—On Saturday, December 19, the North-East Coast Engineers meet at Hartlepool (6 p.m.) for a paper on "The Experimental Engines at the Durham College of Science, Newcastle-upon-Tyne," by Prof. R. L. Weighton.

Niagara.—The *Daily Telegraph* having failed in an attempt to present a testimonial to the United States Ambassador—which, if one could conceive him acceping it, would have driven some Americans frantic—has taken up the "beauties of Niagara" agitation. A "special correspondent" in New York has discovered that "a scheme is at work to spoil Niagara. Only a few days ago the American journals were rejoicing that at last the mighty giant was harnessed. Two or three years back a concern, calling itself the Niagara Falls Power Company, sought the right to intercept the current above the Rapids, and, by turning its energy into electricity, make dollars for themelves." Moreover, Chicago now sends her sewage (ultimately) into the Mississippi instead of into the lake. There are two columns of this sort of thing, but as our contemporary is rather behind the times in this special matter for an up-to-date daily one need not reproduce it. The right has been obtained, the work has been done, and the landscape and general amenities of the falls are none the worse for it. Moreover, all the world, except the *Daily Telegraph*, knows it. The Americans are quite capable of taking care of themselves, their country, their interests, and their ambassadors without our British assistance—and they very much prefer to do so. Why cannot our contemporary let them alone ?

Royal Institution.—At a monthly meeting of the members of the Royal Institution held last Monday, the special thanks of the members were returned to the Duke of Northumberland, president of the institution, for a donation of £200 to the fund for the promotion of experimental research at low temperatures; to Colonel Coleridge Grove for a bust of his father, the late Sir William Grove; and also to Prof. Dewar for a marble pedestal for the bust. Among the lecture arrangements before Easter are six lectures by Prof. Silvanus P. Thompson (adapted to a juvenile auditory) on "Light, Visible and Invisible"; Prof. Augustus D. Waller gives 12 lectures on "Animal Electricity"; Prof. Henry A. Miers, three lectures on "Some Secrets of Crystals"; and Lord Rayleigh, six lectures on "Electricity and Electrical Vibrations." Other lectures are by Dr. J. W. Gregory, Prof. Percy Gardner, Prof. W. Boyd Dawkins, Mr. Carl Armbruster, and Mr. W. F. Lord. The Friday evening meetings will begin on January 22, when a discourse will be given by Prof. Dewar; succeeding discourses will probably be given by the Bishop of London, Prof. Jagadis Chunder Bose, Prof. J. Milne, Dr. G. Johnstone Stoney, Lieutenant-Colonel C. R. Conder, Mr. Shelford Bidwell, Prof. Arthur Smithells, Sir E. Maunde Thompson, Sir W. Turner, Mr. C. T. Heycock, Lord Rayleigh, and others. The Davy-Faraday research laboratory, founded by Dr. Ludwig Mond, F.R.S., as a memorial of Davy and Faraday, is to be opened by the Prince of Wales on Tuesday, 22nd inst. The ceremony will take place in the theatre of the Royal Institution, where, by desire of his Royal Highness, Prof. Dewar will, after the opening ceremony, show experiments illustrative of the use of liquid air in scientific research.

Lenard Rays.—The paper read by Prof. Lenard at the German Association (Deutscher Naturforscher) gives an authoritative summary of his views as to the substantial identity of what are known in this country respectively as the Röntgen, Lenard, and cathode rays. The argument, put shortly, appears to be: Lenard and Röntgen rays have

Digitized by Google

mainly similar properties, therefore they are much the same; but Lenard rays are only cathode rays that have been got outside the tube through an aluminium window. Therefore they are all the same. But the Röntgen rays are ethereal vibrations either longitudinal or transverse. Therefore the cathode rays must be also of the nature of ethereal vibrations, and not a transfer of charged molecules. The writer does not accept the theory, but hopes he has stated it fairly above. The difficulty of devising and carrying out a crucial experiment to determine the point appears to lie in the impossibility of getting cathode rays unattended with Röntgen rays, using the latter term to mean radiations arising from the impact of cathode rays on some other substance. There is also the fluorescent light in the tube to be accounted for, and, in fact, any radiation produced by the collision of opposing streams of molecules. On the other hand, while the Lenard rays seem the same as the cathode rays, it is almost impossible to conceive how a molecule can penetrate the aluminium window—if they did, in time the degree of the vacuum would alter; nor is Sir George Stokes's suggestion that the impulse of the impinging molecule is transmitted through the thin plate and starts off another molecule from the outside surface much more easily acceptable. Should Prof. Lenard's theory prove the correct one, the priority of discovery of the Röntgen radiations will belong to him, leaving to Prof. Röntgen the discovery of their action on the sensitised plate and their practical application.

Telegraph Statistics.—The telegraphic statistics of various countries for 1895 have been summarised and tabulated in the *Journal Télégraphique*, which, as the official organ of the Bureau International, has exceptional means of obtaining information on the subject. So far as length of line goes, Germany comes first with 132,000 kilometres of line, as against France with 93,000, the United Kingdom with 59,000, and India with 71,000. If, however, length of wire is taken, the numbers are—Germany, 490,000; France, 317,000; United Kingdom, 369,000; and India, 219,000. It is not worth reproducing anything beyond the thousands, as now that 11 months have elapsed since the tables were compiled the figures must be already more or less obsolete. For her length of wire Germany had 20,723 offices open; France, 11,553; the United Kingdom, 9,926; and India, 4,046. Of the Indian offices, about two-thirds are scheduled as not receiving foreign messages. There is a similar distinction in Sweden and some other countries, but the proportion is not quite so great. Apparatus are tabulated as Morse, Hughes, and "other systems." The proportion of Morse to others in Germany is 16 to 12; in France, 12 to 6; and in the United Kingdom, 5 to 23. The numbers represent the thousands of instruments. With the exception of Holland, where it is nearly equal, and Roumania, where it is reversed, the Morse show a preponderance elsewhere. As to numbers of messages paid for—in Germany it was 24 million; France, 34 million; United Kingdom, 70 million; and India, 4 million; from which it will be seen that on the average the lines are more worked in this country than anywhere else, or, what is the same thing, the number of messages held to justify a line being erected is higher. The number of foreign telegrams sent were: Germany, 4¼ millions; France, 2¾ millions, and the United Kingdom 4½ millions. These do not include the messages that came through those countries. It is curious that the number of foreign messages received does not in most cases correspond so nearly with those sent as might be expected. The activity of the Germans in foreign trade compared with the French, however, makes itself sufficiently evident in the figures. It may be added that there are no statistics published as to Russia, and none for any of the South and Central American States. For the United States the figures of the Western Union Company are given, but they are not complete.

Accidents and Explosions.—An inquest has been held at Manchester on the death of an electrician named Thomson. Whilst laying electric wires along a ceiling of a factory, the wire he was handling caught a revolving shaft. The deceased was dragged off the scaffold, and the wire tying him on the shaft, he was dragged round till the machine could be stopped. A verdict of "Accidental death" was returned.—An electrician named George Thwaites has been admitted to the Royal Hospital at Belfast, suffering from injuries received while engaged at work in the electric light station. It seems that Thwaites, who is in the employment of Messrs. Holmes, of Newcastle-on-Tyne, was making some extensions on the switchboard, when he accidentally short-circuited the voltmeter leads of one of the dynamos. He was rather severely burned about the face and hands.—About 10 o'clock on Sunday night one of the telegraph street boxes opposite Charing Cross railway station blew up. The explosion appears to have been more violent than usual, but no one was hurt.—An extraordinary and almost incredible report has been published as to the boiler explosion at the electric carbon works at Nanterre, near Paris. It is stated that a crack developed in the boiler and was simply caulked with tarred paper. "As the water no longer escaped from the place where the fissure had been, the steam was brought up to the normal pressure." As we stated last week, the works were wrecked.—When the fire occurred at St. George's, Hanover-square, some three or four weeks ago it was reported that the cause was "fusion of the electric wires." An examination by experts has shown that this could not have been the case. Except on the principle of when you don't understand a thing say it is done by electricity, there appears to have been no foundation for the rumour.—In reference to the bursting of a hydraulic main on St. Andrew's-hill on Sunday week, and the consequent flooding of the transformer sub-station, the Rev. Mr. Clementi Smith has written another letter in which he practically says that he got his idea that there would be "an explosion" from one of the City of London Company's servants. It is easy to suppose that both the police inspector and the reverend gentleman got somehow an exaggerated idea of the danger (to the public) that could possibly ensue, but Mr. Clementi Smith should have enquired further before summarily demanding the abolition of underground transformer sub-stations.

Societies and Institutes.—The *Times* said that Lord Rayleigh's retirement from the council of the Royal Society was "significant." Lord Rayleigh promptly wrote, "Permit me to say that my retirement is significant only of a desire to escape engagements involving journeys to London and of a possibly mistaken impression that the position of an ex-secretary as an unofficial member of council would be a little anomalous." *Nature* takes the *Times* to task in a very high manner about it. In a dispute between two such august institutions as the *Times* and the "Royal" most people would not hurry to intervene. It may be added that the other night Sir Walter Besant called the Royal Society a trade union or a mediæval guild—he did not seem quite certain which. But a great novelist may call anybody anything.—On Saturday night Sir Edwin Sandys Dawes delivered his presidential address to the members of the Institute of Marine Engineers. There was a conversazione afterwards.—At last week's meeting of the Society of Chemical Industry, Dr. Schunck presiding, Dr. Stevenson Macadam, of Edinburgh, read a communication on safe and unsafe mineral oils for domestic lighting

Digitized by Google

His point was that there was no real necessity for the use of unsafe oils.—Last Saturday about 50 members of the Liverpool Engineering Society paid a visit to the Liverpool Gas Company's new works at Garston, and inspected the plant which has recently been laid down there.—At a meeting of the Royal Colonial Institute held on Monday Sir Harry H. Johnston read a paper on "England's Work in Central Africa." The chair was taken by Lord Loch, who, speaking of Lake Nyasa and Lake Tanganyika, said he believed they might look at no distant date for a settlement of those vast regions which would bring them into telegraphic and other means of communication right up through the centre of Africa to Gondokoro and Khartum. (Telegraphic communications have not been very good lately even in some parts of Rhodesia.)—The Glasgow Philosophical Society have presented Lord Kelvin with an address, and placed him on the roll of honorary members. A bust of Lord Kelvin was presented to the society, and the subscribers also presented a replica of it to Lady Kelvin. The address from the Institution of Electrical Engineers was read, and then there were votes of thanks.—Lord Rayleigh and Prof. Ramsay have been elected corresponding members of the Berlin Academy of Sciences.—A list of some meetings and fixtures for next week is given in another note.

A High-Tension Shock.—Dr. W. S. Hedley, of Mansfield-street, in a letter to the *Lancet* has given some particulars of a 2,500-volt shock which came under his notice : "On November 20 an electrical engineer was standing on a chair ready to move a reversing switch on the arc lamp side of a rectifier for lighting a series of 60 lamps (3,000 volts). He casually placed his hand on the metal cover of an ammeter (which was in series with another 60-lamp circuit), and turning to the left and leaning back to make an observation (still standing on the chair) he placed his left hand on an iron pillar. Now the ammeter case proved to be in metallic contact (accidental) with the light leads, and as the return wire was 'earthed' there played through the body from hand to hand a current under a pressure of (nominally) 3,000 volts. As a matter of fact, the E.M.F. tested between the points of contact by a Kelvin electrostatic voltmeter proved to be 2,500 volts. He says that the first thing he realised was that he found himself standing on the floor, but has no clear idea as to whether he jumped off or was 'knocked off.' The forearm was 'drawn up close to the chest,' and the hands clenched. From a little above the elbow downwards he described a 'feeling of pulsation' and a violent beating in exact step with the alternators (running 83 periods per second). All power of movement below the elbow was absolutely lost, but the arm at the shoulder could be moved from the side. The pulsations, although still retaining their periodicity, soon became less violent, and motor power returned successively in the muscles that move the elbow, wrist, and fingers. In three minutes he felt 'none the worse.' There was no sensation of burning at the moment, but 10 minutes afterwards the hands became painful, and examination showed a burn on the tip of the middle and ring fingers (l) and on the back of the little and ring fingers (r) with a seared line across the lower portion of the palm. There has been no other effect excepting that he expresses himself as feeling 'decidedly better in general health.'" As to the violent beating in exact step with the alternators, there must be surely some mistake. There is generally a false sensation after any exceedingly strong impression on the nerves which persists some time after the cause has ceased, but 83 impulses per second (it should really be 166) are much too rapid to be separately appreciated. It may be added that Dr. Hedley estimates after experiments that the current taken was about a quarter of an ampere, but of course the resistance of hand contacts of such a character as described above is not a matter that can be determined with any accuracy.

Motorcarts.—The Scotch Office has been decidedly behind both England and Ireland in getting out its motor-car regulations, but Lord Balfour, Secretary for Scotland, has now issued them. There are differences in the speed allowed, which is lower than elsewhere in the United Kingdom. Under Article 4 of the Scotch regulations a person driving or in charge of a "light locomotive" when used on the highway "shall not, under any circumstances, drive the light locomotive at a greater speed than 10 miles an hour. If the weight unladen of the light locomotive is one ton and a half and does not exceed two tons, he shall not drive the same at a greater speed than eight miles an hour, or if such weight exceeds two tons at a greater speed than five miles an hour. Provided that whatever may be the weight of a light locomotive, if it is used on any highway to draw any vehicle he shall not, under any circumstances, drive it at a greater speed than six miles an hour.' In reference to Mr. Lawson's audacious proposition of a motorcart "Derby," Mr. Dorling, the managing director to the Epsom Grand Stand Association, says that no motorcar races will ever take place on Epsom Down. Of course not; such a gross betrayal of the "noble animal" is not to be imputed to his closest friends and admirers. The Automobile Club are going to have a heavy motorcart race in France next summer on the lines of the Paris and Marseilles race of this year. The *Daily Mail* says people who drive motorcarts with them should not leave their whip at home. It is not suggested that they want it to whip the motor, but for the boys who otherwise will "ride behind." News goes slowly in the Welsh marches, and the General Purposes Committee of the Oswestry Town Council has just presented a recommendation that the Board of Trade be requested to make regulations under the Locomotives and Highways Act limiting the speed of motorcarts at Oswestry to six miles per hour. Even Scotland has got its regulations by this time. However, the matter was duly debated, and an amendment that the speed allowed be eight miles an hour was rejected. According to *Invention*, the biggest motor vehicle in the world is in Australia; but it came from America, so that continent does not lose its monopoly of the biggest things. It is to run from the coast to Coolgardie, and to condense its exhaust so effectually as not to require to take in water on its 400-mile journey. It is to be hoped this is more authentic than the original Parisian motorcar we spoke of last week. Finally, the *Engineer* has come out with an article condemning all existing designs of motor vehicles. The right way of doing things is not to take up existing types of vehicles, remove the shafts, and couple an oil-engine to the hind wheels. The combination is simply ungainly. "The motorcar of 1896 is very far from possible perfection. It is little more, indeed, than a gas-engine in a cart, after all."

Electric Ploughs.—About three weeks ago the Establissements Maguin Company invited a large number of sugar-makers and agriculturists to Charmes to witness some electric ploughing trials. The trials were made in a large field belonging to Mr. Landrin, who, besides being largely interested in agriculture round Charmes, is the director of the Bertaucourt-Epourdon Sugar Works. According to a report of the experiments in the *Revue Industrielle*, the source of power was an ordinary farm portable engine, which was belted to a dynamo giving between 35 and 40 amperes at 500 volts (the engine must therefore have been about 30 h.p.). The dynamo ran at 800

Digitized by Google

revolutions, and the current was taken by bare wires carried on rough improvised posts or stakes with porcelain insulators. The plough was a two-share one and reversible, being of the same type as those used for steam cultivation. On the plough is mounted a motor running at 400 revolutions, which by intermediate gearing works a windlass, round which passes a chain. Except for the loops on the windlass the chain is stationary, and is fixed at the end of the field to a movable anchor with a very broad flake. (A wheel anchor of the Howard type would probably have been better, but would be much more costly.) The motor thus gets a firm pull against the chain, and the motion of the latter is at the same time reduced to an absolute minimum. The speed attained by the plough is stated to have been about 75 yards per minute, or "about five times as fast as oxen" (plough oxen are too slow for anything). A rather deep furrow was drawn. The breadth of the work is not specifically stated, but the amount got through was nearly five acres in a 10-hour day. A direct comparison with existing agricultural practice on the basis of these figures is not easy, as a slight difference in the character of soil, the shape of the plough breast, and the way the work was done would so largely affect the result. But it may be taken that on ordinary land two horses drawing one share would do an acre in an agricultural working day, which, if meal times are deducted, is less than 10 hours. We have therefore, roughly, about 30 (steam) horse-power at the engine doing the work which would be accomplished by 10 actual horses, a result which, if one compares it with some electric tramway work, is for a first attempt far more promising than it looks. The method adopted—*i.e.*, that of warping along a chain—is, as has been pointed out here before, undoubtedly the right one, but some of the details would be easily capable of improvement. The motor, for instance, in these experiments was fed by trolleys running on copper wires carried on stakes running parallel to the furrow, and which would obviously require shifting almost every time the plough crossed the field. An insulated cable coiling on a drum slightly larger than the hauling windlass would be a decidedly better feed, and if a wire rope were used for haulage instead of a chain, the uninsulated return might be through that. Lastly, it should be said that our contemporary claims for this method of mechanical ploughing that it is the realisation of an idea of Mr. Felin, of Sermaize, brought out more than 10 years ago. What that idea was we do not know, but if it was running the plough on a stationary chain rather than a moving rope, it was carried through the experimental stage in England long before that, but, of course, as it was never brought into practical use the invention would be an independent one, and would naturally arise in France, where there is a regular system of steam towing on that principle on some of the rivers. It is to be hoped that the facilities which the electric motor affords for its application to ploughing will result in rendering mechanical cultivation something more than the half success it has hitherto been.

Technical Education.—Sir Philip Magnus, in distributing the prizes on Wednesday night to the successful students of the Norwood Technical Institute, spoke on technical education, and reviewed the history of the polytechnic institutes in London and the provinces. His speech is interesting, as he estimated the amount spent on evening teaching, exclusive of interest on capital outlay for buildings, at over £175,000 a year. London institutes gave facilities, not only for technical, but also for literary and general education which were not obtainable on the same scale and on similar lines in any other capital in the world. As regarded both secondary education and the higher scientific training, we were still very far behind our German and Swiss competitors. Sir Philip commended the advice given by Sir William Hart Dyke in a letter to the *Times* that we should appeal to the patriotism of county and county borough councils, and look to those bodies, or to their education committees, acting in a judicial capacity and with *quasi*-magisterial responsibility, to receive and distribute among necessitous schools, whether Board or Voluntary, the grants in aid entrusted to them by the State. [But the average town councillor does not even know what "technical education" really means. What he likes is "a slap-up institute" which will look a "credit to the borough."] With regard to secondary education, nothing could have been more satisfactory than the reply of the Duke of Devonshire to the deputation which waited upon him on November 25. Sir P. Magnus ended with a panegyric on the virtues of the German clerk. Mr. Morley spoke on the same subject the same evening at Battersea. He defended party politics on the ground of the pleasure they afforded in the way of good oratory and taking sides [one may pay too dear for pleasure], and then came to business. In London, on polytechnics and similar institutions, a capital had been sunk of something like half a million of money; the annual revenue of these institutions amounted to £100,000 a year, of which no less than £25,000 came from the fees of students and members and £9,000 from money earned by the efforts of the students. Those who had studied the educational question seriously were aware that a London polytechnic was not the same thing as the German polytechnic. In German polytechnic institutions the students learned the highest, most important, and profoundest principles in connection with the scientific subject which they there studied. Their object in the London polytechnic institutes was a different one. It was that the craftsman, the man who made things and did things with the labour and the skill of his hand, should have opportunities brought within his reach of training, not merely in the mechanical details, but in the principles and the basis of his work. One very often heard of the workmen being complained of; but it was now being seen that the leaders and captains of industry, especially the employers and the heads of great manufacturing enterprises, must open their minds to the improving of scientific investigation and research and training both for the heads of the enterprises as well as for those who had the actual conduct and the carrying of them out. He thought that those great manufacturers had received a rather useful little fright about German competition. Englishmen seemed to him never to enjoy themselves so thoroughly as when they were in a panic. Mr. Morley quoted Mr. Mather to the effect that what was needed in various branches of engineering was more science, more accuracy, and more intelligence in the chiefs, managers, and foremen, and those who had to carry out the work. Too much attention was paid to athletics and sports in England. [This is not wholly confined to the "gentlemanly" classes.] The end of the speech was about a reform of the London University. If they were going to create a university in London, let them open the gates as wide as they possibly could. They had heard of librarians whose chief function was to prevent people from getting out books. Do not let them have a university the chief function of which was to prevent young men and women from taking degrees. In conclusion, he thought that there were two great superficial curses of our time in this country—our "secularity" [What does Mr. Morley mean by this?] and triviality. All this is, of course, the "literary" view of the matter. It is probably not much more wrong than the "practical man's" view.

THE PRINCIPLES OF ALTERNATE-CURRENT WORKING.*

BY ALFRED HAY, B.Sc.(EDIN.), A.I.E.E.

(Continued from page 601.)

108. Consider a circuit made up of a conductor consisting of two hollow coaxial cylindric shells s_1 and s_2, as shown in longitudinal and transverse sections in Fig. 76. We may imagine the cylindric shells to be two thin tubes of copper placed coaxially and bent into the shape shown, the space between the tubes being filled with some insulating material which serves to keep them apart. Let the ends of the tubes or shells be connected by means of copper plates P_1 and P_2 soldered to them, and let a steady E.M.F. be introduced into the circuit so formed.

We have here the case of two circuits, s_1 and s_2, joined in parallel to a source of steady E.M.F. Let us investigate the law of growth of the current in each of the two circuits.

For the sake of simplicity, we shall suppose the cross-sections of the shells to be the same, so that both shells have the same resistance, say r. The magnetic field due to the current in s_1 is entirely confined to the region outside the inner boundary of this shell; similarly, the magnetic field due to the current in the outer shell s_2 is entirely confined to the region outside the inner boundary of that shell. From this it is at once obvious that the inductance

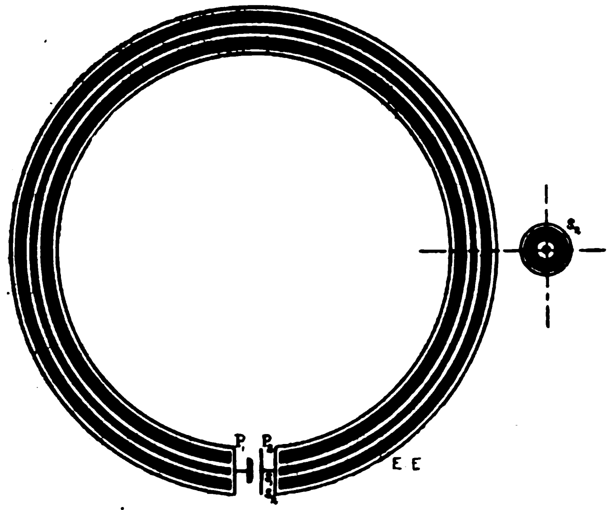

FIG. 76.

L_1 of s_1 is greater than L_2, that of s_2; for a unit current in either shell will produce the same magnetic flux outside the shells; and besides this flux, the current in s_1 produces a magnetic flux in the space between the two shells, whereas the current in s_2 produces no such flux. It is also at once obvious that the whole of the flux through the circuit s_2 must pass through the circuit s_1; in other words, the mutual inductance M of the two shells is equal to L_2, the inductance of the outer shell.

Since the two shells have the same resistance, but the outer shell a smaller inductance, we should expect (Art. 34) the rise of current to its steady value to be more rapid in this outer shell. Besides the effect of (self) inductance, however, we have also to consider that produced by the mutual inductance of the two shells.

Let E denote the steady E.M.F. simultaneously applied to the two shells. In each shell we have three E.M.F.'s, the sum of which must equal E. These three E.M.F.'s are:

(1) The $r\,i$ E.M.F., due to the resistance of each shell.

(2) The induced E.M.F. in each shell due to the changing magnetic flux produced by *its own* current.

(3) The induced E.M.F. in each shell due to the variation of magnetic flux caused by the current in *the other* shell.

If i_1 and i_2 stand for the instantaneous values of the currents in the shells s_1 and s_2 respectively, i_1' and i_2' for their rates of change, then we have the equations:

$$r\,i_1 + L_1\,i_1' + M\,i_2' = E;$$
$$r\,i_2 + L_2\,i_2' + M\,i_1' = E;$$

* Based on a series of evening lectures delivered at the University College, Liverpool.

which now take the place of the equations (α) and (β) of Art. 105. Now since $L_2 = M$, we may insert this value for L_2 in the second equation. Subtracting the second equation from the first, we obtain

$$i_1' = \frac{r\,(i_2 - i_1)}{L_1 - M}.$$

Again, multiplying the first equation by M, the second by L_1, and then subtracting the second from the first, we find

$$i_2' = \frac{E}{M} - \frac{r\,(L_1\,i_2 - M\,i_1)}{M\,(L_1 - M)}.$$

Using these equations and applying the step-by-step process explained in Art. 106, we may plot the curves showing the rise of current in each of the two shells.

109. The expressions obtained for i_1' and i_2' at once indicate a remarkable fact. At the commencement, when the time $t = 0$, and $i_1 = 0$, $i_2 = 0$, we find $i_1' = 0$, $i_2' = \frac{E}{M}$. In other words, while *the current in the outer shell s_2 at once begins to rise at a rapid rate* $\left(\frac{E}{M}\right)$, *the current in the inner shell does not begin to rise until the current in s_2 has reached a sensible value.* The curve showing the rise of current in the outer shell will make a certain angle with the axis of time at the origin, whereas the curve for the inner shell will be *tangential* to the axis of time, as shown in Fig. 77.

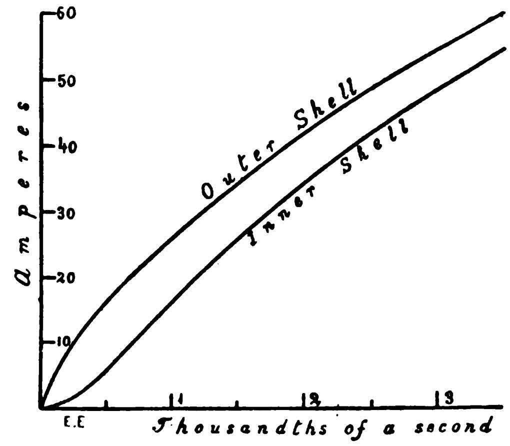

FIG. 77.

110. We shall apply these results to a numerical example Let $r = \cdot001$; $L_1 = 2{\cdot}5 \times 10^{-6}$; $L_2 = M = 2 \times 10^{-6}$, and let $E = \cdot1$. We then find

$$i_1' = 2{,}000\,(i_2 - i_1),$$
$$i_2' = 5 \times 10^4 - 1{,}000\,(2{\cdot}5\,i_2 - 2\,i_1).$$

Using the step-by-step process already explained (Art. 106) we obtain the following set of values:

$t =$	0	10^{-4}	$2{\cdot}33 \times 10^{-4}$	$4{\cdot}57 \times 10^{-4}$	$6{\cdot}75 \times 10^{-4}$	$9{\cdot}4 \times 10^{-4}$
$i_1 =$	0	0	1·33	5·21	9·47	15
$i_2 =$	0	5	10	15	20	25
$t =$	$12{\cdot}26 \times 10^{-4}$		$15{\cdot}27 \times 10^{-4}$	$18{\cdot}58 \times 10^{-4}$	$22{\cdot}1 \times 10^{-4}$	26×10^{-4}
$i_1 =$	20·8		26·3	32·1	37·7	43·3
$i_2 =$	30		35	40	45	50

These results are plotted in Fig. 77. The student will see that the rise of current is much more rapid in the outer shell.

111. Instead of two coaxial cylindric shells, let us next consider a *solid* cylindric conductor. Imagine the conductor split up into a large number of thin cylindric shells. The results deduced above may be applied to each pair of shells, and we are thus led to the conclusion that when a P.D. is established between the two ends of a cylindric conductor, the current rises in the surface layers of the conductor first, and only when it has attained an appreciable value in these surface layers does it begin to penetrate deeper into the conductor.

Digitized by Google

Similar considerations hold good for a conductor of any shape. The current always starts from the *surface* layers and gradually becomes diffused over the whole cross-section of the conductor.

112. We next proceed to consider the problem of two circuits having mutual inductance, a simple harmonic impressed E.M.F. acting on one of the circuits.

Let r_1, L_1 and r_2, L_2 denote the resistance and inductance respectively of each circuit. We shall assume that the currents i_1 and i_2 in the two circuits follow the simple harmonic law, and that the current i_2 lags behind i_1, so that we may write

$$i_1 = I_1 \sin p\,t,$$
$$i_2 = I_2 \sin (p\,t - \theta).$$

If we suppose that e stands for the instantaneous impressed E.M.F. in the first circuit, then, by the principles explained in Art. 105, the currents must satisfy the equations

$$\left.\begin{array}{l} r_1 i_1 + L_1 i_1' + M\,i_2' = e \\ r_2 i_2 + L_2 i_2' + M\,i_1' = 0 \end{array}\right\} \quad . \quad . \quad . \quad (\epsilon)$$

where M is the mutual inductance of the two circuits.

Since we suppose i_1 and i_2 to follow the simple sine law, i_1' and i_2' will, by Art. 22, follow the same law, and their amplitudes will be $p\,I_1$ and $p\,I_2$ respectively. If we draw two rotating vectors, O A and O B (Fig. 78*a*), of lengths I_1 and I_2 respectively, and making an angle θ with each each other, then, supposing the angular velocity in a counter-clockwise direction to be p, the projections of these rotating vectors on the vertical axis will give the

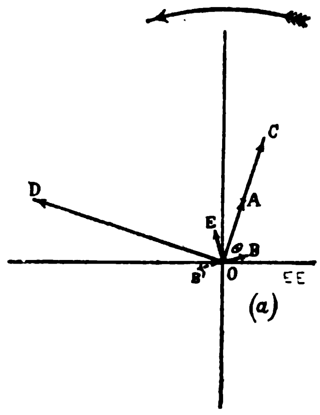

FIG 78A.

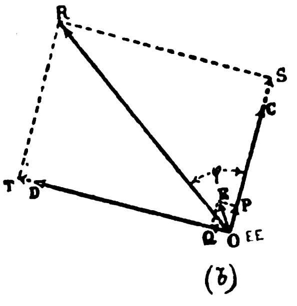

FIG. 78B.

instantaneous values of i_1 and i_2. The projection of a rotating vector O C, of length $r\,I_1$, will give the instantaneous value of the $r\,i_1$ component of the impressed E.M.F. The projections of two other vectors, O D and O E, of lengths $L_1 p\,I_1$ and $M\,p\,I_2$, and drawn at right angles to O A and O B respectively (Art. 22), will give the instantaneous values of the $L_1 i_1'$ and $M\,i_2'$ components of the E.M.F. respectively. By the first of the equations (ϵ) above, the sum of the projections of O C, O D, and O E on the vertical axis at any instant must give the value of the impressed E.M.F. at that instant. The amplitude of the impressed E.M.F. is therefore represented by the length of the rotating vector which is the resultant of the three vectors O D, O C, and O E.

In order to find this resultant, we replace the vector O E by two components (Art. 11), as shown in Fig. 78*b*, one of which, O P, is along O C, while the other, O Q, is along O D. By Art. 12, we have

$$O\,P = O\,E \cos P\,O\,E = M\,p\,I_2 \sin \theta,$$
and
$$O\,Q = O\,E \cos Q\,O\,E = M\,p\,I_2 \cos \theta.$$

Adding O C and O P, we obtain the vector O S; adding O D and O Q, we obtain O T, where

$$O\,S = r\,I_1 + M\,p\,I_2 \sin \theta,$$
$$O\,T = L\,p\,I_1 + M\,p\,I_2 \cos \theta.$$

Finally, compounding O S and O T, we obtain

$$O\,R = \sqrt{\overline{O\,S}^2 + \overline{O\,T}^2}$$
$$= \sqrt{(r\,I_1 + M\,p\,I_2 \sin \theta)^2 + (L\,p\,I_1 + M\,p\,I_2 \cos \theta)^2} \quad . \quad (l)$$

We have thus found the amplitude O R of the impressed E.M.F. in terms of I_1, I_2, and θ.

We next construct a vector diagram for the second circuit. This is shown in Fig. 79, in which $O\,L = r_2\,I_2$, $O\,M = L_2 p\,I_2$, $O\,N = M\,p\,I_1$; O M and O N being at right angles to O B and O A respectively. By the second of the equations (ϵ) above, the sum of the projections of O L, O M, and O N on the vertical axis at any instant must vanish. Hence the resultant of the vectors O L, O M, and O N must equal nothing. Proceeding as in Fig. 78*b*, we find that

$$O\,N \cos \theta + O\,M = 0,$$
and
$$O\,N \sin \theta = O\,L;$$

or, since $O\,L = r_2\,I_2$, $O\,M = L_2 p\,I_2$, and $O\,N = M\,p\,I_1$,

$$M\,p\,I_1 \cos \theta = -\,L_2 p\,I_2 \quad . \quad . \quad . \quad (m)$$
$$M\,p\,I_1 \sin \theta = r_2\,I_2 \quad . \quad . \quad . \quad . \quad (n)$$

Squaring these two equations, and adding, we get

$$I_2 = \frac{M\,p\,I_1}{\sqrt{r_2^2 + p^2 L_2^2}} \quad . \quad . \quad . \quad . \quad (o)$$

Again, dividing the second equation by the first, we find

$$\tan \theta = -\,\frac{L_2 p}{r_2}.$$

The angle of lag θ of the current i_2 behind the current i_1 is therefore greater than π (since its sine is positive and its cosine negative), and the actual position of the rotating vector O B is as shown by the dotted line O B′ in Fig. 78.

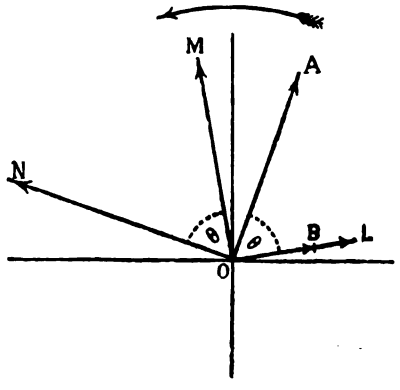

FIG. 79.

113. Using equations (l), (m), (n), and (o) of the preceding article, we may express everything in terms of the amplitude E (= O R, Fig. 78*b*) of the impressed E.M.F., and the resistances and inductances of the two circuits. We thus find

$$I_1 = \frac{E}{\sqrt{\left(r_1 + \dfrac{r_2 p^2 M^2}{r_2^2 + p^2 L_2^2}\right)^2 + p^2 \left(L_1 - \dfrac{M^2 p^2 L_2}{r_2^2 + p^2 L_2^2}\right)^2}} \quad (s)$$

Again, if ϕ denote the angle by which i_1 lags behind the impressed E.M.F., we see from Fig. 78*b* that

$$\tan \phi = \frac{p\left(L_1 - \dfrac{M^2 p^2 L_2}{r_2^2 + p^2 L_2^2}\right)}{r_1 + \dfrac{r_2 p^2 M^2}{r_2^2 + p^2 L_2^2}} \quad . \quad . \quad . \quad . \quad (t)$$

From equations (s) and (t) it is evident that if, while a simple harmonic E.M.F. of amplitude E is applied to a circuit of resistance r_1 and inductance L_1, another circuit, of resistance r_2 and inductance L_2, be brought near the first circuit and placed in such a position that their mutual inductance is M, then the first circuit behaves as if it had a resistance

$$r_1 + \frac{r_2 p^2 M^2}{r_2^2 + p^2 L_2^2},$$

and an inductance

$$L_1 - \frac{M^2 p^2 L_2}{r_2^2 + p^2 L_2^2}.$$

In other words, the apparent resistance of the first circuit

Digitized by Google

is *increased*, and its apparent inductance *diminished*, by the presence of another closed circuit in its neighbourhood.*

(To be continued.)

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 629.)

In certain cases absolute block working is not necessary in consequence of the character of the traffic dealt with, and is undesirable on account of its volume and the necessity for dealing with it in comparatively large batches. Such cases have to be dealt with in a different way. In many cases block working is dispensed with altogether, and the various trains signalled by bell only. In other instances a modified form of signalling, known generally as the permissive block, is made use of. Practically speaking, it is not entitled to the name, since no attempt is made to preserve the space limit between successive trains, which is the essential feature of the absolute block system. Probably two or three instances of actual use of this system, with the advantages obtained, will do more towards showing the necessity for, and the benefit accruing from, this method of working than anything else.

the section is further enhanced if a curve exists on the line or fog prevents the whole of the section being visible to the men at each end.

The instrument shown by Fig. 97 is used as an indicator of the state of the lines in the section A B at H. It is simply an ordinary S N block instrument, such as is used for absolute block working in other places, but differs in the lettering of the dial, and in provision being made to peg the handle in a *vertical* position as shown, in addition to the two ordinary positions on either side of the vertical. The dial is lettered on the upper left hand quadrant "Line occupied," and on the upper right-hand quadrant "Line clear." The lower half is lettered "Line blocked." Signals are given between A and B by means of separate bell communication in exactly the same manner as for absolute block working. If A transmits the "Is line clear" or "Be ready" signal to B on the bell, the response of the latter will depend upon the actual condition of the line. If the line is clear of trains, B will reply as per code, and peg the needles to "Line clear." If the line is already occupied, B replies to the bell signal as before, but pegs the needle to "Line occupied." These are the preliminary signals, corresponding to the "Line clear" signal in absolute block working, which are given on the approach of a train to A, and upon the answer given by B to this signal depends the action taken by A in forwarding the train into the section. If the needles are pegged to

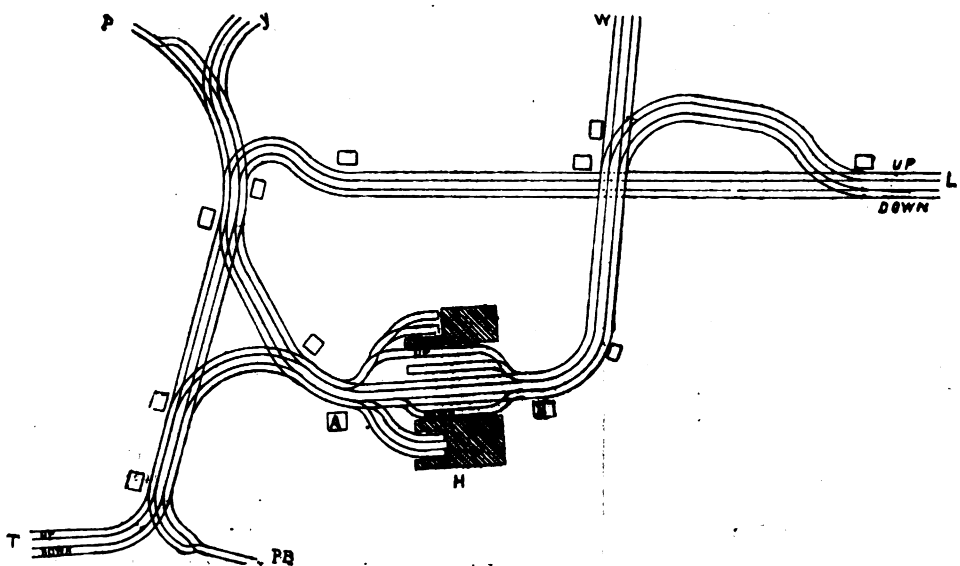

FIG. 96.

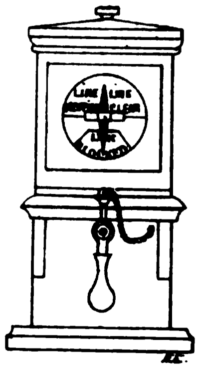

FIG. 97.

Three examples of lines on which permissive block working is in use are shown by Figs. 96, 98, 100. In Fig. 96, the passenger station, H, is the virtual junction for trains from T, P B, P, Y, W, and L. Trains arriving at H from P, Y, P B, and W proceed no further, and passengers travelling by these trains, *en route* for T or L, are transferred to other trains at H. It frequently occurs that a train from T is at the up platform when trains from P, Y, and P B which require to connect with it arrive. Hence these trains must pull up to the same platform, in order that passengers who desire to change for L may do so, the bays being too short and not sufficiently numerous to accommodate the later trains. Similarly, trains from W arrive on the down line with passengers to connect with a train already at the platform ready to proceed to T, Y, P, or P B. Hence block signalling, as commonly understood, cannot be carried on between A and B (Fig. 96).

If bell signals only are used in such a section, considerable responsibility rests upon the signalmen, and great care has to be exercised in order to ensure that trains shall not enter the section from either end at too high a speed in the event of the line being already occupied. Under such circumstances the signalmen have no reminder of the condition of the lines other than that afforded by the bookings in their train-books, and the danger of sending trains into

"Line clear," the signalman at A will lower the home signal, and allow the train to pass in the usual way. If the needles are pegged to "Line occupied," the train must be sent forward at caution, the home signal being kept at danger, and the train being brought forward by hand or other special signals. On the train entering the section A B, the usual "Train on line" signal is sent by A, and B, in response, unpegs the needles from "Line clear" or "Line occupied," as the case may be, and pegs the handle of his instrument in its vertical position, when, the needles at B and A being vertical also, the indication exhibited at both cabins is "Line blocked." As successive trains pass out of the section the "Train out of section" signal is given for each, as in the absolute system, the handle being pegged in the vertical position at the receiving end afterwards for all trains except the last one of any group of trains. When the last of any group leaves the section, it being then clear, the handle is unpegged, but the indication shown by the needles is unchanged and remains at "Line blocked." The difference of the indications, section clear of trains, and section occupied at the receiving end of the section, consists in the position of the peg for the handle, except during the time "Line occupied" or "Line clear" is being exhibited. In the first case the peg is inserted, as shown by Fig. 97; in the second case it hangs in front of the instrument by the chain to which it is attached. The right and left indications of the needle simply show that permission has been given for a train to enter the section: in the first case it may run straight in without

* Provided, of course, the two circuits are so placed that there is mutual inductance between them. If $M=0$, then, as the above equations show, the presence of the second circuit does not in any way affect the first.

Digitized by Google

stopping; in the second case it is to be sent in at caution, it being an additional train.

In many cases it is often difficult for the signalman to communicate a hand signal to the driver of a train standing at the home signal. Obstructions to such signals being seen may arise from another train, standing on the opposite line, being between the driver of the train signalled and the signalman, and in this case the use of a hand signal, especially at night, is liable to be accepted by some other train than the one it is intended for. In such cases, subsidiary mechanical signal arms, or "calling on" signals, are fixed to the same post as the home signal, and are used as a signal to proceed at caution. These signals are, of course, used on the occasions when the "Line occupied" signal is exhibited, the ordinary home signal being used when "Line clear" is shown on the indicators.

It will be observed that this instrument has no provision for showing the number of trains signalled into or accepted in the section, and the signalman at the receiving end must, when conditions exist which prevent his seeing the whole of the section, rely upon his train-book for the information upon which depends his answer to any "Is line clear" or "Be ready" signal that may be offered for his acceptance.

Fig. 98 represents a section of line which, between the points A B, is worked partly by absolute and partly by the permissive system. The sidings shown constitute an important goods and mineral traffic distributing point. The lines between A and B are five in number, two of which constitute the main line, and are worked under absolute block rules; two are up and down independents, and are worked under permissive block rules, whilst the fifth line is a connecting link between the distributing sidings at A and a goods centre at B, and is not worked under any block rules. The construction of the distributing sidings is not such as to afford room for the shunting of more than one train at a time, and it is, therefore, of some importance to get completed trains out of the way as quickly as possible. Such trains are sent to B on the up independent lines, and, being worked under permissive rules, the traffic is dealt with in a much quicker and more effective fashion, since the departure of completed trains from the neighbourhood of the shunting ground is not dependent upon the absence of traffic on the main line, as it would be if the independent line did not exist, and the trains emerged direct on to the main line at A. The arrangement is such as to make B the virtual junction for the distributing sidings on the up side, with the further advantage that such trains complete a portion of their journey at the same time as traffic, which would otherwise delay them, is being carried on on the main line. Trains emerging on to the main line at B come under absolute block rules during their further progress. In a similar way, trains on the down line enter the down independent at B, and run direct to the distributing sidings at A, without further interference with the main line. The use of permissive block rules for the independents is obviously of more use for clearing the main line of a number of trains at such junctions as A and B for more important traffic than if the independents were worked under absolute block rules, since a number of trains may be put on the independent, instead of waiting till the line was clear of the previous train.

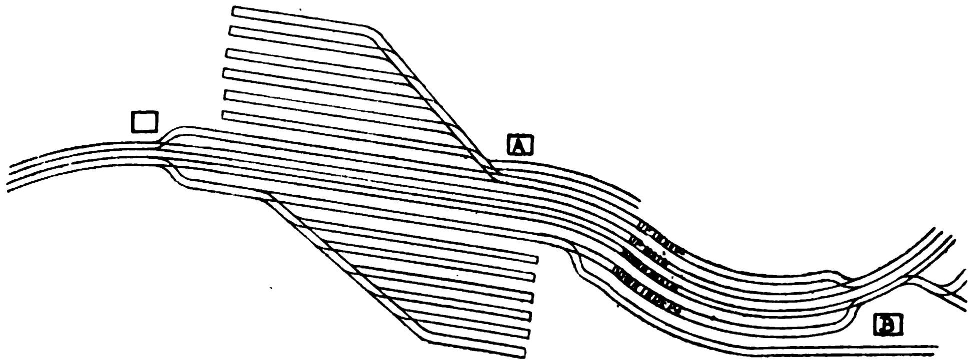

Fig. 98.

The form of instrument used at the receiving end of the section between A and B (Fig. 98) is shown by Fig. 99. This is Tyer's form of permissive block instrument. Its chief point of difference from the previous form of block instrument consists in the provision of means for advising the signalman of the number of trains in the section at any time. The commutator carries inside the instrument a small

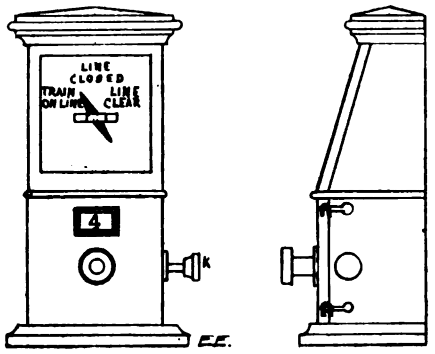

Fig. 99.

disc, around the circumference of which is painted "Line closed," "Line clear," "Train on line," "2," "3," "4," "5," "6." These indications are exhibited at the lower opening in turn, and in the order given above. These indications are mechanical, and are shown by turning the commutator handle, and they are in addition to the indications given by the needle. It will be observed that only when two or more trains occupy the section at the same time does the lower indication differ from that of the needle. The commutator is locked automatically in either of the eight positions it can occupy, and can only be turned forward or backward *during* depression of the small knob, K, on the right of the instrument. Hence, the movement of the commutator must be made deliberately, and it cannot be moved without special intention to do so. The ultimate capacity of a line on which such an instrument is in use would be six trains—*i.e.*, six trains might all be between the two block cabins, A and B, on one pair of rails at the same time. The instrument used at the sending end of the section is similar in appearance to Fig. 99, but it has no commutator or indicator of the number of trains in the section, and the signalman is not called upon to work it in any way.

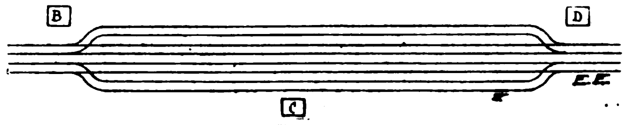

Fig. 100.

Another example of the conditions under which working of traffic under permissive block rules may be of advantage in facilitating traffic over crowded lines is shown by Fig. 100. On this line there is a large amount of fast passenger and other important traffic between two large and important towns, one of which is a seaport of some magnitude. In addition to this traffic there is a large amount of various kinds, but of less importance, in so far as time for delivery is concerned. Such traffic has therefore to give precedence to the more important. Under the absolute rules considerable delay would occur, and therefore in order to cope with

Digitized by Google

the various classes of traffic the lines have been doubled for several miles. The original main line is worked under absolute rules, whilst the up and down independent lines are worked under permissive rules. Trains arriving at one of these junctions, with a small time margin in front of more important traffic, may be run upon the independent line alongside the train for which they have been diverted from the main line, and may be ready to continue the journey the moment they arrive at the exit junction. Practically no delay occurs to either class of train under these circumstances. Not only is this the case, but the main line may be rapidly cleared of a *number* of trains, since the permissive rules allow of a certain number of trains being in each section at the same time.

The form of instrument used on the section of line shown by Fig. 100 for the independent lines is given by Fig. 101. This represents Hampson's form of permissive block instrument. The apparatus for both lines is enclosed in one case. As in Tyer's form of instrument, indications of the number of trains in the section are exhibited at the lower opening, in addition to the dial indications; the dial signals are operated by the signalman at the receiving end only; the commutator and rear section recorder are locked in any one of the positions it can occupy, and the instrument is not adapted to transmit descriptive signals of any kind. As in Tyer's form all signals, other than the mere indication of the condition of the line, are made by a separate bell communication. The instrument is operated by the withdrawal

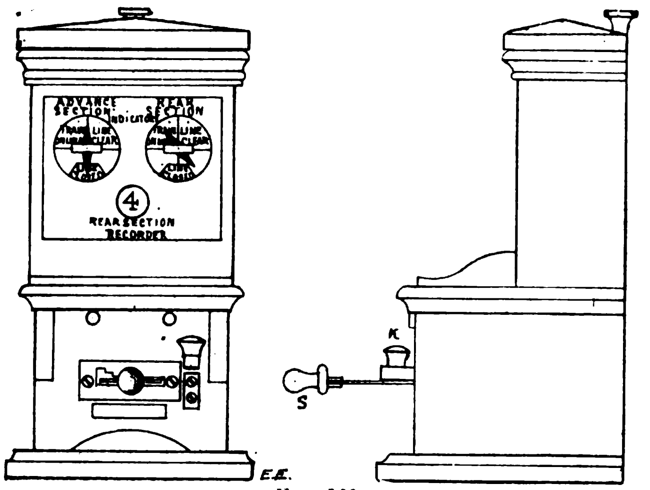

FIG. 101.

of the slide, S, which makes the usual simple commutator changes necessary to show "Line clear" and "Train on line" on the dials, and also imparts movement to a sector, passing behind the lower opening, which is lettered "Line closed," "Line clear," "Train on line," "1," "2," "3," "4," in order given. Movement of the slide from one position to the next in order, backward or forward, can only be made *after* depressing and releasing the knob, K, shown on the right of the commutator handle. In this respect Hampson's instrument differs from Tyer's. In Tyer's form the commutator must be turned during the time the knob, K (Fig. 99), is depressed, and it may, under these conditions, be placed in any of its positions. In Hampson's instrument the commutator slide can only be moved after the knob, K (Fig. 100), has been depressed and released, and it can then only be moved into the *next* position, forward or backward, as the case may be. At the same time there is nothing to prevent the releasing key of Hampson's instrument from being depressed any required number of times. The essential difference between Tyer's and Hampson's instruments is, that with the former it would be easy for a signalman to inadvertently turn the commutator through two positions instead of one; with the latter, the recorder can only be made to travel through two positions by two distinct operations of the releasing key, and must therefore be deliberately made.

It will be observed that the method of working with Tyer's and Hampson's instruments is slightly different to that described in connection with the instrument shown by Fig. 97. The difference consists in the double character of the preliminary signal in use with the latter form of instrument. The two former move more nearly on the lines of the absolute block, in so far as the indications exhibited are concerned: the latter form labours under the disadvantage of having two forms of indicator, the needle and the peg, one of which, the needle, exhibits the same signal whether the line is occupied by or clear of trains. In addition to this, it has the defect of not providing any record of the number of trains in the section at any time at either end. Tyer's and Hampson's instruments do provide such indications up to a prearranged limit depending upon the instrument, but they only do so at the receiving end of the section. It is sometimes contended that it is unnecessary to provide such indications at the sending end of the section, as the signalman there has the dial indication to guide him, and, moreover, cannot send a train forward until the "Be ready" or equivalent preliminary signal is accepted by the man at the receiving end. This contention would be unanswerable if there was anything of an automatic character in the indications, or if they depended in any way upon the trains themselves to act as a check. This, however, is not the case. The indications of the instrument are merely records of the movements of the signalman, and the construction of the locks is not such as will prevent a signalman from moving the commutator in such a way as will indicate a less number of trains than is in the section. If the number of trains in the section is two, say, and a third is sent in from the other end, there is nothing to prevent the signalman from inadvertently moving the commutator to indicate "Train on line," or one, instead of moving it so that it indicates "3." The instrument at the sending end would still indicate "Train on line," as it does whatever number of trains may be in the section, and there is thus no control or check other than vigilance in comparing the "Train out of section" signals with the bookings in the train-book. The exhibition of numbers, indicating the trains in the section, at the sending end, worked synchronously with those at the receiving end, and from that end, would provide a check against error on the part of the signalman at the receiving end, which, under certain circumstances, might be of great value.

Another feature of instruments of the class of which Tyer's and Hampson's are representative is an inevitable difference between the indications exhibited by the instruments and the actual condition of the line at a certain stage in the operation of signalling. The "Line clear" signal is, as already explained, a preparatory signal, and indicates an intermediate stage between line occupied and line clear of trains. Practically, it indicates the conversion of the line from a neutral condition to a state of preparation for the reception of a train which is known to be approaching. An examination of the methods of working will show that there is no such intermediate stage in the conversion of the line from the occupied to the unoccupied state. But in instruments of this class, where the indications for the exit of the last of a group of trains must be made in the exact reverse order to those for the entry of the first of the group, there must necessarily be a "Line clear" indication exhibited between "Train on line" and "Line closed." This, of course, is contrary to the actual conditions obtaining at the time. The "Line clear" signal so shown is, of course, exhibited for a short time only, and is considered of no significance. Such an indication, however, does not appear on any form of absolute block instrument. In this respect, Tyer's form of lock allows of more speedy movement from "Train on line" to "Line closed," since by keeping the knob, K (Fig. 99), depressed, the commutator may be moved at once over the two positions, the needle giving a mere kick to "Line clear" during the operation. In Hampson's instrument, the needles must stand at "Line clear" until the knob, K (Fig. 101), has been depressed and released a second time, and the slide pushed home.

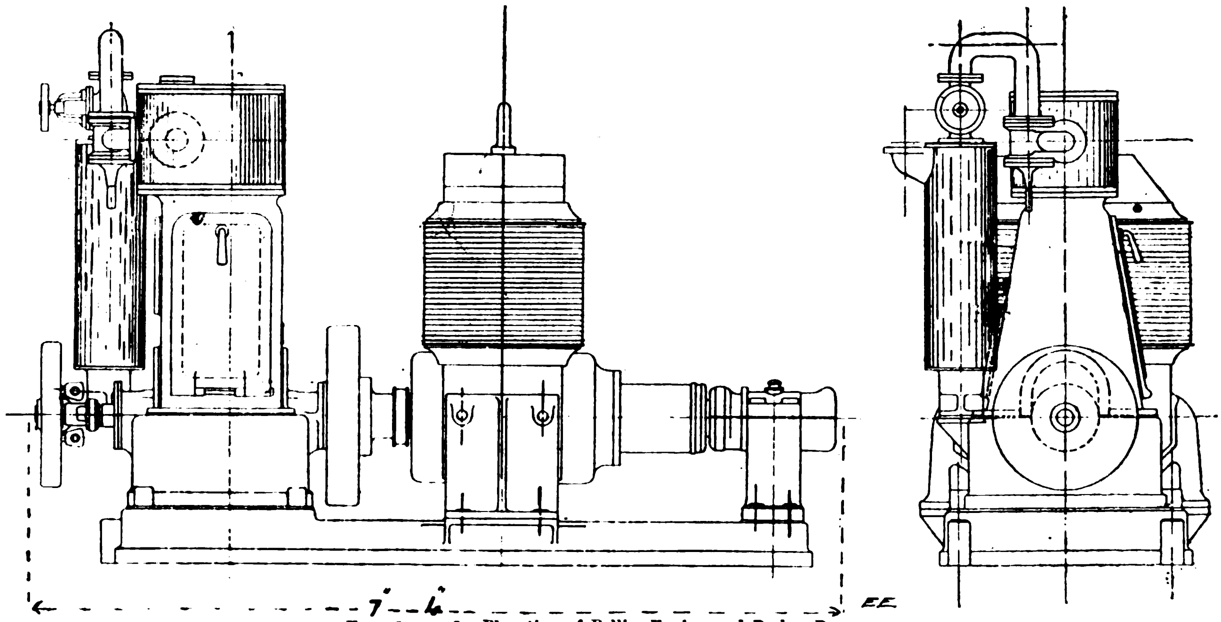
THE ELECTRIC LIGHTING OF S.S. "DRESDEN."

The "Dresden," the most recent addition to the fleet of vessels owned by the Great Eastern Railway Company, is 302ft. long, 38ft. beam, and 16ft. 6in. depth of hold. She is built with a long partial awning deck and poop and a raised forecastle, on the former of which are situated the first-class dining-saloon, ladies' room, staterooms, lavatories, and the accommodation for officers. On the lower decks, and entirely forward of the machinery and boilers, are the first-class staterooms, and in the large deckhouse are the saloon entrance, stateroom, and captain's room on the awning deck, with a spacious trunk skylight for light and ventilation to the saloon. The total number of first-class passengers provided for is 226, and the whole of the fittings and equipment for these are of the most modern and complete description, every detail which might add to the comfort of the passengers having been carefully considered. The arrangement generally is the same as in the steamer "Vienna" (the last vessel placed on the Hook of Holland and Harwich service), including a handsome special stateroom intended for the accommodation of distinguished passengers. An efficient system of fan ventilation is adopted so as to obtain a most ample supply of fresh air to the various spaces, and steam-coil stoves are provided for heating the vessel throughout. The second-class accommodation is also of a very comfortable kind, and situated in the poop and after 'tween decks for 20 passengers. The vessel is schooner rigged, with two light pole masts, to which will be fitted Tate's patent derricks and gear for the rapid handling of cargo and baggage, in addition to three powerful steam-winches. In the 'tween decks forward provision is made for the carriage of horses. Water ballast for trimming purposes is fitted, and the equipment of boats will be stowed on a boat-deck overhead, which will afford rain shelter for passengers, besides forming a convenient promenade on top.

The electrical installation on this vessel, which is a very complete one, has been carried out entirely by the electrical department of Earle's Shipbuilding and Engineering Company, Limited, Hull, by whom the ship and her machinery have also been constructed. The electric generating plant is situated in a compartment at the bottom of the ship, immediately abaft the engine-room, and consequently contiguous to the starting platform, which enables the engineer on watch to have a constant eye on it without leaving his station. It consists of two separate and independent sets of engines and dynamos, supplied by Messrs. G. E. Belliss and Co., Limited, Birmingham, each capable of supplying the whole of the lighting of the ship, so that in case of either an engine or a dynamo breaking down no inconvenience will be suffered by the passengers. The engines are of their well-known patent closed self-lubricating and noiseless type, coupled direct to the dynamos, which have been made by Messrs. Thomas Parker, Limited, of Wolverhampton. These coupled sets (shown in Figs. 1 and 2) are designed to give an output of 300 amperes at 50 volts. The engines give an output of 25 b.h.p. at 500 revolutions per minute, and are specially balanced for high-speed running. The lighting is arranged on the double-wire distributing-box system, the wires being lead-cased and the distributing boxes made of cast metal, specially designed and absolutely watertight. By this system, branch joints, etc., and their attendant evils are very largely obviated. Every part of the ship from stem to stern is lighted with electricity, including the masthead and side signals, the lamps for lighting the passenger and luggage gangways, and the promenade under the shelter deck. There is at each of the above-named gangways a very powerful cluster of lights, so as to make the roadway as bright as day. The main saloon is very fully lighted with 16-c.p. lamps, evenly distributed throughout, and carried by white-metal holders. In the lighting of the staterooms, the convenience and comfort of passengers has been closely studied. In addition to a very complete system of electric bell communication, there is telephonic communication between the smoke-room and bar, whereby thirsty passengers can at any time with the least amount of inconvenience call for and obtain their requirements. The heating of the ship by means of electricity was very carefully considered, and somewhat reluctantly postponed, as there seemed many advantages to be gained by such a system; but as there was not sufficient time to experiment with a view to avoiding any possible mistake, the further consideration was deferred. It is intended to drive the "Dresden" at a speed of 18 knots, and for that purpose she is fitted with two independent sets of triple-compound engines, each capable of driving the ship by itself in case of breakdown to the other at a speed of 14 to 15 knots; together the engines will indicate about 6,000 h.p. Steam is supplied from five huge steel boilers made in accordance with the Board of Trade rules and regulations for a working pressure of 160lb. per square inch, and tested by water pressure to 320lb. The whole of the machinery is designed and arranged with a view to safety as well as high speed, and herein lies one of the great advantages of twin-screw ships over paddle-boats, for in case of an injury to a paddle-wheel or a breakdown with a part of the engine, the ship is always detained for a considerable time and often has to be towed in, meanwhile being at the mercy of the wind and waves; whereas the twin-screw boat, whatever happens to one screw or engine, proceeds along as if nothing had happened, and with a reduction of speed so comparatively slight as to leave her still what may even in these days be called a fast boat. The life-saving appliances in these ships are not only in accordance with the rules and regulations of the Board of Trade, but have



FIGS. 1 AND 2.—Elevation of Belliss Engine and Parker Dynamo.

in addition all that the modern inventor has introduced of any practical use, and all that science can suggest for the rescue of passengers and safely conveying them to land in case of disaster to the ship.

ON THE CATHODE RAYS AND THEIR PROBABLE RELATION TO THE RONTGEN RAYS.

[The following is the paper read before the German Association at Frankfort-on-the-Main by Prof. Lenard, who so narrowly missed being the discoverer of the Röntgen radiations. Unlike the prevalent opinion held in this country, Prof. Lenard holds that the cathode rays are of the same character as the Röntgen rays, and the paper sets forth substantially the evidence in favour of this view. In reading the paper, however, it must be noted that apparently Prof. Lenard includes under the term cathode rays not only the rays arising from the cathode inside the tube, but the same rays or such constituents of them as can be made to pass outside the tube by means of a metal plate or "window" in the glass of the tube. These are generally spoken of in this country as Lenard rays, owing to the fact that Prof. Lenard discovered their existence and experimented with them many months before Prof. Röntgen's discovery of the effect produced by the radiations from a vacuum tube in work on a photographic plate. A similar paper was read by Prof. Lenard at the British Association.]

The cathode rays as produced by the electric discharge in gases have long been known. To these a new kind of rays with kindred properties have been added by the recent discovery of Röntgen. The properties of these newly-discovered rays appear in the light of the present state of knowledge to be in agreement with the theory that they are essentially a limiting case of the cathode rays—that is to say, the Röntgen rays are cathode rays with infinitely small magnetic deflectibility. These rays, therefore, would consist of the same ethereal process as the cathode rays, but with a special value or series of special values of one of the parameters. What kind of theory this points to will now be indicated. By cathode rays are to be understood such rays as proceed from the cathode in a discharge tube.

In the first place, it is to be noted that we already are acquainted with an unbroken series of different kinds of cathode rays which differ only in the amount of their deflectibility by a magnet, just as different kinds of light are distinguished by their refrangibility in a certain medium. The deflectibility of a cathode ray remains the same throughout its whole course, be the gaseous or solid media through which it passes what they may, just as the colour of a light ray remains the same in analogous conditions. The case of fluorescence is an exception in the case of light, and, according to our theory, Röntgen's discovery has supplied an analogy to this in the case of the cathode rays—namely, the conversion of cathode rays of finite deflectibility into rays of imperceptibly small deflectibility by the action of ponderable matter.

Cathode rays of very great deflectibility and all intermediate grades down to comparatively small deflectibility can be produced in discharge tubes. The lower the gas pressure is in such tubes, and, therefore, the greater the electric forces which act upon the gas,* the smaller is the deflectibility of the rays produced. The smallest attainable deflectibility is reached by the application of the greatest electrical forces.

The known kinds of cathode rays have, so far as I have been able to prove it, the property of being absorbed by ponderable matter approximately in proportion to its density—that is to say, in so far as the amount of the absorption is determined by the medium it is twice as much for a medium of twice the density. This property, since independently of the amount of the deflectibility it is common to all kinds of cathode rays, appears to be a characteristic property. It is, as is well known, also a property of the Röntgen rays.

The different kinds of cathode rays have properties which vary gradually with the amount of their deflectibility. For example, so far as quantitative experiments have been made the less deflectible a cathode ray is the less will it be (1) absorbed by passing through a ponderable medium ; the less will it be (2) dispersed by it—that is to say, the less turbid the material is to it. This relation has been found to hold for cathode rays which issue from discharge tubes with thin windows, and which may, therefore, be considered to have undergone the smallest possible change in passing out. It is evident that cathode rays are the more accessible to investigation the less deflectible they are. For with rays of small magnetic deflectibility both the absorption and the dispersion is small. But these are the properties of the Röntgen rays.

Further properties of the cathode rays in relation to their deflectibility have not yet been investigated. Common to all kinds of cathode rays and to the Röntgen rays is the property of making gases conducting, and also the allied property of facilitating the formation of fog. Common also to all these rays is the property of exciting phosphorescence and chemical action.

From what has been stated above, the existence of a transformation of the deflectible into the non-deflectible rays in proportion to the amount of rays absorbed, appears to be probable. On the other hand, Lodge, J. J. Thomson, etc., consider it probable that the non-deflectible rays pass into the optical spectrum through the region of the rays recently discovered by M. Henri Becquerel.

* Condres has recently shown the electrical forces and not the gas pressure is what really determines the deflectibility ; he has, for instance, succeeded in producing cathode rays of small deflectibility with relatively high gas pressures by the application of great E.M.F.'s.

MOLECULES.

It has been more than once noted here that many people nowadays display a readiness to accept as incontrovertible results derived from the kinetic theory of gases which a careful examination of the facts that lie behind the mathematical formulæ does not by any means warrant. In particular there is the difficulty of putting helium and argon into their proper places on account of the "specific heat ratio." Mr. A. Noyes and Mr. Goodwin, in America, have endeavoured to check the correctness of the well-known law connecting this ratio and the number of atoms in a molecule, by comparative investigations on the viscosity of monatomic and polyatomic gases. The work is embodied in a paper which is reprinted in the *Physical Review*, and the conclusion arrived at is that the average cross-section of a mercury molecule (one atom) is nearly the same as a carbon dioxide molecule (three atoms), and 2½ times as large as a hydrogen molecule (two atoms). From this the authors infer that atoms and molecules are of the same order of magnitude, and that the spaces between the atoms in a molecule are not great. It does not, however, seem clear that the results obtained would not be satisfied by the exactly opposite supposition that the atom is exceedingly small compared with the size of the molecule, taking the latter expression to mean the region in which the joint attraction of the atoms is strong enough to sensibly affect the motion of another molecule. Upon either supposition their conclusion would follow that the viscosity of gases is not suitable for distinguishing between monatomic and polyatomic molecules. Since it seems probable that as much is not really known as to the intimate structure of a gas as is generally supposed, it is more than likely that our ideas of what exactly happens in a liquid, and particularly in an electrolyte, are still more wide of the mark.

INSTITUTION OF ELECTRICAL ENGINEERS, Dec. 10.

The annual general meeting of the Institution was held last night, when the statement of accounts, as published in our last issue, was presented, and the election of President, Council, and Officers, as given in our issue of November 20, was duly proceeded with, no other nominations having been made,

HACKNEY.

The following is the conclusion of the report on electric lighting and refuse destructors presented to the Hackney Vestry by Mr. F. Hastings Medhurst, B.Sc., M.I.E.E.:

Extent and Description of Electrical Scheme.—It may be well to mention here that in 1893 the Board of Works for the Hackney district obtained an electric lighting provisional order. The order, like all other similar orders, contains schedule of streets in which it is expected that mains for electric lighting should be laid within two years from the commencement of the order. The local authorities may, if they think fit, lay mains in any other streets in the district as well, but the Board of Trade can, at their absolute discretion, revoke the order if the mains are not by the end of the year laid in the following streets: High-street, Kingsland; High-street, Stoke Newington; Kingsland-road (within the Hackney district); Mare-street; Stoke Newington-road; Dalston-lane. It is, however, more than probable that the Board of Trade will not arbitrarily exercise their powers of revocation if they can be convinced that the Vestry is giving the matter serious attention and preparing to carry into effect the obligations of the order. The above-mentioned streets appear to me to offer a very promising field for an initial installation. I should strongly advise you to provide a scheme for giving a public and private supply of electricity in these streets. Seeing that at the end of last year there were 36,238 lamps of 8 c.p. connected to the mains in the parish of St. Pancras, whilst at Blackpool, Bristol, Bradford, Glasgow, Huddersfield, and Manchester the numbers were 15,609, 36,615, 15,064, 62,560, 15,342, and 66,647 respectively, I think that I am justified in recommending you to provide an initial installation which will enable 16,000 private lights of 8 c.p. (or their equivalent) to be in electrical connection with the mains, in addition to the 140 arc lamps of 1,000 c.p. each, which will be required to efficiently illuminate the streets in question. It is extremely improbable that of the 16,000 lights more than 11,500 will ever be simultaneously alight, so that I have, in my estimate of cost, provided plant (exclusive of spares) for this number and for the 140 public arc lamps.

Generation and Distribution.—I have already pointed out the advisability of adopting a high-tension alternating-current system, with low-tension mains radiating from transforming sub stations. With the method of producing the requisite steam I have already dealt. The alternating current for private lighting will, during the night-time, be generated by "flywheel alternators" (as at Reading, Islington, Portsmouth, and Leicester) of 200 units each, while during the daytime I should recommend the employment of a high-speed vertical steam alternator of 100 units, or of a steam turbine alternator of the same output. The current will be conveyed by means of highly-insulated cables, laid in cast-iron pipes, to the transforming sub-stations (which latter need only be watertight cellars or vaults), and from the sub-stations the low-tension current will be conveyed to the consumers' premises by means of similarly but not equally insulated cables, likewise drawn through cast-iron pipes, with service boxes for connections to consumers' premises at convenient intervals. The transformer sub-stations would be capable of economically feeding a low-tension network of mains reaching to distances of about 250 yards from each sub-station, so that the sub-stations may be 500 yards apart. The current for public lighting would be generated by high-tension continuous-current dynamos and conveyed to the lamps by highly-insulated armoured concentric cables, laid direct in the ground.

Public Lighting.—I have already pointed out that it will, in my opinion, be necessary to erect 140 arc lamps of 1,000 c.p. each so as to give a good illumination in the four miles of street for which I have estimated the cost of an installation. There would be four arc lighting circuits. The lamps should be 100 yards apart on each side of the street, though the point immediately opposite any particular lamp on one side of the street should, where possible, equally divide the distance between two lamps on the other side. Alternate lamps should be on separate circuits, and half the lamps might with advantage be extinguished at midnight by merely actuating a switch at the generating station. The annual cost of lighting these streets electrically will be £1,800, or, according to data kindly supplied to me by your surveyor, Mr. Lovegrove, three times the present cost. Under existing conditions there are 188 gas lamps, costing in the aggregate £600 per annum. The parishes of Stoke Newington and South Hornsey pay collectively £81 towards this amount, so that if the arrangement I propose be carried out the parish of Hackney will have to receive £243 from the above-named parishes, and the cost to you of lighting the streets in question will then become £1,557, as against the present expense of £519. But the light from dusk till midnight will be 16 times greater than at present, and from midnight till dawn eight times as powerful. That the lighting of the streets in question is at present anything but satisfactory will probably be readily admitted. Nor should it be forgotten that the estimated reduction in the cost of refuse disposal is equal to over three times the difference between the present cost of lighting these streets by gas and the expense of illuminating them electrically.

Financial Considerations.—It has already been stated that the scheme I propose will, in addition to the public lighting, provide for 16,000 private lights of 8 c.p. in electrical connection with the mains. I should recommend that at the commencement 5d. per unit be the price charged to private consumers. At this rate the electric light will correspond in cost to gas as 2s. 6d. per 1,000 cubic feet. This will, I believe, be the lowest rate charged to consumers in London for the use of current used during the night. In Newcastle the average price is under 4½d. per unit, owing to the low cost of fuel. Yet at Newcastle the cost of coal per unit has always been very much greater than it will be at Hackney if my recommendations are carried out. Experience in similar London and provincial districts demonstrates that an average consumption of 20 units per lamp per annum may be safely counted on. This would give an output of 320,000 units per annum for private lighting, whilst the public lighting of the streets, which have already been scheduled, will require an additional output of 190,000 units; in other words, 510,000 units is the estimated annual output of the installation. I now beg to submit for your consideration the following estimates of capital outlay and of revenue and expenditure:

ESTIMATES OF CAPITAL.

Buildings and inclined roadway for a refuse destructor of 18 cells (three spare), together with the 18 furnaces, the chimney shaft, and boiler-house; nine tubular boilers (two spare), constructed so as to work in combination with destructor furnaces, and also so as to work with coal and refuse together or, if necessary, with coal alone, each boiler to be capable of evaporating 2,500lb. of water per hour from 212deg. F.; economiser; feed-water heaters; feed-pumps and water service in duplicate; steam and exhaust pipes (in boiler-house only); water-tanks; foundations, setting and fixing of above...	£23,260
Engine-room and offices	5,000
Three steam flywheel alternators, each of a capacity of 200 units (one spare); overhead travelling crane; one steam alternator of 100 units (for day load); two steam exciters (one spare); two arc-light steam generators (one spare), each with a capacity of 60 units; switchboards and instruments; engine-room fittings; duplicate system of steam and exhaust pipes and valves	25,370
Eight miles of high-tension feeders; 24 miles of low-tension distributing mains; 13 miles 4in. cast-iron pipe and requisite surface and connecting boxes; trenching and making good eight miles of street; connections to consumers' houses; 16·5 miles of arc-light mains; 11 transformers of 35 units each; underground vaults or sub-stations for above	18,600
140 arc lamps and ornamental posts, fitted complete, with necessary switches and cut-outs; 140 joint boxes........	4,490
Site........................	3,000
Total	£79,720

ESTIMATE OF PROFIT AND LOSS.

Revenue.	£	s.	d.
Saved on collection and disposal of refuse	3,500	0	0
Present cost of gas-lighting in scheduled streets ...	519	0	0
Sale of 320,000 units for private lighting at 5d. per unit........................	6,666	13	4
	£10,685	13	4

Working Expenses	£	s.	d.
Cost of public lighting in scheduled streets...........	1,557	0	0
Cost of generating and distributing 320,000 units for private lighting: Fuel	200	0	0
Oil, waste, water and engine-room stores, at 0·6d. per unit	800	0	0
Salaries and wages, at 0·8d. per unit................	1,066	13	4
Repairs and maintenance, at 0·7d. per unit (exclusive of repairs to refuse destructor, which has been provided for in calculating cost of burning)	933	6	8
Management at 0·6 per unit	800	0	0
	£5,357	0	0
Revenue........................	£10,685	13	4
Working expenses	5,357	0	0
	£5,328	13	4

In the above estimates I have made no allowance whatever for any revenue that may be derived from the sale of mortar (which can be very economically manufactured from the clinker produced by the burning of the refuse), nor from current sold during the daytime for motive power, although it seems highly probable that if, as I should suggest, electricity be sold for 2½d. per unit during the daytime, there will be a demand for electric energy during the hours of daylight, and almost all the revenue that can be obtained in this way will be profit. The interest and sinking fund on the capital outlay which I have indicated will amount to about £4,000 per annum, leaving a clear net profit of about £1 328 a year, or a very possible net profit of nearly £2,000 a year, if there be, as I confidently anticipate, a fair demand for electrical energy during the daytime and if only a small amount of mortar be sold.

In conclusion, I would only say that I have given very liberal estimates of capital outlay and working expenses, and that I shall be disappointed if they are not appreciably reduced in practice, both with respect to the refuse destructor and to the electricity supply works. In calculating the capital outlay I have, of course, had in view a suitable site, but I have purposely made no mention of the locality for very obvious reasons. I have endeavoured to place this important matter before you fairly, temperately, and without bias; and if there is any further information which I can supply, I shall have great pleasure in affording it.

TO CORRESPONDENTS.

All Rights Reserved. *Secretaries and Managers of Companies are invited to furnish Notice of Meetings, Issue of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.*

All communications intended for the Editor should be addressed C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

"SITUATIONS VACANT" and "WANT PLACES" Advertisements will be charged at THREE WORDS for ONE PENNY with a MINIMUM charge of SIXPENCE.

TO SUBSCRIBERS.

"The Electrical Engineer" *can be had by Order, from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.		6 months.		12 months.
United Kingdom	3s. 3d.	...	6s. 6d.	...	13s. 0d.
Other Places	4s. 11d.	...	9s. 9d.	...	19s. 6d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. Biggs, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

BOUND VOLUMES.

Vol. XVII. of new series of "The Electrical Engineer" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers for binding can be obtained, price 2s.*

THE REGULATION OF ELECTRIC MOTORS.

There is always a right way and a wrong way of solving a problem, and it frequently happens that the wrong way is the more attractive as well as the more costly in the long run. The regulation of motors is the problem we have now before us, and the wrong method of doing this under discussion is Mr. H. Ward Leonard's system. This system was exploited some years ago, and was, we thought, sufficiently controverted at that time. We find, however, that the author has recently read a paper on the subject before the American Institute of Electrical Engineers, under the title "Volts *v.* Ohms." The speed regulation of electric motors is said to be the real subject of the investigation, but from the description we gather that it is rather that of starting a motor economically. The well-used method of inserting a resistance in the armature circuit is, of course, a wasteful method, as at the instant of starting a very large proportion of the power taken from the circuit is wasted in heat. If, however, the motor is to run continuously, the power so wasted is only a small proportion of the total. Now, Mr. Leonard's method involves the use of at least one motor and one dynamo beside the motor to be controlled. The first motor is shunt wound, and placed across the supply main. It then drives the auxiliary dynamo, which also has its shunt across the main, with an extra large shunt rheostat in the circuit. The leads from this dynamo are connected to the active motor, which is also constantly excited by a shunt from the mains. The arrangement then is worked as follows. At one-tenth of the normal speed only one-tenth of the voltage is required to give full load torque in the active motor. As the field of this motor is constant, the current required is practically full-load current. Instead of getting this reduced pressure by added resistance, Mr. Leonard gets it by transformation. He weakens the field of the auxiliary dynamo to about one-tenth of its normal value, so that it may give the pressure required. In this way only the energy required to start the machinery is taken from the main, plus the loss in transformation. The author of the paper discusses the efficiency and stability of the above arrangement at one-tenth speed, and naturally it compares favourably with the resistance starting apparatus. There is one fact he does not mention, and that is, that the commutator of a dynamo running at full current with one-tenth of the normal strength of field gives off light and heat to an alarming extent. In fact, it is utterly impracticable to run a machine in this way for more than a few seconds at a time. So, as a means of speed regulation with wide limit, the method fails from the fact that the dynamo would depreciate too rapidly. For smaller variations in speed the method would doubtless be applicable, but then the question of cost comes in. To apply the matter practically, three machines are required of at least equal output to that of the active motor. Certainly Mr. Leonard shows an arrangement in his paper by which the motor-generator machines need only be of half this output, but then the connection necessitates at half-speed, of

Digitized by Google

the dynamo, passing the full current through its armature, while the magnets are not excited at all. Hence the sparking difficulties preclude this economy in machinery. The consumer who spends, say, eighty pounds for his motor will therefore require to spend at least one hundred and sixty pounds to be able to regulate the speed of this motor, and then the appliance gives larger ranges of speed. Almost equally good results can be obtained by using a shunt motor with extra heavy field magnets and reducing the speed by increasing the strength of field. This will also increase the first cost, but the increment will be small compared to the above arrangement. Where a variation of speed is required for a considerable time, as in driving shop tools, no electrical method can replace the speed pulleys almost universally adopted, although electric means can give fine adjustments for speed between the steps on the pulleys. We wait with curiosity a report of the discussion on the above paper.

ARE CENTRAL STATIONS DOOMED ?

This is a conundrum put by Max Osterberg in the American *Engineering Magazine*. We are not good hands at solving conundrums, so were pleased to find the author had solved the question—to his own satisfaction, if not to that of other people. He concludes, for various reasons set forth, that isolated plants will supersede central stations. This may be so in America, but in Britain the fashion has set in the other way, and many isolated plants are being sold, current being obtained from the central station. Of course, that fact may point to the ultimate suppression of central stations, but the fashion must change first, and, so far as we can see, the only valid reason for such supervision is that fashions do change. Look at bonnets, forsooth. Fashion, then, is like the wind—very fickle. But, after all, Mr. Max Osterberg does not leave central-station engineers without a crumb of comfort, for he admits that a good deal depends upon "commercial considerations." Those at present in Britain tend to make us believers in central stations, and we live in hope that Mr. Osterberg may become a convert to centralisation even in America.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

MOTORCARS.

SIR,—I observe that it is proposed to have a motor Derby. To this none can have any objection. It is merely a question for those who run in the race to consider how far they care to risk their lives with no compensating advantage.

But in the announcement the following words occur: "The committee will require a special ground . . . . at least a full level and straight mile." Elsewhere there appears the following: "But the principal point will be speed, which we are of opinion forms the most satisfactory test as to the excellence of construction of the mechanical vehicle."

In these two quotations lie the danger of the proposed race, so far as the public safety and the pockets of purchasers are concerned.

The Local Government Board, in order to meet the desire of the local authorities to limit the speed, have fixed 12 miles an hour for the maximum, and the Act itself permits no rate beyond 14 miles an hour, and no one can hold out the smallest probability that this rate of speed will be increased in any future Act. Therefore any attempt to place self-propelled vehicles on the market capable of making a pace much greater than that permitted by law will simply act as an incentive to their owners to do that which is forbidden when hurrying to keep an appointment for which they are late.

But the worst feature in the announcement is the statement that speed is the best test for a carriage, because a level track is to be selected for the trial. Experts know perfectly well that the power required to propel a light motor carriage on the level when the road is good is exceedingly small, while such a carriage on an incline might be a complete failure for want of sufficient power. No test could be more delusive than the one suggested. It would place the present petroleum-motor carriage on a par with steam, whereas on meeting an incline the steam carriage would in a few moments be out of sight, whilst the petroleum-driven one was struggling to climb the hill. This I can vouch for from what I have seen in connection with motor carriages and those in my possession, as well as from theory.

It is not fair that the public should be drawn into the net of company promoters by being made to believe that the proposed test is likely in any way to produce a satisfactory vehicle. Anyone who purchased a carriage based on such a notion would soon regret his bargain.—Yours, etc., DAVID L. SALOMONS.

PATENT OFFICE MUSEUM.

SIR,—Some of your readers are aware that a committee has been formed to promote a national museum, in which examples of railway practice may be preserved in addition to the few now shown in the exhibition galleries at South Kensington. At the same place there are a number of models of great interest to engineers—civil, mechanical, hydraulic, and electrical—as well as to inventors generally, and many of these were transferred to the Science and Art Department from the old Patent Museum by the Patents, Designs, and Trade Marks Act of 1883. While the Patent Museum was at the so-called "Brompton Boilers," the exhibits were not only open free each day to the public, but also until 10 o'clock at night for three nights in the week, and it was a most valuable and interesting collection. But since its transfer to the western side of Exhibition-road—a less convenient spot for most of its former visitors—it has not been opened at night until April last, and consequently much of its former usefulness has been impaired.

My purpose in writing is to ask your assistance in re-establishing the Patent Museum, but this time at the Patent Office itself, so that it may be in a more central and accessible spot, and be supplemental, as it were, to the most valuable and accessible technical library in the country. If the models and exhibits referred to were removed to Southampton-buildings, their place at South Kensington could readily be filled with the railway relics aforesaid, so that the two projects are of mutual assistance. But, in addition to the old collection, new models and new materials, illustrative of modern progress, should be provided from time to time, and these as far as possible should be substantial enough to be freely handled. The usefulness of such a museum at such a place is obvious.

It is not generally known that the cost of building large extensions to the Patent Office, now in progress, is provided for out of the annual surplus of the Patent Office. In 1895 that surplus was £96,500, out of which £10,160 was expended in connection with these extensions, and the Government are about to obtain power to acquire more property. Is this not a fitting time, Sir, to urge upon the Board of Trade the re-establishment of a patent museum and have not inventors a prior claim upon, say, £5,000 a year of this surplus to meet its cost? It might be, and should be, made the finest technical museum in the

Digitized by Google

country; and in these days of foreign competition we cannot afford to lose any opportunity of teaching and guiding our inventors and others interested along scientific paths, and inciting them by the ingenuity of their predecessors.—Yours, etc., J. SINCLAIR FAIRFAX.

REVIEWS.

Carriages Without Horses Shall Go. By A. R. SENNETT, A.M.I.C.E., etc. Illustrated. Whittaker and Co. Price 2s.

Auto-Cars. By D. FARMAN, M.I.E.E. Translated from the French by LUCIEN SERRAILLIER; with Preface by Baron NYEVELT. Illustrated.

We cannot enter into detailed criticism upon these works, because they are so evidently books of the moment that a discussion of permanent value would be wasted. The motorcar boom—as senseless and idiotic as most of the company-promoter booms are—may perhaps do a little good in one way, by inducing a larger or smaller number of the public to seek for information of a particular character. To meet this demand the books before us have been issued. Mr. Sennett's is a reprint, with appendices added, of his British Association paper. It is practically a brief historical sketch of the subject, with necessarily much history left out. Such a book fulfils its object, but must not be taken too seriously. So far as we can see, the author assumes that vehicular reform is upon us. On the contrary, we imagine much will have to be done before mechanical takes the place of horse traction. A few hobbyists will ride their hobby to death and pave the way by experiment and experience for something which will supersede animal traction. We must have propagandists, and in this light welcome Mr. Sennett's production, his energetic pushing of his views, his attempts to educate the public mind; and we trust that he will garner some fruit for his pains.

The second book is somewhat more ambitious in character, but, again, it must be classed among those destined to fill a momentary void. We must emphatically protest against such calculations as are given on pp. 64-5-6-7. If such figures are to be given, they should be from well-ascertained facts, from the published documents of public companies, and not estimates. Figures from any books of this kind will be used to induce people ignorant of the subject to invest money which ought not to be invested. So far as pages of theory, so far as descriptions of various forms of motors and of cars are concerned, give them by all means; make the matter as detailed as possible, but eschew the £ s. d. of working expenses. Neither author, translator, or introduction writer knows with any exactitude the costs as will accrue in ordinary road traction. Leaving this point out, the book certainly provides a mass of information of a very useful nature.

ON THE MANUFACTURE OF ALKALI AND BLEACH BY CHEMICAL AND ELECTROLYTICAL METHODS.*

BY BERTRAM BLOUNT, F.I.C., F.C.S., A.M.I.C.E.

There is an unceasing demand—and one, moreover, which is not likely to determine, or even abate, as long as our present concept of civilisation endures—for those products obtainable from salt as a raw material which we include by means of the terms alkali and bleach. Viewing the stupendous quantities of all forms of alkali, soda ash, caustic soda, soda crystals, and bicarbonate of soda and of bleach as powder, or in solution as bleaching liquor, which are prepared for the market, it is not easy to understand in what way and in what directions absorptions of these products can occur. It would doubtless be interesting to trace a few typical hundredweight of each material from the works to its far-away goal—the common sewer; but the enquiry is not sufficiently within our present scope to merit close prosecution, and is too complex and ramified to be dismissed in a paragraph. It is sufficient to realise that the demand exists and is likely to continue.

But although there is a steady and, as far as conceivable, a permanent demand, yet it is not voracious or indiscriminate. Goods to sell must either be good or cheap—preferably both good and cheap. Neither will the market take any account of the ingenuity of contrivance which has led to the production of a given commodity. It is concerned solely with the nature and quality of the commodity and with its price. It follows that a process to be successful in the commercial sense of being remunerative must be capable of preparing either a better product at the same rate or the same product at a cheaper rate before it can hope to be shown any preference over older and better established processes. It matters not a halfpenny to the consumer what elegant principles are illustrated by the process used to supply him with the materials which he requires; he looks only to the stuff and its price—very often indeed only to the price; if his regard wanders further afield it is more likely to light upon the drum in which the material is packed than upon the scientific subtleties whereby the drum has been filled.

I have not said this in praise or condemnation of the consumer; the discussion of ethical questions is altogether foreign to my purpose. I am merely concerned to inculcate this one fact—obvious indeed, but constantly forgotten—viz., that no beauty of principle or execution can save a process which does not pay, and that no faultiness of design or performance can expunge one which does. This clearing of the ground is particularly necessary when considering the present situation of the trade in alkali and bleach and the tendencies, latent or patent, which may eventually or will actually shift its centre of gravity from the chemical to the electrical side. On the face of it, the extant chemical methods of manufacture are roundabout and clumsy, while the processes dependent on the use of electrical energy are singularly simple and direct. As long as zinc was the sole available fuel for the production of electrical energy, chemical methods for obtaining any material, the conjoint reactions for the synthesis of which were endothemic, held the field without possibility of rivalry. With the advent of an efficient dynamo the conditions of competition were radically changed. In spite of the large loss, computed by the ingenious at 90 per cent. or more, which the energy of coal undergoes before it can be delivered as current at the terminals of an electrolytic cell, the cost of a given quantity of electrical energy is no longer so great as to make electrical methods unthinkable when compared with the direct (but wasteful) application of energy as heat by the combustion of fuel in processes that are definitely chemical. It must be remembered that elaborate determinations—thanks, chiefly, to the zeal of engineers intent on improving prime movers—of the total loss from boiler furnace to crankshaft have been repeatedly made, and that every layman of intelligence is aware of the wastefulness of these intermediaries; whereas, on the other hand, the quantity of heat going up the chimney in the simplest furnace operation has either not been computed or, if computed, is not a matter of common knowledge. Thus in the distillation of zinc the energy required to be supplied from the furnace for the reduction of ZnO to Zn (in gramme equivalents) is 56 cal., but the actual quantity needed is at least 5,200 cal., involving the consumption of 10lb. of coal per pound of zinc, or more than 90 times the calculated minimum quantity. It may therefore be feasible to adopt a process admittedly using energy in a costly form in preference to one capable of being performed by energy in a cheap form such as direct heat, if the former be directed with such nicety that the energy is less wastefully employed. A comparison of the energy required for the conversion of common salt into the products NaOH and Cl by the Leblanc process and by any one of the moderately efficient electrolytic processes now seeking a footing may prove instructive. In making this comparison I have avoided stating the quantities of heat theoretically necessary for the several reactions, as these quantities bear but a remote relation to those which are actually required. Thus in the preparation of salt cake (the first step in the Leblanc process), although the reaction represented by the equation

$$2NaCl + H_2SO_4 = Na_2SO_4 + 2HCl$$

needs but a small access of heat for its completion, yet in practice it requires a considerable consumption of coal to bring it about. It will therefore be of greater utility to take as a basis of comparison the fuel found by the actual needs of manufacture to be required for each stage under consideration. In making salt cake by the action of sulphuric acid on salt, about ·3 to ·5 ton of coal is needed for the production of one ton of salt cake. The surplus heat from the combustion of this fuel either escapes with the flue gases or is carried off by the vapour of hydrochloric acid, which has to be cooled, condensed, and collected by absorption in water, its energy existing as sensible and latent heat being communicated to the condensing and cooling water. In the next stage—the black-ash process—the consumption of fuel is ·7 to 1·0 per ton of salt cake, reckoning in both that used for heating the furnace and that for mixing with the charge. Of this quantity about ·3 ton is needed theoretically to bring about the reaction

$$Na_2SO_4 + 4C = 4CO + Na_2S$$

and in practice about ·4 to ·5 ton is used, leaving a balance of

* Paper read before the Northern Society of Electrical Engineers, December 7, 1896.

Digitized by Google

·3 to ·5 ton consumed in the furnace to produce sensible heat and to cause the reaction to take place.

This liberal expenditure is less lavish than it seems, because the waste of the black-ash furnaces is used to boil down the tank liquor (obtained by the lixiviation of the black ash). Nevertheless the expenditure is large, and in the end leaves the soda ash rather worse off, from an energy point of view, than it was at the beginning, inasmuch as the "black salt" (the product of lixiviation) contains a molecule of water which has to be driven off by calcination, involving the consumption of about ·4 ton of coal per ton of soda ash—*i.e.*, about ·3 ton per ton of salt cake originally charged. We are now in a position to sum up roughly the quantity of fuel required to produce one ton of soda ash by the Leblanc process carried out with neither unusual waste nor special economy.

Consumption of Coal per ton of Salt Cake.

	Ton.
In salt-cake furnace	0·4
In black-ash furnace	0·8
In finishing furnace	0·3
	1·5
i.e., per ton of soda ash	2·0 tons.

Seeing that there is always a sensible loss of soda (15 to 20 per cent.) in the process of passing from Na_2SO_4 to Na_2CO_3, this consumption of coal is rather an understatement than the reverse.

In preparing caustic soda from the soda ash made in this manner a further quantity of fuel will be requisite, both for burning the lime needed as a causticising agent and for boiling down the caustic liquor. As surplus heat from the black-ash furnaces is used for a part of the causticising process the quantity of additional fuel is difficult to compute, but if the total amount (including that needed for burning the lime) be put down at ·2 ton per ton of caustic soda produced the estimate will not be excessive. This corresponds with about ·1 ton of coal reckoned on the original salt cake, and the total consumption of fuel for the production of one ton of 77 per cent. caustic may be set down with an approximation sufficient for our present purpose at 2·8 tons. A corresponding estimate of the cost of fuel needed to produce one ton of sodium carbonate or one ton of caustic soda by any modern electrolytic process may be usefully made. Assuming that one horse-power hour can be obtained by the consumption of 2lb. of coal, using modern boilers and engines of good design, and that four-fifths of the energy developed in the engine is available at the terminals of an electrolytic cell, and, further, taking the average working voltage of the cell at four volts, it appears that the consumption of coal necessary for the production of one ton of caustic soda, including that necessary for concentrating the alkaline lye obtained as the immediate product of electrolysis, is 4·2 tons, and that needed for the production of one ton of sodium carbonate may be stated at 3·3 tons, quantities greater certainly than those needed for the Leblanc process, but of the same order of magnitude. But by the electrolytic process, as usually conducted, an amount of chlorine approximately equivalent to that of the caustic soda produced is evolved at the anode.

The energy expended in the production of caustic soda also suffices for the generation of chlorine, and no further quantity of fuel has to be debited against the process. But in obtaining chlorine by the Leblanc process a certain further expenditure of fuel is inevitable. The chlorine appears in the form of hydrochloric acid, and is usually worked up by the Weldon process. In this, which involves heating the chlorine stills, heating the purified still liquor mixed with lime, and blowing in large volumes of air to reoxidise the manganous oxide (all processes needing fuel) a considerable consumption of coal occurs. Similarly in the Deacon process, which uses the hydrochloric acid as gas without condensation in water, heating the air needed to oxidise the gaseous hydrochloric acid is requisite, and in all about one ton of coal is needed for one ton of bleach produced, or, in round numbers, three tons of coal per ton of chlorine, or 2·6 tons of coal per ton of caustic soda. Thus the total consumption of fuel for the production of one ton of caustic soda and its equivalent amount of chlorine rises to 5·4 tons; similarly, for one ton of sodium carbonate and its equivalent of chlorine about four tons of fuel will be required. These figures are to be compared with the corresponding values 4·2 and 3·3 tons for the same products prepared electrolytically.

In the above comparison no pretension to exactitude is made, inasmuch as accurate data are not readily accessible and the consumption of fuel will vary largely according to the practice of each works and the degree of efficiency of the plant and staff, but enough has been said to make it clear that the consumption of fuel by the two methods is not dissimilar, and that on the present basis for the production of electrical energy no great advantage accruing from the saving of coal is to be credited to the electrolytic process. But although it is a comparatively simple matter to arrive at a decision as to the consumption of energy by each of the two typical processes it must not be supposed that decision between them can be based on this computation alone. In all enquiries of the kind it is necessary to preserve the most rigid distinction between the cost of a given operation in energy and in money. These are incommensurable quantities for the adequate reason that the energy cost of a given product is the inevitable outcome of physical facts, while the money cost of a given product is purely no expression of its particular power of appeal to some need, psychical or physical, of human beings. Whence it is clear that a 50-carat diamond, which is energetically inconsiderable when matched with a ton of anthracite, is pecuniarily to be preferred thereto, because it appeals successfully to certain instincts indigenous in barbarous humanity.

If, then, we dismiss electrolytic processes as at present carried out as being to no great extent superior to existing chemical methods in their consumption of energy for a given output, on what ground, if any, are they to be preferred? The first is that no form of matter other than sodium chloride and water is necessary for the production of caustic soda and chlorine from brine, and that there is consequently no waste product. In the Leblanc process, on the other hand, sulphur and nitrate of soda (for the production of sulphuric acid) are needed in the very first stage—viz., the manufacture of salt cake. Of these the sulphur may be recovered by the Chance process, and the soda of the nitrate of soda may find its way into the salt-cake furnace, but the nitric acid is ultimately lost. Again, in the black ash process, the lime present after the completion of the process as calcium sulphide finally appears as a sludge of impure calcium carbonate in the waste from the Chance process. Attempts to utilise it as cement have been made, but, as far as I am aware, with very dubious success. In like manner the lime from the causticising of the soda ash is obtained as carbonate, and is substantially a waste product. Similarly, with regard to the working up of the hydrochloric acid for chlorine, one finds iron and similar impurities from the still liquors in the Weldon process, and calcium chloride after reoxidation and the production of Weldon mud to be disposed of as valueless materials. It must be remembered that these waste products not only mean cost in themselves, but also necessitate an expenditure, which is sometimes serious, in handling and removing them. In the electrolytic process, on the other hand, nothing but finished products should need to be conveyed from the works. The only by-product (hydrogen, appearing at the cathode together with caustic soda) can be trusted to effect its own removal if allowed access to the air.

The other respect in which an electrolytic process has an advantage over chemical methods of making alkali is in the saving of labour. This is to some extent an outcome of the freedom from the necessity for removing waste products spoken of above. Moreover, the material is handled in a liquid or gaseous form throughout the process, up to the point at which the caustic soda solution is boiled down for the production of solid caustic. There is nothing corresponding with the loading-in of salt to the salt-cake furnace and the removal of the salt cake therefrom, nor of the similar proceedings necessary at the black ash stage. In these days, when the manual worker is apt to be exigent, any process which tends towards his deletion has a commercial advantage over those of its competitors which depend upon his aid. It is not merely a diminution of running expenses which may be secured—it is the freedom from the fear of a disastrous stoppage of the whole works which makes labour-saving methods and appliances attractive to the manufacturer. On the contrary side must be set the comparatively high cost of an electrolytic installation and its high rate of depreciation. Seeing that it is impracticable to use more than a very moderate current density at the electrodes of a cell in which a solution of salt is being decomposed, it is requisite to have a large number of cells for even a moderate output; thus the cost of the plant per ton of material produced per day is high. Further, the permanence of such forms of decomposing cell as have been devised hitherto is not very great. Diaphragms and anodes suffer electrolysis as well as does the intended electrolyte. A porous septum which shall have a reasonably low resistance and shall nevertheless keep the products of electrolysis fairly well apart is difficult to design, and complete success has not yet attended the efforts of inventors in this direction.

(*To be continued.*)

GLASGOW CORPORATION TRAMWAYS REPORT.

The following is a condensation of a report by the general manager and engineer of Glasgow on tramway traction and operation in American cities:

In accordance with instructions, we have visited America and investigated the various forms of tramway traction. We sailed from Liverpool on September 19, and after seven weeks' absence arrived home on November 7. The places we visited in pursuance of our investigation embraced the following: New York, Brooklyn, Jersey City, Staten Island, Philadelphia, Baltimore, Washington

Digitized by Google

Pittsburg, Cincinnati, Chicago, Detroit, Cleveland, Buffalo, Niagara, Toronto, Montreal, and Boston. In all these places we had the pleasure of meeting the leading street railway men. We also saw the mayors of some of the most important cities, and visited the works of the principal manufacturers of street railway equipments. We desire to place on record our high appreciation of, and hearty thanks for, the courtesy and kindness shown to us by one and all of the many gentlemen in all these connections whom we had the pleasure of meeting in America. They all did their best to make our visit pleasant as well as instructive and useful. We took it as a compliment, not so much to ourselves as to the old country, and specially to the city of Glasgow, on whose behalf we were collecting information. We shall not be redeeming our promises if we do not heartily embrace every opportunity which presents itself of returning the compliment.

In America tramways are universally styled street railways, and the overhead electric system is usually spoken of as the trolley system. It will also be understood in this report that miles of track means single track where double track is not specially mentioned. Operating expenses per car mile are, as a rule, given exclusive of interest and municipal taxes, which usually include all payments in connection with the franchise or the right to construct and operate.

The authors proceed to give details of the equipment in the various towns mentioned above, and then proceed to draw conclusions as follows :

General Remarks and Conclusions.

It is about the lifetime of one generation since tramways or street railways became recognised as a necessity of city life. Ten years ago, with the exception of a few cables in San Francisco and Chicago, horse traction was universal. Wonderful changes have taken place since then. Many forms of traction have taken the field, and there has been a fierce and continuous struggle for the supremacy. One outcome of all this has been enormous development. In 1890 (not to go further back) there were 9,037 miles of street railways in the United States ; 5,400 miles were operated by horses, 510 miles by cable, 604 miles by steam, and 2,523 miles by electricity. The return for 1896 shows that they have increased to 15,956 miles, of which 1,351 miles were operated by horses, 612 miles by cable, 384 miles by steam, and 13,609 miles by electricity. Within the last five years the number of horses used in operating tramways in America has declined by no less than 80 per cent. Without waiting to trace the history of the traction struggle we shall endeavour to refer to and discuss the different forms of traction brought under our notice on this visit. They have practically all been discussed in former reports already in your hands, but we shall speak of them as seen and judged of in America.

Storage Batteries.—This system was tried some years ago in Washington, among other places. After a large amount of money had been expended on experiments the system was given up as a failure.

Oil and Gas Motors.—Mr. Yerkes, of Chicago, was at great trouble and expense testing the Connelly motors, but they proved unsuccessful, as well as unpopular, and he threw them aside. This is the system which your sub-committee inspected at Croydon. So far as we could learn, there are no other oil or gas motors in America.

Compressed Air.—Mr. Hardie has been working on compressed-air motors for some years, and has three of his cars now running in New York. They cannot be said, however, to be either sufficiently successful or popular to be seriously considered for adoption at present.

The latest compressed-air motor which has been brought out—and it has been done with a considerable show of influence—is one patented by Mr. Knight and Mr. Whitney. The former was one of the patentees of the Bentley-Knight conduit system, and the latter is largely interested in street railways. The first of the Knight-Whitney cars was placed on the Lennox-avenue route during our visit, and we had the pleasure of riding on it with Mr. Knight. All we can say is that the car seemed to run all right throughout the double journey (fully five miles) with one charge. But it would be rash to express an opinion regarding the future of anything of this kind in its first experimental stage, although it seemed to us the best compressed-air system yet produced.

Electromagnetic Systems.—Closed-conduit or magnetic systems have as yet made no headway in America, nor, as far as we could learn, are they looked upon with much favour or hope of practical success. In point of fact, so far as we are aware, no street railway company is at present even experimenting with them.

Electric Open-Conduit or Underground Systems.—Electric open-conduit installations—modifications of Siemens and Halske's Budapest system—have recently been put down, and are being experimented with in Washington and New York. In both cities the overhead system is forbidden. The two experiments are closely allied, and differ only in details. The slot, instead of being in the side rail as in Budapest, is in a third rail in the centre of the track, similar to the ordinary slot for the cable gripper. In Lennox-avenue, New York, the conductors in the conduit are of channel iron for one portion, and 1¼in. steam-tubes for another, while in Washington it is T-iron. The cost of construction is spoken of in America as practically prohibitory, and the special work at junctions and crossings is very expensive, one junction in New York having cost £15,000. In Washington the capital outlay for track and equipment is given at about £20,000 per mile of single line, and in New York the track alone is said to have cost that amount ; and, of course, the horse track and the asset it represents are wiped out. Last winter there was little frost or snow, so that these underground experiments have not been tested through a severe winter. Both in Washington and New York the cars have been stopped for a short time during heavy rains, but while we saw them in dry weather they were running very well and seemed nicer to ride in than the cable cars, and were evidently more popular. One drawback specially spoken of in connection with the operating of the underground system is the great difficulty of locating the defect when anything is wrong. And, of course, apart from snowstorms, there is the difficulty in wet weather of efficient insulation through damp and slush. We observed the electric lighting of the cars working on this system was not quite satisfactory. The lights were dim at times, and went out altogether at the junctions. The streets and climate of Washington are, no doubt, specially favourable for an underground system. Dry weather prevails ; the streets are wide, well formed, and clean : and on the underground routes there is practically no vehicular traffic heavier than buggies and bicycles. Lennox-avenue, New York, is also specially adapted for the system—long, straight lines, and a clean, wide street with only light traffic. The company who own this line and have been experimenting with the underground electric system are the same who have now begun to experiment with the latest compressed-air motor. Evidently they are not so satisfied with the results of the underground experiments as to justify them in proceeding further in that direction at present. They consider the cost of construction prohibitive, and have recently cancelled contracts made in connection with proposed extensions of the electric underground system, just as they had done previously with contracts for cable extension. A short length of the "Love" electric conduit system is still operating in Washington, but a similar experiment has been abandoned in Chicago. As mentioned in our notes under the heading of "Washington," the chief difference between the "Love" and the other underground electric systems is that it has a rolling contact, whereas the others have a sliding contact. Were money no object, and financial results not to be reckoned, an underground electric system can, in a dry climate, be operated where there is sufficient depth (over 2ft.) to construct a conduit. But it seems very doubtful indeed if, for a city and suburban system, even where that depth can be got, it could be made a commercial success, and all the more so in a damp climate like ours. It is well known that the Central Railway construction has made it impracticable to have this system in Argyle-street. On the merits and demerits of the open conduit we have learned nothing which casts the slightest doubt on the thorough soundness of Mr. Arnot's views as expressed in your sub-committee's Continental report. And in any case, with our prsent knowledge, we could not see our way to recommend the spending of money in entirely throwing away the present tramways and the assets represented by them ; and constructing an underground system, which is of necessity so expensive to construct, does not admit of general application to all lines of the system, and is only in the experimental stage, both commercially and from the operating point of view, more especially if there is a proved system which is satisfactory and admits of utilising the present road bed and is cheaper in every way. We feel bound always to bear in mind that the Glasgow Corporation tramways have no rating powers to fall back upon.

Cable System.—The cable system in the earlier days promised to be largely employed in street railways. However, one cannot pass with open eyes and ears through the cities of America without being thoroughly satisfied that it has been superseded. The American street railway men, one and all, speak of it as a "back number." The practical proof of this is that many miles of cable lines have been thrown out in such cities as Philadelphia, Baltimore, Pittsburgh, St. Louis, and even in San Francisco, the home of the cable system. We ourselves saw miles of cable conduits being taken up, and the tracks being reconstructed in every case for the electric overhead system. We also saw a few first-rate cable lines in the United States which are not likely to be disturbed in the meantime. The most notable of these are the trunk lines in New York, Chicago, and Washington. The New York authorities meantime forbid the overhead trolley system, and cables have, at an enormous cost, been put down in some of the busiest thoroughfares, including Broadway, which has the very busiest street railway in existence. They are all working satisfactorily and successfully, but the management make no secret of their preference for the overhead electric system—if they could get it. In like manner, cable lines are running very successfully in Chicago, in such busy thoroughfares as State street and Wabash-avenue—ideal cable routes—as also in the main arteries of a few other cities. In all such cases, however, the cables occupy the trunk lines—corresponding to our Argyle and Renfield streets—and no fair comparison can be made of the operating of such routes and the outside routes which feed them. On the average routes the cable system is more expensive than the overhead electric, and is considered rigid and cumbrous by comparison. There is no probability of the cable system being extended in any of the cities. On the contrary, there is a probability that when the construction or equipment requires renewal this system will give place to the more flexible and popular trolley.

Electric Overhead or Trolley System.—This is now undoubtedly the standard system of tramway traction in America. This is borne out by our notes in the various cities visited, and even more strongly by the actual facts. The invention of a patentee may, on its first appearance, be more or less successfully launched according to the backing it receives from the interest or influence of men of means and position. But no such influence can permanently affect the survival of the fittest. We cannot and need not say anything about the future. But up to the present time there is no difficulty

Digitized by Google

whatever in making-up one's mind as to the best surviving and fittest form of street railway traction in America. Street railway managers and engineers have only one answer to the question, From your experience, and taking both efficiency and economy into account, what is the best form of tramway traction for Glasgow to adopt instead of horses? With unanimous voice they answer: the trolley. Each of the patentees and owners of other systems only claims that his system is the best where the trolley is prohibited. And at home we have heard the admission made that the reason why they don't want us to begin with a section of the overhead system is because they are convinced that if we began with it we would have nothing else.

Electricity has undoubtedly played the leading part in developing street railways in America. The trolley system was only introduced some eight or nine years ago, and since then the mileage of the American street railways has been practically doubled, and at the present time no less than 85 per cent. of the total mileage is operated by the trolley, and the percentage is daily increasing. The system had undoubtedly a crude beginning. In a new country all railroads and street railways must of necessity be constructed in the readiest and cheapest way possible. When the district traversed comes to be more settled and populous there is, of course, so much more money and traffic as to admit of a more permanent construction. Horse tramways were, as a rule, in America first laid down in very temporary fashion. Light rails were simply laid on cross ties or sleepers, to which they were spiked, and the ground levelled up or roughly paved, as the case might be. These rails carried the small horse cars in a way, but were totally insufficient to carry the heavier electrical cars at the higher rate of speed. When, therefore, electrical cars were introduced, the whole track had to be thrown out and laid with much heavier rails on a much stronger foundation. In early examples of the electric system the appearance of the overhead construction does not seem to have entered into the minds or calculations of the constructors. This is not to be wondered at. Their chief aim was rapid transit and development. And they were accustomed to seeing the obtrusive wooden telegraph poles on the sides of their streets carrying the telegraph wires, and, later, similar poles carrying the telephone wires in rapidly-increasing numbers. The side poles necessary to carry the cross-wires for the trolley were insignificant and beautiful by comparison, and so they stuck them up as fast as they could. The people got rapid transit and were delighted. Meantime, in some of the leading cities the appearance of the crude telegraph and telephone poles, and the innumerable wires they now carry, roused the municipal authorities. This was especially the case in New York City — the same city which had sanctioned elevated railways over their streets, which for ugliness have no rival. Whatever they may think of their elevated railroads, they were undoubtedly right in abolishing the huge wooden telegraph and telephone poles, which even yet disfigure most American cities. In many cases State or municipal ordinances have been passed requiring that in five years all telephone wires within certain areas shall be placed in ducts underground. Thus the objectionable poles have disappeared in New York, and are disappearing also in Washington, Boston, Chicago, etc. And no doubt all the chief cities will see it to be their credit to remove these eyesores. New York has evidently gone off to the other extreme, and will allow no overhead wires whatever. Washington has taken the same position, although the capital has still a good many of the old telegraph poles in her principal avenues. Chicago for a time declined to sanction the trolley system down town, but on the pressure of her own ratepayers the municipality is relenting, and very soon, according to Mayor Swift, the up-town trolleys will run right into the centre of the city. The Commissioners of the district of Columbia have also forbidden the introduction of the trolley system into Washington. We need scarcely refer to Washington in this connection, however, as it is a place by itself, and has little or nothing in common with a busy commercial city. With these exceptions every city in America has got, and is well served by, the trolley system, and in no case has the overhead system, when once introduced, ever been abandoned.

After seeing the best overhead construction for the electric overhead system, and considering its vast importance as a means of rapid transit of passengers on city and suburban streets and roads, we are perfectly reconciled to it, and feel that it only wants to be seen in use to be appreciated. Boston seems second to no city in her wish to regard her amenity, and Boston has the trolley everywhere. Mayor Quincey gave us freely his views on the overhead system from his point of view as representing the citizens, and they are in favour of the trolley, which during the last few years has done so much to develop the city. The city of Philadelphia ranks high among American cities. Mayor Warwick, of that city, was quite as frank and strong in his testimony in favour of the trolley, so general and popular in his city. It of course goes without saying that if a system as good and as cheap can be had without any overhead construction we should prefer it. But there is none such known at present. And we feel sure that if the citizens saw this system of rapid transit in operation on the Springburn route—comfortable cars, propelled, illuminated, and heated by the same power—they would not for a moment object to the appearance of neat poles to carry the wires, especially if the old lamp-posts were done away with, and the trolley poles made use of for electrically lighting the streets. We believe the citizens would soon conclude that it was beautiful as a whole.

Glasgow, as the commercial metropolis of Scotland, must continue to be a city of enterprise and industry. As such let us make it as artistic as we can. Is not the most beautiful ideal of an industrial city, however, one in which all classes of the citizens have decent houses to live in, as well as plenty of work by which they can earn sufficient money to meet their reasonable wants? These are the necessaries which make it possible for the individual members of an industrial community to live beautiful lives and build up beautiful characters. They must therefore occupy a foremost place in the city which is to be beautiful in the highest sense. Civilisation demands that the æsthetic gives place in many instances to the useful. We never were prouder of Glasgow than when we heard of the high place assigned to her as a municipality by the Americans. But we have not served 20 years in the Health Department, and been acquainted with "life in one room," without knowing Glasgow's blemishes—and they are common to all our older cities. One great city improvement scheme has been carried out in our city, and another is now being favourably considered. In Glasgow as it was five years ago there was a population of 565,714 on an area of 6,111 acres, giving 92 persons to the acre, or 58,800 to the square mile. In the present Greater Glasgow, apart from the adjoining but still separate burghs, we have a population of 705,000 on an area of 12,311 acres, giving 57 persons to the acre, or 36,480 to the square mile. When the four separate burghs now served by our tramway system are included we have a population of 841,000 persons on an area of 14,661 acres, which also gives 57 to the acre, or 36,480 to the square mile. No American city, with the exception of New York, is half so densely populated. No one wishes our citizens to continue so closely packed together as they now are. How are they to be spread out? In our humble opinion, and judging from what we have been privileged to see in America, the most powerful instrument which lies to the hand of the municipality for effecting this purpose is the best and cheapest possible tramway service radiating from the centre of the city outwards in every direction.

Such a system must be safe, rapid as far as consistent with safety, elastic as to speed, clean, comfortable, and attractive, flexible enough to apply to all routes and contingencies of street traffic, and, of course, as cheap as possible; and it would be all the better if each route had its suburban attractions in the shape of a park for music, and the usual facilities for amusement and recreation generally. As surely as you give cheap and rapid transit, which will enable all sorts and conditions of people living at a distance to travel comfortably to and from their work in the city, so surely will houses to accommodate them be built on cheaper ground—meaning cheaper rent—and with healthier surroundings. From all we have seen, we are of opinion that the overhead electric system of tramway traction reasonably fulfil these conditions. Its safety depends upon reasonable care and judgment as to speed and general working. There is practically no danger from the overhead wires, provided ordinary care is exercised in maintaining them properly. No man, so far as we could learn, has been killed by the current from the trolley wires. We have seen dozens of men who have had 500 to 600 volts without injury—in fact, almost every switchboard man has had it, some over and over again. They don't take it because they like it, but they have had it all the same. The president of the West End Company of Boston told us that they had comparatively more accidents with the horse cars than with the electric cars. If this can be said of the system in Boston, there is no reason why it should not apply to Glasgow, for Boston has the overhead system throughout, and down town the traffic is much more congested than in any part of Glasgow. The Mayor of Chicago expressed his opinion that the lieges in his city suffered more from bicycles than electric cars. Then the question of electrolysis is one which may freely be dismissed. We were well assured that by working to the Board of Trade regulations there can be no trouble in this connection. Under the rough-and ready way in which in the early days the trolley system was installed, it is no wonder that electrolysis resulted. The returns were very imperfect. Where the return is sufficient electrolysis is unknown. Where there have been indications of electrolytic action on gas or water pipes, engineers have had no difficulty in arresting it.

With regard to speed, the electric cars are under perfect control, and can run at any speed. There is no reason why on the average 50 per cent. should not be added to our time-table speed for horse traction.

The electric system is eminently flexible. The cars can be backed when necessary (which is not the case with the cable system), and they can easily be turned on to any route. And it is a system which admits of an easy extension of routes in longer or shorter stages as circumstances require. That an electrically-propelled car can be made clean, comfortable, and attractive by good seating, good lighting, and heating if necessary, is beyond a doubt, and these are very strong points in favour of electric traction. We believe that the poles, if of neat design and judiciously used for street-lighting, can be erected so as not to offend the eye. Where the buildings are continuous, the overhead construction is least noticed. If the cross-wires were fixed to the buildings, as in Hamburg, no poles would be necessary at such places, but it might look as well to have side poles throughout. That electric traction is cheap has also been clearly established, and all the more so when all that it fulfils is taken into account. So great and so general have been the changes in operating companies through amalgamation and consolidation that it is now almost impossible in very many cases to get from books or accounts exact figures bearing on the cost of operating by horses prior to the substitution of electric traction.

It may be remarked here that these changes have led in very many cases to over-capitalisation, chiefly through watering of stock. In a published table we have seen that in the case of one large company it takes no less than 58 per cent. of the total earnings to pay interest on capital liabilities. The published returns

Digitized by Google

dealing with 15,425 miles of American street railways show that, over all, the capital stock and funded debt amount to £18,293 per mile of single track. In New York State the average is nearly double, being £36,560 per mile of single track. This may explain the reason why a large proportion of the street railway companies in America are not paying dividends. There is no doubt, however, that the companies who have conducted their business throughout on sound financial lines have, as a rule, very good properties at the present time. Although there was difficulty in getting comparative costs of operating in as many instances as we should have liked, we have given some good and reliable comparisons under the headings of the various cities. In addition to these, a deal of information regarding costs was given to us on the understanding that it was not for publication. These we have taken with the other to arrive at an average. Taking them on the average, the percentage of operating expenses to receipts with overhead electric traction in America is at least 15 per cent. less than with horse traction. The operating expenses per car per mile are, on the average, 2d. less than with horses. There are further financial gains to be taken into account. On the average, as compared with horse traction, the speed of the cars in America is accelerated by over 50 per cent., and the additional traffic developed by the substitution of electric traction has not been less on the average than 25 per cent.

It is true that the development which has taken place in Glasgow since July 1, 1894, may have made it impossible to realise such favourable results here, but we are confident that the results will be all in the same direction, even although the cost of conversion doubled our capital, as in Boston. No doubt it will be borne in mind that an object-lesson of 2½ miles cannot be expected to produce as good results as the operation on a large scale of an entire system. It should also be noted in this connection that Glasgow is much better served by city and suburban railways than are the American cities. The fare which is universal in America is five cents (2½d.) for any distance the car travels, and most companies also give free transfers to other routes in certain directions. A few companies sell discount tickets slightly reducing the five-cent fare. The Americans are quite astonished at our one-cent fare, and also that their minimum is practically our maximum. There are no cars—cable, electric, or horse—in America with top seats like ours, the obvious reason being the extremes of the climate. Seats on the roof of the car would be too hot in summer and too cold in winter. In most cases close cars are used in winter and open cars in summer. The adoption of the trolley does not interfere with the use of the top seats.

In the matter of organisation and management generally we did not consider America in advance of the old country. The cars in America do not carry half as many passengers per car mile as ours do in Glasgow. With regard to the permanent way, there are certainly some points in their track construction which we have very carefully noted, and particularly the rail welding, but, on the whole, there is scarcely a track up to the present time in America equal to what we have recently been putting down in Glasgow, and in very many cases electric cars are running in America on tracks very much inferior to the Glasgow horse tracks. American managers and engineers, while they smile at our still continuing to operate with horses, at the same time congratulate us on our having been able to wait. The pioneers of the electric overhead system have come through a trying and expensive experience. The first motors, generators, and equipments were crude, and had soon to be thrown aside in favour of newer designs. These also in their turn became obsolete. Even up till within the last two years great improvements were made, but now it is generally believed that engines and generators, motors and line equipments have all been by experience so much improved that now they are practically standardised, and they can undoubtedly be bought at very much less money than at any former time.

The adoption of large units from 1,000 h.p. to 2,000 h.p. has very considerably cheapened the cost of production and maintenance in the power station. Electric motors are not only immensely improved, but they now cost only about one-fourth of the price charged in the early days of electric traction, and all the latest electrical equipments are much reduced in price. The result of improved motors and equipments is that the cost of maintenance has been reduced from three cents per car mile to one cent. One of the greatest improvements has been in the controller. The series-parallel controller is now almost universally used in America. It not only enables the driver or motorman to regulate the speed to a nicety, but it is also fitted with a reversing arrangement by which he can not only back the car but can also cause the motors to act as an emergency brake should occasion arise. By its use there is also a great saving in current as compared with the rheostat formerly used.

Under these circumstances we feel that nothing has hitherto been lost by delay. We also believe that the time has now come when it is perfectly safe to make a move on a small scale, and are satisfied that the opportunities that have been given us for studying the whole question, both in Europe and in America, have brought our information so well up to date that we should have no difficulty in taking in hand to give an object-lesson on the Springburn route of which the citizens will not be ashamed. Although the question of alternating currents for longer distances is at present occupying a good deal of attention, we need not enter upon it here, as direct current would, in any event, be used for a short distance like the route to Springburn. The estimate already given of the cost of equipping the Springburn section on the basis of the present service, apart from any necessary renewal of rails, is £19,575, as detailed in last report by the sub-committee on mechanical traction.

RECOMMENDATION.

We therefore simply confirm the recommendation of the sub-committee as per their report on mechanical traction in Europe, dated July last, which reads as follows: "That, having carefully considered the whole question, we recommend that the route from Mitchell street to Springburn be equipped for overhead electric traction as indicated, and that with a view to providing in this way for the necessary augmentation of the service, which is sure to be required next spring, it be remitted to the Tramways Committee with powers to equip this route accordingly as soon as they conveniently can." And we make the further suggestion that the Corporation remit to the Electric Lighting Committee, acting in co-operation with the Tramways Committee, to light electrically as an experiment a portion of the route with a view to utilising the traction poles for lighting purposes.

LEGAL INTELLIGENCE.

OVERHEAD WIRES AT BRIGHTON.

A trunk line of telephonic communication is in course of erection between London and Brighton, and the Postmaster-General recently made application to the Brighton Corporation for permission to bring the line overhead into Brighton by way of Ditchling-road. The matter has been seriously considered by the Council, and at the last meeting the Works Committee brought forward a recommendation that the Council consent to the erection of overhead wires along the Ditchling-road, from the railway bridge to the boundary of the borough, on condition that no poles be placed upon the highway (except on such portions as are not enclosed by land occupied with buildings); that they be of approved design, and in approved positions, and that the Postmaster-General undertake to remove the same when the erection of houses renders the removal necessary in the Council's opinion. A letter was received from the Postmaster-General, however, intimating that he could not undertake to remove the poles upon the erection of houses.

The matter being thus at a deadlock, **Sir Robert Hunter**, solicitor to the General Post Office, made an application at the Brighton Borough Bench, on behalf of the Postmaster-General, for the stipendiary (Mr. C. G. Heathcote) to decide the matter by arbitration.

The case has already occupied two days, and was not concluded at the time of going to press.

"ELECTRICAL APPRENTICES."

At the Thames Police Court last week Samuel Fynn, electrician, of Commercial-road, was charged on remand with obtaining money by false pretences. The allegations against the prisoner were that he advertised for apprentices to be taught, for a premium, electrical engineering, but that he did practically no business, and that the lads were put to menial tasks, and learned absolutely nothing.

The defence was that the prisoner had been very unfortunate. When the boys were first taken by him he had a good business, but it had fallen off considerably. When the last execution was put in and he found that he could go on no longer, he had tried to have the indentures transferred to a well-known firm of electrical engineers.

Further evidence was given in support of the charge, and the case was again adjourned.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Bolton.—The Corporation require tenders for a new steam-boiler at the electricity works.

Strassburg.—December 16 is the date for tenders for the supply of 1,060 wooden telegraph poles to Elsass-Lothringen Railway Authorities.

Essen.—Among other articles for supply by tender to the Prussian State Railway Authorities at Essen on December 17 are 1,000 battery zincs.

Denton. — Specifications and tenders are invited for electric light installation. Apply to Messrs. John Lever and Co., galloon manufacturers, Denton.

Brussels.—Tenders will be received on December 24 at the Brussels Bourse for the supply of wooden telegraph poles for the Belgian telegraph service.

The Hague.—The Dutch Waterstaat Ministry want tenders on 18th inst. for the supply of zinc, iron, and copper stores for the telegraphic service in the forthcoming year.

Elberfeld.—Among other miscellaneous stores, tenders will be received at Elberfeld on December 30 for the supply of electric light carbons for the Prussian State Railway.

Breslau.—December 14 is the date for tenders at Breslau for the supply of telegraph poles to the Railway Telegraph Authorities. The office is Brüderstrasse 32, Breslau, and particulars are obtainable for 7½d.

Saint-Yvon (France).—Tenders will be wanted on January 31 for an electric lighting installation (to replace 1,500 gas lights) at

Digitized by Google

the lunatic asylum at Saint-Yvon, in the Seine Inferieure. Application to the asylum authorities.

Madrid.—Tenders are wanted by December 16 for the supply of 20 tons of telegraph wire (copper) for the Government Telegraphs. Application should be made to la Dirección general de Correos y Telegrafos, Madrid, Calle de Carretas 10.

Kiel.—Tenders will be received on December 18 for the supply of iron, copper, bronze, and steel wire for the Imperial Dockyard. Particulars (price 7d.) from the Kaiserl. Werft Abtheilung für Verwaltungs Angelegenheiten, Kiel, Germany.

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s.) from the Generaldirektion, (Centralbureau) Grossh. Badischen, Staatseisenbahnen, Karlsruhe, Germany.

Harrogate.—The Town Council are prepared to receive tenders for wiring the Municipal Offices, Victoria Baths, Market Hall, and Public Library; also for electrical fittings for the same. Specifications and forms of tender can be obtained at the office of the Electrical Engineer, Montpellier-gardens. Tenders must be delivered on or before January 1, 1897. Further particulars appear in our advertisement columns.

Wakefield.—The Visiting Committee of the County Council invite tenders for the maintenance and renewal of the electrical recording stations, signals, bells, and telephones at the West Riding Asylum, Wakefield. For further particulars, form of tender, and instructions apply to Mr. J. S. Banks, clerk of works. Sealed tenders, properly endorsed, to be forwarded to Mr. J. Vickers Edwards, county surveyor, Wakefield, by December 14.

Camberwell (London).—The Baths Committee of the Vestry invite tenders for the renewal, etc., of 45 accumulators or storage batteries in connection with the electric lighting of their baths and wash-houses in Church-street. Tenders to be delivered on the 14th inst., not later than 4 o'clock in the afternoon. Full particulars from Mr. O. S. Brown, surveyor to the Vestry, Vestry Hall, Camberwell. Additional details are published in our advertisement columns.

Aberdeen.—The Corporation Gas and Electricity Works invite tenders for supplying the following articles for one year from January 1 to December 31, 1897: cast iron work; malleable iron and ironmongery; steel goods; brass, lead, and tin work; ropes, rope yarn, tow, etc.; painter and glazier's work; timber; carting, all according to schedules, which will be delivered to intending contractors at the Gas Engineer's Office, Cotton-street. Sealed tenders to be addressed to the Town Council, and, marked as such, to be delivered at the Gas Office, Board-street, Aberdeen, by 14th inst.

Colwyn Bay.—The Urban District Council invite plans, particulars, and estimates, etc., for a scheme of electric lighting for their district, the powers for which they obtained last session. To the author of the scheme considered the best a premium of £30 will be paid, and in the event of the work being carried out such premium must be considered as part payment of the engineer's commission. To the author of the scheme considered second best a premium of £20 will be paid. Further information will be received on personal application to Mr. Wm. Jones, A.M.I.C.E., the Council's surveyor. The schemes must be sent in not later than January 12, 1897. Further particulars are contained in an advertisement in another part of the paper.

Swansea.—Tenders are wanted for the entire construction and equipment of the Constitution Hill Tramway, Swansea. Plans may be seen and all particulars obtained at the offices of Mr. Charles T. Ruthen, C.E., 24, Goat-street, Swansea, engineer to undertaking, or at the offices of the consulting engineer, Mr. G. Croydon Marks, C.E., 18, Southampton-buildings, Chancery-lane, London, W.C. Specifications, forms of tender, etc., may be obtained from either of above upon payment of £5 (Bank of England note), which amount will be returned upon receipt of a bona fide tender. Tenders to be sent to the Proprietors, Constitution Hill Tramway, care of Messrs. Marks and Ruthen, 24, Goat-street, Swansea, by 10 a.m. on 16th inst.

London, N.—The Vestry of St. Mary, Islington, require tenders for the supply of machine tools, smiths' tools, and engineers' tools. Specification, conditions, and form of tender may be obtained on application on or before 14th inst. to the Electrical Engineer, 50, Eden-grove, Holloway, N. A deposit of £1. 1s. will be required, which will be returned on receipt of a bona fide tender. All tenders must be sent under cover, endorsed "Electricity Department, Tools," and addressed to Mr. Wm. F. Dewey, vestry clerk, Vestry Hall, Upper-street, N., and must be received not later than 12 noon on 16th inst. Persons tendering must annex to their tenders a schedule of wages relating to their trade, and will be required to make a declaration that they do and will, during the continuance of any contract they may enter into with the Vestry, continue to pay the trade union rate of wages, as in practice obtain, and observe the conditions and hours of labour prevalent among the several classes of labour they may employ.

RESULTS OF TENDERS.

Rangoon.—Mr. D. D. Coath's tender for a trial lighting of the main streets of Rangoon by electricity has been accepted at Rs.3,400 (nearly £200).

South Shields.—The Council have accepted Messrs. Ferranti's tender for the extension of plant required—viz., steam alternator and transformers, £5,412. 10s.; also rectifier and switchboard, £589.

Hanover.—Twelve firms tendered for the supply of telegraph posts to the German State Railways. The prices vary, according to the place of delivery and quantities, from an equivalent of 10s. 6d. to 1s. 4d. each.

Hastings.—The Town Council have accepted the following tenders for the boilers and machinery at the proposed electric light station; Messrs. Babcock and Wilcox, Limited, two boilers and superheaters, £854; Messrs. Crompton and Co., three steam alternators, £2,231.

Paris.—The contract for the supply of 10,000 telegraphic cross-pieces to the Post and Telegraph Department on November 26 has been awarded to Bouchacourt et Cie., Paris, at 28,450fr. The other contracts for brackets, etc., were divided between a number of French firms. Lot 11 (U brackets) was not awarded. The copper wire and solder contracts go to Bestrandias, of Paris.

Dublin.—The following tenders were received by the Dublin Bread Company, Limited, for the supply of a motor van:—

Cutting Bros., Derby	£373
Arnold's Motor Carriage Company, East Peckham	350
Gerhardt and Olhme, Leipzig-Lindenau	250
New and Mayne, Westminster	250
Watford Engineering Works, Watford	275

West Ham.—Mr. J. J. Steinitz the borough electrical engineer, informs us that 97 tenders were sent in as the result of advertisements appearing in the technical papers for new plant. The Council have adopted the tenders of the following firms:

	£	s.	d.
S. Z. de Ferranti, Limited, steam alternators and exciters	£9,600	0	0
W. H. Allen, Son, and Co., surface condenser and pumps	650	0	0
S. Z. de Ferranti, station switchboard	633	0	0
British Insulated Wire Company, high and low tension mains, etc.	8,094	11	0
Brush Company, Limited, transformer sub stations and transformers	1,453	10	0
General Electric Company, Limited, instruments	260	0	0
Drake and Gorham, arc lamp-posts and transformers	2,530	0	0
Taylor and Hubbard, 10-ton crane	246	0	0

BUSINESS NOTES.

Sonning.—An electric light column has been erected on the bridge.

Western and Brazilian Telegraph Company.—For the past week the receipts were £2,804.

Great Northern Telegraph Company.—For the month of November the receipts were £24,000.

Walsall.—The electric lighting of the shops in Digbeth and High street appears to be giving great satisfaction.

Stourport.—A fund has been started for the purpose of providing an electric organ at the parish church.

South Shields.—Mr. Jeckell, the borough electrical engineer, is getting out estimates for lighting the parish church clock with electricity.

An Armoured Motorcar.—It is stated that the War Office has under consideration a type of motorcar, armoured and armed, for purposes of war.

Blackburn.—The question of lighting the sewage works at Samlesbury by electricity has been referred to the sub-committee to consider and report upon.

Levenshulme.—The seal of the District Council was affixed at the last meeting to a memorial to the Board of Trade for an electricity provisional order.

Malta.—Valetta and its suburbs, together with the harbour, were lighted last week by electricity for the first time. The inauguration was very successful.

Acetylene.—New acetylene works are to be erected at Vernayaz, Valais, Switzerland, on a capital of £50,000. The turbines, driven by water, are to be of 100 h.p.

Middlesbrough.—The minute agreeing to ask the Imperial Tramways Company to submit proposals of extensions to the Streets Committee has been passed.

Lisburn.—The Streets Committee of the Commissioners have been empowered to engage an electrical engineer to report on the prospects of electric lighting in the town.

Boston.—The Harbour Commissioners have unanimously resolved to light the dock by electricity, at a cost of £1,294. 4s. A scheme for lighting the town was not entertained.

Dover.—The report of the town clerk and surveyor strongly recommending the adoption of the overhead system for the tramway has been referred to a sub-committee.

Dingwall.—Electric light will probably be introduced here shortly. The Town Council have asked for certain proposals on behalf of a company to be submitted in writing.

Blackpool.—A start has been made with the construction of a double line of tramways along Station-road, South Shore, connecting the Lytham-road and promenade sections.

Watford.—The Urban Council will hold a special meeting on the 31st inst. for the purpose of passing the formal resolution applying for a provisional order for electric lighting.

Digitized by Google

Catalogues.—We have received catalogues from the Electrical Company, Limited, Messrs. Samuel Withers and Co., and Messrs. Mavor and Coulson, which we shall notice in next week's issue.

Lambeth (London).—The *Gazette* of December 4 contains the notice of the application of the Lambeth Vestry to transfer their provisional order to the South London Electric Supply Corporation, Limited.

Standard Gauges.—Messrs. Lehmann Bros., of Torriano-avenue, N.W., inform us that they are now manufacturing the half-nut gauges recommended by the British Association in their last report.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended December 6 amounted to £1,069, as compared with £1,042 in the corresponding week of the previous year, being an increase of £27.

Commercial Cable Company.—A special meeting of the shareholders of the Company will be held at the Company's offices in the Postal Telegraph-building, 253, Broadway, New York, U.S.A., on December 22, 1896, at 11 a.m.

Hastings.—Judging by the number of applications granted by the Town Council for permission to fix projecting arc lamps outside premises, there is a growing, strong demand for electric light in the town at the present moment.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended December 4 were £1,892. 5s. 10d., compared with £1 841 1s. 5d. for the corresponding period of last year, being an increase of £51. 4s. 5d.

Edinburgh.—At the Town Council meeting it was remitted to the Lord Provost's Committee to consider the advisability of giving consideration to the more recent mechanical motors in view of the tramway extension to Portobello, and report.

Correction.—In an advertisement last week for an assistant engineer at Derby, the salary offered was given as three guineas a week, when two guineas was the sum intended. The advertisement is reprinted in its correct form in this week's issue.

Bucklow.—A copy of the Manchester Carriage and Tramway Company's scheme deposited in Parliament, with the plans, were before the Council at their last meeting, and it was decided to call a special meeting a month from that date to discuss the matter.

Guildford.—A letter was read at the Town Council meeting from the Guildford Electricity Supply Company, Limited, stating that the company was now prepared to supply electric current for street-lighting, and, if the Council desired, they would send estimates.

Eastern Extension Telegraph Company.—The directors of the Eastern Extension, Australasia, and China Telegraph Company, Limited, have declared an interim dividend for the quarter ended September 30 of 2s. 6d. per share free of income tax, payable on 15th prox.

Postal Telegraph Cable Company of New York.—A quarterly dividend of 1 per cent. will be paid on January 15 out of the net earnings of all stockholders of record on December 31. The transfer books will be closed on 31st inst., and reopened on the morning of January 7.

Caswell, Limited.—This Company has been registered, with a capital of £50,000 in £1 shares, to carry on the business of manufacturers and dealers in cycles, launches, motors, and carriages of all kinds, as electricians, etc., and as producers and suppliers of motive power, light, and heat.

City and South London Railway.—The returns for the week ended December 6 were £1,052, compared with £977 for the corresponding period of last year, being an increase of £75. The total receipts for the half-year 1896 were £21,947, compared with £20,527 last year, being an increase of £1,420.

Downham.—Mr. A. B. Bird gave notice at the Urban District Council meeting that he would apply to the next meeting to carry an electric wire alongside his present telephone wire, and on the same posts, from his flour mills to his private residence, for the purpose of lighting the latter by electricity.

Westralia Motor Carrying Company, Limited.—This Company has been registered, with a capital of £7 in £1 shares, to carry on the business of carriers, transport agents, coach and carriage builders, cycle, motor, carriage, and autocar manufacturers, dealers and repairers, engineers, machinists, etc.

Burnley.—At the Town Council meeting, Councillor Parsons submitted for adoption the minutes of the Gas and Electric Lighting Committee. Councillor Dickinson called attention to the dark state of the road near the Cross Keys Hotel. Councillor Parsons promised to bring the matter before the proper authorities.

Cheltenham.—The Town Council have decided that the gauge of the proposed light railway shall be 3ft. 6in. instead of 4ft. 8½in., and they have also decided to oppose the railway altogether unless Section 21 is so modified that no other power except electricity be used without the sanction of at least two-thirds of the Council.

Bedminster.—Resolutions were passed at a meeting of ratepayers in favour of the extension of the tramways by electrical power, and of the provision of the power by the Corporation, and also that the tramways company, if in five years a better means of traction than the overhead system were discovered, should be compelled to adopt it.

The Electrophone.—The principal London theatres were placed in connection with the Railway Hotel, Bromley, last week, and at the invitation of the National Telephone Company a large number of leading local tradesmen and others attended. The Telephone Company have opened new offices at 13, East-street, Bromley. The Bromley Urban Council Offices have been connected in a similar manner.

Govan.—A deputation from the Parish Council has been received by the Tramway Committee of the Town Council. The object of the deputation was to press on the committee the advisability of extending the present car service to Linthouse terminus—a distance of 600 yards beyond where the cars presently stop. The committee promised to give the request their careful attention.

Altrincham.—The Clerk reported at the Urban District Council meeting that he had received within the time specified a notice and a copy of the plans from the Manchester Carriage and Tramway Company of their intention to apply to the Board of Trade for a provisional order to construct a line of tramways through the district. It was agreed to refer the matter to the Highways Committee.

Bedford.—The electrical engineer to the borough electric lighting works reported at the recent meeting of the Town Council respecting the presence of coal-gas in the electrical street boxes. The gas company have previously been informed of the serious state of things, but it has not been remedied. Proceedings were directed to be taken against the gas company if the matter was not promptly seen to.

Another Electrical Exhibition.—It is stated that arrangements on a very large scale are being made in Como, Italy, for an electrical exhibition and congress, to be held in 1899, to commemorate the centenary of the invention of the voltaic pile. It was in 1799 that Alessandro Volta, the inventor, while professor of natural philosphy at the University of Paris, made the discoveries that have immortalised his name.

The Dardanelles Forts.—An Austrian military paper states that two electric search-lights have been sent especially from St. Petersburg for the new fort of the Dardanelles known as the Sultan Abdul Hamid, and with them went the artificers and engineers to place them in position. A Russian professor has offered his gratuitous services for the working of the search-lights, and these have been accepted.

Bury.—The minutes of the Electric Lighting Committee, which were not discussed at the Town Council meeting, stated that Councillor Ashworth had been appointed chairman and Councillor Ward deputy-chairman of the committee. The Borough Engineer reported that the application of the Technical Instruction Committee to connect the school with the Corporation electricity mains was neither feasible nor desirable.

Ambleside.—A letter was read at the District Council meeting from the Board of Trade relative to electric light, and on the suggestion of the clerk the memorial asking for power to apply the light in the Council's district was signed. The Lighting Committee's report was read, which showed that several lamps, posts, and brackets were necessary and that other minor improvements were wanted. The report was adopted.

Paris.—It appears that all the deliberations of the Municipal Council concerning the Metropolitan Railway are likely to be fruitless. In order, however, to augment the means of transport in view of the exhibition, the Council will, in the long run, probably accept the proposals of the Eastern and Western Railways to prolong their lines towards the centre of the city. The extension of the electric tramways is also proposed.

Aberdeen.—The Watching and Lighting Committee have appointed a sub-committee to meet the Harbour Commissioners with the view of endeavouring to arrive at some satisfactory arrangement in reference to the proposal to light the docks by electricity from the Corporation mains. The Town Council are still experimenting with electric street lighting. The electric light has been installed at Kemnay granite quaries by Mr. John Fyfe.

Dewsbury.—For six weeks ended November 21 the electric energy discharged was 17,649 units, against 11,187 last year. A letter was read at the Town Council meeting from the secretary to the Electric Lighting Extension Syndicate, asking whether the Corporation would enter into an agreement for the supply of electric energy to the syndicate, such energy to be distributed by them through penny-in-the-slot meters. The application was not entertained.

Harwood.—A letter was read at the District Council meeting from the captain of the fire brigade, urging the necessity for having electric fire bells fixed in the firemen's houses in order to save time when a fire occurred. He pointed out that at the recent fire at Rishton the members of the brigade had to be knocked up, causing considerable delay. The cost, it was stated, would be about £30. The matter was referred to the Fire Brigade Committee for consideration.

Copenhagen.—There is a project on foot for an electric aerial railway from the heart of the city to the woods called Charlottenlund, lying to the north along the Sound. The cars will run at an altitude of about 15ft. to 16ft. from the ground, and at a maximum speed of 31 miles an hour. It is proposed to have 10 cars, each accommodating 40 passengers, and running every four or five minutes. The distance which it is proposed to traverse is about five miles.

Darfield.—The Chairman explained at the Urban District Council meeting that the Houghton Main Colliery Company had not sufficient power to supply Darfield with the electric light. The Rev. B. T. Barnes said it would be too costly a thing to put their own plant down. The Chairman said it would be better not to rush forward in this matter, as he understood from an expert that the electric light was as yet in its infancy. The matter will receive further consideration.

Digitized by Google

Hull.—A long discussion took place at the last meeting of the Town Council on the proposal to adopt a scheme emanating from the Electric Lighting Committee to extend the present installation in the town by the adoption of the high-pressure tension, at a cost of £42,000. Objection was taken on the ground that, as the low-tension principle was a proved success, it ought to be continued. Ultimately it was decided by 26 to 24 to send the minutes back for further consideration.

Morley.—The Corporation have given formal statutory notice of their intention to apply to the Board of Trade, under the Electric Lighting Acts, 1882 and 1888, to authorise the supply of electricity for public and private purposes within the borough of Morley. The names of the streets in which it is proposed that electric lines shall be laid down within a specified time are Queen-street, Chapel-hill, and Church-street. The area is but a circumscribed one. It will, however, suffice for the present.

Swansea.—A statutory meeting of the ratepayers has been held to consider the proposal to promote a Bill in Parliament for the acquisition of the Swansea tramways and for other purposes. There was a strong rowdy element in the room, and considerable disturbance was made by employés at the gasworks The resolution consenting to the Bill was lost, and a poll of the town will now be taken. The question has been the subject of hot debates at various ratepayers' and other meetings.

Wrexham.—At the Town Council meeting it was reported that the Rural District Council had resolved to object to the inclusion in the provisional order to be made by the Town Council for the purpose of providing electric lighting of the portions of Stansty and Broughton lying within the parliamentary borough of Wrexham and the townships of Bersham, Erddig, Abenbury, and Acton. It was thereupon resolved that the area proposed to be lighted should be limited to the municipal borough.

Changes of Address.—All communications to the Technical Education Committee of the Kent County Council should be addressed in future to the committee's new offices at 53, Parliament-street, Westminster, S.W. The chairman of the committee is Mr. Geo. M. Arnold, J.P., D.L., Milton Hall, Gravesend.—Mr. S. Bousfield Tatham, electrical engineer, informs us that in consequence of the greatly increased business he has removed to larger offices and showrooms at 26, Thurloe-place, South Kensington.

Prestbury.—A letter was read at the Parish Council meeting from the clerk to the County Council asking the Council's opinion with regard to the proposed light railway for Cheltenham: (1) Were they in favour of a light railway to be worked electrically and to run by the side of the main road? (2) should this railway be suitable for carrying heavy goods, as coal or corn? and (3) should the gauge be the same as an ordinary railway? The matter was placed on the agenda for next meeting, along with other suggestions.

Railways and Motor Competition.—The Liverpool and Lancashire Transport Company having instructed their surveyors to report as to using Liverpool and Manchester highways for motor traffic from the ship's side to the warehouses in Manchester, the surveyors have just completed their task, and report the suitability of these roads for motor traffic. It is calculated that merchandise can be carried between the two cities at one-third the present railway rates. It is understood that a new company will be formed at an early date.

Electric Welding.—At the conversazione given by the Institute of Marine Engineers at Stratford on December 4 the Electric Welding Company, Limited, of 21, Hindon-street, Pimlico, S.W., showed a most interesting and varied assortment of samples of welding work executed by the Thomson patent electric welding apparatus. In addition to a new type of automatic welder for iron, copper, etc., they exhibited an entirely novel departure in a complete set of electrically-welded fittings for cycle work, which comprised head lugs, main bracket lugs, rear forks, and pedals.

Waterloo.—At the Parish Council meeting the Clerk said he wrote to the electric tramway company asking them what progress they were making with their scheme, and he had received the following reply: "Dear Sir,—I am instructed to state that my clients are busy negotiating a contract with the Corporation of Ashton-under-Lyne for the supply of electricity. They are also getting on as fast as possible with the other many preliminary steps and contracts before they start upon the ground. The matter is not being delayed in any way.—Yours, faithfully, L. Marl."

Personal.—According to unanimous recommendations of committees of the St. Pancras Vestry the salary of Mr. David Arthur Smith, assistant clerk in the electricity and public lighting department is to be increased from £100 to £120 per annum; and Messrs. Henry Ridley Burnett and Percy Nicholas Hooper, electricians at the King's-road station, are to be promoted to the positions of assistant engineers at the station, and their salaries to be increased from £110 to £140 per annum each.—The salary of Mr. Thornhill, assistant manager at the Taunton borough electric light works, has been increased from £75 to £100 per annum.

New Copper Company.—The Mountain Copper Company, Limited, has been formed, with a capital of £1,250,000, for the purpose of acquiring and working on an extended scale the copper mines belonging to the Mountain Mines, Limited, situated at Iron Mountain, Shasta County, in the State of California, the smelting works connected therewith, and other extensive property, as well as the entire interest in the railway to the mines, and also the refining works in the neighbourhood of New York, owned by the New Jersey Metal Refining Works, Limited. The capital is divided into 250,000 shares of £5 each, of which 83,326 fully-paid are reserved for the vendors in part payment of the purchase-money, and the remaining 166,674 shares are now being offered for subscription.

Tunbridge Wells.—The introduction of electricity for the purpose of lighting the streets of the town is converting most of its old opponents by reason of the great contrast between the streets lighted by electricity and those lighted by gas. These latter streets were always considered to be well enough lighted, but now the contrast is so great that they appear to be almost in total darkness. The consequence is that the Town Council has been inundated with complaints, and the question of improving the lighting of side streets has been referred for the deliberation of the Lighting Committee. The price of current for motor purposes has also been referred back to the committee. The committee had already recommended that current should be supplied to the omnibus company at 3d. per unit.

Electric Locomotives.—According to the *Railway Gazette*, the three electric locomotives of the Baltimore and Ohio Railroad Tunnel Line at Baltimore, O., will soon be used to handle the passenger trains as well as the freight trains. The overhead conductors are being extended three-quarters of a mile northward—to the new Mount Royal Station—and 1,500ft. southward, to obviate the necessity of using steam "pusher" engines on the tunnel approaches. The electric engines are giving good satisfaction, and the maximum load hauled so far has been a train of 41 loaded freight cars with two locomotives not working. The electric power plant is now being used not only to furnish the power for the tunnel locomotives, but to run 180 street cars of the Baltimore Traction Company, and also to furnish a large amount of light.

Brighton.—Great sympathy is felt for Mr. Volk in the loss he has suffered through the gales of last week. Not only was his electric tramway along the Madeira-road very seriously damaged, almost half of it being destroyed, but the new Brighton and Rottingdean electric seashore railway which was opened a week previously was also affected. The car was smashed and a portion of the line injured, while the waiting-room at the Brighton end was almost razed to the ground. This loss, of course, will be borne by the company, but the other falls on Mr. Volk alone. Mr. Volk has successfully overcome many serious obstacles at Brighton, and there is no doubt he will "still come up smiling," although perhaps this is the hardest blow of all. A fund has been started in the town and liberally responded to, as a mark of the sympathy felt by his fellow-townsmen.

City and South London Railway.—In the course of an interview with a representative of the *Financial News*, Mr. Thomas C. Jenkin, the general manager of this railway, said they were going to connect at Lombard-street with the Central London and the City and Waterloo by means of a subway to the Mansion House Station, and at Moorgate-street they would connect with the Great Northern and City. On this railroad the tunnels will be very large, and will accommodate ordinary railway carriages. At a point about Finsbury Park an ordinary train will enter the tunnel; here the steam-engine will uncouple and an electric locomotive take its place. The electric locomotive will bring the train right on underground to a Moorgate-street station. With that station, when it is constructed, the City and South London Company will connect. All these electric lines will dovetail more or less.

Manchester.—A special meeting of the City Council has been held for the purpose of determining on an application to the Board of Trade for authority to extend the tramway system of the city. The extension includes the doubling of the line in part of Cross-street and part of Chorlton-road, the making of new lines in Ashton New-road, Moss-lane East, Denmark-road, Greenheys-lane, and certain minor changes. Mr. Alderman Milling proposed that such application be made. The Highways Committee, he stated, had found these extensions to be highly desirable. Mr. Tunstall seconded the motion. Mr. Sutton suggested an extension of the tramways by Ashton New-road to Audenshaw, but was reminded by Mr. Alderman Milling that this would be a work for the tramways company and not for the Corporation, Audenshaw being outside the city boundary. The resolution was passed unanimously.

An Electrical Company in Liquidation.—Meetings of the creditors and shareholders of Inrig and Chester, Limited, electrical engineers, White Post-lane, Victoria Park, have been held at Carey-street. Mr. Cully, assistant receiver, said the history of the company was very short, and, so far as the creditors were concerned, very disastrous. It was registered in February last to acquire the business of the Globe Electrical Company, in order to meet the wishes of Mr. Chester, who was asked to become a partner with Mr. Inrig in the business. The nominal capital was £2,000, but the only shares issued were £500 to Mr. Inrig as vendor and about £600 to Mr. Chester or his relatives. As time went on money was required, and was raised by means of loans secured by a charge over the whole of the assets. The unsecured debts were estimated at £1,583, and the assets at £100. The case was left with the official receiver, to be wound up in the usual manner.

Colchester.—The Electric Light Works Committee reported at the Town Council meeting that at a meeting of the committee on November 20, a letter was read from the engineer to the Great Eastern Railway Company with reference to the lighting of the North Station, and the borough surveyor was instructed to confer thereon with the engineer or with the district engineer, Mr. Jones. A letter dated November 14 was read from Messrs. Elwes and Turner, solicitors for Mr. A. T. Osborne, enquiring whether the contract for sale of the site for an electric lighting station is to

Digitized by Google

be carried out, and the committee desired the town clerk to communicate with the Local Government Board. The military authorities wrote, under date November 14, stating that the new military hospital would be occupied on Monday, November 16, from which date the electric light would be required; and the borough surveyor reported that all needful arrangements had been made. The report was adopted.

Birmingham.—The electric lighting of the annual exhibition at Bingley Hall was carried out by the Walsall Electrical Company, Limited, whose engine and dynamo were working in view of the public.—Mr. William Cope, of Bristol-road, has submitted to Dr. Hopkinson, the special tramway adviser of the Corporation, and also to the members of the Public Works Committee, the specification of a patent he has taken out for improvements in connection with conduits for electric tramways. The principal features of the patent are a chamber of special form—somewhat bottle-shaped—wherein the electric conductor is to be laid; and, secondly, an internal car, forming a covering to the conductor, and protecting it from any dirt or wet that may fall through the slot rail. The form of conductor is also patented. It is claimed for it that it can be more cheaply constructed than other underground systems, that it secures perfect insulation, and has the advantage of being with easy reach of the surface.

Kirkby.—At the District Council meeting the question of lighting the parish with electricity was fully discussed, and Mr. Leivers contended that the matter was floored, he having asked for an estimate and been told that it would cost a matter of £12,000. Mr. Shacklock said this was out of reason, and the undertaking would cost no such amount. He believed that if the parish laid down a plant it would be an ultimate saving to the ratepayers. The Act would not allow them to take over the plant of the Sutton Gas Company. He was most anxious that the benefit of the ratepayers at large should be considered, and he believed that if a plant were laid down the whole of the ratepayers would benefit. Mr. Gelsthorpe moved that Mr. Furse, of Nottingham, be asked to prepare an estimate, after ascertaining his fee for the estimate. Mr. Hayes thought the matter altogether impracticable, and any money spent in the matter would be a waste to the parish. Mr. Gelsthorpe was of the same opinion, but others on the Council had a different view.

Londonderry.—Councillor Thompson has been elected chairman of the Lighting Committee. Councillor Hastings, in supporting the motion, said he felt convinced that Councillor Thompson would, as chairman, help to have developed the electric lighting of the city. They wanted about £30,000, whether Councillor Thompson liked it or not, to develop and encourage private lighting by electricity and to complete the public lighting of the streets electrically. At present they were labouring under a discount. Their generating power was good enough, but the electric light—that is, 170 lamps—cost more money than the gas of old did. He would suggest to Councillor Thompson to formulate a scheme to raise £30,000 to carry out to a satisfactory completion the public lighting of the city, and to provide, in addition, private lighting by electricity. There were some streets as yet insufficiently lighted. He was of opinion that 30 more electric lamps were wanted to complete the public lighting and have the necessity for the use of gas lamps obviated.

Shoreditch.—The Vestry have approved of a further report of the Works Committee stating that they had considered a report and plan prepared by the surveyor with reference to the ventilation of sewers, and they had decided to make an experimental connection at Bowling Green-walk, with the intake of the forced-draught fans of the destructors on the electric lighting station, at a cost of about £10, and that observations of the influence on the sewers be then taken. They had authorised the surveyor to obtain an anemometer for this purpose. The Electric Lighting Extension Syndicate, Limited, forwarded a draft of the terms of agreement which they proposed to enter into with the Vestry. They wished to be placed on the same level as any other large consumer of electric energy in the district at a reduction on the Vestry's usual rate. The syndicate further pointed out that the introduction of their penny-in-the-slot meters and free wiring would no doubt induce many to use electricity, and greatly benefit the Vestry's undertaking. The letter was referred to the Electric Lighting Committee.

Electric Lighting of Trains.—The *Newcastle Daily Chronicle* says: "While the members of the Tynemouth Recreation Association are about the work of asking for increased facilities from the railway company, they might point out the need there is for lighting up the carriages during the long tunnel passage under the town of North Shields. In these days of electrical engineering skill there cannot be any difficulty about switching on the electric light when a long tunnel is being entered. Indeed, it is already done on many of the South Country railways, and it is very needful that it should be done on the Tynemouth line for the sake of ladies and children travelling to the seaside. Perhaps Mr. Engel will undertake to show the directors and engineers of the railway company how easily the thing could be accomplished when he opens his electrical exhibition at Pandon Dene in February next. Newcastle has lagged woefully behind in the matter of street locomotion, but the private enterprise now manifested in the way of electric lighting on all hands serve to show Tyneside does not mean to be last in the race after the light and energy of the near future."

Motorcar in the County Court.—A case affecting the traffic influences of horseless vehicles has engaged the attention of his Honour Judge Shand in the Liverpool County Court, and public interest was shown by the crowded attendance. Mr. J. M. Sutherland, a hay and straw dealer, sued the North of England Horseless Carriage Company for £20. 10s., damage to a pony and trap. A motorcar belonging to the defendants was stationary in London-road on October 3, and just as the engine was set in motion plaintiff's pony, which was being driven past, took fright and came into collision with a bread-van, causing injury to both pony and trap. One of the witnesses for the plaintiff declared that the motor made a noise something like a steam thrashing machine, and another that it was like a railway only considerably reduced. For the other side it was declared that the accident was caused through the carelessness of the pony's driver, as the animal did not take fright until it came into collision with the bread-van. The motor made only a "coughing" sound, ejecting vapour from underneath. In reply to the Judge, Mr. Collingwood Hope (for the plaintiff), said that the car was being run as a locomotive, it being before the Act of Parliament was amended. The jury gave the plaintiff a verdict for £12s. 10s.

Cardiff.—Mr. Atkinson, who is acting for the syndicate which promotes the electric tramway from Cardiff to Penarth, has published a small pamphlet, accompanied by a printed sheet of views, designed to overcome the objection of unsightliness which is always raised against the adoption of the overhead system. Views of electric tramways at Milan, Lubeck, Baden, Havre, and Bristol show that even in surroundings where appearance is of great importance—such as the vicinity of fine public buildings—the overhead wires, with their needful supports, are not destructive of æsthetic effect. The pamphlet deals also with more practical considerations, and demonstrates conclusively that to work by electricity is the best method. Under the heading of "The Logic of Facts," it shows how very rapid has been the growth of electric traction during recent years. At a meeting of the Parliamentary and Tramways Committee the following resolution was unanimously passed: "That inasmuch as the Corporation feel that they should keep in their own hands all their roads within the municipality available for tramways or other purposes, the Corporation cannot consent to the application of the Penarth Tramways Syndicate, Limited, for a provisional order to construct tramway within the borough."

Crystal Palace.—The National Cycle Show has been on at the Palace this week. It covers all the ground floor, and has flowed up into the galleries. The shepherd knows his sheep, and presumably the cyclist knows his cycle, but barring variations in the brakes—when there are brakes—it is difficult for the ordinary man to distinguish the differences marking the goods of the 320 exhibitors. The engineer has never loved the pitch chain, though for some kind of work he would be puzzled to do without it, and it is not surprising, therefore, to notice that there is a continuance of the attempts to get rid of it from the safety. The most hopeful of these appears to be the use of a horizontal shaft and bevel gear, or its equivalent. This is practically indistinguishable from the frame, and at a short distance the machine looks absolutely gearless. There is a great gain in the appearance, but the writer doubts if the arrangement can be built quite as light as the uncased chain, unless strength is sacrificed. One firm by way of showing that it did its own electroplating exhibited two dynamos on its stand. The build of the armatures of these was noticed much more frequently than might have been expected. Hence it may be inferred that there are a considerable proportion of electricians interested in cycles, and this note has come to be written. The show closes on Saturday.

Rotherhithe.—At the Vestry meeting the General Purposes Committee reported that they had considered a letter from Mr. S. Morse, on behalf of the County of London and Brush Provincial Electric Lighting Company, Limited, asking for the formal consent of the Vestry to the application of the company for a provisional order in respect to Rotherhithe. The compulsory streets scheduled were Union-road, Albion-street, Rotherhithe-street, and Lower-road. The committee, having been given power to act, had declined to consent to the application. The Clerk read a letter from the secretary of the company asking the Vestry to reconsider the matter. The company were prepared to enter into an agreement to supply current for street-lighting purposes at 3½d. per unit, and to give the Vestry an opportunity of purchasing the undertaking from the company at the expiration of a time to be specified in the agreement. Mr. Stuart moved that the Vestry approve of the action of the committee in declining to consent to the application. At the present time one electric lighting company had a provisional order entitling them to supply Rotherhithe, and were ready to go on with the scheme if they could secure sufficient customers. He did not think they should allow another company to come in. Mr. Mortimer seconded the motion, which was carried.

Hampstead.—The Lighting Committee reported at the Vestry meeting that they had received a report from the engineer on the growth of the electric lighting undertaking, and the necessity of providing further plant at the central station to meet the demand for current in the winter of 1897, and they were of opinion that the suggestions of the engineer should be carried out, and therefore they recommended that the following additional plant be provided at an estimated cost of £4,500—viz., one 300-kilowatt alternator, with switch-panel, connections, and foundations; one exciter, with switch-panel, connections, and foundations; the second feed-water heater; and one overhead traveller for the second bay in the new engine room. They also recommended that the two new boilers at the electric station be insured against explosion for the sum of £4,000 each in the Boiler Insurance and Steam Power Company, Limited, at a total annual premium of £9. They recommended that low-tension mains for the supply of current to private consumers be laid as follows: Kidderpore-avenue and Platt's-lane (portions), at an estimated cost of £81½;

Digitized by Google

and Manstone-road, Shoot-up-hill, £57. The report was adopted. Mr. Reed, chairman of the Lighting Committee, replying to Mr. Farmer, said that the Willesden District Council had sent a letter on the subject of lighting the High-road, Kilburn, by electricity, which would be considered by the sub-committee at their meeting on Monday.

Canterbury.—At the Town Council meeting the Lighting Committee of November 26 reported as follows: "Mr. Alderman Mason was elected charman of the committee for the ensuing year. Mr. R. Hammond attended the meeting. The committee having visited the site adjoining St. John's Hospital and at the rear thereof recommend that the same be acquired, providing satisfactory terms be arranged with the trustees of the charity, and subject to a favourable report being received from the engineer and the surveyor as to the foundations, and that the original scheme, which includes a dust destructor in conjunction with the electric light, be proceeded with. The electrical engineer submitted final plans and estimates, etc., of the electric lighting works and dust destructor. The committee recommend that the same be adopted, and that the engineer be authorised to advertise for tenders for the works and issue the specifications—the tenders to be returnable to the town clerk." Alderman Mason said there were certain reasons why it was desirable that this matter should be discussed in committee. He would therefore move that the report be considered in committee of the whole house at the close of that meeting. The proposal was agreed to. In accordance with this arrangement the matter was discussed in committee. Subsequently the meeting resumed sitting as a town council. The paragraph in regard to the St. John's Hospital site was referred back, and that in regard to the issue of tenders is to stand over for the present. Meanwhile other sites will be inspected.

Grimsby.—The Highways and Public Works Committee at their last meeting considered the proposed application of the Grimsby Street Tramways Company for additional power, especially with reference to the application of electric power. The Chairman remarked that he thought there should be a sub-committee to consider the details of these matters and report to the committee. The Deputy Town Clerk, in reply to questions from several of the committee, explained that the tramway company were applying to the Board of Trade for powers to run trams by electricity in Grimsby, and the Corporation should be in a position to say they had certain powers over them. The Corporation would probably wish to impose restrictions or conditions as to the form of supports for the upright power which was to be applied for working the electric trams; and it might be a question whether they should not ask the company to complete the circuit of the traffic—to ask for powers to unite the two ends of the tramway by means of Welholme-road. And there were many other matters indirectly arising in connection with these applications which needed consideration. Mr. Alward seconded the chairman's proposal for a sub-committee, remarking that he hoped they would not allow the overhead system to be adopted, as it was very objectionable, and he did not know whether or not it was dangerous. They ought all to facilitate the application being granted, but some conditions must certainly require to be imposed. Eventually the sub-committee was appointed to consist of the following: Alderman Dobson, Messrs. Alward, Barrett, Hill, Melhuish, Watkinson, Nutt, and Wintringham.

Portsmouth.—A Local Government Board enquiry has been held into an application by the Corporation for power to borrow £16,020 for electric lighting extension and additional machinery, and the sum required was divided into two items, £6 015 being asked for extension works and £10,005 for new machinery. The machinery section of the account was dealt with by Mr. Manville, who explained that £10,005 was required for an engine and other plant. The demand for the electric light, he stated, had increased beyond the committee's expectation; so much so, indeed, that the spare engine had to be used as well as the other two, and on Mondays and Fridays the plant was overloaded. At present it was impossible to take on more customers. The Inspector inquired if the business was in a satisfactory state and was informed that the profits of the undertaking were 7½ per cent. gross and 2½ per cent. net. Councillor Murtough, speaking as a member of the committee, said it was very gratifying to the whole of that body that the electric light undertaking had proved so successful. Everything was done to make as much as possible out of the present plant, and it was unfortunate that the new engine would take so long to build. Tradesmen were anxious to get the current into their places as soon as possible. Another engine would shortly be required. Mr. H. Johnson asked whether it was not a fact that some people were taking to gas for the winter months, the electric light being too cold. Alderman Ellis replied that he only knew one instance in which a gentleman had voluntarily given up electric light and gone back to gas. After the enquiry the inspector paid a visit to the electric works.

Bristol.—Under the auspices of the North St. Phillip's Labour Electoral Association, a meeting has been held to consider the tramway extension scheme, and a resolution urging the members of the Town Council not to sanction the further extension of electric traction on the tramways unless the supply of electric power be taken from the Corporation was largely out-voted. A meeting, convened by the Bedminster West Ward Ratepayers' Association, has been held for the purpose of being addressed by Mr. George Pearson on the subject of the tramways extension scheme and the supply of the electric power. Three questions were put to the meeting: whether they favoured the extension of the tramways by electrical power; whether they favoured the provision of the power by the Corporation; and whether the tramways company, if in five years a better means of traction than the overhead system were discovered, should be compelled to adopt it? The unanimous answer to each question was in the affirmative. At a meeting of the Stoke's-croft and North-street Ratepayers' Association the following resolution was unanimously adopted: "That before sanctioning any application for tramways extension it should be made a condition that the supply of electric power for use on any lines of trams where electric traction is not now employed should be obtained from the Corporation." We have received a copy of the report prepared by Mr. H. P. Parshall, consulting electrical engineer to the tramways company, which also contains opinions by Prof. Hopkinson and Lord Kelvin agreeing with his recommendations that the company should be allowed to generate their own supply. In spite of this, however, the Town Council have decided against the company.

Rathmines.—A discussion took place at the meeting of the Commissioners in reference to the Tramway Bill about to be promoted by the Commissioners Mr. Carey said he wished to have it made clear that they were determined not to be handed over to the tramway company to be dictated to by them, and be placed in their power. They would be losing a great opportunity if they did not go on with their Bill, and they should not have any compromise. The Chairman stated that in certain papers a bogus advertisement had appeared with reference to the supposed reduction of the franchise, abolition of co option, extension of the wards, and other matters not contemplated in the Bill, good, bad, or indifferent. That advertisement, although Mr. Fawcett's name was used in the matter, was utterly misleading to the public, and was published without any authority. Mr. Regan expressed his opinion that the question as between the Commissioners and the tramway company was one for compromise, and he had attended the ratepayers' meeting in the Commercial Buildings with a view of hearing what was to be said against the Bill. The Chairman said they desired no antagonism with the tramway company. Their only object was to maintain the rights of the ratepayers. Mr. Plunkett expressed his strong desire that before another step was taken they should meet the tramway company. If they could not make a proper arrangement, then he would be in favour of going on with the Bill. At the meeting in the Commercial Buildings Mr. William Murphy was present, and made certain propositions to the meeting which were not set forth in the circular issued by that meeting. It was decided to request the tramway company to furnish a copy of the proposals made by Mr. Murphy.

Caversham.—A letter was read at the District Council meeting from the Imperial Tramways Company, Limited, stating that the company proposed to reconstruct and considerably extend their tramways within the borough of Reading, and to make an extension along the Caversham Bridge, Bridge-street, Church street, Gosbrook-road, and South-street. They applied for the sanction of the District Council for so much of their operations as might be within the district of the Council. The gauge of line proposed to be adopted was 3ft. 6in., or such other gauge as the Reading Corporation and the Caversham Urban District Council might agree with the company. The line proposed to be laid within the Council's district was a single line with passing places or sidings at convenient distances. The company proposed to lay their line upon a solid bed of concrete, and to pave between the rails and for 18in. beyond the outer rails with granite or scoriæ setts, laid throughout in cement grouting and upon the solid concrete. It was proposed by the company, subject to the consent of the Corporation of Reading and the Council, to work the traffic by a system of overhead electric traction, such as was now in operation in several cities on the Continent, and also at Bristol and Dublin. The authorities at all places where the electric overhead system was in operation were perfectly satisfied as to its safety and convenience, and it was in no way objectionable to the ordinary traffic of the road. The standards for carrying the overhead wires were ornamental in design, and could be placed in line with the lamp posts at the side of the road, so as to form no obstacle to traffic. It was decided to call at an early date a special meeting of the committee of the whole Council to consider the proposal of the tramways company.

Bradford.—The Corporation electrical showroom in the Swan-arcade was opened by the mayor (Mr. T. Speight), who is also chairman of the Gas and Electricity Committee on December 2. His worship was accompanied by the other members of the Electricity Committee. The room is not sufficiently large to admit practical experiments where motive power of over 2 h.p. is required, but on a small scale almost every example of the application of electricity is given, while full particulars as to the hiring or purchasing of the numerous appliances are supplied by Mr. J. Copperthwaite, of the Electricity Department. The appliances show the application of electricity as an illuminant, for motive power, and for heating. Under the former head every device of lighting is shown by arc lamps, Ediswan's sunlights, and artistic chandeliers suitable for house or office. Motors are on view from ¼ h.p. upwards. This branch of the showroom the committee are desirous of extending, and special arrangements are being made for hiring the motors. There are a large number of air-fans, and amongst the cooking and heating apparatus on view are hot cupboards for hotels, portable radiators for heating offices, sitting-rooms, etc., electric cookers, kettles, frying-pans, curling-iron heaters, coffee-pots, billiard-table irons, pans of every description, flat irons, and foot warmers. Almost all the articles may be hired. The following firms exhibited motors: R. E. Crompton and Co., Limited, Chelmsford, Essex; J. H. Holmes and Co., Newcastle-on-Tyne; Standard Dynamo and Motor Manufacturing Company, Harris-street, Bradford; Rosling and Appleby, Trafalgar-street, Bradford; Phœnix Dynamo Manufacturing Com-

Digitized by Google

pany, Hubert-street, Bradford. The Town Council have decided to light up the main entrance to the town hall and the staircase with incandescent electric lamps, and to erect three new arc light standards in the neighbourhood of the town hall.

Trial of Heavy Motorcars in France.—The Automobile Club, under which were organised the race of light motor carriages from Paris to Bordeaux and from Paris to Marseilles and back, has decided to get up for next year a competition between heavy vehicles propelled by automatic traction, and in order that the makers of all kinds of cars, wagons, and similar vehicles should have plenty of time to prepare for the contest, which is open to all the world, the official programme has already been issued. The contest is to be for vehicles transporting passengers and goods on the high roads not in direct communication with railways, and it is to be held over roads in the vicinity of Paris on July 1 and five following days. The vehicles for passengers must be capable of accommodating at least 10, with 30 kilos (66lb.) of luggage per passenger, while the parcel vans and carts must hold at least a ton of goods. The number of exhibits which each maker may send is not limited, but he can only show one of the some type, and before the trials commence the vehicles entered (fee £8 up to June 1 and double up to the 28th) must be photographed and passed in review by the commission of the Automobile Club and obtain a certificate. The trials will begin on July 1, the distance of 187 miles being divided into six stages of varying lengths, according to the number of stoppages in each mile. A committee will be appointed to see how the competing vehicles work, whether they stop readily on the inclines, what they attain up and down hill, and, in a word, to judge how far they are likely to be of practical use. The prizes will be awarded with special reference to these qualifications, and the Automobile Club will prepare an official report of the trials and send it to all the civil engineers, industrial companies, and mayors in France. Entries may be made and full particulars obtained from the secretary of the Automobile Club, Place de l'Opera, Paris.

Large Transformers.—In the transmission of power from Niagara to Buffalo some large transformers have been used. The over-all dimensions of these, together with their weight, will be of interest to our readers. For the Niagara end of the line the General Electric Company have supplied three transformers, together with an air fan for cooling. Each of these transformers is of 1,250 h.p. capacity, and any two of them can be used to transform 2,500 h.p. delivered to them in two-phase currents at 2 200 volts to three-phase currents at either 11,000 or 22 000 volts. In these transformers the coil connections are so arranged that the change in the voltage from 11,000 to 22,000 can be easily effected. The transformers are each 7ft. 10in. high, and measure 5ft. 4in. by 4ft. 8in. at the base. Each weighs about 25,000lb. A 5-h.p. motor is used to drive the air blast through the coils of these transformers, and also through spaces left in the laminations of the iron cores. The arrangement of coils in these transformers is such that very strong insulation will have to be punctured before connection can be made between the different coils, or between the coils and the iron. At the same time the air-spaces are so placed that the air is brought intimately in contact with each coil, and gives an excellent cooling effect. This method of cooling makes necessary the occupation of a good deal of space in insulation and air, which has a tendency to increase the size of each transformer. Still, it is very apparent that it has the very great advantage of making the transformer clean and accessible. and much more convenient to handle than a transformer cooled by other methods. At the Buffalo end of the line four 255-kilowatt or 360-h.p. transformers are used in reducing the current from the line to a voltage suitable for connection to the rotary converters. These step-down transformers are each 6ft. 10in. high and measure 3ft. 11in. by 3ft. at the base. They weigh about 7,000lb. each. From these details, for which we are indebted to our New York namesake the *Electrical Engineer*, it will be seen that with the large size the weight per kilowatt output is about 26¾lb., and per horse-power is 20lb. In the same size the weight per kilowatt is 26¼lb., and per horse-power 19·5lb.

Coseley.—At the District Council meeting the Clerk laid before the meeting the usual notices required to be given by the promoters of the new tramway scheme, and also read a letter from Mr. A. W. Hickman respecting the proposed line from the Fighting Cocks to Bilston. He asked the Council to insist on the rails being laid on the side of the road instead of in the middle. The effect of laying rails in the middle of a road was to give the maximum amount of inconvenience, while if they were laid on the side the expense of keeping the road in repair would be materially reduced. The Chairman said he had acknowledged the receipt of the letter and had told Mr. Hickman that he personally favoured the idea of the rails being laid on the side of the road. Councillor Clayton also advocated the rails being laid on the side of the road. At present the tramlines monopolised the middle of the road, and it was often difficult for vehicles to pass on either side. Councillor Slater said he believed on the Continent the rails were laid on the side of the road. Councillor Wones said he understood that Coseley and Sedgley Councils were to confer on the subject. Councillor Rolinson said before the rails could be placed on the side of the road the Board of Trade would have to give their sanction. He could mention places where it would be extremely awkward for the lines to be on the side of the road, besides being a great inconvenience to shops. The whole question required careful consideration. As soon as Dudley Town Council heard of the proposals of the syndicate they at once decided to apply for a provisional order to put down an electric lighting station in the town, and the syndicate had already promised to take from Wolverhampton and Dudley a portion of their motive power. Seeing that such a large portion of the tramway passed through Coseley and Sedgley he was not disposed to give away powers they already possessed, but to go in for powers they did not possess. He therefore gave notice that at the next meeting of the Council he should propose that application be made for a provisional order for power to put down electric stations for lighting and for motive power. After further discussion it was decided to arrange with Sedgley District Council for a joint meeting on the tramway question.

Appointments Vacant.—The Crown Agents for the Colonies invite applications for the posts of electrical engineer and assistant electrical engineer in connection with the erection and working of an electric light plant which is about to be established in Lagos, on the West Coast of Africa. The electrical engineer will have to go out with the plant and to superintend its erection and starting to work. Salary £50 per month, and his appointment will be for six months, subject to a renewal for a further period of two months. Salary will commence on date of embarkation, and continue until date of his arrival in England on his return at the termination of his engagement. The assistant engineer will also go out with the plant, and act as the engineer's assistant. He will remain in charge of the plant after it has been completed. Salary £300 a year, and the appointment will be for one year, subject to renewal for a further period of two years. Half salary will be paid during voyages out and home. Free passage out and home again on expiration of engagement will be given. Leave of absence: if engagement is extended for a further two years, six months on half salary after every 12 months' residential service, if exigencies of the service permit, with free passage home and out again. Applicants for both posts must have had a thorough mechanical training and electrical training, and be well versed in the erection and running of locomotive boilers, undertype engines, and alternators. Married men are ineligible, and a strict medical examination will be necessary. Applications, stating age and experience, and accompanied by copies of not more than three recent testimonials, with the names and addresses of references of whom enquiry may be made, will be received by the Crown Agents for the Colonies, Downing street, London, S.W., up to 14th inst. They must be enclosed in an envelope marked "Application for Electrical Engineer, Lagos."—Applications are also invited for an engine-driver and fitter to assist in the erection and working of the plant. Salary £250 per annum, and the appointment will be for one year subject to a renewal for a further period of two years. Applications to be in by the 14th inst.—The Electric Committee of the Belfast Corporation have a vacancy for a temporary draughtsman. Applications to be sent to Mr. Victor A. H. McCowen, city electrical engineer, on or before Thursday, December 17, 1896, endorsed "Draughtsman." See advertisement.

Speed Indicator.—The accompanying illustration represents the chronographic cycle and motorcar speed indicator invented by Messrs. S. Smith and Son, 9, Strand, W.C., an instrument which has already given great satisfaction. The small arc of figures on the left hand of the dial between the 35 and 55 seconds of the outside circle contains divisions giving a range from 40in. to 136in. gears; the small pointer (shown between the figures 40 and 45) is brought round to whatever gear the machine may be (in the illustration it is on to 70, each division line counting as two); the pointer once set it is only necessary to count the number of pedallings that are done while the long hand is travelling from zero (that is, the 60th second) until it crosses the large pointer (shown between figures 10 and 15) and the number counted is the speed in miles per hour that is being traversed at the time of observation, say, 10 pedallings—10 miles per hour is the speed. If the number of pedallings in the same period is increased to 15—then 15 miles per hour is being done.

The rim or glass is made to revolve, so that it is possible to adjust the instrument and to record the speed for or by any rider, and on any machine. For the rider's own use it is attached to the handle-bar, for which purpose a special carrier has been designed. The important parts of the watch that are liable to be damaged by damp are made of palladium, which does not rust, and therefore the watch is also non-magnetisable. The price of the instrument is £2. 2s.

Belfast.—At the Town Council meeting the town clerk read the minutes of the Council in committee in regard to the proposal made by the Corporation to the tramway company as to the terms upon which they would permit the introduction of electrical traction—namely, 6 per cent. on the gross receipts. Councillor John M'Cormick, in moving the adoption of the minutes, said when he found an overwhelming majority of the Corporation

Digitized by Google

deciding in favour of the overhead system, he considered it was his duty to see that the Corporation should receive the best terms for giving its sanction to the introduction of the electrical overhead system, that a sum of 6 per cent. on the gross receipts should be paid to the Corporation by the tramway company. He thought this was a very reasonable proposal, and he thought the strongest argument in favour of it were the figures supplied by the company itself. They simply adopted the figures of the company for the remainder of the existing terms. Alderman Henderson, in seconding the resolution, did not think it would be at all fair that the Corporation should attempt to fix the distances the trams should run for penny or twopenny fares. They should try to get as large a sum as possible for the ratepayers, and he had no doubt the tramway company would see it was to their advantage to increase the journeys and reduce the fares. The motion was carried by 26 to 5. The Electric Lighting Committee reported that they proposed from time to time, as occasion may require, to take into the works young men qualifying themselves as engineers as improvers, each party on being approved to pay a fee of £50, which shall entitle him to remain in the works for three years, provided he shall conduct himself to the satisfaction of the committee and their engineer, and discharge in a proper manner the duties to be assigned to him, wages at the rate of 5s. per week to be paid him for the first year, 10s. per week for the second year, and 15s. per week for the third year. The committee also recommended that the yard in M'Auley-street be taken as a site for the electric station. The adoption of the report was moved by Councillor Jaffe, and seconded by Councillor Weir. Councillor Woodside said they were about to expend about £100,000 on a new electric station, and he thought a suggestion should be made to the committee that they should confine the preparation of plans for the new building to local architects. Councillor W. M'Cormick wished to know if the plan could not be prepared in the surveyor's department. Councillor Murphy thought the electrical engineer would be quite capable of preparing the necessary plans. The report was adopted.

Yarmouth.—It was reported at the Town Council meeting that the representative of the British Thomson-Houston, Limited, and Mr. Waller, of the firm of Messrs. Kincaid, Waller, and Manville, consulting engineers, had discussed with the Lands Committee the route of the proposed Great Yarmouth tramways, and explained the method to be adopted in the construction and working. The committee recommended the Council to approve the route as shown in the deposited plans, upon the understanding that in the event of tramway No. 9 (Regent street, Regent-road, etc.) being authorised, a clause should be inserted in the provisional order to the effect that previous to the exercise of such powers the promoters shall obtain the express permission of the Corporation. It is further recommended that consent be also subject to the insertion of such other clauses in the provisional order for the protection of the interest of the Corporation and of the public as might hereafter be considered advisable. Mr. F. Burton moved, as an amendment, that the part of the scheme from the Drive down King's-road to the quay be excluded. He was aware it would destroy the continuity of the route, but he protested against trams going round such a narrow corner. He suggested an alternative route by Albert-square or Barrack-road. Mr. A. Youell seconded. Mr. C. H. Wiltshire objected to trams going down Regent-street or Regent-road, owing to the sharp corners from King-street. The Deputy-Mayor (Mr. T. A. Rising) said those thoroughfares were only introduced upon the suggestion of members of the Council, and he pointed out that previous to the exercise of those powers the permission of the Corporation must be obtained. Mr. T. Green condemned the whole scheme, believing it would not pay, and in that event great inconvenience would be caused by the pulling up of the roads in order to lay the lines, and afterwards relaying them. He referred to the failure to carry out a previous scheme, and quoted Ipswich and Colchester as towns where tramways had not been a financial success. Where the traffic was to come from during nine months of the year he did not know. The amendment proposed by Mr. Burton having been defeated, Mr. Wiltshire moved that the whole question of route be referred back to committee, on the ground that it had not received proper consideration, especially if, as had been stated, the permission of the Council, if obtained, was intended to be disposed of subsequently by the company in question. Mr. T. Green seconded. Mr. H. Chamberlain said Regent-street and Regent-road were only inserted in deference to the expressed wish of several members of the Council. The whole question of route was then referred back.

Keswick.—At the Urban District Council meeting the Deputy-Clerk read the following letter from the Keswick Electric Light Company: "I am instructed by the directors of the Keswick Electric Light Company, Limited, to say that they accept the electric lighting provisional order of the Keswick Urban District Council on the terms named in your letter of the 4th inst. In doing so, the directors think that one or two slight modifications in the terms will be readily allowed by the Council. In Clause 3 the words 'or nine pillars and lamps of 16 c.p. each' should be expunged. It would not be satisfactory either to the Council or this company to have single 16-c.p. lamps placed in conspicuous positions. From the former part of Clause 8, ending with the words 'obligation, etc.,' the following words only should be substituted, 'In case the winding-up of the company.' The clauses thus altered will fully meet the needs of the Council. The latter portion of Clause 10, following the words 'Board of Trade,' is understood to be in effect a repetition of Clause 2." The following is a summarised statement of the terms offered by the Council in their letter of the 4th ult.: "(1) The Council propose to transfer to the company their provisional order for electric lighting except Sections 7, 53, 54, 60, and 69 (which do not apply to a company) for the consideration and on the terms following. (2) The company to pay to the Council on the execution of the transfer the whole of the costs incurred by them in obtaining the order and the Act in confirming the same. (3) The company at their own cost to erect and maintain in such places within the district of the Council as the latter shall point out three pillars and lamps of 50 or three of 16 c.p. each, or nine pillars and lamps of 10 c.p. each and free of charge and keep the same lighted during such period each 24 hours as the Council shall prescribe in respect of the gas or other lamps used for lighting their district. (4) The company to execute all compulsory and other works and exercise the powers of the provisional order. (5) The company not to sub-let, assign, or part with the possession of the order or apply to the Board of Trade for leave to do so without the consent of the Council. (6) The transfer to contain all usual and necessary clauses to safeguard the public and ensure due execution of the order. Any case of difference to be settled by the Board of Trade. (7) At any time after the expiration of 42 years from the date of transfer the Council may by six months' notice in writing have the option to purchase the company's undertaking on the terms of paying the value of the undertaking. (8) In case of the bankruptcy, insolvency, or winding-up of the company, or failure of the company to fulfil their obligations, the Council to have power to take possession in the same manner as if the 42 years had expired. (9) The Council to have the privilege of executing all necessary works affecting any streets, bridges, sewers, etc., under their control the company paying all expenses. (10) Any agreement with the company for transfer or purchase, etc., to be subject to the sanction of the Board of Trade, and the costs of the Council in the negotiations for the company's works, including the solicitors' and engineers' charges, etc., to be paid by the company. A resolution was passed authorising the solicitors to the Council to inform the company that the Council consented to the alteration in the terms with regard to lights, and to arrange for the preparation of the necessary deed for the transfer of the provisional order to the company.

Reading.—At the Town Council meeting the Finance and General Purposes Committee reported that at a meeting of the committee on November 13 the town clerk submitted a notice received by him of a proposed application to the Board of Trade for a provisional order authorising the construction of tramways in this borough. The following letter was received from Mr. Francis, secretary to the Reading Electric Supply Company: "With reference to the recent minute of the Town Council respecting the proposed introduction of electric tramways in Reading, I am directed to acquaint you that when the Council have come to a decision in the matter and are prepared to receive applications my Board will be glad to make a communication to the Council." It was decided "that, as soon as the advertisement of the intended application has been published, and the plans and other documents required by the Tramways Act, 1870, and the standing orders of Parliament, to be deposited on or before November 30 shall have been published and deposited, the borough engineer and surveyor do report on the proposed scheme, in order that the committee may consider and recommend to the Council whether the Council, as the local authority for this borough, should give their consent, which is required by the Tramways Act, 1870, to the proposed tramways, or should refuse to consent thereto, and, if so, upon what grounds, and generally as to the steps which the committee may consider best calculated to protect and secure the interests of the borough in the matter." At a meeting on November 27 the town clerk submitted a copy of a newspaper containing a parliamentary notice of an intended application to the Board of Trade by the Reading Tramways Company, Limited, for a provisional order under the Tramways Act, 1870. He also submitted a letter, dated November 11, from Mr. J. Clifton Robinson, C.E., the managing director of the company, giving certain explanations with reference to the proposed new scheme, which was accompanied by certain plans purporting to illustrate the intended lines of tramways and other particulars with reference thereto. The committee considered the matter, and the town clerk gave explanations as to the legal position of the Corporation and the company respectively with respect to the existing tramways and the proposed new tramways respectively under the Tramways Act, 1870, the Reading Tramways provisional order, confirmed by Parliament in the year 1878, and the standing orders of Parliament. It was resolved to recommend to the Council as follows: "That the Council, being the local authority and the road authority under the Tramways Act, 1870, do not consent to the proposed scheme for tramways indicated in the parliamentary notice now submitted to the committee, for the reason, amongst others, that it appears that if such consent were given and the proposed new system of tramways were authorised by provisional order confirmed by Parliament the powers and privileges of the Corporation with respect to the purchase of the existing tramways after August 16, 1897, would be postponed and otherwise prejudicially affected. That the retaining by the town clerk of Messrs. Sharpe and Co., of 9, Bridge-street, Westminster, to act as parliamentary agents for the Corporation in the matter be approved. That the borough engineer and surveyor, when presenting the report ordered by the committee on the 13th inst., do also report as to the various systems of traction, other than animal traction, available for the working of street tramways and their comparative suitability for tramways in the streets of this borough, particularly the streets included in the proposed scheme of the Reading Tramways Company, Limited." The report was adopted.

PROVISIONAL PATENTS, 1896.

NOVEMBER 30.

27167. **Improvements in electrical batteries.** Charles Edouard O'Keenan, 8, Rue de Princes, Brussels.

27188 **Improvements in or relating to electro-mechanical indicating and recording apparatus.** Charles Edward Vernon and Arthur Ross, 111, Hatton-garden, London.

27195. **Improvements in electrical switches** Jacob Gutmann, 6, Bream's buildings, Chancery lane, London.

27207. **Improvements in the electric ignition of charges in explosive engines.** Edward Joel Pennington, 111, Hatton-garden, London.

27209. **Improvements in dynamo-electric machines.** William Brooks Sayers, Henry Alexander Mavor, William Arthur Coulson, and Samuel Mavor, 46, Lincoln's inn fields London.

DECEMBER 1.

27227. **An improved method of lighting pianofortes by electricity.** Kenneth Barry Ryan Littlestone-on-Sea, Kent

27262 **An improved primary element with interchangeable electrodes and regenerable positive electrodes.** Oscar Rothmund, Edler von Burgwall, and Leopold Ofenschüssel, 18, Fulham-place, Paddington, London. (Complete specification.)

27265. **Improvements in incandescent electric lamps** George Davis, 38, Margravine-gardens, West Kensington, London.

27284 **Improvements in magnetic separators** Victor Isidor Feeny, 60, Queen Victoria-street, London. (Joseph Beals Hamilton, United States.) (Complete specification.)

27301. **Improvements in electric furnaces.** Edgar Field Price, 78, Fleet-street. London.

27304. **Improvements relating to electric arc lamps.** William Reginald Ridings and John Henry Crawford, 124, Chancery-lane, London.

27323. **Improvements in electric arc furnaces.** The Acetylene Illuminating Company, Limited and Percy Crundall Day, 55, Chancery-lane, London.

27344. **An improved mode of mounting filaments in electric glow lamps.** John Archibald Sinclair, 191, Fleet-street, London.

27353. **Improvements in driving apparatus and gear for electrical road or other vehicles.** Edward William Bonson 54, Bellefields-road, Brixton, London.

27354. **An improved electrical switch for power or traction purposes.** Edward William Bonson, 54, Bellefields-road, Brixton, London.

27364. **Improvements relating to safety fuses or fusible cut-outs for electrical circuits and to switches connected therewith.** John William Ewart and Louis John Steele, 11, Southampton-buildings, Chancery-lane, London.

DECEMBER 2.

27376. **Improvements in or relating to electric joints for suspending or supporting electroliers or the like.** William Wilson, 14, Vere-street, Birmingham.

27438. **Improvements in or relating to the application of electric propulsion on railways and tramways** Ladislav Vojacek, 8, Quality-court, Chancery-lane, E.C.

27446. **Improvements in electrical resistance** Rookes Evelyn Bell Crompton, 55, Chancery-lane, London.

27449. **Improved means or apparatus for igniting and extinguishing gas from a distance by means of electricity.** Joseph Denis Cyprien Chateau, 46, Lincoln's-inn fields, London.

27462. **Improvements relating to writing telegraphs.** Philip Arthur Newton. 6, Bream's-buildings, Chancery-lane London. (The Gray European Telautograph Company, United States.)

27464. **Improvements in electrically-driven wool-shearing or hair-clipping machines.** Gershon Bowmar, 1, Queen Victoria-street, London.

DECEMBER 3.

27482. **Improvements in the insulators of electric lamp-holders.** Alfred Watson, jun., 24, Temple-row, Birmingham.

27511. **Improved holder for telephone receivers.** Edmund James Hartshorn and Alfred Jowitt, Sand-street, Aspley, Huddersfield.

27558. **Improvements in electrical signalling apparatus for railways.** William Andrews, 7, Quality-court, Chancery-lane, London.

27578. **Improvements in alternating-current dynamo-electric machines.** John William Ewart, 11, Southampton-buildings, Chancery-lane, London.

27588. **Improved insulating material for electric conductors** Frederick Hawkins, 111, Hatton-garden, London.

DECEMBER 4.

27629. **Improvements in or applicable to ceiling roses for electric lamps.** Everard Acheson, 4, St. Ann's-square, Manchester.

27696. **Improvements relating to electrically-propelled vehicles.** Francis Lauder Muirhead, 124, Chancery-lane.

27695. **Improvements in or relating to the insulation of electric conductors.** Frederick Hawkins, 111, Hatton-gardens, London.

27701. **Improvements in and in connection with the manufacture of electrodes for secondary electric batteries.** Henry Léitner, 37, Chancery-lane, London.

27706. **Improvements in or connected with circuit closers for electric bells.** James Newton, 53, Chancery-lane, London. (Complete specification.)

DECEMBER 5.

27736. **Improvements in conducting arrangements for electric railways and tramways.** Edward Hopkinson, 28, Southampton-buildings, Chancery-lane, London.

27753. **Improvements in electrical measuring apparatus.** William Oliver Smith, George Keith Buller Elphinstone, and Arthur Cecil Heap, 101, St. Martin's-lane, London.

27754. **Improvements in electrical ignition apparatus for oil and gas engines and the like.** Anthony George New, Palace-chambers, Westminster.

SPECIFICATIONS PUBLISHED.

1895.

22233. **Accumulators and their electrode plates, partly applicable to primary batteries.** Engl and Wüste.

24264. **Resistance switch apparatus for starting electromotors.** Siemens Bros. and Co., Limited. (Siemens and Halske.)

24735 **Electric arc lamps or lighting apparatus.** Smith.

1896

64. **Electric tramways or railways.** Krizik.

557. **Electric batteries.** Collins and Cogan.

1842. **Holders for electric glow lamps and analogous electrical contact devices** Kenny.

2199 **Apparatus for transforming alternating into continuous electric currents or conversely.** Imray. (La Société Anonyme pour la transmission de la force par l'Electricité.)

14092. **Electric motors, especially applicable to the propulsion of velocipedes and motorcars.** Clerc and Pingault.

22102. **Electric lighting device for oil-lamps.** Fitzpatrick. (Eckel and Glinicke)

NOTES.

The Junior Engineers.—There is to be a visit of the Institution of Junior Engineers to the Deptford station of the London Electric Supply Company to-morrow (Saturday) at 3 p.m.

Obituary.—Mr. Alfred Nobel, the inventor of dynamite, has died at San Remo. The idea of sopping up nitro-glycerine with earth does not seem a very great one, but it is difficult to estimate what it has done in the way of facilitating some kinds of blasting work.

The Civil Engineers.—At the ordinary meeting on Tuesday, December 22, at 8 p.m., the paper to be discussed is "Steel Skeleton Construction in Chicago," by Mr. E. C. Shankland, M.I.C.E. There is a students' meeting to-day (Friday), when a paper will be read on "Wells and Well Sinking," by Mr. John W. Kitchin. Mr. Alexr. R. Binnie will preside.

Victoria University.—Among the appointments to vacant external examinerships at the Victoria University, Manchester, are the following: Mathematics—H. F. Baker (Cambridge); engineering—T. Hudson Beare (University College, London); physics—A. W. Reinold (Royal Naval College, Greenwich); chemistry—J. Millar Thomson (King's College, London).

Stoppage.—There was a failure of the electric light over the whole of Cardiff on Saturday night. According to an interview which a representative of one of the local papers had with Mr. Applebee, "the cause of the mishap was a fire on the switchboard," which made it necessary for a time to cut off the supply to the whole town. In about a quarter of an hour the damage was rectified sufficiently to get the light on again.

Motorcarts.—There has been introduced into the Manx Legislature a Bill to legalise the use of light locomotives, more or less on the lines of the English Act. Fourteen miles an hour is fixed as the maximum speed along public highways, and it is provided that yearly duties shall be charged. The papers are full of accounts of motor-cart runs, and there is an occasional account of a break-down, but none of an accident, taking that word in the sense of somebody or something being hurt. For the present, however, we have had enough of the subject.

French Civil Engineers.—Mr. Henri Boucher, the Minister of Commerce, presides at the meeting of the Société des Ingenieurs Civils de France, which takes place yesterday (Thursday) and to-day. Among the subjects for discussion are electrical accumulators, which is introduced by Mr. G. Margaine. The final elections of officers and committee take place this evening. For the presidency the preliminary election gave Mr. E. Lippmann almost, but not quite, an absolute majority, so that he may be practically regarded as already the president for the forthcoming year.

Battersea Polytechnic.—The first meeting of the engineering society founded in connection with the South-West London Polytechnic Institute was held on Saturday, December 12. A lecture was delivered by Prof. Schwartz on "Recent Developments in Electric Supply Stations." Dr. Garnett, M.A., of the Technical Education Board, occupied the chair, and in his opening remarks referred to the good that would be done by such a society. Prof. Schwartz, in his lecture, dealt particularly with the new supply station at Leyton, which the society visit next Saturday, the 19th inst., and which it is well known presents the unusual feature of discarding steam in favour of Dowson gas as a source of power.

The Iron Gates.—It is reported that a project has been seriously started for utilising the power of the Danubian cataracts in the neighbourhood of the Iron Gates. The *Daily Telegraph*, if it chooses, may turn its attention to the matter, as, unlike Niagara, the work is not done, but at present does not appear to have got much farther than proposals made by a Mr. H. Luther to the Servian Government. Some of the details, if correctly reported, look a little queer, but one may reasonably wait for more progress to be made and more details to be obtainable before discussing the practical possibilities of the matter.

An Ideal Sketch.—Dr. C. E. Emery, of the American Institute of Electrical Engineers, has some ideas as to what the high-speed electric locomotive of the future will look like. The motors will be hung on the frame of the engine and be independent of the driving-wheel axles, and the wheels will be big wheels. There will also be a bogie in front; in fact, the electric locomotive will look very like a steam locomotive without the boiler and without a chimney, the latter being an omission which must not fail to be noted, although the "smoke-stack" is not nowadays such a prominent object as it used to be in the early types of American locomotive. It may be, of course, that they will build electric locomotives in that way—such things are done. The original type of railway carriage in this country was simply the bodies of three coaches joined together. But with all respect to Dr. Emery, the type of engine he anticipates will hardly persist.

Telegraphs in Malacca.—At a conference of representatives of the Protected Malay States, the advisability of a junction of the telegraphic system of the Native States with that of Burma through the Malay-Siamese territory was discussed. Such a junction, the *Straits Times* says, would facilitate inter-state communication and inter-state trade, particularly as the Native States lines are to be extended through Johore to Singapore. But such a junction would have more extensive results than these. Burma is connected with the Indian system, and there would thus be established an alternative telegraphic route to Europe, as far as most of the route is concerned, by a land line as against a cable route. The rates from India to Europe are comparatively cheap compared with the rates to Europe from the Straits Settlements, so that in the event of such a junction taking place as that suggested, competition is anticipated, and a consequent reduction in rates.

Meteorological Society.—At the monthly meeting of this society held on Wednesday, at the Institution of Civil Engineers, Mr. E. Mawley, F.R.H.S., president, in the chair, a paper by Dr. Leigh Canney on the "Winter Climate of Egypt" was read by the secretary. The observations of Dr. Leigh were started with the object of arriving by a strictly comparable method at the precise differences between the climates of Upper and Lower Egypt, all previous observations having failed in this respect. Mr. R. H. Curtis also read a paper on an "Attempt to Determine the Velocity Equivalents of Wind Forces Estimated by Beaufort's Scale." The author has compared the anemometric records at Scilly, Fleetwood, Yarmouth, and Holyhead with the wind forces as estimated by the observers at the same or adjoining stations, and has by this method obtained a satisfactory table of velocity equivalents in miles per hour for the estimated forces by Beaufort's scale.

Victorian Exhibition.—On Tuesday the Duke of Cambridge presided at the first meeting of the committee of advice of the Victorian Era Exhibition (Earl's Court), held at the Royal Institute of Painters in Water-Colours,

Digitized by Google

Piccadilly. Mr. Crémieu-Javal spoke of the advantages offered by the proposed site of the exhibition at Earl's Court. Sir Stafford Northcote, M.P., Sir C. Kennedy, Mr. MacWhirter, R.A., Sir G. Birdwood, Mr. C. Wyndham, and Mr. W. H. Cummings were present to represent the commercial and industrial, economic, fine arts, historical, dramatic, and musical sections respectively, and the Marquis of Lorne spoke as to a section devoted to women's work. It does not seem quite clear where, if anywhere, electrical work is to come in, but as its development here and abroad is distinctly one of the events of the reign—and, moreover, it is still a subject about which people in general are very ignorant and much interested—it is to be presumed that a place will be found for it somewhere.

Some Forthcoming Events.—To-day (Friday), at noon, is the distribution of the certificates at the Crystal Palace Engineering School. In the evening Mr. McDougall's paper is read at the Junior Engineers. The annual meeting of the French Society of Civil Engineers takes place at Paris. Our own Civil Engineers have a students' meeting, particulars of which are given in another note.—To-morrow (Saturday) the Institution of Junior Engineers have a visit to the Deptford central station of the London Electric Supply Corporation (3 p.m.) and the Battersea Polytechnic engineers visit Leyton. The North-East Coast Engineers also have a meeting at Hartlepool.—On Tuesday, December 22, the Prince of Wales is to open the Davy-Faraday Laboratory at the Royal Institution (3 p.m.), and in the evening the Civil Engineers have a meeting, as to which particulars have been given elsewhere.—Other fixtures for the forthcoming week are of an annual character, and our readers may be trusted to remember them of themselves.

Acetylene.—Last Saturday afternoon, in the Moabit quarter of Berlin, there was an explosion of acetylene gas in the laboratory of Mr. Georg Isaac, a manufacturing chemist, which resulted in the death of Mr. Isaac and three of his assistants. It is part of the irony of fate that Mr. Isaac was engaged in experiments with a view of rendering the storage and handling of acetylene completely safe, and it was so far believed that he had succeeded that he was to have shortly exhibited his results to the Emperor. As all the four people in the laboratory were killed and the place was practically destroyed, the precise circumstances under which the explosion took place will probably never be known, but this affair, following so closely upon the explosion at the Pictet laboratory in Paris, will probably convince people that the chemists were right in saying that, even in the hands of men that know what they are dealing with, acetylene, especially in a compressed form, was a substance which could not be regarded as altogether trustworthy. Even scientific men occasionally forget that if a substance will not explode when you might expect it to do so, it is by no means safe to conclude that it will not go off when you do not expect it.

More Technical Education.—Sir Owen Roberts distributed on Tuesday evening the annual prizes and certificates gained by the students attending the commercial classes of the Regent-street Polytechnic. In the course of a short address Sir Owen Roberts said he was not going to frighten them with the bogey of the German clerk, but went on to say that in order to cope with other countries in commercial enterprise they must study modern languages, which he was glad to see were taught with so much success at the polytechnic. The world was getting very full, and they would have to learn not only French and German, but Spanish, Italian, and Russian. China would some day open up to the enterprising Englishman more than was imagined, and the Chinese language, as well as the Japanese, would have to be studied. Siberia would also have to be reckoned with, and those who learned Russian would be well rewarded.—Why not modern Greek for the Levant, and Arabic? The competition of the Arab trader is a factor in South and East Africa, not to mention the Mohammedan world. Surely this sort of thing has been carried just a little too far. The poor clerk will have no time left to learn spelling and addition.

Railway Museum.—Mr. Clement E. Stretton has forwarded us the full list of the National Railway Museum Committee, which has been formed for the purpose of preserving documents, etc., relating to railway history, and relics. It comprises the Right Hon. Viscount Dalrymple; the Right Hon. J. H. A. Macdonald, P.C., C.B., LL.D., F.R.S.S. (L. and E.), M.I.E.E., Lord Justice-Clerk of Scotland; W. M. Acworth, London, S.W.; A. R. Bennett, London, N.W.; S. R. Blundstone, M.I.M.E., London, W.C.; F. W. Brewer, London, N.; R. H. Burnett, Manchester; P. Caldecott, London, S.W.; C. Chambers, London, S.E.; F. A. Channing, M.P., London, S.W.; J. Sinclair-Fairfax, president Society Patent Agents, London, W.C.; H. Greenly, London, W.; D. H. Littlejohn, M.A., Dundee; F. MacDermont, London, E.C.; Perry F. Nursey, past-president Society of Engineers, London, E.C.; W. B. Paley, London, S.W.; John Ramsbottom, Alderley Edge, Cheshire; C. Rous-Marten, London, S.W.; W. J. Scott, B.A., Sunbury Common; C. Stretton, Leicester; Archibald Sturrock, London, S.W.; A. M. Willcox, London, E.C.; T. Houghton-Wright, Swansea. Hon. joint secretaries: Clement E. Stretton, Leicester, and Norman D. Macdonald, Edinburgh.

Oxygen.—That gaseous oxygen is paramagnetic was a fact early discovered when the phenomena of diamagnetism were first investigated. And in these latter days, when it has come to be liquefied, the way in which the fluid was made to stick to the poles of an electromagnet might easily have led one to infer rashly that liquid oxygen might be magnetic in the sense that the term is applied to iron. From a theoretical point of view, of course, the problem of a strongly magnetic fluid would be a very curious one, but it can hardly be said that there is anything like a real theory as to what actually takes place when iron is magnetised which is so firmly established as to allow one to pronounce *à priori* that a particular phenomenon is impossible. The quantitative results, however, which have been obtained by Prof. Dewar and Prof. Fleming in the course of their investigation of this and other questions connected with low-temperature research have shown that, as might be expected, the magnetic properties of liquid oxygen are relatively feeble when compared with highly magnetic substances. As a result of further work of the same investigators, the magnetic and electric constants of liquid oxygen and liquid air have been correlated—they appear to be very much what they should be—and the measurement and the values obtained were the subject of a paper at yesterday's meeting of the Royal Society.

Physical Society.—Prof. Ayrton presided at last Friday's meeting of the Physical Society. Dr. Chree's paper on "The Applications of Physics and Mathematics to Seismology" was read. Assuming that the substance of the earth is a homogeneous, isotropic, elastic solid [it is not, though in most cases it acts just as though it were], Dr. Chree examined in as general a manner as possible the amounts of flexure which would be produced by different systems of loading. Constants, of course, had to be assumed, but on one very possible assumption a result comes out that the filling and emptying of an estuary or tidal river might deviate a spirit-level or plumb-line by one-tenth of a second of arc. The author also considered

Digitized by Google

the effects of the attraction of the sun and moon, producing as they must "tides" in the solid crust of the earth, on the reading of a level, and the measured altitude of a star as obtained with an artificial horizon. On the very vexed subject of the effective elasticity of the earth, the author considers the transmission of earthquake waves to show a Young's modulus which is less than that of iron, but the bulk modulus is very high indeed. Prof. Perry thought Dr. Chree had taken too high values for his constants. Dr. Chree pleaded "Thomson and Tait" as his authority, but appeared not to be quite certain that the really proper way of attacking the question was not by the "equations of pulverulence" of Prof. Karl Pearson and Prof. Boussinesq. Few of our readers will expect us to follow him further here. Mr. Rudel's paper on "Musical Tubes" was, in the absence of the author, read by the secretary. The paper contained some interesting results (the reason, for instance, why church bells are not really musical), and the discussion went off into "overtones" and "partials." The electrical engineer may very possibly be compelled some day to understand all that theory, though not in connection with sound waves. At present it is decidedly outside his province. The next meeting is on January 22.

Householders' Troubles.—Some time ago the Commissioner of Police circulated a warning in which special attention was called to a thief who gained access to houses in the Metropolis on the pretence of inspecting telegraph or electric light wires. (This particular gentleman used to carry a coil of copper wire which, for some reasons inscrutable to ordinary minds, was generally taken as evidence that he really was an electricity man). It would seem, however, that the publication of the warning in the Press was not effectual, for since the notice appeared a number of larcenies of this kind have occurred in London, the thief applying sometimes to inspect electric wires, and sometimes to examine the water cisterns or ventilating pipes. The Commissioner desires "again to warn the public that if householders allow their servants to admit unauthorised persons to their houses on any pretence whatever, they have themselves to blame if they are robbed, and the police can do little or nothing to help them." Probably this last sentence is not intended to mean quite as much as it seems. The real inspector on a surprise visit is trouble enough, but the sham inspector-thief, if the police cannot deal with him, adds a new terror to existence. The sham-electrician thief has caused Mr. J. Atkinson, of Brook-street, W., to call attention to what looks like a real case of wiring trespass. Mr. Atkinson says: "During recent heavy rains I found the wet coming through my top rooms. I sent for the builder, who found a great many of the tiles displaced, and he proved to me that it had been done by someone who had affixed to my chimney stack an electric wire as thick as my little finger. I went to the police station. They said they could not help me, as you must first catch your hare; and eventually was told I must trace the wire to find whose it was. I went out on the roof, but could not trace it, so many being about, and came down as wise as ever. Now, I do think it shameful that one's house is not his own. I never gave permission for this cable to be affixed, and knew nothing of it." What is even more remarkable is the confidence (which appears to be justified) of the unknown fixers of the cable that the aggrieved householder will not simply—well, render the cable useless. If that failed, there are other resources of science available to show where the wire goes to.

Rontgen Radiations.—The New York *Electrical Review* has a seven-column long letter over the signature of Mr. Nikola Tesla, and dealing with the subject of the Röntgen radiations. There is, however, little that is new in it except the following, which we give entire, though with reserve, on account of the eminence of the author: "As to the hurtful actions on the skin, which have been variously reported, I note that they are misinterpreted. These effects have been known to me some time, but I have been unable, on account of pressing matters, to dwell on the subject. They are not due to the Röntgen rays, but merely to the ozone generated in contact with the skin. Nitrous acid may also be responsible to a small extent. The ozone, when abundantly produced, attacks the skin and many organic substances most energetically, the action being no doubt heightened by the heat and moisture of the skin. After exposing the hand, for instance, for some time the skin loses its elasticity, which causes a tension and pain, and subsequently an inflammation and blistering. This occurs mostly only at short range, but may be produced by a single terminal bulb, or generally by a very highly exhausted bulb, in which the terminals act independently at greater distance. Owing to this, I have always taken the precaution when getting impressions with the rays to guard the person by a screen made of aluminium wires, which is connected to the ground, preferably through a condenser. The radical means, however, of preventing such actions is to make impossible the access of the air to the skin while exposing, as, for instance, by immersing in oil. As this would be inconvenient in most cases, a metallic screen should be resorted to. The action of the ozone on some substances when placed near the bulb in such a way that the gas is generated on their surfaces is so powerful that the substances are practically destroyed in a few minutes. When a wire heavily insulated with rubber is connected to the terminal of a high-frequency coil, sometimes an exposure of barely a minute is sufficient to completely wreck the rubber insulation." The formation of ozone by the electric spark is, of course, well known, but some chemical evidence of its production by a Röntgen-ray bulb would have been acceptable. The context shows that it is not the make-and-break which is supposed to do the mischief.

The Hull Extensions.—Either way is often better than no way, and few will doubt that Hull is to be congratulated that the deadlock has come to an end, and the committee's scheme will go through. We have hitherto refrained from comment on the affair, because it seemed eminently a case where comment could do little good. Yet we may remind critics of either side that it is quite possible for a man after having taken every trouble to arrive at a correct judgment to be honestly convinced that he is right, and yet not to have all the right on his side. But there are some general considerations which claim attention. In some places, for instance, the Hull deadlock has been used as an argument against municipal ownership. Now this is simply wide of the mark. The choice lies practically between a municipality and a monopolist company. The man of business who thinks his judgment on technical matters better than the expert officers of the company, and who therefore over-rules their advice, is by no means unknown at board meetings. Only these are private, and the public never hear of it; with a town council they do. It is simply one of these cases where the rule *de non existentibus*, etc., leads one very far astray. Then there is another matter which has a professional bearing. A mechanical contemporary has suggested that at Hull, not only the electric light committee, but also the electric engineer ought to resign forthwith. The suggestion will hardly be received with gratitude in the profession. An engineer's position may often not be altogether a bed of roses, but it will hardly smooth it to make a rule of

Digitized by Google

etiquette that whenever his council will not agree with his suggestions the engineer should forthwith resign—and presumably occupy his time in the perusal of the technical papers until an appointment falls vacant under the town council of Sybaris. And there is the other side. Representative institutions may be all wrong, but as things stand the ratepayers would hardly consider that a town councillor had done his work if he confined himself to appointing an expert official of whose qualifications he had only the ordinary means of judging, and thought it his duty thenceforward without further consideration to authorise any expenditure that official suggested. That experts may have sometimes to submit to the judgment of inexperts seems inevitable, and the risk of a wrong judgment must be taken. It is said that even an electrical engineer has at times been known to disregard the expert advice of his medical man.

Society of Engineers. — The forty-third annual general meeting of the Society of Engineers was held on December 14 at the rooms of the society, 17, Victoria-street, Westminster, S.W. The chair was occupied by Mr. Samuel Herbert Cox, president, and the following gentlemen were elected as the council and officers for 1897: as president, Mr. G. Maxwell Lawford; as vice-presidents, Messrs. W. Worby Beaumont, J. Corry Fell, and Henry O'Connor; as ordinary members of council, Messrs. J. Patten Barber, Joseph Bernays, George Burt, D. B. Butler, H. S. H. Farrar, Percy Griffith, Charles Mason, and Stephen Sellon; as hon. secretary and treasurer, Mr. Perry Fairfax Nursey; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A. The forty-third annual dinner of the society took place at the Holborn Restaurant on Wednesday. The president, Mr. Samuel Herbert Cox, occupied the chair, and amongst a large company present were Mr. W. H. M. Christie, F.R.S. (Astronomer Royal), Admiral Colomb, Colonel Cox, Mr. A. J. Walter, Messrs. W. Worby Beaumont, John Corry Fell, and G. Maxwell Lawford (vice-presidents), Messrs. Charles Gandon, W. A. Valon, J.P., and J. W. Wilson, jun. (past-presidents), Messrs. George Burt, D. B. Butler, Percy Griffith, and Charles Mason (members of council), Mr. Perry Fairfax Nursey (hon. secretary and treasurer), Mr. Samuel Wood (hon. auditor), and Mr. G. A. Pryce Cuxson (secretary). The President, in reply to the toast of "Success to the Society of Engineers," alluded to the antiquity of the society, which was founded in 1854, and said that although old age did not invariably carry honours with it, he thought the society was as well preserved and as capable of doing as good work now as in the hey-day of its youth. A study of the *Transactions* showed that there was no falling off in the quality of the papers, and all would agree that so far as the discussions of the papers were concerned, the difficulty was not to find those who were ready to express their opinions, but to enable everyone who wanted to speak the opportunity to do so in the limited time at disposal. During the past year the usual vacation visits had been paid, and the society had to express its thanks to those who had so kindly received them. He regretted that owing to absence from England he had unfortunately been unable to attend these visits, and expressed his thanks to Mr. Maxwell Lawford, the president-elect, for having attended to his duties during his enforced absence, and added that the society was so well organised and possessed such a tower of strength in their secretary, Mr. Pryce Cuxson, that the temporary absence of a president appeared to have very little effect upon its welfare.

The Royal Institution.—The annual prospectus of the Royal Institution has been issued. The following embodies a dated list of the lectures up to Easter: Prof. A. D. Waller, F.R.S., Fullerian Professor of Physiology, will deliver 12 lectures on "Animal Electricity" on Tuesdays, January 19, 26, February 2, 19, 16, 23, March 2, 9, 16, 23, 30, April 8; Prof. H. A. Miers, F.R.S., lectures on "Some Secrets of Crystals" on Thursdays, January 21, 28, February 4; Dr. J. W. Gregory, of the British Museum, lectures on "The Problems of Arctic Geology" on Thursdays, February 11, 18, 25; Dr. Percy Gardiner, Professor of Classical Archæology and Art in the University of Oxford, is to deliver three lectures on "Greek History and Extant Monuments" on Thursdays, March 4, 11, 18; Prof. W. Boyd Dawkins, F.R.S., will give three lectures on "The Relation of Geology to History" (pre-Roman and Roman Britain) on Thursdays, March 25, April 1, 8; Mr. Carl Ambruster delivers three lectures on "Neglected Italian and French Composers" on Saturdays, Jan. 23, 30, Feb. 6; and Mr. W. Frewen Lord three lectures on "The Growth of the Mediterranean Route to the East" on Saturdays. Lastly, Lord Rayleigh, F.R.S., is to give six lectures on "Electricity and Electrical Vibrations" on Saturdays, March 6, 13, 20, 27, April 3, 10. The Friday evening discourses depend in a great measure on the free kindness of eminent men, whose time is subject to the sudden claims of public or professional duty. They are therefore liable to change; but subject to this the arrangements will be as follows: January 22, Prof. Dewar on the "Properties of Liquid Oxygen"; January 29, the Bishop of London on "The Picturesque in History"; February 5, Prof. Jagadis Chunder Bose, M.A., D.Sc., on "The Polarisation of the Electric Ray;" February 12, Prof. J. Milne on "Seismology"; February 19, Dr. G. Johnstone Stoney on "The Approaching Return of the Great Swarm of November Meteors"; February 26, Lieutenant-Colonel C. R. Conder on "Palestine Exploration"; March 5, Mr. Shelford Bidwell on "Curiosities of Vision"; March 12, Prof. A. Smithells on "The Source of Light in Flames"; March 19, Sir E. Maunde Thompson, K.C.B., on "Greek and Latin Palæography"; March 26, Sir William Turner on "Early Man in Scotland"; April 2, Mr. C. T. Heycock on "Metallic Alloys and the Theory of Solution"; and on April 9 a discourse by Lord Rayleigh. The syllabus of Prof. Silvanus Thompson's Christmas lectures on light, to be delivered on December 29 and 31 and January 2, 5, 7, and 9, shows that the lectures run over pretty nearly the whole of physical optics, the Röntgen radiations coming in as the subject of the last lecture. The syllabus is a good enough one, but the task that Prof. Thompson has undertaken of adapting such a subject to the comprehension of a "juvenile auditory" is not exactly a light one. Before Christmas there is, of course, the opening of the Davy-Faraday laboratory, to take place next week.

Science Teaching at Liverpool.—The William Gossage laboratories and the extension of the chemical laboratories of University College, Liverpool, were opened on Saturday by the Earl of Derby. The new buildings include a laboratory, and in the basement an additional lecture-room to seat 70 or 80, a preparation-room, and a gas analysis room. These constitute the William Gossage laboratories. The other new buildings comprise a metallurgical laboratory, a store for apparatus and chemicals, a dynamo-room, electric accumulator room, and a heating chamber. An address was delivered by Prof. Ramsay, in which he contended that better work was done in small laboratories than in very large ones. "In a comparatively small laboratory," he said, "an atmosphere of interest exists. The workers speak to each other in friendly intercourse and criticise each other's work; the influence of seniors on juniors is felt. But in a large laboratory, where the principles of the factory

Digitized by Google

supersede the kindly intercourse of friends, where one is lost in labyrinths of passages and puzzled by multiplicity of rooms; where no one knows what his neighbour is doing, nor cares, such advantages are lost. For my part, I prefer the gossip of a village to the county council formalities of a city." So far as possible, students should know how to make their own apparatus or improvise equivalents. Prof. Ramsay added some remarks on the subjeet of the teaching of chemistry, which, however, are equally applicable to all kinds of science teaching. "The theme of chemical education," he said, "has recently been discussed within these walls, but on totally different lines from those I propose to follow. My thesis is that students are, as a rule, much overtaught. I should not regard that laboratory as a chemical heaven where every student had an assistant at his elbow, keeping him on the straight path and guarding him from error. And taking for granted that the object of training students in chemistry is to teach them how to discover new truths, and to form theories concerning the relations between old truths, it is well to adopt the well-known method of trial and failure. A student gains much more knowledge, much more experience, and much more confidence, if, instead of following a printed guide, with a commissionaire at his side to warn him when he goes astray, and to insist on his following the beaten track, he attempts, *proprio motu*, to devise a new method (even when its failure stares in his guardian's face) and tries it. Indeed, there is far too much spoon-feeding." This is vigorously put, and Prof. Ramsay's eminence in the scientific world ought to command for it at least as much attention as is given to the remarks of the average politician speaking about a subject which he does not understand. The crux of the matter, however, lies in the assumption of the final cause of science teaching. There is so usually a mediate and effective cause to be considered—the passing of the "exam." And so long as people continue to look to the list of scholarships and "honours" gained as a test of educational ability, and public and semi-public bodies "cannot, you know, take the responsibility of appointing a man who has no certificates," no amount of talking will much alter matters. Left to himself, a man would rather "research" and make things than "cram" up other people's results to satisfy a syllabus.

Wireless Telegraphy.—Mr. W. H. Preece lectured at Toynbee Hall on Saturday night on the subject of "Telegraphy Without Wires." A great part of the lecture, of course, dealt with elementary matters, and it is to be hoped that the East-Enders duly comprehended it all, but some of the reporters, even with their shorthand to help them, got a little mixed up. Some of Mr. Preece's personal experiences in the matter may, however, be worth reproducing. The idea of telegraphing by induction is, of course, an old one, but before the telephone there was no practical means of carrying it out. In 1884, said Mr. Preece, he was astonished to learn that the operators in the telephone exchange in the City of London who knew the Morse code were able from the sounds heard to read messages that were going through London to Bradford by the telegraph wires. The wires belonging to the Post Office were underground, and those belonging to the Telephone Company overground, and by dint of careful experiments this very fact was found to be the reason why the messages going to Bradford were read by the Telephone Company. Further experiments showed that similar effects could be traced in certain cases on wires separated by as great a distance as 10 miles. After giving further details of various experiments, intentional and unintentional, Mr. Preece said that in 1893 telegrams were transmitted across the Bristol Channel, a distance of three miles, whilst speech was maintained across Loch Ness. In March of last year the cable connecting the Island of Mull with the mainland near Oban having been broken, communication by this means was established pending the arrival of the cable-ship for repairs. Skirting the coast of the island ran an overhead wire well adapted for the purpose; on the mainland a gutta-percha-insulated wire was laid along the ground, earthed in a running stream nearly a mile away from the sea, the other end being in the sea. In the course of four days no fewer than 156 messages were thus despatched—one being a Press message of 120 words. Then the repair of the cable enabled the ordinary method of transmission to be resorted to. The official at Mull reported, "I do not think an ordinary Morse circuit could have given better results." Curiously enough, the chief difficulty was the incessant screaming of the sea fowl, but strong earth currents interfered very much. Mr. Preece then referred to the subject of "magnetic storms" and kindred forms of disturbance, the ultimate source of which might have to be sought for in phenomena occurring as far away as the sun. Returning to practical work, Mr. Preece pointed out that, although it might seem that in wireless telegraphy it would only be possible to have one circuit working at a time, otherwise the messages would get mixed up, that might be avoided by taking advantage of the principle of resonance. The system, however, had proved useless for effecting communication with lightships. Some months ago an attempt was made at considerable expense to communicate between Ramsgate and the North Goodwin lightship by the Evershed method of induction; but the conductivity of the sea-water was too great, and failure was the consequence. It was a disappointment, as preliminary experiments on a small scale had been very promising. Speech had been maintained by telephone through six fathoms of water in Dover Harbour, but became impracticable at the actual distance between the two coils, as the damping effect increased so rapidly with the thickness of water. Mr. Preece then referred to the Marconi experiments. Mr. Marconi, a young Italian electrician, came to him recently, he said, with a system of telegraphy without wires, depending not on electromagnetic but on electrostatic effects—that is to say, on electric waves of a much higher rate of vibration, 250,000,000 a second in fact [*i.e.*, Hertzian waves]. These smaller waves were capable of being projected in one direction only like light, and consequently their power was not so enormously diminished in transmission to any distance. Then came the surprise of the evening, which was nothing less than the first public exhibition of the Marconi apparatus, or rather the outside of the case containing it. Mr. Marconi himself was present and exhibited it. What appeared to be two ordinary boxes were placed at each end of the room, the signal was made in one and a bell immediately rung in the other. Mr. Preece further said that the Post Office had decided to spare no expense in experimenting with the apparatus, and one of the first trials would be from Penarth to an island in the Channel. He might add that he had the greatest faith in the apparatus. The curious thing about it was that there was no new principle introduced. The first man who taught us how to generate these electromagnetic waves was Hertz. But in making practical use of those waves Mr. Marconi had invented devices which were highly novel and very beautiful, and when they were patented and made public he thought they would be admired by everybody. Mr. Preece added that communication in this manner was not affected by either fog or rain, and concluded by referring to the possible services that might be rendered to navigation by this method of communication.

CHESTER ELECTRICITY WORKS.

Perhaps this ancient city of the Roman occupation has never in all her history been more in line with the spirit of the times than it is to-day. Its Corporation, its officials, its citizens, are eager that the city shall be, as it always has been, in the front rank of those which mark time. It is a

MR. B. C. ROBERTS, J.P., MAYOR OF CHESTER.

beautiful city; its old-world, half timber, Gothic architecture gives it a charm which must be seen to be felt or understood. We think that if the ruins of Melrose are best seen by the light of the moon, the beauties of Chester will be better seen under the light of the electric arc than by any other system of artificial lighting. The authorities of Chester are to be congratulated in having adopted this light, and though we should like to digress to some length upon the ancient history of Chester we must refrain, and plunge *in medias res* of its latest achievement.

The history of the electric lighting scheme dates back some years; in fact, the adoption of electric lighting was discussed some years even before the provisional order was obtained in 1890. Chester owes its electricity supply undertaking just completed to the untiring energies of the present Mayor and Electric Lighting Committee, who have loyally supported the scheme through its many stages of progress. Benjamin Chaffers Roberts, Esq., J.P., now in the second year of his mayoralty, holds the position of chairman of the Electric Lighting Committee. From the period when he succeeded the late W. C. Deeley the scheme has been prosecuted with vigour and expedition, the foundation stone of the generating station buildings being laid by the mayoress in May, 1896, midway in the

MR. S SMITH, TOWN CLERK OF CHESTER.

first year of his office. Owing to the unflagging interest and strenuous endeavours of the Mayor, who has been loyally supported by the Electric Lighting Committee, the public and private lighting of the ancient city of Chester has become an accomplished fact, and we offer to his worship and his co-workers our congratulations on the successful issue of the undertaking. We are pleased to be able to give the portrait of the Mayor of Chester. Our other portrait is that of the town clerk, Samuel Smith, Esq., also an enthusiastic and indefatigable worker in any cause undertaken by the Town Council, judging from what we have from time to time heard. The vexations, delays, and disappointments which have occurred during the various stages of the electric light undertaking would have discouraged, if not deterred, other than conscientious public servants. We also have pleasure in recognising the efforts of the city surveyor, Isaac M. Jones, Esq., and other permanent officials, for so ably seconding the committee and Council to carry out the installation.

THE TOWN HALL, CHESTER.

Digitized by Google

At the request of the Town Council some dozen electric light contractors submitted designs, schemes, and estimates for lighting Chester with electricity, and in connection with these schemes the Council have at different periods sought advice from Dr. John Hopkinson, Mr. W. H. Preece, Lord Kelvin, and Prof. Kennedy, whose services as consulting engineer to the Council are now retained. The scheme which has just been carried out to completion was evolved from that submitted by Messrs. Thos. Parker, Limited, of Wolverhampton, in competition with various other firms. It is a unique undertaking in several respects, the station being arranged for supply to a network of mains on a three-wire system fed by feeders, the pressure in houses being 210 volts. The means of regulating the supply by a battery and balancing by a continuous-current transformer in connection with battery is novel in some respects, as will be gathered from what follows.

The compulsory area of supply is that portion of the town within the city walls (see Fig. 1), but mains have already been laid outside this area. Messrs. Thos. Parker, Limited, secured the contract for the supply of the whole of the necessary plant, the conditions being that the contractors should be entirely responsible for the working of the station, and to keep the plant in order and pay all expenses, the station to be handed over to the Corporation at the end of three years or any time before, the Corporation meanwhile guaranteeing a certain demand and paying the contractors in a decreasing ratio according as this demand is exceeded.

The prospects of the station are exceedingly rosy; in fact, the application for the supply of current has been far beyond that anticipated. A supply to an equivalent of 8,000 8-c.p. lamps has been applied for, and other establishments have been wired but not yet connected on to the mains. The present capacity of the plant has already become insufficient to meet demands; the committee have accordingly instructed Prof. Kennedy to make extensions of machinery and plant and to extend the system of mains. Two 400-i.h.p. sets of engines and dynamos are to be added to the plant already installed.

Amongst the buildings being wired may be mentioned the Grosvenor Hotel, Queen's Hotel, Old Bank Buildings, New Blossom Hotel, and the Westminster Hotel. Mr. Rupert, of Stafford, has secured the contract, amounting to something like £2,000, for wiring the Municipal Buildings—a photograph of which we give—comprising town hall, public market, and free library. The market is not shown in our photograph. The market lighting scheme was prepared by Prof. Kennedy and the city surveyor, and provides 36 arc lights of the Crompton-Pochin type, each of 2,000 c.p., for the lighting of the market. The market shops are wired for 94 incandescent lights of 16 c.p. each. About 500 lamps will be fixed in the town hall, of 8 c.p., 16 c.p., and 32 c.p. Electroliers of a special design in brass and iron are being supplied by Messrs. Singers, of Frome, for the Council-chamber, assembly-room, police court, Mayor's parlour, and the committee-rooms. The "rows" and "arcades," for which Chester is so famous, will ultimately be lighted by means of incandescent lamps. Current is supplied to consumers through meters placed in the houses; the meters used being of the Ferranti make.

The price charged per B. T. unit is 6d. for lighting and 4d. for power; meter rents also being charged. Discount at the rate of from £1 per cent. to £5 per cent. is allowed to large consumers, according to the number of units used per annum.

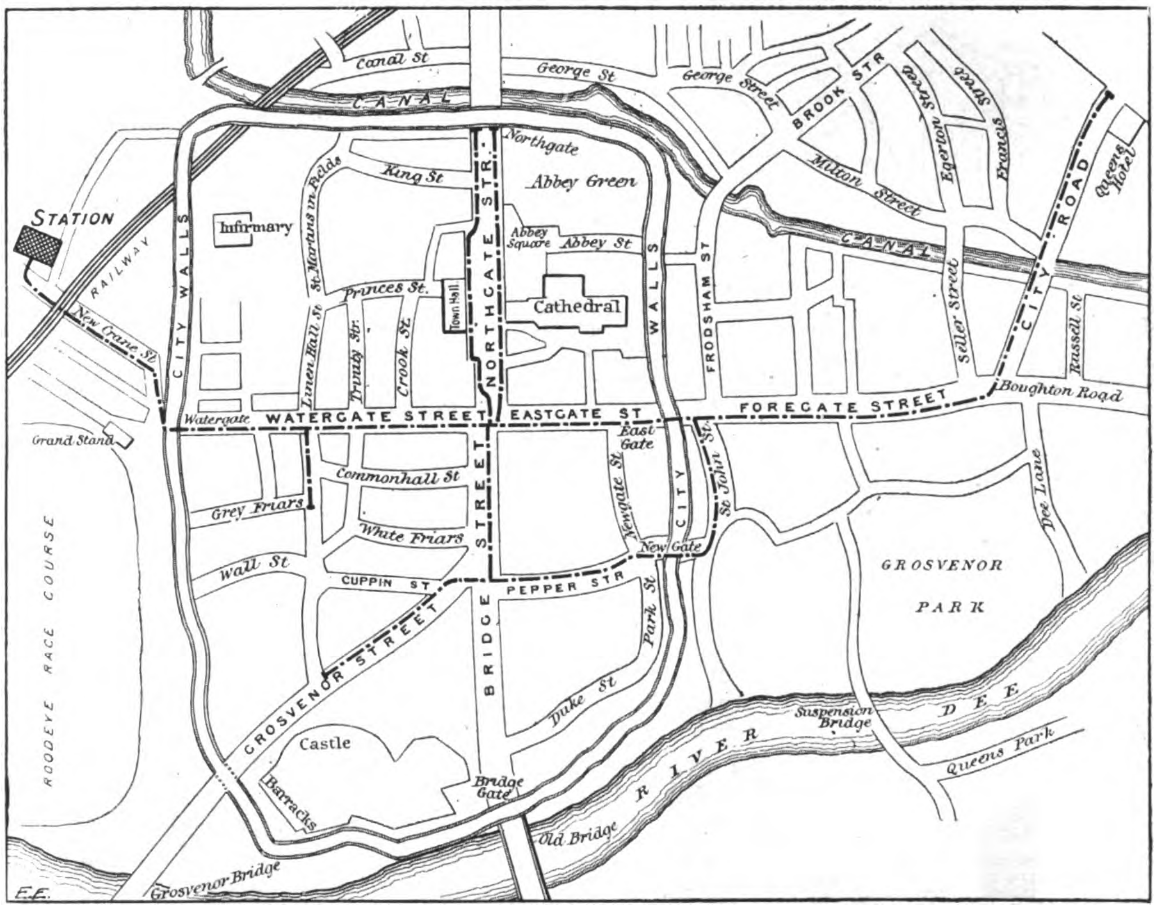

FIG. 1.—Map of Chester, showing Electric Light Mains.

The loan borrowed to defray the cost of the scheme was £25,000, nearly all of which has been expended, the station buildings and plant absorbing about £17,000 of the amount. Mr. G. E. Clarke has been Prof. Kennedy's representative at Chester. Mr. F. Thursfield has looked after the work on behalf of Messrs. Thos. Parker, Limited.

We are indebted to W. H. Matthews Jones, Esq., son of the city surveyor, for the photographs of the interior of the boiler and engine rooms. The exposures were made under very unfavourable circumstances. The atmospheric conditions were bad, and the station, moreover, was in a great state of unpreparedness.

Site of Station

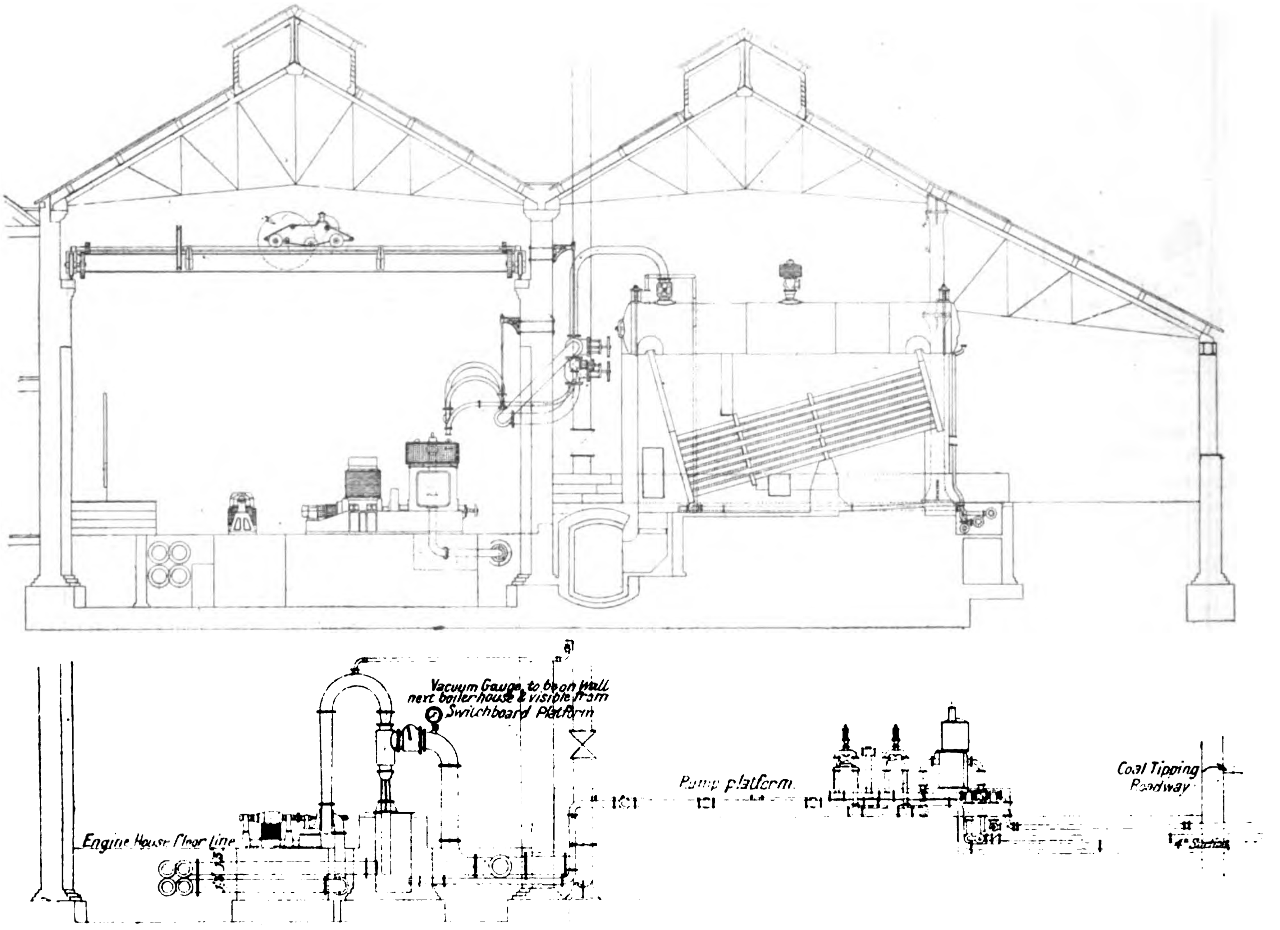
The site, as marked on the accompanying map, is in close proximity to the Chester and Holyhead Railway, and facing Crane-street. Parliamentary sanction to the construction of a coal siding branching from the above railway into the station yard has been refused, and this necessitates carting from the Central Railway Station, which is situate about

Digitized by Google

1¼ miles distant. Of course, this means that the price of coal delivered to the station yard is considerably in excess of what would be the case were a siding sanctioned. But notwithstanding this drawback, the cost of coal delivered is still very low. Slack can be delivered at the rate of 6s. per ton, and a better class of coal is expected to average not more than 7s. to 8s. per ton delivered. As will be seen by the accompanying map of the area supplied (Fig. 1), the position of the station with regard to that area is not at all central; it is, in fact, about one-third of a mile or more from the centre of compulsory area. Within convenient distance of the station runs the canal of the Shropshire Union Railway and Canal Company, whence water is taken for condensing purposes. The site affords ample provision for future extension of buildings, should they become necessary.

Station Buildings.

These comprise engine and dynamo room, boiler-house, battery-room, offices, coal-store, and chimney shaft, etc. The dimensions of the principal rooms are as follows: engine and dynamo room, 59ft. by 33ft.; boiler-house, 59ft. by 45ft. 6in.; battery-room, 25ft. by 22ft.; the heights being 33ft., 31ft., and 33ft. respectively. The engineer's and enquiry office, storeroom, and battery-room are situated on the ground floor, while the meter and testing rooms, general offices, and lavatory are on the first floor, the battery-room being continued through first floor to roof. Behind the offices, which face Crane-street, is situated the engine and dynamo room, at the rear of this, again, being the boiler-house. The roof of the former (Fig. 2) is supported on iron principals, and ample provision for light and ventilation is afforded by louvres in the roof and windows of fair proportions in the end walls. The walls are faced with brown salt-glazed bricks to a height of 4ft. 6in., with moulded capping, and above this with ivory-white glazed bricks, the floor being paved with red tiles. A platform is provided at the office side for the switchboard. It is about 4ft. above floor-level, and approached by steps. An eight-ton travelling crane runs the length of the room. The boiler-house provides accommodation for five boilers, but only three are at present fixed. As in the engine-room, the ventilation is by means of louvres. The roof, which is of two spans, is carried on iron principals from walls, and by a row of cast-iron columns in line with boiler-faces. The chief span is of 27ft. Bricks set on edge in cement form the pavement. A couple of large openings at the rear enable coal to be tipped from the yard on to the stoking floor. The battery-room is lined with whitewashed bricks, and the floor is paved with blue chequered Staffordshire bricks set in pitch. Ample ventilation is provided by means of two Boyle's 12in. ventilators. Fig. 4 shows the general plan of these buildings



FIGS. 2 AND 3.—Elevations of the Chester Electric Light Station.

The lofty chimney shaft, which makes the station a conspicuous landmark, is 150ft. in height. At base it is 7ft. square, and the inner lining is of firebrick to a height of 70ft., the internal diameter being 7ft. Difficulties with regard to the foundations for the chimney shaft were met with, for when excavation was commenced evidence was found of an old river bed, water being discovered 5ft. below the surface. Prof. Kennedy made an examination, with the result that it was decided not to excavate further, but to extend the area of the foundation. Concrete was then laid by Prof. Kennedy's orders over an area 35ft. square to a depth of 6ft., a solid mass of concrete, 35ft. by 35ft. by 6ft., being thus obtained. The foundations for both the chimney shaft and the buildings may be termed surface foundations. However, the plan adopted in lieu of driving in piles has apparently met the difficulty successfully, notwithstanding the treacherous nature of the soil, for the buildings have shown no signs of settlement, and the test of perpendicularity which the shaft was submitted to proved very satisfactory. Owing to this difficulty in connection with the foundations, the buildings are raised slightly above the original level intended, and the flues from the boilers are necessarily carried into the chimney shaft above the intended level, but the alteration has otherwise made little material difference to the designs. The chimney shaft contains some 1,050 tons of material, and is surmounted with a cast-iron circular moulded cap, supplied by Messrs. Smith, of Whitchurch, who also supplied the iron columns and roof supports, etc. in connection with the buildings. A lightning-conductor

Digitized by Google

of copper tape, 1in. by ⅛in., connected with the iron cap, and with a solid copper plate embedded in coke at its lower extremity, has also been fixed. In concluding these few remarks on the building, we may add that the front elevation is of Ruabon pressed bricks dressed with stone; to give the front elevation a pleasing appearance. Mr. Thomas Browne, builder, Chester, was the contractor for the buildings, and his contract, besides the erection of the buildings, included chimney shaft and foundations.

The wiring of the buildings and offices for electric

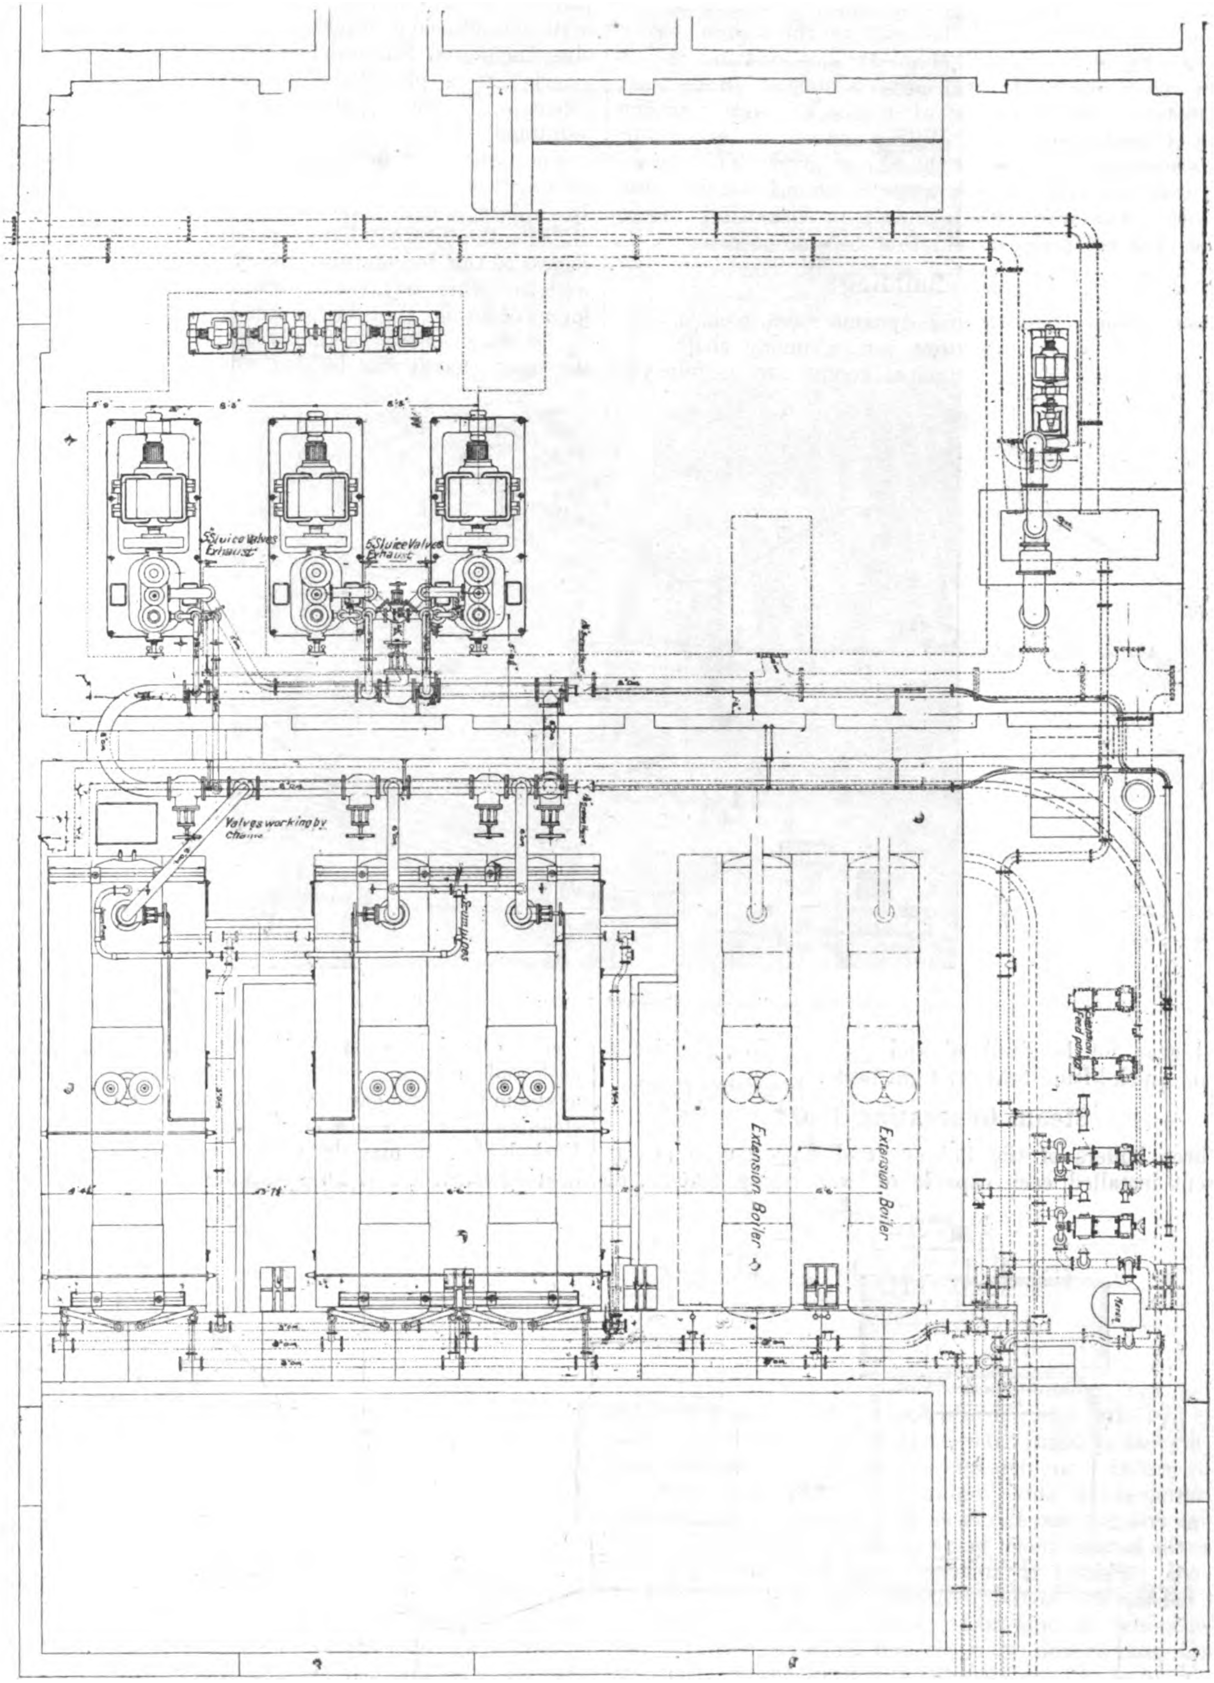


FIG. 4.—General Plan of the Station.

lighting was carried out by the Walsall Electric Company, who supplied all the fittings. Some 50 16-c.p. lamps were installed, and five 32-c.p., while three 100-c.p. lamps are used to light the engine-room.

The clerk of the works superintending the construction of the buildings on behalf of the Corporation was Mr. Helms.

also that the roof glazing throughout is on Helliwell's patent system.

The architects for the buildings were Messrs. Davies and Sons, of Chester, and the design is in every respects creditable to the firm—a substantial structure has been erected of an eminently practical design, without undue extravagance, and yet with sufficient architecture combined

Traveller.

An overhead travelling crane, supplied by Messrs. Carrick and Ritchie, of Edinburgh, traverses the length of the engine and dynamo room. It has been designed for a working load of eight tons, and is provided with the usual gear for longitudinal and cross motion, besides a special quick-lifting gear for light loads.

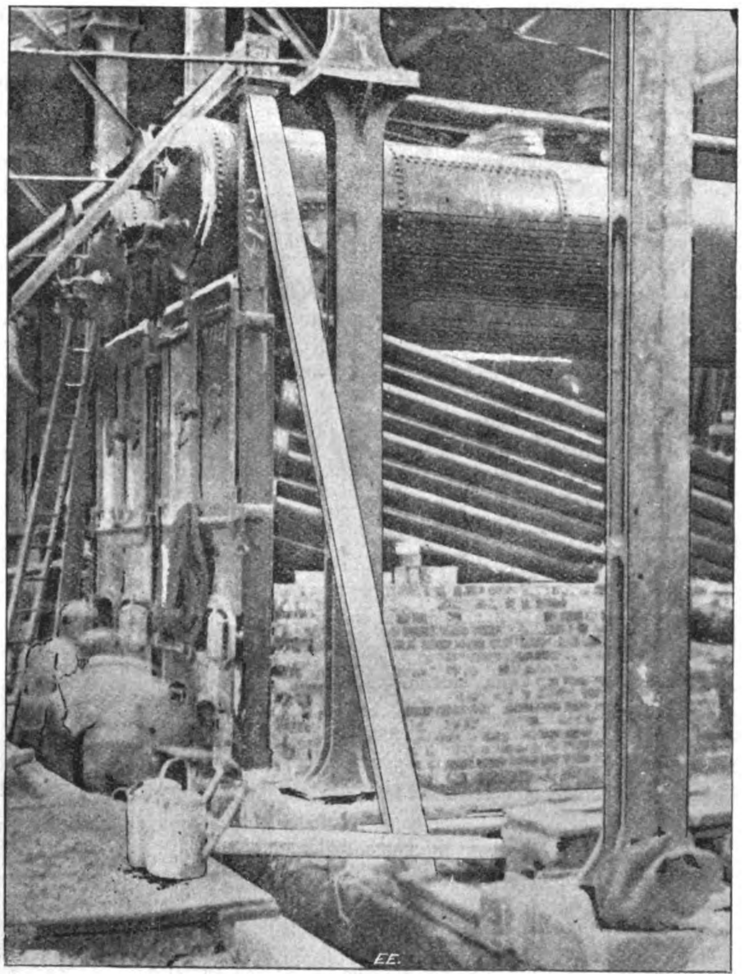

FIG 5.—View of Boilers and Seating in course of Erection.

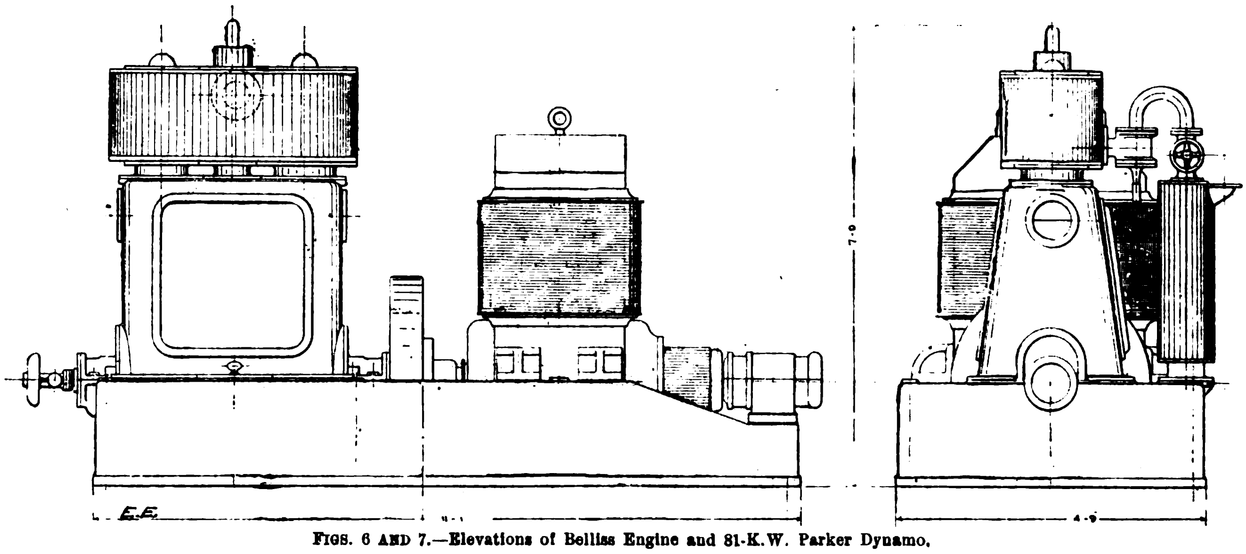
Steam Generating Plant.

Three boilers of the Babcock and Wilcox type are at present installed, each capable of evaporating 5,000lb. of water per hour at a working pressure of 160lb. per square inch, which, in fact, will be the rate of working under normal conditions. The steam-drums of these boilers are of steel plate, the tubes being of wrought iron, lap-welded, and connected at ends with steel headers. The fittings throughout have been supplied by Messrs. Alex. Turnbull and Co., of Glasgow, and include for each boiler a steam stop-valve 6in. internal diameter, a safety-valve arranged to carry off steam without allowing pressure to rise more than 5lb. above pressure, at which the valve is set to blow off; duplicate feed check-valves and duplicate feed stop-valves, each of 2in. internal diameter; a scum-cock and drain-pipe; a blow-off valve 2in. internal diameter; a steam-pressure gauge; a stop-valve ¾in. diameter for cleaning pipe connections; and two glass water-gauges. Each boiler, it may be added, has 1,619 square feet of heating surface, and an hydraulic test of 250lb. pressure per square inch was applied before delivery. The foundations consist of 7ft. of concrete. The main flue is 7ft. by 6ft., and passes along at the back of boilers, and is intercepted by an economiser; but a by-pass to chimney shaft is also provided. These flues, together with the economiser flues and by-pass, are lined with firebricks. The grate area of



FIGS. 6 AND 7.—Elevations of Belliss Engine and 81-K.W. Parker Dynamo.

Digitized by Google

these boilers is 30 square feet. Each boiler is composed of eight sections, nine tubes high, the tubes being 4in. diameter and 18ft. long, the headers being of wrought mild steel. The steam and water drums are 42in. in diameter.

A fuel economiser of 144 tubes has been supplied by E. Green and Son, Limited, of Manchester and Wakefield, and is of their high-pressure type, being fitted throughout with patent internal lids, and all flanges strengthened. An improved method of admitting the feed water, recently patented by the makers, has been applied to the economiser under notice for the prevention of external corrosion taking place on the vertical tubes when feeding with water at a low temperature. The water enters by the top branch pipe at the coldest end and passes downwards through the first few rows of tubes, the flow being evenly distributed by means of nozzles placed at the top of each. This arrangement has been found to act very successfully and to considerably increase the durability of economisers working under the conditions indicated. The economiser is designed to heat 1,000 gallons of water per hour from 60deg. to 200deg. F., and to work under a pressure of 160lb. per square inch. The scrapers are worked by means of a small electric motor of about ½ h.p.

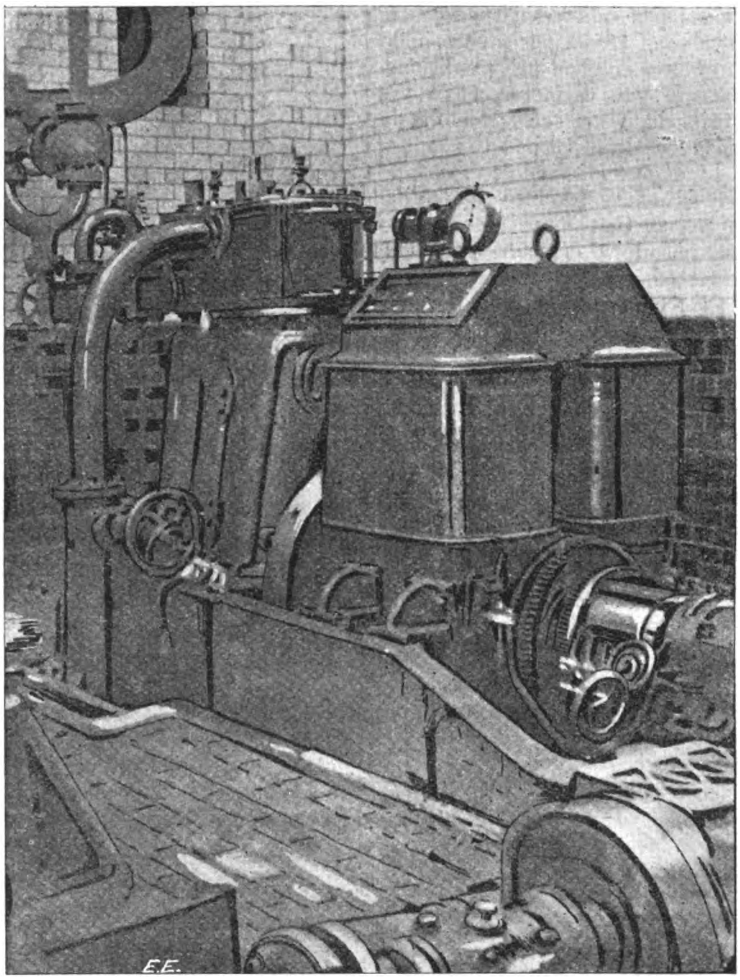


Fig. 8.—View of 81-K.W. Steam Dynamo.

Feeding Gear.

A feed-water tank is placed in close proximity to the chimney shaft, receiving its supply from the water company's mains, but it is also connected with the condenser discharge pipe. Two feed-pumps of Tangye's duplex pattern (Fig. 3), each capable of delivering to the boilers 1,500 gallons per hour, are situated in the boiler-house. These are carried on steel joists about 2ft. above the level of the stoking floor, and a chase runs along the front of the boilers and at the side of the flues for carrying the feed and blow-off pipes. The feed-pipe service provides complete duplication from the pumps to the economiser; from the economiser feed-pipes in boiler-house; also from the pumps to the boiler direct. The pumps deliver to two lines of 'bus pipes, and are arranged to take steam from either of the main ranges of steam-pipes. All the feed-pipes are of copper, with faced steel flanges and tees of cast iron. As will be gathered from the above remarks, the system of feed-pipes is very elaborate; every precaution has been taken, in fact, to avoid possibility of a breakdown.

Steam and Exhaust Pipes.

The steam-pipes, as shown in Figs. 3 and 4, are arranged on the ring principle, with loops to engines and direct branches to boilers, and valves are so placed to enable any one engine or boiler to be cut out independently of the others. The main line is composed of steel lap-welded pipes of 8in. diameter suspended by rods to give flexibility. All bends smaller than 6in. diameter are of solid-drawn copper with wrought-iron steel flanges brazed on. The pipes to engines are also of copper, with turned flanges and joints, all steam joints being made with corrugated gunmetal rings and mastic cement. Ample provision for drainage is provided by steam separators. All steam-pipes were subjected to an hydraulic test of 350lb. pressure per square inch before being accepted. Alternative means of exhaust are provided: either through the condenser or direct into the atmosphere. The exhaust pipes are of cast iron, 15in. internal diameter. An improved exhaust sluice-valve is provided for each engine. We may add here that the steel steam-pipes were supplied by Messrs. J. Russell and Co., of Wednesbury; the cast-iron pipes by Messrs. J. S. Roberts and Co., of West Bromwich; the copper pipes and bends by Messrs. Isaac Stoor and Co., of Manchester; the steam-valves throughout have been supplied by Messrs. Alex. Turnbull and Co., of Glasgow; while McDougall steam-traps are used, supplied by Messrs. W. B. Haigh and Co. It may be mentioned also that the steam-pipes have been covered with magnesia non-conducting material, supplied by the Washington Chemical Company.

The ejector condenser plant, supplied by Messrs. Körting Bros., of Westminster, is capable of condensing

Digitized by Google

10,000lb. of steam per hour, with a vacuum equal to 24in. of mercury in main exhaust. The water for condensing, as previously mentioned, is obtained from the contiguous canal of the Shropshire Union Railway and Canal Company, the connections to the condenser being four cast-iron pipes of 9in. internal diameter. A centrifugal pump is connected with the condenser capable of discharging 700 gallons of water per minute to a height of 20ft. above suction-pipe. It is driven by an electric motor (direct coupled) supplied by Messrs. Parker, Limited. The combined plant is situated in the engine and dynamo room on one bedplate, and automatic lubrication is provided for all bearings. The motor is wound for 440 volts, and has been designed for a wide range of speed to suit the condition of working. Its starting switch, regulating resistances, etc., are controlled from the switchboard.

Engines.

These were manufactured by Messrs. G. E. Belliss and Co., of Birmingham. The engines are three in number, designed to indicate continuously 135 h.p. when running at a speed of 380 revolutions per minute, with a steam pressure at the engine stop-valve of 150lb. per square inch, under either condensing or non-condensing conditions. The high-pressure cylinders are 9in. diameter, while the low-pressure cylinders are 15in. diameter, the stroke being 9in. We have several times recently described the Belliss two-crank compound type of engine of similar design to those at Chester, so it is needless to go into a detailed description now; suffice it to say that forced lubrication is provided, and the engines are coupled direct to dynamos. The combined sets were tested under the supervision of Prof. Kennedy at full, three-quarter, and half loads before being delivered. The sets were run for six hours under full load with highly satisfactory results, and we understand are running equally well at the station. The tests were made under condensing conditions, and by the courtesy of Messrs. Belliss and Co. we are enabled to give full particulars of the tests as under. The engines shown in elevation in Figs. 6 and 7 and in perspective in Fig. 8 are coupled direct by flanged coupling to the dynamos.

Dynamos.

Three dynamos are at present installed, each identical in design, giving 184 amperes at 440 volts pressure at 380 revolutions per minute. They are driven direct, and each engine and dynamo has a common bedplate, with a foundation of concrete 5ft. thick. The machines are of Messrs. Parker's shunt-wound continuous-current type, with drum armatures, Eickmeyer wound, the field magnets being of the two-pole horseshoe inverted pattern, armature below magnets. The magnets and pole-pieces are of cast steel, carried on cradles of a special design, to facilitate examination or repair of armatures, the pole-pieces being cut through on the horizontal axis above the point where supported by the cradles, thus allowing the whole top half of the field magnets to be lifted bodily clear of the armature. The armatures have cores of charcoal-iron discs separated by paper, and are so arranged that they can be lifted out for repairs, after the field magnets have been removed, by a direct vertical lift. Another interesting feature of these machines is that the brush pillars are carried by a rocking gear, which can either be worked by hand or by a worm and wheel attachment, for fine adjustment. Each machine is self-excited, and capable of running steadily at any E.M.F. of from 420 to 450 volts at normal speed. A resistance is placed in the shunt circuit of each dynamo field, the regulating switches being placed on a rail in front of the switchboard. The leads are taken to the switchboard in separate iron pipes laid under the surface of the floor. It was stipulated that the combined efficiency of each dynamo and engine should not be less than 81 per cent., which figure is much below the efficiency actually obtained—*i.e.*, 87·78 per cent.

Besides the three dynamos described above there are three other machines—viz., a balancing transformer, consisting of two balancing armatures direct-connected, and two charging dynamos, or boosters, also coupled by flange couplings to the balancing transformer. The latter is connected across the outer mains of the three-wire system at the switchboard omnibus bars. The middle wire is connected to the common terminal of the two armatures. This transformer is capable of balancing the whole system when any current up to 100 amperes in either direction passes through the middle wire. The shafts of the three machines being coupled together, the combined machine runs as one, the balancing armatures driving the two boosters as generators, the latter giving a maximum output of 50 amperes at 70 volts. These boosters are designed to give an E.M.F. of from 10 to 70 volts on open circuit with any current between 0 and 50 amperes. The flange coupling mentioned above is capable of easy disconnection. It may be mentioned that all commutators are of copper insulated with mica, and lubrication, both in the case of the large and small machines, is by means of ring lubricators. Five feet of solid concrete form an efficient foundation for the boosters and transformers.

Accumulators.

There are two batteries, each of 115 cells. The cells are of the E.P.S. 25-plate K type in glass boxes, each having a normal capacity of 300 ampere-hours, and designed to give without injury or undue waste in recharging the following discharges: 60 amperes for five hours, 80 amperes for three hours, 120 amperes for 30 minutes, these results being obtained with the temperature of the electrolyte at 55deg. F. The cells are supported on oil insulators carried by dry wood bearers, the plates being separated by three glass tube separators. They are arranged in double parallel rows in two tiers, access being obtained to the upper cells by means of raised platforms running between each row. The batteries are connected to the boosters and switchboard are explained elsewhere.

Switchboard and Method of Working.

The switchboard (Fig. 9) has been supplied by Messrs. Thomas Parker, Limited, of Wolverhampton, and consists of three panels of enamelled slate supported on an iron framework. It is arranged for three dynamos, three feeders, two batteries, one balancing transformer, two boosters, and a three-wire system of distribution, the middle wire being permanently connected to earth. The accompanying diagram will give a rough idea of the board. The centre panel contains the battery, balancing transformer, and booster instruments and switches. The negative instruments are situated on the right-hand outside panel and the positive on the left, the feeders being at the top of the board. On a handrail in front of the board, switches for regulating the fields of the dynamos and balancing transformer are placed; the resistances which they communicate with are under the switchboard platform. The switches for regulating the boosters and starting the balancing transformer form part of the main switchboard. In the circuit of each dynamo are the following instruments: an automatic zero cut-out switch, fitted with fuse to blow at 300 amperes, and an ammeter reading up to 200 amperes; also two terminals are provided to enable connection being made either through the automatic switch or direct to dynamo bar. In circuit with the feeders are two duplex fuses, each to carry 500 amperes and two ammeters graduated to 500 amperes. Three feeder bars are placed

Digitized by Google

vertically on the front of each outer panel, and between these are placed alternately the dynamo bars. In each battery circuit is a regulating switch of special design interlocked with booster reversing switch, a battery ammeter reading up to 200 amperes, an emergency switch for cutting the battery out of circuit, and two registering meters reading direct in ampere-hours. The balancing transformer is in circuit with a duplex starting switch, an ammeter reading to 150 amperes, and also a middle wire ammeter. The booster circuits are provided with an ammeter graduated up to 100 amperes; a pair of omnibus bars for plugging the secondary on to the battery circuit, the milking leads, or the meter test circuit; a reversing switch enables the E.M.F. of the booster to be added to that at the 'bus bars for charging the battery, or on discharge the booster E.M.F. can be added to that of the battery when the 'bus bars are at a higher E.M.F. than the battery. A voltmeter, with multiple contact switch, is also provided. At the back of the outer panels are placed a couple of 'bus bars 2in. wide by $\frac{5}{8}$in. thick, and 15 main switchboard plugs are provided. The of the battery would be sufficient to cope with the public lighting together with private lighting, as the public arcs remain alight from sunset to sunrise.

The Mains.

The whole of the cables have been manufactured and laid by the Callender's Cable and Construction Company, Limited, of London and Erith, who have also carried out the whole of the street work, including the excavation and repaving, and the erection of the arc lamps and brackets. The cables used are concentric, lead-sheathed, and steel-armoured. They are insulated by bitumenised fibre between the conductors and over the outer conductor, the armouring consisting of two steel tapes protected by a final yarn well compounded, and as an additional safeguard tarred boards have been placed in the trenches over the run of the cables wherever the mains are in the road. These boards are intended to serve as an indication to workmen in the future of the presence of the cables underneath.

The distributing network consists of triple concentric cables, laid in all the principal streets in the city, as shown

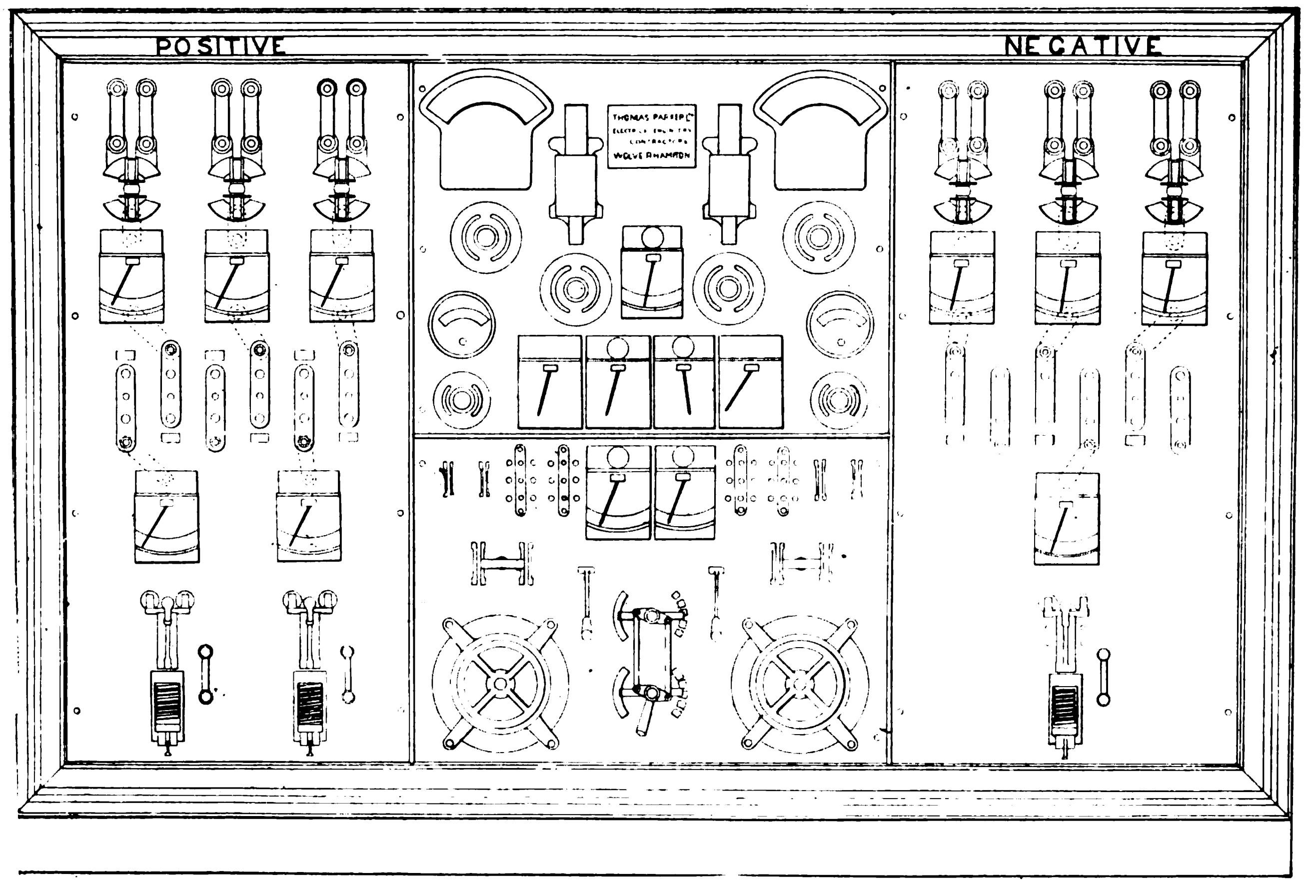

FIG. 9.—Elevation of Switchboard at Chester.

dynamos can be run in parallel or separately on the feeders as may be desired. By means of the above arrangement of the boosters they can be made to supply extra E.M.F. for charging the batteries, or can be connected in series with the batteries to hitch up when discharging. It may also be mentioned that there are nine reserve cells in each battery, which can be switched in from the switchboard as required. All switchboard connections are of copper, but the battery fittings are of brass, painted with anti-sulphuric enamel—blue for positive connections and red for negatives. We mention this because it is contrary to usual custom, and might be confusing. The feeder voltmeters on switchboard are of the Weston pattern, while the voltmeters used for the 'bus bars and dynamos are of the Kelvin electrostatic type. The ammeters are Kelvin instruments, and the battery meter is of Thomson-Houston make. The battery will always be kept in circuit to act as a regulator. The system of working has not been finally decided, but it is probable that the accumulators will be charged during light load. They will not be depended upon, however, to supply the night demand unaided, for it is doubtful whether the present capacity in the plan (Fig. 1). Two sizes of cables are used, one of them having the conductors ·10 square inch, ·06 square inch, ·10 square inch, and the other ·06 square inch, ·06 square inch, ·06 square inch; the neutral wire of the network is placed as the outer conductor of the cables. This network is connected with the station by means of two feeders, each consisting of a two-conductor concentric cable, each conductor being of ·50 square inch. These feeder mains are run as far as the Cross, where they terminate in a large dividing box, from which five sub-feeders are run to the feeding points on the network. These sub-feeders are two-conductor concentric cable, each of ·25 square inch section. The connection between the neutral wire of the network and the station is made by a single-conductor cable ·25 square inch in section, which joins into the network at a specially constructed box close to the Cross. Pilot wires run from each sub-feeder box direct back to the station, and these pilot wires consist of three-core cable, each conductor being separately insulated and being of ·008 square inch section.

THE BRISTOL TRAMWAYS.

The supply of expert reports on the question of Bristol tramways still keeps up, and there is evidently a very strong local feeling on the subject. Our readers have been kept informed of the state of the controversy in our columns of "Business Notes." The report of Mr. H. F. Parshall to the tramway company and the opinions of Dr. John Hopkinson and Lord Kelvin are printed elsewhere in this issue. The facts are briefly as follows: The electrically-equipped line from Bristol to Kingswood has been a success both from the public and the tramway company's points of view. The company therefore wish to convert practically all the rest of the tramways in Bristol into electric lines, and applied to the Corporation for their consent. Mr. W. H. Preece was called in by the Traction Committee to advise them on the matter, and reported at length. These recommendations were to the effect that the sanction should not be given unless the power required is taken from the Corporation. The committee in question added other restrictive clauses in their report to the Council, one being that the sanction for the trolley construction should only hold good for five years. The report of this committee has practically been adopted by the Council by a majority of thirty-one to twenty-one votes. Hence the matter will have to be thrashed out before Parliament when the tramway company's Bill comes up for discussion. The speeches on the question at the last meeting of the Bristol Town Council showed that both sides had a grip of the real matter at issue. We take the primary question at issue to be how far the present tendency towards municipalisation can lead us with advantage. We hold that the supply of water, electric light, and gas, and other necessities should be under the control of the town, but hardly see why the authorities should undertake the supply and working of tramways, 'buses, cabs, and parcel deliveries. It is round this perhaps abstract point that the matter turns, but the practical details have given grounds for a conflict between experts. Mr. Preece naturally concludes that by the charges made for the supply of power to the tramway company the Corporation will be able to relieve the electric lighting department of part of its standing charges. The opposition report by Mr. Parshall shows that the company does not wish a profit to be made by the Corporation out of the supply of power. He doubts that economy would result from the combination of power and light, and states that "the lighting machinery now installed could not in any case be used in place of the machines required for the electric traction work. The two plants would have to be separate and distinct." The same idea is expressed in the two confirmatory opinions. Yet Mr. Parshall used a very similar plant to supply the feeders on the Dublin-Dalkey line. The alternate-current generators were certainly three-phase; but a single-phase synchronous system would also have served the purpose. It is our opinion, in spite of the authorities arrayed against us, that economy in

Digitized by Google

the actual cost of power should result from the combination of the two schemes if under able control. The coal supplies and steam generating plant could at least be shared, and with forethought the generating plant could also be made to give mutual assistance on emergencies. The only question is whether the dual supply at Bristol would give such an economy, or whether the Corporation would, by increasing the capital outlay and working expenses, nullify the possible saving. The idea that this will be the case justifies the experts in their conclusions. In the other points at issue the Corporation are certainly acting in an arbitrary manner. It is absurd to expect a company to regrade their streets for them and to erect an overhead system of electric traction on a five-year license. It would be utterly impossible to get the necessary capital under such restrictions.

THE ANNUAL MEETING.

The first annual meeting of the Institution of Electrical Engineers under the amended articles of association was held last week. The attendance was restricted to members and associates of the Institution, and a very fair number were present. The discussion before the report of the Council was adopted showed the value of the alterations in the constitution. Previously no discussion was possible without moving an amendment to the report. As such an amendment was usually taken as a censure on the Council few suggestions were made, and the annual meeting did not give the member his due voice in the control of affairs. From our report of this year's meeting it will be seen that there was no dearth of suggestions. Perhaps an unduly large proportion of these had reference to the best way of providing more attractions at the conversazione. Still, other speakers had the primary object of the Institution in view, and their proposals tended towards raising its status in the engineering world. When only one paper of all those read in a session is worthy of a premium, some decided move is required to remedy the matter. While not concurring with the idea that the secretary should invite papers on his own responsibility, we think that a general invitation stating on what subjects papers are most urgently required should be sent to all members, as is done by the Institution of Civil Engineers. In special cases additional pressure might be brought to bear, but if the members and associates will only take an active interest in their society, such a course will very seldom be necessary. No one raised the question as to the reading of papers in abstract, which we think to be a reform urgently required. The full proofs of the papers can, as a rule, be obtained beforehand by those who wish to take part in the discussion. Thus by reading an abstract only, much valuable time could be saved and time given for more papers per session.

The E M.F. of a Thermo-Couple.—In a paper recently read before the Paris Academy of Sciences on "The Influence of Magnetisation upon the E.M F. of a Thermo-couple, of which Iron is one of the Elements," by Messrs. U. Lala and A. Fournier, it has been stated that a diminution of the E M.F. was observed to take place when the couple was placed in a strong magnetic field.

CHESTER ELECTRICITY WORKS.

(Concluded from page 689.)

The feeder, network, and other boxes are of a special design, and are so arranged that, whilst all the ends of the cable are securely protected, and quite out of the reach of any damp or moisture, any line or section coming into the boxes can be readily disconnected. Consumers are joined to the mains by cast-iron service

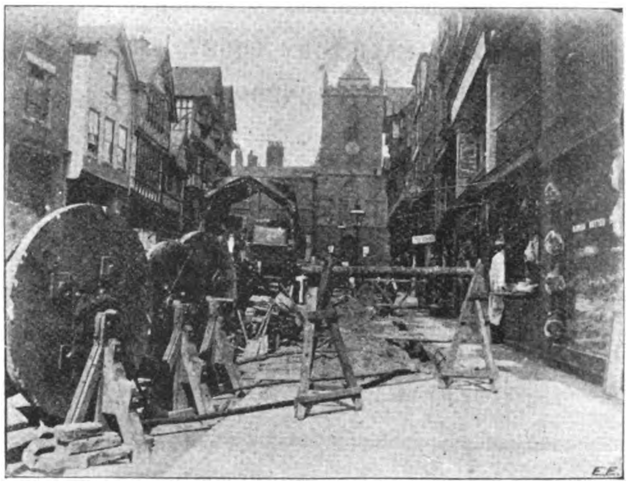

FIG 10.—Main-Laying at Chester.

boxes fitting on the mains, and the branch leading from the distributors into the consumer's premises consists of concentric armoured cable, similar to the mains themselves. These cables end in one of Reid's patent fuse and cut-out boxes, which is fastened on a suitable board attached to the walls in the consumer's premises. The arc lamps are supplied by single-conductor cable across the two

FIG. 11.—View of Cables in Trench.

outers of the three-wire system. Mr. A. Burton superintended the laying of the mains. The following are the lengths of cable supplied :

Area, square inch.	Type.	Length.	Use.
·5 ...	Concentric ...	1 500 yards ...	Main feeder.
25 ..	Single	750 ,, ...	Neutral feeder.
·25 ...	Concentric ...	625 ,, ...	Sub-feeder.
·35 ...	,, ...	850 ,, ...	,,
·1, ·06, ·1 ..	Triple conc. ...	1,400 ,, ...	Distributor.

a good idea of the characteristic architecture in this quaint old town.

Public Lighting.

At present 48 arc lamps have been erected in the principal streets. They are carried on standards 22ft.

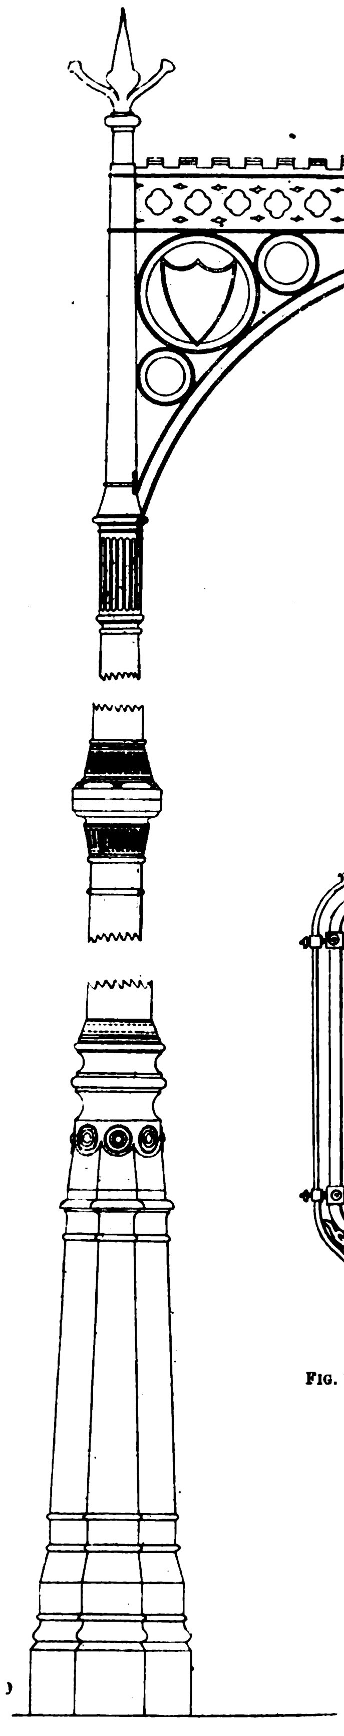

FIG. 12.—Lamp-post used at Chester.

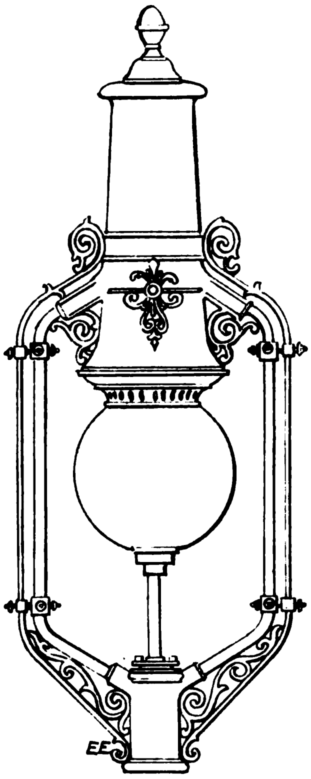

FIG. 13.—Type of Lamp-Carrier used on Gates of Town.

high, of Gothic design (Fig. 12), and in some cases on brackets attached to the buildings. The city gates are also to be surmounted with arc lamps, as shown in Fig. 13, in lieu of the existing gas lamps. The arc standards, together with the brackets, have been supplied by Messrs. Lucy and Co., of Oxford. It may be mentioned that they are of precisely similar design to those erected at Oxford. The arc lamps were supplied by Messrs. Johnson and Phillips, of Old Charlton, and are of their single-carbon 16-18 hour focussing type; they are fitted with 18in. light opalescent globes and copper spinnings. The lamps are regulated for a current of 10 amperes, and are joined up four in series on the street mains of 210 volts, a steadying or line resistance being used. Each lamp is fitted with a special automatic cut-out, and is provided with a substitution resistance, this being automatically inserted instead of a lamp, if by any means the rods stick apart, or the lamp is not trimmed, thus keeping the current constant, and preventing the others being put out; a fuse is arranged for at each end of the line joining the four lamps to the mains. Of the arc lamps, 22 are suspended from ornamental cast-iron columns, as shown in Fig. 12, and two in Messrs. Johnson and Phillips's standard carriers, shown in Fig. 13, the rest from brackets. The lamps are attached to the posts by special weather protecting hoods, having a ball and socket joint, so the lamp will hang perpendicular, notwithstanding the lamp-post may be a little out of truth.

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Continued from page 658.)

In concluding these articles it may be useful to recapitulate some of the chief conditions which experience and the general trend of development indicate as necessary, and it may also be of some interest to see in what degree the most modern apparatus is calculated, if adopted generally, to secure immunity from errors of a similar character to those which are known to have been the direct cause of some of the more recent accidents. It is only by the study of the combinations which make for or against the object aimed at that the knowledge usually denominated "practical" is obtained, and it is commonly acknowledged that the experience acquired from failure is most completely assimilated.

In a former article the chief causes contributing to accident were referred to. They may here be briefly summarised as follows: (1) acceptance of a train into a section which is already occupied; (2) sending a train into a section already occupied; (3) failure to notice the positions of the fixed mechanical signals. These deviations from the rules under which block working is carried on, have all at one time or another been the first cause of accident.

The three causes enumerated cover the possibility of error on the part of the three responsible persons engaged in the working of any train through a block section worked under absolute rules—viz.: (1) the signalman at the receiving end; (2) the signalman at the sending end; (3) the driver of the train passing into or out of the section. Of these three persons the first is usually considered as holding the most responsible position, since it is he who, under the ordinary working conditions, accepts or declines to allow trains to enter the section at the opposite end according to the condition of the line at the time. There is no doubt that when working strictly to regulations, the signalman at the receiving end is in a position of great responsibility, since, before accepting any train, he must assure himself that the *whole* of the preceding train has cleared the section, and that no obstruction exists, at his own station, which involves possible impediment to the approaching train throughout the *whole* length of the section it has entered, or is about to enter. A failure in observing this most elementary rule of block working led to a most disastrous accident on one of the leading railways about four years ago, and resulted in considerable loss of life under most lamentable conditions, and in great destruction of property.

During the time that work is carried on in accordance with the rules of the service, the sending signalman's responsibilities are confined to the exhibition of the proper mechanical outdoor signals for the information of the driver

Digitized by Google

of any train which may approach, and generally acting in accordance with instructions received from the other end of the section. If, however, any deviation from the usual method of working occurs, either from negligence or inadvertence, it is just as likely to originate at the sending end as at the receiving end, and the results may be equally disastrous. There is no lack of instances where trains have been sent forward under the impression that the indication of the block instrument refers to that train, and the lowering of the signal at the proper time has been neglected. In other instances trains have been sent forward without any of the usual block signals being exchanged, and the signalman at the receiving end has had no intimation of the train until it came under his personal observation.

In so far as the *acceptance* of a second train into an absolute block section is concerned, apparatus of a similar nature to that shown by Fig. 50, Saxby and Farmer's (Figs. 55-60), or Sykes's (Figs. 67-71), in which the receiving instrument is locked to "Train on line" until the train signalled has passed a certain point, or one of a number of points at relief sidings or junctions, would appear sufficient. To be consistent, however, the arrangements should be completely automatic, and this, of course, involves the use of releasing treadles at each of the points at which a train may clear the section, and other means of cancellation than exist at present.

In so far as the *sending* of a second train into a section is concerned, such arrangements as are shown by Fig. 54 (Winter's), Figs. 63-65, (Saxby and Farmer's), or Fig. 74 (Sykes's), in which the signal controlling the advance section is locked until the "Train on line" or "Line clear" signal is accepted, and is automatically replaced to "danger" by the passage of the train into the section, are a great advance on the usual method of working, and should be sufficient to prevent such errors. These methods have the further advantage of not interfering with the usual method of working traffic or requiring the line to be cleared for a greater time than ordinary for an approaching train. This, of course, is a matter of considerable importance in the working of busy junctions.

In cases of non-automatic working, a point of some importance arises on further consideration of the two probable causes of error just referred to. In one case, the *acceptance* of a second train may be made under the impression that it has been forgotten to clear the line for the last train. On the other hand, as has been shown, a train may be sent into a section under a similar misapprehension. In neither case does the ordinary form of instrument afford any indication of the deviation from the regular methods of working, and any attempt to avert the consequences arising must depend upon the signalman remembering the conditions actually existing, and, recognising his error, taking such steps as are possible under the circumstances. Certainly some such intimation might be of the greatest possible utility to the signalman at the receiving end of the section; and it is quite conceivable that, under certain circumstances, prompt action on the part of the receiving signalman, as a consequence of an automatic indication of the presence of two trains in the section, might enable him to avert the consequences of the error by allowing the first train to draw within the protection of one of the stop signals. Such apparatus need be of the simplest possible construction, but, owing to its casual use, would require to be carefully maintained in working order.

If the third contributory cause of error—failure to notice the position of the fixed mechanical signals—is considered, it will be observed that there is not anything like the number of devices in use, or suggested, to protect the driver from possibility of error. With some exceptions the driver is the only person of the three concerned who has, practically, been left to depend upon himself. Whilst this is the case neither of the signalmen are in such a position of responsibility as the driver. Errors on the part of either of the signalmen may be minimised and accident averted by vigilance and promptitude on the part of the driver, and have been on many occasions. If, however, the driver errs and runs past the signals, the signalmen have no control over his actions whatever, and are powerless to avert the consequences. It cannot be too strongly insisted upon that block signalling is only a means to an end, and that end is the exhibition of the proper signals for the guidance of the drivers of trains. If the necessity for automatic control of the means of signalling to the driver is felt, and the general line of progress is sufficient to prove this, how much more important is it that special means should be provided to ensure that the person for whose guidance the whole system of signalling is devised, is really made aware of the conditions under which he is running at any and every point where signals are exhibited.

A big smash on one of the leading lines a few years ago was directly traceable to failure on the part of the drivers of the train to observe the positions of the mechanical signals at the entrance to the section in which the collision occurred owing to the prevalence of fog. One of the two drivers of the train which ran past the signals paid for the error with his life, and the other with the loss of a limb. It is true, of course, that railway companies have elaborated arrangements for replacing the usual visual signal by aural equivalents in the event of a fog, or other similar cause, preventing the former from being available. For the period of the introduction of fog-signalling, it was no doubt eminently suitable, but for the present period it leaves something to be desired. In the first place, the indication to the driver that the line is clear, and signals, which he cannot see, are off for his advance, is of a negative character only. The absence of an explosion, due to the engine passing over one or more fog signals, is taken as an indication that the line is clear to proceed. Under this condition the driver has no real assurance that fog-signalling has been commenced.

Again, the fog signals have, in the ordinary form of working, to be placed in position by men stationed at the signals, and these men must take the position of the arm as a guide to their own actions in placing the fog signals to be exploded, or removing them, according as the signal arm is "on" or "off." The control of the section of line protected by the signal is dual, and therefore, whilst there *may* be two possible checks against error, there are undoubtedly two points at which error may arise. Further, the calling out of the fogmen for their special work depends under the present system, in many instances, upon the signalman, and he must exercise his judgment upon the necessity, or otherwise, for calling out these men as occasion may require. Some time may elapse between the decision to commence fogging and the actual commencement, more especially during the night. During this interval the necessity for the fogmen may increase, or it may cease altogether. In the first case the signalman may think he has delayed calling out the men too long, and in the other case he would think his action was premature. In either case his position is not a comfortable one.

Many attempts have been made to provide automatic, or semi-automatic, means to warn the driver of the positions of signals he is approaching or passing, under conditions which prevent their being seen; and railway companies are by no means backward in giving a trial to apparatus which possesses any of the elements necessary to success. Some forms of apparatus for this purpose are adaptations of the ordinary fog signal to use, at any time, by the aid of mechanical means, by the signalman working the signal. Usually a number of fog signals are kept in a special case near the signal, and the signalman, by the use of a special lever in the cabin, communicating with the box by a wire, is able to place a fog signal near the rail, on a specially prepared base, for explosion by the depression of a rod over which the train passes. The ability to commence using the fog signal at any time is a great advantage.

Unless, however, the apparatus is duplicated, only one fog signal can be put in position at once, and in the event of its not being exploded, from any cause, the results may be serious. Moreover, the adjustment of the fog signal in position for explosion is somewhat fine for operation at such a distance as "distant" signals are usually placed, by the aid of a wire which is subject to alterations of length with varying temperatures.

(To be concluded.)

INSTITUTION OF ELECTRICAL ENGINEERS, Dec. 10.

Dr. JOHN HOPKINSON (president) in the chair.

This was the annual general meeting. There was no paper down for reading and no ballot for new members.

After the formal business, the **Chairman** asked Mr. Campbell Swinton to be one of the scrutineers of the ballot papers for the election of the officers and Council.

Mr. Swinton: Is there anything to scrutinise? [As no additional nominations had been made, the house list, as given in our issue of November 20, must necessarily be elected.]

The **Chairman**: We shall have to go through the form.

The **Secretary** (Mr. Webb): There can hardly be an election without a return of the ballot papers. There have, as a matter of fact, been a considerable number of papers sent in.

Mr. Fairfax was nominated as the other scrutineer, and later on the formal report of the election was made.

The following is the report of the Council:

Elections.—The total number of additions to the register during the year has been 246, comprising eight foreign members, 14 members, 128 associates, and 96 students; and 58 candidates have been approved for election next month. Twenty-two associates have been transferred to the class of members, and 72 students to the class of associates.

Deaths and Resignations.—The losses which the Institution have sustained by death, although greater than last year, are not above the average. As follows: three foreign members—L. Beckwith, W. C. A. Staring, Dr. A. Stoletow; five members—A. Bell, F. S. Harwood, J. Thewlis Johnson, H. J. Vose, and Gordon Wigan; 15 associates—E. W. Adamson, E. Burn, A. Calder, G. F. Clements, A. T. Durrant, W. Eccles, H. L Harris, H. C. Hodges, J. A. Kingdon, A. Langman, E J. Lecoat, H. C. Oates, C. H. Phillips, J. R. Pickering, and C. M. Stobart; one student—A H. Gossage. Mr. Staring, a past director-in-chief of the Netherlands Telegraphs was one of the original members of the Institution. Mr. A. Bell, who was for a long period connected with the Postal Telegraph Department, had been a member for 20 years; Mr J. Thewlis-Johnson was one of the original members; and Mr. Gordon Wigan had been a member for 23 years. Four foreign members, nine members, 21 associates, and seven students have resigned during the year.

Papers.—Besides the valuable inaugural address of the President, the following papers have been read during the year: February 27, "High-Voltage Lamps and their Influence on Central-Station Practice," G. L. Addenbrooke (member); March 26, "Telephone Exchanges and their Working," Dane Sinclair (member); April 30, "On Railway Telegraphs, with Special Reference to Recent Improvements," W. Langdon (member); May 14, "Experimental Tests on the Influence of the Shape of the Applied Potential Difference Wave on the Iron Losses of Transformers" Stanley Beeton, C. Percy Taylor (students), and J. M. Barr; May 28, "The Utilisation of Water Power, especially with a Small Fall, with some Examples of Plants for Generating Electrical Energy," A. Steiger; November 12, "Telephone Trunk-Line System in Great Britain," J. Gavey (member). The list is smaller than usual, owing to the circumstance of the discussion of two papers read in November of last year having occupied two of this year's meetings.

Annual Premiums.—In respect of the papers read during the session 1895 96 by others than members of their own body, the Council regret that only one is of that character and possesses sufficient merit to entitle the authors to a premium—viz., "Experimental Tests, etc," by Messrs. Stanley Beeton and C. P. Taylor (students), and J. Barr. To the authors of this paper they award the Institution premium, and having regard to the fact of the authors being three in number, they intend to increase the premium from £10 to £15. Of the papers read at the students' meetings the majority have been of considerable merit, and the Council have decided to present on this occasion two premiums of £3. 3s. each. They award one of these to Messrs. Ray and V. Watlington for their paper on "Underground Conductors," and the other to Mr. E. B. Wedmore for his paper on "A Simple Method of Analysing Harmonic Curves." Honorary mention is made of the following: "Post Office Form of Wheatstone Bridge" by G. Lemmens; "Electricity Supply Meters," by G. W. D. Ricks.

Salomons Scholarship.—The Council have awarded a scholarship of £50 to Mr. E. W. Marchent, a student of the Central Technical College.

Students' Class.—The Council have observed with satisfaction not only the continued improvement in the character of the papers read at the students' meetings, but also an increased activity on the part of the Students' Committee in other directions. Your secretary was able to arrange for visits by parties of the students to the following works and stations during the session—viz, Messrs. Willans and Robinson's works, Thames Ditton; St. Pancras electric light stations; Messrs. Siemens Bros.' works at Woolwich; Metropolitan Electric Supply Company's station; the City of London electric supply station, Bankside; the London Electric Supply Company's station at Deptford; the General Electric Company's "Robertson Lamp Factory," Brook Green; the Board of Trade laboratory (by kind permission of Major Cardew). To the above-named firms and the engineers of the several companies the Council desire to acknowledge their appreciation of the kind facilities thus afforded to the students of the Institution. In September last a visit by some of the students to Switzerland was organised by permission of the Council, and your secretary was enabled, chiefly through the good offices of Dr. du Riche Preller (member) and Mr. A. Steiger, to obtain for the party special facilities for inspecting many of the most important electrical and engineering works in that country, their reception being of the kindest character.

Fire Risk (Wiring Rules).—The final revision of these rules has been purposely delayed in consequence of the sanctioning by the Board of Trade of the use of higher voltages, rendering necessary considerable further alterations in and additions to the rules. The Council have made a grant of money from the funds of the Institution for the purpose of enabling the committee to carry out tests of switches, fuses, and other appliances as now supplied by manufacturers, in order to ascertain how far these are suitable for the increased pressures. A committee was appointed by the Council on May 28 to consider the Council's expenditure in the direct advancement of the electrical industry, and whether, having regard to the annual surplus, the time has not arrived for greater expenditure in that direction, and report.

Annual Dinner.—The annual dinner, which was this year held at the Criterion Restaurant on November 25, was largely attended, the chief guest being the Duke of Norfolk, Postmaster-General.

Annual Conversazione.—The conversazione was this year again held in the galleries of the Royal Institute of Painters in Water Colours, and was very numerously attended.

Building Fund.—In accordance with a resolution passed at the meeting of members and associates on July 6 last, certain stock, representing at the price of that day the sum of £3,500, have been transferred to the building fund account, and the interest accruing from the same has been and will be in future credited to the same account, and will be invested from time to time. It is a striking and satisfactory proof of the sound judgment exercised by your hon. treasurers (the late Mr. E. Graves and Sir D. Salomons) in making the Institution's investments, that the increase in value of the stock so transferred to the building fund between the date of their purchase and that of their transfer was no less than £221. 1s. 5d., which sum figures in the balance-sheet as profit added to the general fund.

Annual Accounts and Financial Position.—In accordance with the resolution passed at the ordinary general meeting of March 12 last, the statement of accounts and balance-sheet for the year ending Detember 31, 1895, as then presented, were re-cast, and were in their new form adopted at the special general meeting of members and associates held on July 6. Among the alterations made in the articles of association by the special resolution previously alluded to was one enacting that the financial year should thenceforth be taken to end on September 30 in each year, and that the annual accounts should in future be made up to that date and laid before the annual general meeting next following. Accordingly, the statement and balance-sheet to be presented this evening only covers the nine months comprised between January 1 and September 30 last. The accountants have considered it desirable to make some further slight modifications in the form of these accounts, but they are framed substantially on the same basis as those adopted last July. It will be seen that the receipts exceed the expenditure during this period of nine months by the amount of £887. 19s. 6d., and this is without debiting the receipts with anything on account of outstanding subscriptions (the estimated realisable amount of which on September 30 was £532), as had this been done, the accounts would have shown 12 months' income as against only nine months' expenditure, with the result that the balance then shown would have been misleading. When the next year's accounts are made up this difficulty, of course, will not arise. The sum of £801. 3s. has been invested during the year on account of general investment fund, and £75 on account of life compositions. As announced by the President at the ordinary general meeting of November 12, Sir D. Salomons found it necessary, in consequence of the many calls upon his time, to decline nomination this year for re-election as hon. treasurer. The Council greatly regret that such should be the case, as although under the revised articles of association Sir D. Salomons could no longer have remained a vice-president, they had hoped by his re-election as hon. treasurer to continue to have the benefit of his advice, which has hitherto proved of so much value.

Amendments in the Articles of Association.—With a desire to meet as far as was desirable in the general interests of the Institution various suggestions which had reached them, your Council appointed a special committee to consider in what direction the articles of association might be amended with advantage, the result being that a series of amendments were submitted by the Council to a general meeting of members only on June 15 last, and adopted by a unanimous resolution, which was duly confirmed, and thus made a "special resolution" under the Companies' Acts on July 6. The Council earnestly trust that these amendments will work satisfactorily, and will tend to strengthen that feeling of confidence which should subsist between the general body of members and their elected representatives.

The Library: Secretary's Report.—I beg to report that the accessions to the library during the year number 53; of these five were purchased, the remainder having been kindly presented either by the authors or publishers. The specifications of all electrical patents continue to be supplied to the Institution by the kindness of H.M. Commissioners of Patents. The number of patents applied for this year up to November 25 was 26 425, of which 1,314, or 4·97 per cent., were electric. The corresponding numbers last year were 22,422 and 1,367, or 6·09 per cent. The periodicals or printed *Proceedings* of other societies received regularly are, with some few additions, the same as last year. The number of visitors to the library to the end of November has been 654, of whom 67 were non-members. The corresponding numbers last year were 743 and 116 respectively. F. H. WEBB, Secretary.

Digitized by Google

The **Chairman** formally moved the adoption of the report, and **Sir Henry Mance** seconded it. An informal discussion then followed on a multitude of subjects.

Mr. Fairfax put a question as to where the new articles of association were obtainable, and the **Secretary** said they were circulated at the time of the change (last summer), and subsequently were printed in the *Journal* of July and August.

Mr. A. A. Campbell Swinton suggested that at the annual conversazione there should be scientific instruments exhibited and experiments shown. To do that would be only taking a leaf out of the proceedings of the Royal Society. At present there were three attractions at their conversazione—the ladies, the refreshments, and the music. What he proposed was something more scientific, as not everyone was able to attend the conversazione of the Royal Society.

A suggestion was also made by **Mr. Groves** that the sessional year, as well as the financial year, should begin on September 30.

Mr. Erskine thought the conversazione might be held in a better place, where they would have more room and better air.

Mr. E. W. Parsons said that the Queen's Hall would be a suitable place.

Mr. C. B. Clay suggested that the Council should specially invite papers from gentlemen who were exceptionally qualified to give them on any particular subjects.

Mr. C. Bright suggested the Imperial Institute as a good place for the conversazione. There were a great number of vacant rooms there.

Major Flood Page, in reference to the Wiring Rules Committee, asked whether the fuses and other articles to be sent in to the committee by the makers would be unmarked and not identifiable as the work of any particular firm. If that was not so, he thought he could say some makers would find themselves unable to co-operate in the matter. They might not care to submit to a scientific opinion on what was really a commercial product.

The **Chairman** said Mr. Crompton, as chairman of the committee in question, would reply.

Mr. R. E. B. Crompton said the committee went on the principle that the manufacturers knew their own business better than anyone else. They had to keep in mind the requirements of the higher voltage now permitted by the Board of Trade, and in the revised rules which would be shortly issued certain figures relating to lengths and other dimensions would have to be inserted. The committee could insert suitable figures from their own knowledge, but they considered it would be presumptuous to do so without getting at what was the latest practice in the matter. The idea was that the manufacturer should send in what he made, and the articles should be roughly tested to see that they fulfilled their purpose, and then what were found the minimum distances filled into their rules. The articles when done with would be returned. The object was to make the rules as little oppressive as possible. There was no doubt that in that way the committee would obtain very valuable results, and ultimately embody them in a report; but before the name of any maker was published his permission would be obtained. The immediate object of the committee was to issue the regulations as soon as possible.

Major Flood Page said that there would be strong objection to something like a trade advertisement coming from a scientific committee. He again suggested that the samples should have no makers' names on them.

Mr. Crompton said it was the wish of the committee to fall in with the general desire on the matter, but on some articles it would be difficult to obliterate the names or marks, when, for example, they were of porcelain.

Mr. R. S. Erskine urged that the new regulations were wanted by the supply companies as speedily as possible. Consulting engineers did not know at present what to specify nor contractors what they must look to provide. It was mainly a matter of length of breaks and that sort of thing, and hardly touched matters really material to the rival interests of the trade.

Mr J. S. Raworth congratulated the Council on the manner in which they had met the wishes of some of the members of the Institution—wishes perhaps which had not been expressed at the time so well and clearly as could have been wished. Although there was only a small attendance that evening, he thought that the experiment of having no paper on the evening of the annual general meeting had proved a success.

The **Chairman** said that with regard to the annual soirée the exhibition of scientific instruments and experiments would be obviously impossible unless they held their soirée in a new place. In his previous presidency, in the endeavour to find a better place, it had come to pass that the soirée had to be put off until the autumn instead of being held in the summer. That had made him naturally reluctant to attempt an innovation of this kind during his present presidency. To alter the time at which the new council is elected to the time the sessional meetings begin would necessitate an alteration of the articles of association. The question of obtaining special papers from specially qualified men had been already under the consideration of the Editing Committee, and would be still further considered by them. In reference to the alterations made in the articles of association and the constitution and election of the Council, it had really been their desire not only that the Institution should be worked in the best way, but that it should be worked in the way desired by its members.

The resolution for the report was then put and carried unanimously, and a second resolution for the accounts having been formally proposed by the **Chairman**,

Major Flood Page seconded the resolution, and called attention to the fact that the *Journal* cost £599, so that when the postage was added it appeared that 30 per cent. of their annual subscriptions went for the cost of the *Journal* [postage of the *Journal* and notices of meetings was £239]. In an institution to which he belonged—the United Services—with more than double the number of members that the Electrical Engineers had, the result of a circular sent round was to show that a large number of the members did not care to receive the *Journal*. In that case there was no other means of getting the papers which were read, but they (the Electrical Engineers) got them at once in the columns of the technical Press. He thought if a similar circular were sent out by the Institution it might result in the saving of £100 or £200 a year of the money now spent in printing copies of the *Journal*.

The **Chairman** said that Major Flood Page's suggestion should receive the consideration of the Finance Committee.

The resolution for the accounts was then put and carried unanimously.

Prof. Silvanus Thompson then moved a vote of thanks to the Institution of Civil Engineers for giving them the benefit of holding their meetings in that building. The Civil Engineers not only gave them their large and commodious rooms, but also supplied them free with the electric energy for lighting and with the services of their attendants. In fact, he believed the Institution of Electrical Engineers was at the cost of nothing except the refreshments supplied after the meetings, so that their debt to the Civil Engineers was a very practical one. He would like to embody in the vote of thanks a clause congratulating the Civil Engineers "upon the splendour and magnificence of their new building."

Mr. Sydney Morse seconded this, and the vote of thanks, with the addition of the congratulatory clause, was then carried.

Mr. Frank Bailey moved a vote of thanks to the foreign honorary treasurers and secretaries.

Mr. Dane Sinclair seconded this.

Major Flood Page, as germane to the subject, suggested the desirability of endeavouring to encourage the formation of affiliated institution in the Colonies, specially mentioning the Australian Colonies and the Cape of Good Hope. They might start with quite a small number of members at first, but in this way their Institution would become the parent and chief of a network of institutions and be a rallying point for the profession throughout the whole of the British Empire.

Mr. E. Manville also suggested that it would be advantageous to members of the Institution practising abroad, and particularly in Argentina and other South American States, if a certificate or diploma of membership were given. In the more out-of-the-way parts of the world a mere exhibition of the list of members was not always accepted as sufficient evidence as to a man's professional standing in the way that a certificate would be. In Argentina the Government were proposing to introduce a rigid examination which would have to be passed by those wishing to practise as electrical engineers. Immunity would, however, be given to members of Institution of Electrical Engineers.

The resolution was then put and carried.

Mr. R. E. B. Crompton rose to move a vote of regret at the retirement through ill-health of Mr. John Aylmer, the local secretary and honorary treasurer of the Institution in France. Mr. Crompton added an expression of the personal regret with which he received the news of Mr. Aylmer's ill-health, and spoke in very high terms of the courtesy and kindness he had displayed to the members, and the attention he had always given to the interests of the society.

Mr. Edmunds seconded this, and, like Mr. Crompton, referred to the work done by Mr. Aylmer on the occasion of the Paris exhibitions.

The **Secretary** (Mr. Webb) said that he might add a few words, as the services rendered by a local secretary came more prominently before him than they could do before the members of the Institution. No local secretary could be more ready to do anything for the Institution than Mr. Aylmer, and he might add that even quite recently—he might say at the last moment—Mr. Aylmer, in spite of his ill-health, had taken special trouble to enable him (the secretary) to obtain numbers of a journal that he had been unable to secure through any other means.

The resolution was then carried.

The **Chairman** moved that the best thanks of the Institution be given to Sir David Salomons for his past services on the occasion of his retirement from the office of honorary treasurer.

Mr. C. Bright seconded this, and the resolution was carried.

Sir Henry Mance proposed, and **Mr. Raworth** seconded, a vote of thanks to the honorary auditors (Messrs. Danvers and Stroh), and **Mr. Sinclair** moved, and **Mr. Raworth** seconded, a similar vote to the honorary solicitors.

Mr. Raworth proposed a vote of thanks to the President (Dr. Hopkinson), specially mentioning the trouble he had taken in reference to the alteration of the articles of association.

Mr. Page seconded this, and congratulated the Council on the ballot list they had prepared. He was pleased to see the two new members of Council from Manchester present that evening, and looked forward to a large increase in the number of members of the Institution and a third time of presidency for Dr. Hopkinson.

The **Chairman** briefly acknowledged this, and the proceedings ended.

The next meeting is on January 14, when the new president (Sir Henry Mance) will deliver the presidential address.

Ashton.—The Town Council have decided to erect 60 arc lamps in certain streets. Mr. Clirehugh's report recommended the erection of 150 lamps. The draft agreement between the Corporation and the British Electric Traction (Pioneer) Company relative to the supply of power to the tramway company has been submitted to the solicitor to the tramway company for approval.

Digitized by Google

THE BRISTOL TRAMWAYS.

The following is the report of Mr. H. F. Parshall on the above subject, together with opinions by Dr. John Hopkinson and Lord Kelvin :

Gentlemen,—I have considered the report of Mr. W. H. Preece to the town clerk of Bristol on the subject of electric traction on tramways. It would be difficult to make an intelligible answer to Mr. Preece's report by taking it up from point to point. However, the fundamental ideas of the report can be sub-divided so that an answer can be easily followed.

I take it that what Mr. Preece has attempted to demonstrate is that (1) the electrical trolley system is the most efficient and useful system ; (2) that the supply of electricity from the Lighting Committee's plant at Bristol can be done more cheaply than by the tramway's company with such plant as they may construct. The first point may be inferred from Mr. Preece's report. On the second, however, there can be no misunderstanding as to Mr. Preece's recommendation.

The points that I would bring to your attention with respect to the first proposition—that is, with respect to the fitness of the trolley system for Bristol—are as follows : that both in Europe and the United States it is an accepted fact that the trolley system is simplest, most economical, and, if well constructed, is not æsthetically objectionable in streets ; that in case of such narrow streets as Lawrence-hill and West-street, which have been successfully operated by the trolley system for more than a year, the trolley system has not been found objectionable, nor has any necessity for a conduit suggested itself, and I know of no other streets in Bristol which it is proposed to equip that are so congested and generally unfavourable.

With regard to the examples of conduit system instanced in Mr. Preece's report, that of Budapest is exceptional, and for reasons of which you are well aware, open to such objections as render the system unsuitable to this country. The one at Blackpool is too small to be of any assistance in judging what may or may not be found useful in Bristol. As to Chicago, Mr. Preece is under a misapprehension, as there is no conduit system, and the trolley has been sanctioned to supersede the cable system. In Washington the conduit system is in use, but the conditions at Washington differ widely from those at Bristol, and the system in general has been installed for a short time only. It remains to be demonstrated whether or not it will stand the conditions brought to bear upon it by an American winter or by such conditions of moisture and street traffic as obtain in Bristol. In New York the conduit system is not considered sufficiently practicable to admit of any further extension. The engineers who installed the first line have advised their directors that a further extension of the present system is not warranted by the facts gleaned from the operation of the present conduit system. It seems hardly necessary for me to say that I quite concur with the opinion and conclusion of Mr. Preece that the conduit system is not economically practical in Bristol, and that we must consider things as they are.

Taking it therefore as an accepted fact that the trolley system is the one best adapted for the operation of tramways, the remaining point to be considered is whether or not the electricity for such a system can be more economically supplied from a lighting station such as now exists at Bristol or from a station specially designed to meet your requirements and specially managed by your own staff. I shall first consider the experience gained in the United States, where both electric lighting and electric traction have been carried on to a very large extent, and where both have reached a high state of perfection. Amongst the most representative cities are Boston, Chicago, and Washington, in which both electric lighting and electric traction may be said to have attained alike prominence and perfection. If you were to ask a manager of either the traction company or the lighting company in these cities whether or not he considered there would be any advantage in consolidating the electric supply for the lighting and tramways systems, you would receive a direct answer that there would be no possible advantage and that there would probably be some disadvantages. These men, having had large experience and observation, have seen that the nature of supply is absolutely different. In the case of electric lighting, the supply of energy from moment to moment is practically constant, and the desired condition is constant pressure, so that the lamps may be kept at a uniform light. In the case of electric traction, the supply of electricity from moment to moment varies greatly. Take your own St. George's station as an example. The power output at one moment amounts to not more than one-fifth the output of the working machinery. A moment afterwards the whole capacity of the working machinery is utilised. To properly supply electricity for a traction system, it requires machinery of much the same nature as that required in a rolling-mill, in which the load is either all on or all off and from moment to moment. In the cities above referred to the lighting and traction generating plants are entirely separate and distinct, as indeed in all other cities in the United States with which I am acquainted ; and, as you know, my experience in the States has been very general, inasmuch as much of the machinery in use there has been built from my designs. It is agreed by all authorities there that owing to the different conditions of supply there would be no economy, and probably a direct disadvantage, in supplying both systems from the same plant.

The next statement by Mr. Preece that I desire to bring to your attention is that the reduction of the total cost per unit as the output increases is well shown in the case of Manchester. I admit that this is true in the case of Manchester. The fact remains, however, that all the electricity is supplied for the same purpose, but if the electricity were supplied for two such widely different purposes as electric traction and electric lighting, the opposite would probably be found to be the case. If the same machinery were used for both purposes, either the tramway or the lighting would suffer. It is a recognised fact that incandescent lamps cannot be made to burn steadily in a system where the loads rapidly fluctuate, as in a tramway system. Taking up specifically the cases mention by Mr. Preece where both electric lighting and electric traction plants are supplied from the same station, we will consider that of Hamburg. The machinery was specially designed with reference to a combined lighting and tramways system, and was primarily designed to suit the requirements of tramway system, the lighting system being considered of minor importance. The only advantage gained is that the machines can be interchanged in case of failure ; in case one of the tramway machines fails, a certain amount of lighting apparatus can be utilised. None of the machines are, however, used for both purposes at the same time. You will see that such an arrangement as this offers no precedent for Bristol, since the lighting machinery now installed could not in any case be used in place of the machines required for the electric traction work. The two plants would have to be separate and distinct, as is admitted by Mr. Preece. In each plant there would have to be the same margin for over-loads, short circuits, and emergencies ; since in the case of emergencies neither plant could be utilised to assist the other. Even in the case of the Hamburg arrangement it has not been demonstrated that there is any increased economy resulting from the supply of electrical energy for both lighting and traction purposes from under the same roof ; and, as illustrating the feeling of the tramway company with reference to the use of a plant not controlled by themselves, I may refer to the company's last annual report stating that "we could have transported even more people if the Hamburg electricity works would have kept pace with us in their progress." I would further point out that the differences that exist between England and Germany in the price of labour make comparisons of cost altogether misleading. The average wage of a motorman in such a system as that at Hamburg is about 18s. per week, whereas your motormen on the St. George line receive 30s. a week, and, as you know, the item of labour in connection with tramway work is the principal one to be considered. With respect to the cases of Dresden, Geneva, Havre, and Rome, I have already furnished you with information which you have published, showing their total inapplicability to Bristol. An additional feature which occurs to me with regard to Rome is that the storage batteries for bridging over the interval in the evening, although only for 12 cars, involve a weight of lead amounting to 100 tons, and such an arrangement for Bristol would necessitate the provision by the Lighting Committee of 1,500 tons of lead in batteries !

It cannot be too strongly impressed that there does not exist at the present time such an installation as Mr. Preece suggests as practicable for Bristol. His load diagrams seems to show that the maximum loads overlap, though as to this uniformly occurring I cannot agree with him, since the maximum load of the tramway company may or may not occur at the time suggested by Mr. Preece. The maximum loads occur on certain days—that is, holidays and Saturdays—and not at certain hours of any particular day. The two maximum loads may, however, occasionally happen at the same time. In tramway experience it has been found most economical to provide for these maxima by a proper margin in the generating machinery, and storage batteries in large systems are not considered economical or practicable. In some lighting installations in Germany, storage batteries have been found practicable and economical for lighting purposes. If, as Mr. Preece suggests, the modern accumulator eliminates the possibility of a breakdown or renders one independent of the machinery at a breakdown, why have these not been installed at Bristol so that in case of a breakdown of the alternators these accumulators could take up the load ? In the system as now installed, this provision has not been made, having regard either to economy or emergency, and for the very reason that the installation at Bristol is not supplied with such machinery as permits of economical storage nor of the supply of energy for an electric tramways system. I would point out to you that a system of storage in connection with the present lighting machinery would be both inefficient and expensive. Synchronous motors of the same capacity and cost as the alternators now used, as well as dynamos of approximately the same cost, would be required in connection with storage batteries. The efficiency of such a system would then be only about 70 per cent., as against 100 per cent. when the electricity is delivered direct to the consumer's circuits, as you are proposing to do in connection with your tramway work.

There are other points to which I would draw your attention. First, with respect to Mr. Preece's load diagrams. The amount of power he proposes is altogether insufficient for the number of cars upon which he bases his calculations. Mr. Preece states your car stock at 100 ; as a fact it is 125. He estimates it will be increased to 150, which I accept in my estimates of power required. Mr. Preece proceeds to state the daily average run per car at 70 miles, whereas from your own experience at St. George you know that not less than 100 miles is the regular practice. Again, for some inexplicable reason, Mr. Preece takes 300 days per annum, instead of the 365 known to tramway managers, the result being that his mileage for one car amounts to 21,000 per annum as against 36,500, which is the fact—an error on Mr. Preece's part of no less than 75 per cent., which multiplied over the 150 cars gives a similar mistake in the quantity of electricity to be consumed, so that instead of the 3,150,000 units per annum of Mr. Preece, you would require 5,475,000 units, even assuming for the moment that one unit per car mile would be adequate, having regard to the difficult gradients

Digitized by Google

in Bristol. You will appreciate the magnitude of this miscalculation when I remind you that the error represents four times the total quantity generated last year by the Bristol Corporation electricity department. Equally so with reference to the generating plant estimated by Mr. Preece as sufficient for the tramway purposes, you are aware that I have already advised you that it would be necessary to instal plant of approximately twice that capacity. Further, Mr. Preece himself, while recommending a distinct electrical plant, claims that the staff would be common. Considering, however, the differences in the machinery and the different conditions of supply, a separate staff would be required for each branch. I have already pointed out the inefficiency of any storage system as applicable to the Bristol alternators, and it follows, therefore, that there would also require to be provided a full complement of engines, boilers, etc., for each business. Where, then, with duplicate machinery, duplicate staff and absolute lack of interchangeability can there result any economy?

I do not agree with Mr. Preece's statement that three (or perhaps four) central stations would be found necessary in Bristol, inasmuch as one central station properly situated will be entirely sufficient for your purposes. With regard to Mr. Preece's criticism of the location of your St. George station, I may point out that the district served is an outlying one, and the station is favourably placed to enable you to comply with the requirements of the Board of Trade restricting the drop in the earth return to seven volts. The location of that station is also advantageous in view of your contemplated operation of the Old Market and Staple Hill line from that source.

Considering finally Mr. Preece's closing statement, he has not demonstrated that the cost of production per unit will be reduced by the arrangement proposed by the Lighting Committee. Considering the wide differences in the nature of supply of electricity for an electric traction and an electric lighting system, the combination of two such systems of supply would divert the attention of the electric lighting engineers from their legitimate field and render the supply of electricity to both consumers uncertain or unsatisfactory, since a special knowledge and a special staff are required for the proper carrying out of either branch of the work. As your engineer, I should strongly advise you not to hazard the success of the entire business of your company by undertaking to extend the system of electric traction in Bristol, if accompanied by a condition that you are not to be permitted to generate your own supply of electricity.

(Signed) Horace Field Parshall, M.I.C.E., M.I.E.E.
December, 22, 1896.

Opinion of Dr. John Hopkinson, F.R.S.

Gentlemen,—I have carefully considered Mr. W. H. Preece's report to the Bristol Corporation Electric Lighting Committee and Mr. Parshall's report to the directors of the Bristol Tramways Company, and I fully concur in Mr. Parshall's recommendation—viz., that you should not extend electric traction in Bristol unless you are permitted to generate your own supply of electricity. In my capacity as an adviser to municipal corporations I have given the question at issue some study, and have no hesitation in advising that in the particular circumstances at Bristol the Corporation cannot possibly supply the current to the tramway company as cheaply as the tramway company can generate it for themselves. The tramway company would be ill advised in entering upon such a dual arrangement as that suggested by the Lighting Committee's adviser, for I am convinced that such an arrangement would result in serious disadvantage to both parties.

December 5, 1896. (Signed) J. Hopkinson.

Opinion of Lord Kelvin, D.C.L.

I have read Mr. Preece's report to the Lighting Committee of the Bristol Corporation and Mr. Parshall's reply to the Bristol Tramways and Carriage Company. I agree with Mr. Parshall that the present Bristol plant is altogether unsuited for the supply, or for economically contributing to the supply of the tramways system. The supply of an electric tramway system in conjunction with a lighting system could not in my opinion be realised with good economy under the conditions obtaining at Bristol. The tramway company having already had more than a year's practical experience in the use of electric traction on a part of their lines are well qualified to judge of their needs for the whole; and considering all the circumstances, I am strongly of opinion that the Corporation of Bristol cannot do better than leave the tramway company free to arrange its own plans for generating, supplying, and using electricity for its traction.

December 5, 1896. (Signed) Kelvin.

LEGAL INTELLIGENCE.

THE HOPKINSON PATENT.

In the petition by Dr. John Hopkinson, F.R.S., and the Westinghouse Electric Company for the prolongation of letters patent granted in July, 1882, in respect to a method for distributing electricity, it will be remembered that, after arguments were heard before the Long Vacation, their Lordships intimated that they declined to grant the prayer of the petition, but would reserve their reasons for their report to her Majesty. These reasons were given on Wednesday by Lord Hobhouse in a court constituted by Lords Hobhouse, MacNaghten, and Davey, and Sir Richard Couch. For the subjoined report of their Lordships' judgment we are indebted to the *Times*.

Lord Hobhouse, in now delivering their Lordships' reasons, said: The petitioners in this case are Dr. John Hopkinson, the inventor and patentee, and the Westinghouse Electric Company, who are assignees of the patent. Before the case was opened, the Attorney-General drew the attention of their Lordships to some statements in the petition which, as he contended, disclose a grave objection to the extension prayed for. It appears that in 1889 the petitioning company was formed for the purpose of acquiring the beneficial interest in the patent, which was then vested in an American company under an agreement with Hopkinson; that since July 20, 1889, the petitioning company have worked the invention for their own benefit; and that in 1891 Hopkinson formally declared himself to be a trustee for them. It further appears that prior to 1889 Hopkinson made the trifling profit of £350 from this patent and from one taken out by him in Germany, but that subsequently to the agreements by which the company acquired the beneficial interest he has received the sum of £19,400 as the price of the English and German patents. The only substantial petitioners, therefore, are the company. Hopkinson has no interest, but it is not alleged that the sum of nearly £20,000 is less than an adequate remuneration to him. The Company state that their expenditure in acquiring the patents and in defending them against encroachment has largely exceeded their receipts, and they contend that they stand in the position of persons who take up and assist inventors in developing useful inventions, and that this merit has been recognised as entitling assignees of patents to a prolongation of the term. To support this contention Mr. Moulton referred to the judgment of this Board delivered by Lord Brougham in the year 1843 in the case of Morgan's Patent (1 Webst. Pat., Ca., 737). Lord Brougham there points out that a patentee is benefited by the chance of a sale, and therefore in his interest consideration has been given to the claims of assignees. That shows the reason why assignees have been allowed to come for prolongation, and it shows no more. When they do come, all the circumstances, including the inventor's remuneration, must be considered. In the particular case cited prolongation was refused. The claims of assignees were the subject of consideration in the case of Claridge's Patent, which was decided in the year 1851 (7 Moo., P. C., 394). The judgment of the Board was delivered by Sir J. Jervis. He pointed out that assignees, though their right to petition was recognised, were not to be treated with the same indulgence as patentees. In that case Claridge, the inventor, had received ample satisfaction. The company, his assignees, had entered into a commercial speculation, and their loss was not a ground for prolongation of the patent. The same subject was discussed more fully in 1863 in Norton's Patent (1 Moo., N. S., 339), when Lord Romilly delivered the judgment of this Board. He quotes the language of Lord Langdale in a previous petition by the Electric Telegraph Company. After saying that it would not be right to take into consideration the commercial affairs of the company, Lord Langdale continues thus: "They buy this patent right; they buy it for a commercial purpose, not at all with the view of encouraging the inventors or of rewarding the inventors, though when they are sinking their own capital in this particular mode they do incidentally give a profit to the inventors. It is not the same case as some cases which have arisen where the inventor, being himself struggling with difficulty for the want of capital, is obliged to obtain the assistance of persons who have capital, giving them a share of the profits, which may be done in a great variety of ways and under many different circumstances; but these parties, with a knowledge of the value of the invention and its capability of being reduced to practical use to any extent to which capital might be employed upon it, think fit to engage that capital in carrying on a trade by the use of this particular invention." Lord Romilly then adds (to this quotation from Lord Langdale): "The ground that the merits of the inventor ought to be properly rewarded in dealing with the merits of an invention which has proved useful and beneficial to the public does not exist in the case of an assignee, unless the assignee be a person who has assisted the patentee with funds to enable him to perfect and bring out his invention and thus enabled him to bring it into use, none of which grounds exist in the present case." The Act of 1883 has, by defining the word "patentee," confirmed the assignee's right to petition for prolongation, and it empowers her Majesty to grant it if this Board reports that "the patentee" has been inadequately remunerated. But their Lordships do not consider that by this definition the Legislature has placed assignees on the same favourable footing as inventors with regard to prolongation, or has altered the principles which guided this Board in the cases above cited. It cannot be seriously contended that an assignee, who may have purchased a patent at a late period of his life, can, if he has lost money, come here alleging that he is by statute a patentee who has been inadequately remunerated, and ask for a report to that effect. In the case of the Bower-Barff Patent (App. Ca., 1895, p. 657) the principles of the prior cases were applied by this Board. In that case, as in the case now before their Lordships, the original inventors had received substantial remuneration, and the assignees had suffered loss. In delivering the judgment of the Board, Lord Watson pointed out that the inventors had no practical interest in the question, and were in the same position as if they were dead, because they had no longer an interest to ask for a prolongation on their own account, seeing that they had been sufficiently remunerated at the expense of the public. Their Lordships consider that they would be departing both from authority and from sound principle if they were to hold that this company occupies the position of an inventor who has been inadequately remunerated. The company entered on a purely commercial speculation,

Digitized by Google

which unluckily for them has up to the present time proved unremunerative. They did not assist to perfect or bring out the invention. They purchased it, or at least the beneficial interest, out and out, from a prior assignee of the inventor, who has in one way or another been well paid, and has now no claim or interest to ask for an extension. It is therefore impossible for their Lordships to make such a report as under Section 25 of the Act is the necessary condition of extension. The petitioners must pay the costs. There are as many as seven sets of opponents, and there ought not to be in this case more than one set of costs allowed. The matter stood over to give the parties an opportunity of agreeing as to an amount. It was intimated that in case of non-agreement their Lordships would themselves name a sum, as has sometimes been done. As no agreement has been come to, the sum they name is £400.

CLAIM FOR ELECTRIC LIGHT FITTING .

In the Westminster County Court on December 15, before his Honour Judge Lumley Smith, Q.C., the case of Harper *v.* Haynes was heard.

The plaintiff in this case is a dealer in electrical appliances, carrying on business at Westminster, and he sued the defendant, an electrical engineer, to recover payment of an account in respect of fittings supplied to the value of £15.

The **Defendant** appeared and denied his liability, on the ground that the goods were ordered by and supplied to his brother, who was at the time in business for himself.

His **Honour** said it was a very strange story, and he should adjourn the case for the attendance of the brother.

ACTION AGAINST THE BRISTOL TRAMWAYS COMPANY.

At the Bristol County Court, on December 15, his Honour Judge Austin dealt with the action brought by James Cox, a carpenter, of Croydon-street, Easton-road, against the Bristol Tramways and Carriage Company, Limited, to recover £40 for personal damages. Mr. J. Cochrane represented the plaintiff. and Mr. F. E Weatherly (instructed by Messrs Stanley, Wasbrough, and Doggett) appeared for the defendants.

Plaintiff when alighting from a car was thrown to the ground and dislocated his shoulder.

His **Honour** said he believed that plaintiff got off the car when it was in motion. That was one of the most careless things a man could do. There were no grounds for action, so judgment would be given for defendants, with costs.

BRIGHTON AND OVERHEAD WIRES.

At the Brighton Police Court on December 11, the Stipendiary (Mr. C. G. Heathcote), acting as arbitrator, gave a further hearing to the case between the Brighton Corporation and the Postmaster-General with regard to the dispute about the erection of poles in Ditchling-road for the support of the overhead wires of a trunk line of telephone communication between London and Brighton.

The **Stipendiary,** after hearing the evidence, reserved his award, saying the time allowed was anything not exceeding three months, but he hoped to give it much before that.

DAMAGES FOR FALSE IMPRISONMENT.

In the City of London Court, on December 14, Mr. Commissioner Kerr disposed of two cases in which Thomas Britton, Pemberton-terrace, Holloway, and Edward Magill, King-street, Lambeth, sued the National Telephone Company, Limited, for £50 damages each for false imprisonment and malicious prosecution. Mr. W. M. Thompson appeared for the plaintiffs, and Mr. Stephenson for the defendants.

Mr. Thompson said that Britton had been 19 years in the service of the defendant company as a telegraph wire worker. He and Maghill had to adjust some wires and lay new ones. While they were at work in July last on the top of premises in the Strand they were given into custody for stealing old wire to the value of £5. 10s. After two hearings Sir John Bridge at Bow-street Police Court discharged both men. Neither had been able to get work in the same line since, and Britton was now compelled to take labourer's employment to keep his wife and children from starving. By those proceedings the men wanted publicly to clear their characters, which was much more important to them than any money payment which might be given them.

For the defendant company, evidence was given to show that a felony had been committed, and that the defendants had reasonable and probable cause for giving the plaintiffs into custody. They were seen handling the wire, which disappeared and could not be found.

Mr. Commissioner Kerr said there was neither reasonable nor probable cause for the defendants giving the plaintiffs into custody. All the evidence which had been given was consistent with the innocence of both men. The defendants had been a great deal too hasty. He asked if the defendant company would reinstate both men and pay them their wages from the time of the false imprisonment.

Mr. Stephenson said he had no instructions.

Mr. Commissioner Kerr said then he would find for the plaintiffs and give them the full sum claimed, £50 in each case, with costs.

THE "ELECTRICAL APPRENTICES" CASE.

At the Thames Police Court on Thursday, December 11, Samuel Fynn, 40, an electrician, again appeared on remand charged with obtaining various sums of money by false pretences. Mr. Frayling conducted the case on behalf of the Public Prosecutor, and Mr. G. H. Young defended. The particulars of the allegations have already been published. Evidence was now called as to the prisoner's financial position during the time he was taking apprentices.

Mr. Charles Tijon, high bailiff of Bow County Court, proved that 25 executions and arrests for debt had been issued against the accused since 1892; four bills of sale for £30 each had been executed since 1893 on his plant and furniture, and during the past five years the parish authorities had to distrain for rates about twice each year.

The prisoner was committed for trial, bail being allowed.

COMPANIES' MEETINGS AND REPORTS.

CROMPTON AND CO., LIMITED.

An extraordinary general meeting of this Company was held on Monday at the Cannon street Hotel, E.C., Mr. J. Trotter presiding. The purpose of the meeting was to pass a resolution authorising the directors to increase the borrowing powers of the Company from £100,000 to £150,000 on such security and upon such terms as to interest or otherwise as they might deem fit.

The **Chairman** moved the resolution, and remarked that at their meeting in the summer he stated to the shareholders that they were extremely active at the works. The Board, however, had no idea at that time that there would be such a remarkable increase in the business in the past six months as that which had actually occurred. At the date of the last accounts they were paying under £500 a week in wages at Chelmsford, whereas they were now paying over £750 a week. The conditions under which they were working were also about as unfavourable as they could be, for they had not yet gone into their new works. Nevertheless, the private account they had taken out for the six months had shown a very satisfactory profit, which the directors regarded as unusually gratifying in view of the conditions under which they were working, which were anything but economical. They were also expecting, and were practically assured of, a considerable further increase of work under satisfactory contracts which they were just about to enter into. In these circumstances they were obliged to provide extra capital. The stock during the past six months had increased by £9,500, all of which, practically, was not an increase of stock lying in their warehouses, but work in progress throughout the shops; and their good book debts had increased by £15,000. The borrowing powers they required would certainly be less than £50,000, but they had thought it right to ask for the increased power with the view of possibly taking the large contracts they saw before them. He could not, of course, say whether the present season of activity in the electrical world would or would not continue, but at the present time there was a very large amount of business coming to them. If this activity did not continue they would not require to retain the additional money now asked for for any very long period, but he hoped it would continue, and that their business would go on increasing, as that would mean a dividend for the shareholders. They could not, however, expect to be really prosperous before they got into their new works, but they hoped to be in them some time next spring. Their policy had been one of concentration at Chelmsford, and he was glad to be able to inform them that they had quite recently disposed of the Lillie-road premises; such of the work done there as they cared to retain would be taken to Chelmsford.

Mr. R. E. B. Crompton seconded the resolution, saying that they had been at great pains to design new works at Chelmsford of the latest and most economical type, and hoped to get into them by the middle of the spring—in April or May. He could corroborate all that the chairman had said respecting the increased activity at Chelmsford. They had orders which they hoped would fully occupy them for some time to come, and at prices much better than they obtained in the lean years through which they had been passing. He himself, as they knew, was probably one of the greatest sufferers by the non-payment of dividends in the past, and therefore he need scarcely tell them that he personally would strain every nerve to bring about a better state of things in that respect.

Mr. Thornton enquired whether the money to be borrowed would rank before the preference shareholders, or whether new share were to be issued ?

Mr. Evans said they had been told of increased activity and better prospects for several years now, but he had never had a dividend since he had bought his shares. Could the chairman say definitely that next year they would pay a dividend upon the preference shares ? Also he would like to know the rate of interest at which the money would be borrowed.

The **Chairman** said that the money borrowed would rank before the preference shares and after the debentures. Facilities had been offered them at a reasonable rate of interest for obtaining the additional money required. He still thought that there ought to be a writing down of certain of their assets, and he proposed within a reasonable time to bring forward a scheme for dealing with their shares on an equitable basis. He expected that they would realise a very considerable profit on the year, but whether they would be justified in using that for payment of a dividend

Digitized by Google

was a different matter, for he did not think it would be right to carry forward items in the accounts which they believed to be over-estimated. The scheme which he intended to bring forward was to deal with this and to allow of dividends being paid.

The resolution was then carried unanimously, and the meeting ended.

BRITISH ELECTRIC TRACTION COMPANY.

The statutory meeting of the British Electric Traction Company, Limited, was held at Winchester House, E.C., on Monday, and was followed by an extraordinary general meeting to approve agreements. Sir Charles Rivers Wilson presided.

The **Chairman** said the Company was registered on October 26 last, and the statutory meeting had to be held, under the Companies' Acts, within four months of the formation of the Company. He believed it was usual to allow rather a longer interval to elapse than the directors had done on the present occasion, but it was necessary to hold an extraordinary meeting, and they had thought it would be more convenient to hold the two meetings on the same occasion. Subscriptions were invited from the public to the capital of the new company, which was formed to take over the business of the Pioneer Company. They proceeded to allotment on £200,000, this being the proportion of capital required to enable them to apply for an official quotation. The shares were taken up by the shareholders of the Pioneer Company and by the Electric and General Investment Company and the latter's financial friends, who had great confidence in the future of electric traction and in the success of the Company. They lost no time in proceeding to work on the lines of policy indicated to them at the meeting on the 5th ult., and as set out in the prospectus It was so very recently that he had the honour of addressing the shareholders and explaining what their policy was, and it was so recently that the present company had absolutely come into active existence, that he need not recapitulate the various engagements entered into or the various schemes intended. He would only just mention one scheme which was very far advanced; that was the contract made with the North Staffordshire Tramways Company for adapting their lines with electrical appliances—he referred to the arrangement with the Brush Company, who, under a contract with the company, would apply electrical apparatus to the North Staffordshire tramways. Other schemes to which he alluded would be taken in their order, or according as the urgency of the case might require. He would take the opportunity of correcting a little misunderstanding which appeared to exist in the minds of certain persons, and which had entailed various enquiries on the part of shareholders. It was that there was some connection between their Company and its objects and the objects of the new motorcar companies. There was no connection whatever between them. The present Company's means of communication was by means of rails and flanged wheels, and the whole thing was altogether different in its essence and its objects from the motorcar movement. Of the new schemes they were promoting, the principal one was that for amalgamating several important tramway undertakings in South Staffordshire. They proposed to deal with four companies, and they intended to ask Parliament for powers for an amalgamation, an extension, etc. They were promoting a Bill in the ensuing session under the title of the Birmingham, Wolverhampton, and District Tramways, with the object of amalgamating various existing lines and equipping them for electrical working. The Bill also provided for making physical junctions between the existing tramways and uniform gauge throughout, and powers were also taken for several considerable extensions. The Wolverhampton Company worked by means of horses, and the Dudley and Wolverhampton Company and the Dudley and Stourbridge Company worked with steam, as did also the South Staffordshire Company. Negotiations had been pending for some time with these three companies for purchasing their undertakings and in one case a definite contract had been concluded, while the negotiations with regard to the others were more or less advanced. It was just possible that they might not be able to arrive at satisfactory terms with one or two of these companies, in which case, much as they would regret it, they would be dropped from the scheme, and the others would be proceeded with. They had, however, a strong expectation and hoped that they would be able to induce all of the companies in question to come into one general scheme. They could not go forward with this important proposal except with the concurrence of the local authorities concerned and with the approval of the Board of Trade and Parliament; and although they hoped to obtain the various consents required, the shareholders must not be surprised if it proved impossible to remove all the difficulties in the way during one parliamentary session. In certain cases they had found that there were distinct advantages in applying the principles and provisions of the Light Railways Act, which was passed last August, to their undertaking, and they proposed immediately to apply this Act to obtaining light railway orders for tramways and extensions of other lines over which at present they had control at Crewe, the Potteries, and Hartlepool. He need not trouble them with respect to Hartlepool, as it was proposed to apply for an order in this case in the name of a local company. With regard to the other companies, they proposed to go to the Light Railway Commissioners and obtain their recommendation to the Board of Trade, who, they hoped, would thereupon issue the orders. As regarded Crewe, there were no tramways of any kind at present in that very important centre, and a resolution had been passed by the Town Council in favour of the establishment of electrical tramways, and in favour of the Pioneer Company carrying out the work. They considered themselves practically the same concern as the Pioneer Company. As regarded the Potteries district, the order they were promoting for tramways was under an arrangement with the local authorities, by which they had bound themselves to make further extensions of tramways in this district. They had a contract with the North Staffordshire Company for the electrical equipment of eight miles of tramways. In the last session of Parliament a provisional order was obtained for extending these tramways over a total length of about 12 miles. The present order was for further extensions in various directions—13 miles in all—so as to connect Longton, Stoke, Hanley, Burslem, Tunstall, and Newcastle-under-Lyme by one system of electrical tramways, making a total network of 33 miles of these tramways in North Staffordshire. At Norwich they were promoting a light railway order for tramways within the city, with extensions to Thorpe, Eaton, Cossey, and other places in the immediate vicinity. Norwich had a population of over 100,000, and was the largest city in the United Kingdom without tramways of any description, and they therefore felt that it afforded scope for introducing electrical tramways. The scheme there would embrace about 13 miles of line. These were the three schemes for which they proposed to apply to the Commissioners to recommend orders. If there was any shareholder who wished to be informed of anything in greater detail, he would be happy to afford all the information in his power.

One question only was asked relating to the system to be adopted, and, in reply to it, the **Chairman** said the system which commended itself to the Board was the overhead trolley system, and it was upon that they had proceeded in every case up to the present. It was entirely a question for the municipality or corporation whether overhead wires should be erected.

This concluded the statutory meeting, and the extraordinary meeting which followed was merely formal, the subject having been already dealt with in the chairman's speech. The **Chairman** moved, and **Sir Charles Freemantle** seconded, the following resolutions: "That the proposed Crewe Light Railway Order, a draft of which has been submitted to the meeting and has been initialled by the chairman for the purpose of identification, be, and the same is hereby, approved, subject to all such additions, alterations, and variations as the Light Railway Commissioners or the Board of Trade may think fit to make therein." "That the Norwich and District Light Railway Order, a draft of which has been submitted to the meeting and has been initialled by the chairman for the purpose of identification, be, and the same is hereby, approved, subject to all such additions, alterations, and variations as the Light Railway Commissioners or the Board of Trade may think fit to make therein." "That the proposed Potteries Light Railway Order, a draft of which has been submitted to the meeting and has been initialled by the chairman for the purpose of identification, be, and the same is hereby, approved, subject to all such additions, alterations, and variations as the Light Railway Commissioners or the Board of Trade may think fit to make therein."

Each of these resolutions having been put separately and carried unanimously, the proceedings terminated. A confirmatory meeting will be required in the usual course.

ELMORE'S PATENT COPPER DEPOSITING COMPANY.

The ordinary general meeting was held on Saturday, December 12, at the Cannon-street Hotel, under the presidency of Mr. A. S. Elmore, managing director.

The **Chairman**, in moving the adoption of the report and accounts, said that the directors had to congratulate the shareholders upon the fact that the Company continued to show a satisfactory improvement over the results of former years. Their business had continued to prosper, notwithstanding the keen competition to which they had been subjected and the drawback of not having sufficient working capital, which they alluded to specially in the third page of the report, in which they made the following appeal to the shareholders – viz.: "The directors earnestly ask the shareholders to thoroughly consider the Company's position. In the past, very sanguine anticipations were prematurely expressed — £70,000 was distributed in dividends which should have been husbanded for trading purposes, and about £70,000 was sunk in freehold land, involving a very heavy annual charge for interest The natural consequences were that the Company was denuded of working capital long before it could hope to overcome the initial difficulties common to every new enterprise, or to show the real merits and possibilities of the business. Only very small and most inadequate further sums of capital could be raised with the utmost difficulty and on exceedingly onerous terms; hence the business has never yet had a fair chance, although, thanks to the devotion of some of the Company's servants, a moderate success has been shown sufficient to convince every observer that the Elmore process produces an altogether unequalled finished article at a very low cost. Having to deal with a very costly form of raw material at £40 to £50 a ton, as contrasted with an iron foundry, where the raw material is perhaps only one-twentieth the cost of copper, a large capital is necessary for stocks in trade, and to allow the usual trade credit to customers; thus our competitors' accounts show their stocks to be many times the amount of ours, exclusive of very large cash and debtor balances. The shareholders cannot fail to see that without sufficient funds in hand the works cannot by any possibility produce large results, and all that the present directors—who share no responsibility for the mistakes made in the earlier years - could possibly hope to accomplish has been accomplished—namely, to show that a profit can be made even under the most unfavourable conditions, and thereby enable the shareholders to appreciate the real merits of the business and its potential success." The result of these operations was that

Digitized by Google

they showed in the manufacturing account a gross profit of £6,895. The Company had never had so many contracts and orders in hand as at the present time. In conclusion, the Chairman alluded to the fact that the directors were contemplating the amalgamation of this Company with the Elmore's Wire Company, the two companies being carried on as one, but the rights of the shareholders in each being scrupulously regarded. The scheme was not ripe at present, but the directors would carry it out and submit it to the shareholders at the earliest possible date.

The report was adopted.

VENEZUELA TELEPHONE COMPANY.

The annual general meeting of the Venezuela Telephone and Electrical Appliances Company, Limited, was held on Thursday, December 10, at 28, Victoria-street, S.W., Sir Douglas Fox presiding.

The **Chairman** stated that the shareholders had every reason to be satisfied with the way in which the business had been conducted in Venezuela, and with its gradual and steady growth. The net revenue of the Company during the past year amounted to £9,334, which enabled the Board, after payment of debenture interest, to recommend the declaration of a dividend of 4 per cent. for the year on the capital of the Company, and to place £2,500 to the reserve fund. The number of subscribers had increased from 2,287 on June 30, 1895, to 2,524 on June 30, 1896, since which date there had been a further increase of about 100 subscribers.

CONTRACTS FOR ELECTRICAL SUPPLIES

CONTRACTS OPEN.

Paris.—Tenders will be received on 30th inst. at the Assistance Publique, Paris, Avenue Victoria 3, for a telephone and electric bell installation.

Denton.—Specifications and tenders are invited for an electric light installation. Apply to Messrs. John Lever and Co., galloon manufacturers, Denton.

Brussels.—Tenders will be received on December 24 at the Brussels Bourse for the supply of wooden telegraph poles for the Belgian telegraph service.

Elberfeld.—Among other miscellaneous stores, tenders will be received at Elberfeld on December 30 for the supply of electric light carbons for the Prussian State Railway.

Saint-Yvon (France).—Tenders will be wanted on January 31 for an electric lighting installation (to replace 1,500 gas lights) at the lunatic asylum at Saint-Yvon, in the Seine Inferieure. Application to the asylum authorities.

Salford.—The Corporation require tenders for the supply of one mile of high-tension armoured cable. Tenders to be delivered not later than 22nd inst. Full particulars to be obtained of the Gas Engineer, Gas Offices, Bloom-street, Salford.

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s.) from the Generaldirektion, (Centralbureau) Grossh. Badischen Staatseisenbahnen, Karlsruhe, Germany.

Harrogate.—The Town Council are prepared to receive tenders for wiring the Municipal Offices, Victoria Baths, Market Hall, and Public Library; also for electrical fittings for the same. Specifications and forms of tender can be obtained at the office of the Electrical Engineer, Montpellier-gardens. Tenders must be delivered on or before January 1, 1897.

Hull.—The Corporation invite tenders for a lease of the tramways authorised to be constructed by the Tramways Orders Confirmation (No. 1) Act, 1896. Tenders to be delivered by February 1, endorsed "Tramway Tender," at the office of Mr. R. Hill Dawe, town clerk, Town Hall, Hull, from whom all particulars and conditions of tender may be obtained.

Colwyn Bay.—The Urban District Council invite plans, particulars, and estimates, etc., for a scheme of electric lighting for their district, the powers for which they obtained last session. To the author of the scheme considered the best a premium of £30 will be paid, and in the event of the work being carried out such premium must be considered as part payment of the engineer's commission. To the author of the scheme considered second best a premium of £20 will be paid. Further information will be received on personal application to Mr. Wm. Jones, A.M.I C.E., the Council's surveyor. The schemes must be sent in not later than January 12, 1897. Further particulars are contained in an advertisement in another part of the paper.

RESULTS OF TENDERS.

Chelmsford.—The contract for the wiring, switches, etc., in connection with the lighting arrangements at Messrs. Crompton and Co.'s new works has been given to Messrs. T. H. P. Dennis and Son.

Londonderry.—The tender of Messrs. Braulik, of London, for the supply of carbons for the year from January 1, 1897 has been recommended for acceptance by the Lighting Committee of the Corporation.

Berlin.—Ten firms tendered for the supply of telegraph posts to the Prussian State Railways on December 10. This gives over 80 prices for different sizes, and these again differ according to place of delivery. The head of the list is Schneider, of Guben, but the firm to whom the contract will go is not stated.

Cardiff.—The lighting of the new General Post Office here has been placed in the hands of Messrs. J. B. Saunders and Co., of Cardiff. Thirty-four arc lamps and nearly 600 incandescents will be employed.

Posen.—For the supply of telegraph posts to the State Railways on December 5, 11 firms tendered. The first on the list is Von Wilzewsky (Wronke) at prices ranging from the equivalents of 3s. 11½d. to 1s. 4d. according to size.

Ayr.—The Town Council have placed the contracts for boilers, engines, and generators with Messrs. Siemens Bros. and Co., the price being £7,037, and for transformers, switches, etc., with Messrs. John Fowler and Co., Leeds, the price being £645. 15s.

Morley.—The Electric Lighting Committee, after visiting Halifax and Manchester, and inspecting the engines of Messrs. Pollit and Wigzell and Messrs. Goodfellow, recommended that the tender of the Electric Construction Company, providing Messrs. Pollet and Wigzell's engines, be adopted. This has been confirmed by the Council.

BUSINESS NOTES.

Ipswich.—The Town Council have agreed to apply to the Board of Trade for an electricity provisional order.

Edinburgh.—The Corporation contemplate the rearrangement of and additions to the electric lighting of the market.

Maidenhead.—The Town Council have resolved to apply for a provisional order for lighting the town with electricity.

Kenilworth.—It is understood that the National Telephone Company contemplate opening an exchange here next year.

Swaffham (Norfolk).—The Guardians have resolved to fix an electric bell between the receiving ward and infirmary buildings.

St. Pancras.—The London County Council have agreed to lend the Vestry £6,540 for an electric light installation at Stanhope-street.

Dundee.—The tramway company propose to introduce a motorcar service experimentally on several routes in the city and suburbs.

Chester.—A further sum of £6,000 has been placed to the credit of the Electric Lighting Committee to pay towards the cost of the electric lighting of the city.

Leith.—At a special meeting of the Town Council a resolution was passed approving of the draft provisional order for the Board of Trade on electric lighting.

Withington.—The seal of the District Council has been affixed to the memorial to the Board of Trade for powers to provide the district with electric light, etc.

Bootle.—The Mayor stated at the Town Council meeting that the report of the deputation on electric lighting would in due time be presented to the Council.

Smoking Concert.—The staff of the London Electric Lighting Company held a smoking concert on Tuesday night at the Masons' Hall Tavern, Basinghall-street.

Pemberton.—Some correspondence on the question of electric light was read at the District Council meeting, and the further consideration of the subject was deferred for a month.

Burton.—The Town Council are applying to the Local Government Board for power to borrow £1,000 for alterations at the institute and for lighting that building with electricity.

Islington.—The Electric Lighting Committee recommend the Vestry at to-night's meeting to erect an arc lamp and transformer in St. John's-park, at a total estimated cost of £79. 14s. 6d.

Kensington.—The Vestry have discussed the question of the new Piccadilly and Brompton electric railway, and eventually referred the subject to the Law and Parliamentary Committee.

St. Saviour's, S.E.—The St. Saviour's Board of Works have instructed the General Purposes Committee "to enquire as to the feasibility of substituting electricity for gas as a street illuminant."

Ealing.—The Electric Lighting Committee have instructed the electrical engineer to enquire into the report upon the system adopted elsewhere of supplying electric light on the "penny-in-the-slot" principle.

Brush Electrical Engineering Company.—The transfer-books of the 4½ per cent. second debenture stock will, in view of interest payable on January 1, be closed from to-day (Friday) to that date, both days inclusive.

Huddersfield.—The Town Council have resolved to promote a Bill in the next session of Parliament to enable the Corporation to "run carriages on the tramways to be worked by steam electric, or mechanical power."

Fleetwood.—The Urban District Council have approved the amended deed of transfer of the Fleetwood Electric Lighting Order, 1890, to the Fleetwood and District Electric Light and Power Syndicate, Limited.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended December 13 amounted to £1,098, as compared with £1 081 in the corresponding week of the previous year, being an increase of £17.

City of London Electric Lighting Company.—The transfer-books and register of holders of 5 per cent. debenture stock will be closed on 31st inst. for the purpose of preparing the warrants for the interest due January 1.

Digitized by Google

Whitehaven.—The Town Council have declined the offer of the Electrical Power Storage Company, Limited, with reference to the future maintenance of the storage battery, and the work is to be done by the Corporation workmen.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended December 11 were £1,876. 17s. 3d., compared with £1 710 11s. for the corresponding period of last year, being an increase of £166. 6s. 3d.

Electric Manufacturing Company, Limited.—This Company has been registered, with a capital of £3,000 in £1 shares, to carry on the business of merchants importers, exporters, and manufacturers of all kinds of goods, chattels, and merchandise.

Correction.—We are informed that Mr. W. H. Coles, who was one of the candidates for the Shoreditch electrical engineership, and who we stated had in hand a station at Pontypool, had nothing to do with that station, the engineer to which is Mr. P. J. S. Tiddeman.

Buluwayo.—At the meeting of the Buluwayo Waterworks Company, Limited, the Chairman stated that they hoped to have the electric lighting machinery fixed by February or March. The plant, which has been obtained from New York, provides for 4,000 16-c.p. lamps.

Henstead.—The Highways Committee of the Rural District Council have dissented from the proposal of the electric tramway company to take over certain roads in their district, and have resolved that a letter to this effect be sent to the Light Railways Commissioners.

Electric Railways and Churches.—The City Church Preservation Society purposes taking prompt action with a view to preventing the threatened destruction of St. Mildred, Bread-street, in connection with the scheme for the construction of the new electric railway.

Swadlincote.—It was stated at the District Council meeting, with regard to the application for an electric lighting order, that the committee had instructed Prof. Robinson to confine the compulsory area to the streets included in the estimate of cost as contained in his report.

Leeds.—The Highways Committee have passed a resolution recommending the City Council to authorise the committee to proceed with the extension of the tramways up York-road to a point near the entrance to Victoria-avenue, by virtue of the Leeds Corporation Tramways Act, 1896.

Bolton.—The Town Council have approved of a petition for leave to bring in a Bill in the next session of Parliament for extensive improvements, including powers for running tramway cars by electricity, and also for extending the tramways. The ratepayers have approved of the Bill.

City and South London Railway.—The returns for the week ended December 13 were £1,075, compared with £1,014 for the corresponding period of last year, being an increase of £61. The total receipts for the half-year 1896 were £23,022, compared with £21,541 last year, being an increase of £1,481.

Madagascar.—Applications have been received by the French Government from six Parisian syndicates for railway concessions between Tamatave and Antananarivo, one of the proposals being for an electric line. It has been decided that the concessions shall under no circumstances be given to foreigners.

City and South London Railway.—Work has not yet been commenced beneath the church of St. Mary Woolnoth, but expert opinion has been taken upon the possibility of making the station without endangering the church, and it is stated that, from an engineering point of view, the project is quite feasible.

Electric and General Investment Company, Limited.—The directors have declared an interim dividend on the capital paid up on the ordinary shares at the rate of 10 per cent. per annum for the six months ended November 30, which is payable on and after January 1 to shareholders registered on the former date.

Westralian Motor Carrying Company, Limited.—This Company has been registered, with a capital of £7 in £1 shares, to carry on the business of carriers, transport agents, coach and carriage builders, cycle, motor, carriage, and autocar manufacturers, dealers and repairers, engineers, machinists, etc.

Agency Change.—Messrs. J. P. Hall and Co., of Oldham, inform us that Messrs. Girdlestone and Co. have ceased to act for them as London agents; they will therefore feel obliged if their customers will forward all enquiries and orders direct to them at Oldham until such times as they are able to make other arrangements.

Yarmouth.—The Surveyor reported at the Town Council meeting that additional applications for electric light had been received for 282 lamps, the total number of customers now being 195 for 9,729 lamps. Last month £213. 2s. 2d. was earned beyond cost of production; the cost of capital and sundry charges amount to £150 a month.

Bournemouth.—The Bournemouth and District Electric Supply Company, Limited, appealed before the Branksome magistrates on Monday against the assessment of their property in the parish of Branksome. The result was a reduction of the net assessment from £1,900 to £465. 18s., which is as it stood in 1895. Notice of appeal was given.

Carlisle.—As a considerable portion of the period prescribed by the Electric Lighting Order, 1895, for the laying of distributing mains in certain streets has elapsed, the Council have authorised the General Purposes Committee to call in a consulting electrical engineer to advise as to the best means of carrying into effect the powers conferred by that order.

Battersea.—The Vestry have decided that ground should at once be secured for a central electric light station, and that the Vestry should purchase of Mr. G. Neal Grove Wharf and Canada Wharf for the sum of £8,500, and land and premises in the Lombard-road of Mr. Audoire for the sum of £5,400.

Plymouth.—The Borough Surveyor reported at the Town Council meeting that the electrical engineer had obtained the electric cables to be laid in Old Town-street and Ebrington-street, and that he proposed to lay them forthwith, and he pointed out the desirability of completing the footways in these streets simultaneously with the execution of the electrical works.

Electric Gun Mechanism.—The preliminary firing trials of the new designs of mountings for the 12in. breechloading wire guns to be fitted on board the battleships "Cæsar" and "Illustrious" have proved in every way satisfactory. The special features of these gun mountings are the ease and rapidity with which they can be operated by hydraulic, electric, or hand power.

A Brilliant Notion.—The following interesting paragraph has been manufactured by one of the London news agencies and circulated widely among the London and provincial Press: "It is said that the lighting of certain of the London prisons by electricity is under consideration, and it is proposed to erect a special description of tread-wheel to supply the motive power."

Southport.—At the meeting of the Town Council Councillor Hesford proposed the adoption of the minutes of the Electricity Committee, omitting the clause as to the insurance of the works and plant. In consequence of the insurance companies having increased their rate from 5s. to 10s., the committee wished to consider the matter further. The minutes were adopted.

Bangor.—According to the minutes of the Lighting Committee which were adopted at the Town Council meeting, it appeared that the Mayor was elected chairman for the ensuing year. With regard to the electric light provisional order, letters were received from the town clerk andthe parliamentary agent on the subject of the bill of costs. The Council were recommended to pay the bill.

Dublin.—Mr. Beattie stated at the meeting of the Corporation that he was endeavouring to collect all the information that would be required to enable the Council to deal with the tramway question. He had purposely delayed calling a meeting until the law agent had supplied him with the information he required, and which he hoped to have completed about the first week in January.

Blackpool.—A commencement has been made with the laying of the new cable, and the new flywheel alternator by Ferranti is being erected and is expected to be running about the end of January. Mr. Quin, the borough electrical engineer, attended a meeting of the Tradesmen's Association recently, and explained in detail the new system of charges which will come into operation on January 1.

Glasgow.—The cars on the new subway railway are lighted by electricity. The Corporation have decided to have the electric light switched on in the principal thoroughfares and crossings during fogs. The Statute Labour Committee have agreed to receive a deputation of the National Telephone Company in order that the question of underground wayleave for the telephones of the city might be discussed.

Silverdale (Lancs.).—A letter was read at the Urban District Council meeting from the Board of Trade enclosing a communication from the Windermere and District Electricity Supply Company, in which the company expressed their willingness to exclude Ulverston and Grange from their scheme if these places desired it. The letter was referred to the General Purposes Committee for further consideration.

Acetylene Gas Lighting Development Syndicate, Limited.—This Company has been registered, with a capital of £1,200 in £10 shares, to acquire, develop, and turn to account any patents relating to the manufacture of chemicals used in the production of acetylene gas and carburetted hydrogen, and to acquire the benefit of an agreement with V. B. Lewes and the Comptoir International, Limited.

Woking.—The Sanitary and Lighting Committee reported at the Urban District Council meeting that they had received a letter from the electric lighting company stating that they would endeavour to improve the lighting of the streets. The committee directed the company to be informed that the lights supplied were not in accordance with their contract, and that they be called upon to supply lights according to contract.

City of London.—At the meeting of the Commissioners of Sewers the Streets Committee recommended that the City of London Electric Lighting Company should be required to provide a means of testing the supply of energy to the public lamps, by which the Commission would be enabled to ascertain whether the said lamps were supplied for the full time and at the full rate of energy defined in the contracts. The report was adopted.

Sedgley.—At the District Council meeting a letter was read from Mr. F. F. Bennett, of Manchester, offering his services in case the Council proposed to introduce electricity in the district. The letter was laid on the table. It was reported that the syndicate had laid before the Council plans of the new tramway from the Fighting Cocks to Bilston. It was decided to arrange a conference on the subject with Coseley District Council.

Electric Omnibuses.—It is reported that the truck of one of the new electric omnibuses made a trial trip in the early hours of Wednesday morning, about nine miles of the London streets being traversed. According to a News Agency, who appear to have been the only representative of the Press favoured with the information, the trial was very satisfactory, but we fail to see the necessity for so much secrecy if the machine is really a good one.

Digitized by Google

Bromley.—The committee of the whole Council reported at the District Council meeting that they had considered further correspondence from Messrs. Waterer and Dickins and from Mr. H. Podger on the subject of the transfer of the electric lighting provisional order to a syndicate of ratepayers, and had adjourned the subject for further consideration, the clerk and surveyor being instructed meanwhile to obtain information bearing on the matter.

Llandudno.—A special meeting of the Urban District Council has been held to consider the parliamentary notice, plans, etc., deposited with the clerk to the Council with reference to a light railway proposed to be constructed by the Llandudno and Colwyn Bay Light Railway Syndicate from Colwyn Bay to Llandudno. It is intended that the motive power shall be electricity, the gauge to be 3ft. 6in. The Council by seven votes to six rejected the scheme so far as Llandudno was concerned.

Bucharest.—Some time ago the municipal authorities of the city of Bucharest advertised for schemes and estimates of a system of artificial lighting to replace petroleum, but under conditions which made it almost impossible for electric lighting or gas to compete on any of the existing systems of distribution. The authorities have now advertised for tenders for petroleum lighting for one year, with ability to renew. The inference, therefore, is that the former scheme is at present in abeyance.

Projected Scottish-Icelandic Cable.—A Reuter's telegram states that the establishment of a telegraph cable between Scotland and Iceland *viâ* the Shetland and Faröe Islands, is contemplated by an English telegraph company acting in connection with influential Icelanders. Mr. Mitchell, a barrister, and Mr. Thordall, an Icelandic merchant of London, representing the company, and Mr. Haldorsson, a merchant of Iceland, have arrived at Copenhagen in order to enter into negotiations with the Danish Government concerning the scheme.

Lewisham.—At the meeting of the District Board of Works the Clerk reported the deposit at the Board's offices by the Blackheath and Greenwich District Electric Light Company, Limited, of notice of their intended application to the Board of Trade for a provisional order under the Electric Lighting Acts to empower the company to supply electricity in part of the parish of Lewisham, and giving notice that any representation or objection respecting the application must be addressed to the Board of Trade on or before January 15.

Isle of Man.—In view of the fact that the Imperial Parliament has passed a Bill authorising the use upon certain roads of motor-cars, there has been introduced into the Manx Legislature, at the instance of Mr. James Mylchreest, who represents Castletown in the House of Keys, a Bill to legalise the use of light locomotives, not to exceed in weight four tons, and so constructed that no smoke or visible vapour is emitted therefrom. Fourteen miles is fixed as the maximum speed of travel along public highways. It is provided that yearly duties shall be charged.

Grange.—At the Urban District Council meeting a letter was read from the Board of Trade enclosing a communication from the Windermere and District Electricity Supply Company, in which the company expressed their willingness to exclude Ulverston and Grange from their scheme if these places desired it. Councillor Midgley considered that it might possibly be detrimental to the interests of Grange to be left out of the scheme, and therefore he proposed that the letter be referred to the General Purposes Committee for further consideration. This was agreed to.

Market Deeping—At the Town Council meeting the Mayor read the report of Mr. A. Collins, electrical engineer, of London, on the possibility of lighting the dock by electricity. He presented a scheme, and estimated the cost of providing the necessary plant at £1,294. 4s., and stated that the annual cost of maintenance would amount to £152. 10s. He quoted statistics that the gas consumed at the dock cost £176. 6s 6d. per year, and that the candle-power was 364, and added that under his scheme the candle-power would be 9,660. The scheme was unanimously adopted.

Brighton.—The borough engineer (Mr. F. J. C. May) has in hand temporary works for the protection of the Madeira-road, which, of course, also includes the protection of Mr. Volk's electric railway. The Works Committee have recommended for adoption the scheme prepared by Mr. May for the erection of a groyne and sea-wall at a cost of about £30,000, and if this is carried out, it is probable that Mr. Volk will be able to come to some agreement with the Corporation which will practically ensure the absolute protection of the railway from serious damage by the sea.

Prizes for Motorcars.—The detailed regulations for the trials of self-moving vehicles for light and heavy loads, for which the Royal Agricultural Society have announced their intention to offer prizes, have been issued. The competition will be in two classes—(*a*) for light-load vehicles which would take the place of light spring carts for carrying loads up to two tons; and (*b*) for heavy-load vehicles capable of carrying four tons. Two prizes of £100 and £50 will be offered in each class. The trials will take place early in June next, and will include a run, out and back, over a distance of 50 miles.

Belfast.—The Electric Committee have authorised the engineer to notice consumers that the pressure at which electric current will be supplied to them will be uniformly 220 volts in place of 110 and 220 as heretofore, and that fittings will have to be provided to suit the pressure in future. A large twin-screw steamer has just been launched from the shipbuilding yard of Messrs. Workman, Clark, and Co., Limited, which will be fitted throughout with an installation of electric light by Messrs. W. C. Martin and Co., Glasgow, including Suez Canal searchlight, sidelights, and powerful cargo lamps at all hatchways for night work.

Prince Motor Syndicate, Limited.—This Company has been registered, with a capital of £50,000 in £1 shares, to carry on, in all or any of their respective branches, the businesses of manufacturers of and dealers in motors of every description, cycles, carts, ships, flying-machines, etc.; as electricians, mechanical engineers, etc.; to obtain licenses under the Hackney Carriage Act and otherwise, and to carry on in all its branches the business of omnibus, carriage, and launch proprietors and carriers of passengers and goods; and to construct, purchase, lease, or otherwise acquire any rail or tram way, and to equip, maintain, and work the same.

Coventry.—At a meeting of the General Works Committee of the City Council the question of the proposed extension of the electric tramways through the city from Chapple Fields on the west to Stoke on the east came up for consideration. The laying of the trams through the narrow and crowded thoroughfares of Smithford-street, High-street, and Earl-street was strongly objected to, but in the end it was arranged that the Corporation should not object to the tramways company taking the powers they asked for, provided a clause be inserted in their Bill that the tramways shall not be laid through the thoroughfares named without the consent of the Council.

Lambeth.—At the meeting of the Vestry the Clerk (Mr. H. J. Smith), in a special report with regard to the electric lighting order, stated that the Board of Trade had intimated that they would not sanction the transfer of the Lambeth electric lighting order to a private individual, but would require a company to undertake a transfer. It has been arranged by the holders of the order that this should be done by a company known as the South London Electrical Supply Corporation, Limited. This company, which had been registered with a capital of £325,000, would not go to the public for subscription, the Board having sanctioned £200,000 being underwritten.

Lee.—The General Purposes Committee reported at the meeting of the Board of Works that they had considered a notice from the Blackheath and Greenwich District Electric Light Company of an application for a provisional order authorising the company to provide electric lighting for certain parts of Charlton, Eltham, Kidbrook, Lee, etc. They recommended that the company should be informed that the Board could not at present consent to the proposed provisional order, and wished to know whether the company would be prepared to extend the area to the whole, or what larger part of the district. The recommendation was agreed to without discussion.

Hove (Brighton).—The Hove Electric Lighting Company, Limited, have given notice that on and after January 1 next an important reduction will be made in the charge for current by reducing the time per day for the charge at 8d. per unit to one hour in lieu of two hours as at present. The effect of the new arrangement will be that after the consumer has used sufficient electrical energy to supply the maximum number of lights switched on at any one time for one hour per day, all energy consumed by him subsequently will be at the rate of 4d. per unit. The charge on and after the above date for electrical energy for motive power will be at the rate of 3d. per Board of Trade unit.

Ayr.—The extension of the electric light has been again considered at the Town Council. Mr. Craig alleged that the present plant had failed to work in parallel, and that the test for this essential had not been applied by the engineer, Mr. Hammond. The Treasurer said that was entirely a mistake. Mr. Hammond had made a statement which he took for an assurance that the parallel test had been successfully applied. Mr. Pink, the Corporation electrical engineer, said the test had never been applied in a manner satisfactory to him. He had endeavoured to apply it himself unsuccessfully. It was, after some further discussion, agreed to proceed with the extension of the plant, doubling the producing power.

Stafford.—Alderman W. H. Peach mentioned at the Town Council meeting that the assessment of the electric lighting works, plant, etc., had been increased from £250 to £380. That the amount was not larger was due to the efforts of Mr. Bell, the manager. The Electric Lighting Extension Syndicate, Limited, had applied for special terms for the supply of electricity by means of penny-in-the-slot meters, but the committee did not think that the Corporation should accede to the request. The department were supplying twice as much electricity as they were last year, and it was the wish of the committee that the gas and the electric light undertakings should grow up side by side, the one not to supersede the other.

Oswestry.—A motion stood on the agenda of the last Council meeting in Councillor Davies's name in favour of the discontinuance of the electric light in the Cross Market. The Town Clerk said before Mr. Davies brought forward his motion it would, perhaps, save time if he read one of the clauses of the agreement with the electric lighting company, which provided that it was necessary for either side to give notice of their intention to discontinue the contracts. The proposition of Councillor Davies was therefore no good until next September, when he would be at liberty to move a resolution on the subject. Councillor Lacon said one of the electric lamps in the Cross Market went out of order on the previous Saturday night. The Chairman said that if only one lamp was out of order he was afraid it would occur again.

Newington.—At the meeting of the Vestry the Electric Lighting Committe recommended "(*a*) that the application to the Board of Trade by the County of London and Brush Provincial Electric Lighting Company, Limited, for a provisional order to enable the said company to supply electricity for both public and private purposes within the area of and under the jurisdiction of the Vestry be opposed: (*b*) that the memorial submitted be sealed and

Digitized by Google

forwarded to the Board of Trade, applying for a provisional order under Section 4 of the Electric Lighting Act, 1882, for the supply by the Vestry of electricity for lighting purposes, both public and private, within the area of the parish; and (c) that a cheque be drawn in favour of the Board of Trade for £50 and lodged with the memorial, as required by the rules of the Board." After an uproarious discussion, during which some strong language was used, the recommendations were agreed to.

A New Gold Recovery Process.—A company, called the Haycraft Gold Reduction and Mining Company, has been formed, with a capital of £200,000, to acquire the exclusive rights of the process for Western Australia, and to develop and work about 36 acres of gold-mining leases in Kalgoorlie, Western Australia. The company will also take over the plant and a leasehold battery station covering five acres in Kalgoorlie. The purchase-price to be paid to the vendor syndicate is £75,000, of which £55,000 will be paid in shares. The present issue consists of 95,000 shares of £1 each. The process consists of a combination of electrolytic chlorination and electro-amalgamation. These operations are carried on in one vessel at boiling temperature, the ore being treated as it is received from the crushing mill. After about two hours' treatment from 80 to 97 per cent. of the gold, it is claimed, is extracted, as against from 70 to 91 per cent. by other methods.

South London Electric Supply Corporation, Limited.—This Company has been registered, with a capital of £325,000 in £5 shares, to obtain by purchase the Lambeth Electric Lighting Order, 1892, and all or every interest therein of one Charles William Sax; to adopt and carry out three several contracts—viz., the first, made between Messrs. Manlove, Alliott, and Co., Limited, of the one part, and W. R. Jackson, for this Company, of the other part; the second, made between the British Insulated Wire Company, Limited, of the one part, and W. R Jackson of the other part; S. Z. de Ferranti, Limited, and the said W. R. Jackson—the said agreements bearing date December 3, 1896; to act as undertakers for the supply of electricity for lighting and other purposes within the parish of Lambeth, or elsewhere; to erect a destructor or destructors to deal with refuse; as manufacturers of and dealers in chemical substances, mortar and artificial stone, clinkers, and to distil coal or other fuel; to promote railways, tramways, auto-car companies, hydraulic works.

Cupar.—At a meeting of the County Road Board of the Fifeshire County Council the Chairman stated that the committee were asked to get the price of a telephone system extending to 101 miles, taking the district of Leven as far as Anstruther. They had got an offer to do the work for £1,900 from a London firm, and another firm had offered to do it for £2,000. A Glasgow firm had offered to execute the work for £1,955. Mr. James Pollock, electrical engineer of that firm, had called upon him on the previous night, and had offered to provide the best wire used and the best instruments at the above price, and to uphold them for six months after they were erected. He thought the cost would not exceed £2,000, and he recommended that the matter be remitted to the committee to carefully consider the estimates and bring up a report. Colonel Erskine suggested that the telephone be put into the hospitals, as it would be very useful in these. This was agreed to. The Chairman recommended that they ask the County Council to allow that Board to accept the lowest or best offer up to £2,000 for a private telephone system. This was also agreed to.

Exeter.—The Electric Lighting Committee report a continued increase in business, but the new transformer has prevented any additional strain on the works. A 24 hours' supply is now given. A memorial was read at the last meeting of the City Council from 220 ratepayers asking the Council to take into consideration the desirability of reducing the charge to 4d. per Board of Trade unit. It would greatly retard the growth of electric lighting in the city if the Corporation maintained the present maximum charge of 6d. per unit. Mr. Wreford moved that the memorial be referred to the Electric Lighting Committee. The resolution was carried, and another communication from Messrs. Massingham and Co., Taunton, was read, stating that should the Corporation accede to the request contained in the memorial they would be prepared to make arrangements for undertaking the free wiring and complete installation of the electric light wherever supplied from the Corporation mains, without any initial charge to the consumers, merely charging a rental sufficient to pay a fair rate of interest on the outlay. This communication was also referred to the Electric Lighting Committee.

Kingstown.—At the meeting of the Commissioners Mr. M'Cullagh said he had been a good deal agitated at the last monthly meeting in reference to the condition of the two men who had been injured on the electric tramline, and he had made some strong representations as to the rectification of the then existing condition of things. He was happy to say from his experience and close observation that he thought a great improvement had since been effected. The tramway officials were anxious to meet the requirements of the public, and there had been no cause of complaint or any accident of a serious character. It would be a great improvement if they could get the interlacing of the lines effected in the congested portion of George's-street. He regretted that anything he had said should have had the effect of causing the dismissal of a responsible official, and, under the circumstances, he would be happy to do all he could to have him reinstated in his position. The Chairman said he was aware that the tramway company were making the greatest possible efforts to devise a scheme which would be most easy for everybody. That scheme would probably be laid before them early in the new year. Mr. Buckley said the Board had no official information with respect to the proposed interlacing of the lines in George's-street. The subject then dropped.

Bray.—A letter was read at the meeting of the Commissioners from Mr. Lilley, hon. secretary, Bray Pier and Tramways Syndicate, in reply to a communication from the Commissioners informing the syndicate that a guarantee for the satisfactory carrying out of the schemes would be required. Mr. Lilley stated that, so far from taking exception to the suggestion, his syndicate desired to conform in every possible way, and asked what guarantee would be required. The Chairman suggested that the syndicate should lodge £5,000 as a guarantee for the pier and £5,000 for the tramway. The Town Clerk said that it had been suggested that the money was to be lodged in the names of trustees—one on behalf of the township and another on behalf of the syndicate. The sum to be invested in approved securities, and the full amount, with the interest earned on it, handed to the syndicate or company. The majority of the Commissioners considered the sum named by the chairman as too high, and ultimately it was decided that £5,000 should be lodged in the hands of trustees as a guarantee for the due carrying out of the two schemes; and the town clerk was directed to inform Mr. Lilley of the decision, and also that his syndicate should state what they were disposed to pay for way-leave for trams and rent for pier.

Catalogues.—We have received from Messrs. Mavor and Coulson, 47, King-street, Bridgeton Cross, Glasgow, a copy of their latest electric light and power catalogue. The book is well bound and, which is exceedingly convenient, it is thumb indexed. It contains illustrations of combined plant, dynamos, and motors, and also full prices in tabular form, a description of the "C. C." system of concentric wiring, and illustrations of switchboards, switches, fuse boxes, junctions, terminals, connections for arc lamps, and all kinds of fittings, etc. Instructions are also given for making "C. C." joints, and these instructions are fully illustrated with diagrams. The catalogue is worthy of careful attention, for the figures, illustrations, and reading matter are alike of a most useful character; but space does not permit of our entering into detail.—Messrs. Samuel Withers and Co., of Park Works, West Bromwich, send us an illustrated list of the fire and burglar resisting safes, iron doors, and frames, deed boxes patent lever locks, galvanised tanks, etc., of which they are the patentees and manufacturers. The testimonials alone are a sufficient recommendation of the great value of the security against fire and burglars which Messrs. Withers afford, but if additional recommendation is required references are given to nearly 40 banking and railway and other companies and corporations.

Sheffield.—The City Council have unanimously approved the Sheffield Corporation Street Widenings and Tramways Bill, which seeks powers to make tramway extensions. Mr. Marsh drew attention to a paragraph in the minutes which stated that the Mechanical Traction Syndicate, Limited, had made an offer to supply cable or electric traction for the existing tramways, and portions of the proposed extension, on a lease being granted to them for not less than 21 years at a rent of £30,000 per annum, and on other conditions. The committee stated in their reply to the syndicate that they were not prepared to recommend the Council to consider proposals "from any company." He suggested that that might be amended to read "from this company," so that the Council might have the opportunity of considering any further proposal, if one were made. Alderman Clegg, in reply, said it must not be assumed, because they desired to know whether cars could be adapted to electric cars, that they had resolved on any special form of traction. The fact was they were going to order new cars, to meet the extra demands of the traffic, and they thought it desirable to have cars which, in case they recommended electricity for motive power could be adapted for use. That was the only object contemplated in the recommendation. With reference to the offer of the Mechanical Traction Syndicate, the committee purposely disposed of it in a summary manner, because they wanted to let people know that now the Corporation had possession of the tramways they did not intend to let anybody else come in. Moreover, if the Council knew all the conditions which the proposal of the syndicate contained, they would come to the conclusion that the offer of £30,000 was not a very great thing after all.

Cardiff.—On the presentation at the Council meeting of the report of the Tramways Committee recommending the purchase of the lines and depôts of the Cardiff Tramways Company for £61,000 and that the lines be leased to the company for 15 years at 5½ per cent., with certain reservations, Councillor Robinson asked the town clerk when the whole of the lines of the Provincial Tramway Company could be acquired. The Town Clerk stated that there was no part of the lines which could not be acquired by the Corporation in three years' time, and that the 30 per cent., in addition to the then value of the lines, would only apply to small portions of the line. Accordingly, the whole matter was referred to the committee again. The Council having resolved not to consent to the Penarth Electric Tramways Syndicate's scheme, the company replied informing the Council that they thoroughly approved of the proposed tramways in Corporation-road, Clare-road, and Wood-street being constructed, and if necessary being maintained by the Council, the syndicate entering into an agreement for the use only of the same on terms to be mutually arranged. A discussion took place on the question, and the resolution refusing leave was referred back to the committee for further consideration. The Lighting Committee have requested the borough engineer to report on the probable cost of lighting all the lanes with electricity. Mr. Applebee (superintendent electrical engineer) reported that up to November 30 12,909-c.p. lamps were connected, compared with 7,732 at the same date in 1895, and no fewer than 1,200 lamps were now awaiting connection. During the past

Digitized by Google

month the total number of Board of Trade units developed was 49,888, and the estimated revenue was £690. 4s. 1½d. private supply, and £78 public arc lights.

PROVISIONAL PATENTS, 1896.

DECEMBER 5.

27776. Improvements in or connected with the obtainment of metals or alloys by electrolysis or hydro-electro-chemical action. Pascal Marino, 47, Lincoln's-inn fields, London.

27809. Improvements in electric safety fuses. Morton Blencowe Cotterell and Hubert Russell, 13, Lanier-road, Lewisham.

DECEMBER 7.

27812. An improved electric battery. Eduard Saarburger, 11, Southampton-buildings, Chancery-lane, London.

27877. Improvements in or relating to electricity meters. George Hookham, 18, Southampton-buildings, Chancery-lane, London.

27903. Improvements in electrical glow lamps. Paul Scharf, 28, Southampton-buildings, Chancery-lane, London.

DECEMBER 8.

27992. Improvements in and with reference to electrical cable couplings by means of an insulating and locking arrangement. Michael Culligan, 1, Belgrave-square, Rathmines, co. Dublin.

28017. Improvements in and relating to electric lamps for cycles and the like. Thomas Gidley Howden, 46, Lincoln's-inn fields, London.

28043. An improvement in secondary voltaic batteries. Edward Maurice Grant, 28, Southampton-buildings, Chancery-lane, London.

28061. An improved electric current or pressure regulating device. Richard Holsten, 6, Lord-street, Liverpool.

28062. An improved device for regulating the distance apart of freshly inserted carbons in arc lamps. Richard Holsten, 6, Lord-street, Liverpool.

28070. Improvements in electric cables particularly suitable for telephone circuits. Frederick Hawkins, 111, Hatton-garden, London.

28101. Improved means for lighting by electricity and incandescence. John Archibald Sinclair, 191, Fleet-street, London.

DECEMBER 9.

28158. Improvements in ammeters. Siemens Bros. and Co., Limited, and John Nabel, 28, Southampton-buildings, Chancery-lane, London.

28193. Improvements in the caps of incandescent electric lamps. Edgar Julius Sander and Arthur Clifford, 22, Southampton-buildings, Chancery-lane, London.

28196. Improvements relating to dynamo-electric machines with motors for driving the same. Arthur Fischer and Adolf Held, 18, Buckingham-street, Strand, London. (Complete specification.)

DECEMBER 10.

28249. Improvements in or relating to terminals and other similar parts of electric conductors or apparatus. John Henry Kerridge, 111, Hatton-garden, London.

28267. Improvements in apparatus for measuring electricity. Edward Howard Percy Humphreys, 55, Chancery-lane, London.

28288. Improvements in anodes for the electro-deposition of nickel. Thomas Richard Canning, 4, South-street, Finsbury, London.

DECEMBER 11.

28314. Improvements in electrical storage batteries and cells. Rankin Kennedy, 33 Gladstone-street, Bradford.

28315. Improvements in controlling gear for variable speeds for mechanically and electrically propelled vehicles. Rankin Kennedy, 33, Gladstone-street, Bradford.

28347. Improvements in ceiling roses for electrical purposes. William Paul Theerman, 12, Corporation-street, Manchester.

28355. Improvements in connecting flexible wires to terminals for sundry electrical purposes. William Henry Lane, "Perugia," Sidney road, Staines, Middlesex.

28367. Improvements in electric arc lamps. Emil Hungerbuhler and Alfred Slatter, 433, Strand, London.

28392. Improvements in the method of and means or apparatus for actuating gas-valves controlled by the aid of electrical energy. Frederick Richard Boardman, 55, Chancery-lane, London.

28400. Improvements in and relating to electric motors. William Phillips Thompson, 322, High Holborn, London. (Julien Dulait, Belgium.)

DECEMBER 12.

28434. Improvements in electric tramways and apparatus therefor. James Enright, 202, Holland-road, Kensington.

28442. Improvements in regulating transformers. Manchester Edison-Swan Company, Limited, Alfred Still, and Edward Woodrowe Cowan, Victoria-street, Manchester.

28443. Improvements in high-tension electric fusible cut-outs. Manchester Edison-Swan Company, Limited, Alfred Still, and Edward Woodrowe Cowan, Victoria-street, Manchester.

28488. Improvements in or relating to electric arc lamps. Thomas Spencer and Christian J. Toerring, jun., 111, Hatton garden, London. (Complete specification.)

28511. Improvements in the manufacture of electric accumulators or secondary batteries. Lorenz Lucas, 4, South-street, Finsbury, London.

SPECIFICATIONS PUBLISHED.

1895.

22150. Electric indicators for bells, telephones, alarms, and the like. Walton.

23111. Electric incandescent lamps. Joel and Fanta.

23462. Striking and regulating mechanism of arc lamps. Coteworth.

1896.

64a. Electric tramways. Krizik. (Date claimed under Patents Rule 19, January 1, 1896.)

868. Electric meters. Raab.

968. Electro-deposition of metals. Graham.

1457. Incandescence electric lamps. Stearn. (Topham.)

10429 Holders for electric glow lamps. Kenny.

14015 Electric heating devices. Dymond. (The Chemisch Elektrische Fabrik "Prometheus" Gesellschaft mit beschrankler Haftung.)

16404 Electrical signalling apparatus or bells. Jevons and Collins.

18786. System of control for electric motors. Lake. (Sperry.)

26981. Production, regulation, and utilisation of electric currents of high frequency and apparatus therefor. Lake. (Tesla.)

21293. Electrical door bolts. Page.

23291. Trolleys for overhead systems of electric traction. The British Thomson-Houston Company, Limited. (Bassett.)

23315. Electrical apparatus for controlling traffic on single lines of railway. O'Donnell. (Hopkins.)

NOTES.

Forthcoming Event.—Prof. Silvanus P. Thompson's first Christmas lecture at the Royal Institution, on Dec. 29, at 3 p.m.

Society of Arts.—Mr. C. T. Dent's lectures to children on "The Growth of Mountains" are fixed for the evenings of January 6 and 13.

Municipal Electrical Association.—This association will hold a meeting at the Westminster Palace Hotel, London, on Thursday, January 28, to consider the subject of "Fire Risks at Electricity Works." Mr. Pearson, of Bristol, will read a paper.

The Pacific Cable Conference.—The delegates to the Pacific Cable Conference have done something at last—they have done taking evidence. They have now to consider their report, but at present the meetings are adjourned for the Christmas holidays.

A Capillary Tube Phenomenon.—It would appear from a contribution of Mr. Schutt to *Wiedemann's Annalen* that if a current is forced to pass along the air at ordinary pressure contained in a very fine capillary tube, a very brilliant light is produced. The phenomenon seems to be explicable in more than one way, and it is significant that the inner surface of the tube is rapidly destroyed by the process.

Obituary.—We hear with regret of the death of Mr. William Moir, A.I.E.E., which took place on the 12th inst., after an illness of some months' duration. Mr. Moir was formerly of Callender's Cable Company, and latterly with Anderson and Munro, of Glasgow.—The death has also been announced of Mr. John Galloway, vice-chairman of Messrs. Galloway and Co., the engineers and boiler-makers, of Manchester.

Rontgen Rays and Blindness.—The loose talk, often ascribed to people who ought to know better, which has prevailed in America on the subject of overcoming blindness by the Röntgen rays has induced the superintendent of the School for the Blind at Philadelphia to test the matter with two blind students. Of course, the results were negative As usual, there is the exasperating neglect to mention which of the many forms of blindness were tried, but one would appear to be a case of cataract or some form of lenticular disease.

Magnetism and E.M.F.—As has been already noted, experiments have been made by Messrs. Lala and Fournier which, from the results communicated to the *Comptes Rendus*, would show that the E.M.F. of an iron-copper couple may be reduced in certain cases by a very considerable fraction of its total value if the couple is placed in a strong magnetic field. It would also appear from work by the same investigators that the E.M.F. of a copper-iron galvanic couple is reduced in a similar manner when the iron is strongly magnetised. The result is more than curious, as the effect ought to be very small.

Kromskop. — This is the name of the instrument embodying Mr. Ives's contribution to the problem of colour photography. It has no special concern for electricians, and it is simply introduced here to point a protest against the depths of ugliness and bad taste as to nomenclature into which so many designers of new apparatus permit themselves to fall. There really seems no possible excuse for adopting this illiterate variant of chromatoscope instead of the correct form. When we first saw the word we took it for South African Dutch, and puzzled our memories to know what it could mean.

Crystal Palace.—The certificates awarded by the examiners for the winter term examination to the students of the Crystal Palace Company's School of Practical Engineering were distributed on Friday by Mr. J. F. Flannery, M.P. Among those present were Mr. J. W. Wilson, principal of the school, and Mr. G. T. Rait, chairman of the Crystal Palace Company. Mr. W. T. Harbord was recommended for the medal of the School of Art, Science, and Literature, and certificates of honour were awarded to Mr. P. W. Tolhurst and Mr. N. W. Brushfield.

The Academie.—At the annual meeting at Paris, on Monday, of the French Academy of Sciences one of the two Arago medals was awarded to Lord Kelvin in honour of the recent jubilee of his professorship at Glasgow. Mr. Cornu, the president, spoke in glowing terms of the recent celebration at Glasgow. Mr. D. Abadie, the Abyssinian explorer, received the other Arago medal, and a prize was awarded to Prince Henry of Orleans for his explorations. Mr. Cornu, in an address on the Röntgen rays, dwelt on the "brilliant experiments" of Mr. Crookes 20 years ago, the lustre of which had been rekindled by the new researches of Lenard and Röntgen.

Condensers.—Mr. H. V. Carpenter, in connection with Mr. E. W. Poole, has been making an experimental study of the "soaking in" of a charge into solid dielectrics. Three condensers were used. In one the dielectric was mica, in the second paraffin, and the third had a very thin dielectric of a composition not ascertained. As published in the *Physical Review*, the results arrived at by the authors are that the "absorption" varies more rapidly than the thickness of the condenser and differs with different dielectrics. The curves and results obtained are interesting, but the data are hardly sufficient to warrant the setting out at greater length the conclusions arrived at upon the general question.

Scottish Engineers.—We have received the December number of the *Transactions* of the Institution of Engineers and Shipbuilders in Scotland. It contains the discussion on Mr. Morton's paper ("Steam") and Mr. Sinclair Couper's paper on "Internal Corrosion in Steam-Boilers." In reference to the former we could wish Mr. Stromeyer or Mr. Morton would not turn their T's and *t*'s topsy-turvy. Mr. Couper doubts the theory of the galvanic action of zinc used in marine boilers to prevent corrosion of the iron, although the zinc rapidly wastes away. His reason for doing so is that the pins or hangers supporting the zinc plate usually corrode at or near the point of contact. It is, however, rather a complicated matter.

New Cell.—The Sicard and Falle element consists of a zinc vase containing within it the positive, which is a cylinder of carbon containing a mixture of sulphate and zinc, potash alum, sulphuric acid, and bichromate of potassium. The cylinder is held in its place by being packed with sawdust, or some similar material, which fills the intervening space between the zinc and the carbon, and this is soaked with a solution of common salt. The E.M.F. is said to be over two volts. This seems high, but it should be said that the inventors do not claim for the cell anything more than that it is a convenient one for bells and that sort of thing. The inventors have also arranged the same combination in a rather better way on the lines of an ordinary cell.

Hertzian Waves in Water.—We have been favoured with the full text of Prof. D. Mazzotto's paper communicated to the Accademia dei Lincei on the subject of a redetermination of the index of refraction of water for electric waves. We hope as soon as time and space permit to give an abstract of the paper, but at present can

Digitized by Google

only briefly note that Prof. Mazzotto's final value of the index of refraction for about 9in. waves (26 centimetres) is 9·0. It has, of course, been known for some years that for waves of this length the refractive index of water was very great compared with the index for light waves, but whether it will be found that the matter has a practical significance when it is attempted to carry on wireless telegraphy through a heavy rainstorm remains to be seen.

Accumulator-Making.—It is suggested by *Electron* (Madrid) that of all electrical industries the making of accumulators is the one for which Spain is most suited. Apparently because there is lead in that country. But it seems that accumulator-making is no light work to undertake. "The industry in question requires for its working, not only material money capital, so to say, but also and even principally the intellectual capital derived from a profound knowledge of chemistry and its applications to electricity, and a conscientious study of the very varied applications of the electric fluid." After that it is satisfactory to learn from our contemporary that they have got at Manzanares a factory which makes an accumulator which is superior to all other storage batteries. Unfortunately, the particular construction of this cell is not given.

Tramway Signalling.—Mr. Adolph Garing, of Carlstadt, New Jersey, has invented and patented an apparatus designed to prevent head collisions on trolley and other tramways. The invention consists principally of an electromagnet at each end of a section and a signal-carrying circuit wire leading from each magnet to the other end of the section, to connect with a ground contact point adapted to be closed by the armature of the electromagnet at the end of the section, the current passing through the circuit wires containing the signals being controlled by a part carried by the car. The signal boxes are designed to have each a night signal in the shape of a red electric lamp and a day signal in the shape of targets having "safety" or "danger" positions. But no one wants any more wires to bury, contact arrangements to get out of order, or posts to erect in the streets.

The Polytechnic.—This is the season of prize distributions, and our readers would hardly thank us if we embarked on the task of giving even a short notice of them all. But a reference may be made to the distribution of the prizes to the engineering and architectural students at the parent of all polytechnics, the Regent-street building, on Tuesday by Mr. Alfred Waterhouse. Mr. Buckmaster mentioned the architectural defects of the Polytechnic, and Mr. Hibbert declared that Mr. Ruskin had compared an architect to an accumulator. (But then Mr. Ruskin did not know what in the world an accumulator was, and would not learn—should it not be a transformer.) Mr. Waterhouse, however, assented, so it is to be presumed that the architects do not mind. Then there was music and "living photographs," including the motorcart race from Paris to Marseilles.

Round and Round.—By way of saving expense, the plan has been tried on the electric railway and elsewhere of not issuing tickets to the lowest class. This does very well in England, but it appears that in North Britain it will not operate. The Glasgow subway railway on its opening tried to run without tickets, but on the opening day it was found the passengers would not leave the cars, and numbers travelled round and round for one penny, preventing others from getting in. The subway railway has been closed on account of an accident. When it reopens this week tickets are to be introduced. There are legends of countrymen and others going round and round on our own Inner Circle here in London, but even the railway official with the chance of "excessing" has never supposed anyone would do it on purpose. Our ideas of an enjoyable ride appear to differ from those which prevail in Glasgow.

The Birkbeck Institution. — Mr. Frederick E. Boughton, who was for upwards of 20 years intimately connected with the Birkbeck Institution, died about a month ago after a few days' illness. Mr. Boughton some years ago had contracted heavy liabilities, in part on behalf of others; but by great efforts and many sacrifices on his part these have been very considerably reduced, and in a few years longer the measures he was taking would have discharged them completely. But his death has cut short these efforts, and the provision he had made for his family by life insurance will be entirely absorbed in discharging the remaining obligations. Under these circumstances an appeal has been made to students and friends and a committee formed, with Mr. H. Wells Eames as secretary, for the purpose of receiving subscriptions. Mr. Boughton was demonstrator in experimental physics at the Birkbeck for nearly 10 years, and since 1884 was the head of the physics department.

The Musical Taste of the Telephone.—The phonograph and the telephone are such modern finish-the-nineteenth-century kind of affairs, that no one would suspect them of a predilection for old-fashioned ways. Yet, so far as musical instruments are concerned, that is the case, for while with the phonograph and telephone a completely satisfactory reproduction of pianoforte music is usually difficult, it appears that the harpsichord is reproduced beautifully. Mr. Arnold Dolmetsch, who is an enthusiast in the matter of that instrument, says the reason is that because the tone of it is more musical. The philistine physicist will probably suggest that the character of the natural sound of the telephone disc has more in common with the tinkle of the harpsichord (or of a musical box) than of the sound of the hammered piano wire. The telephone has often a nasty way of transmitting noises which are anything but musical. That would account for it transmitting the blow of the pianoforte hammer too strongly.

International Code Telegrams.—At a special meeting of the principal code owners in Liverpool who do business with the Continent, convened to decide what reply should be made to the Postmaster-General's request that code owners should supply, free of any charge, copies of their codes to the Director of the Berne International Telegraph Office, with a view to the inclusion of as many words as admissible in the revised edition of the official vocabulary, it was resolved that there were objections to acceding to this request, as much of the contents of these codes are of a private character, the meanings being attached therein to the words taken from code dictionaries. A letter to this effect was accordingly despatched to the General Post Office. Of course, if the words used are taken from "admitted" dictionaries, it does not matter whether the codes are sent to Berne or not. But there can be no doubt that the proposed regulations as to code telegrams are not viewed without a certain amount of mistrust in business circles.

Yorkshire College Engineering Society.—At the ordinary meeting of the members of this society last week at Leeds, Mr. H. McLaren (the president) in the chair, a paper on the "Utilisation of Multiphase Currents in Electric Driving" was read by Mr. Percy Nicholls, of Manchester. The lecturer explained the principle of the three-phase motor, and remarked that with a three-phase generator no return line was necessary, as in the case of a

Digitized by Google

single-phase alternator (three wires instead of two). Another advantage was that they required very little attention, and ran for days together without being touched, the automatic lubrication being very perfect. By means of a small switch the motor could be run in either direction, and resistances could be used to vary the speed. By the use of the lantern and screen the lecturer showed the most recent types of three-phase motors of both English and foreign make, and referred to the well-known Frankfort power transmission line. A discussion followed, in which Messrs. McLaren, Sykes, Towler, Darley, and Cornock took part.

Motorcarts.—It has always seemed probable that there was a fine potentiality of pyrotechnic display about the benzine motorcart; but two of them have shown that they have the true artistic spirit in selecting a wide stage and a good audience for the show. One chose the Boulevard Haussmann, in Paris, last week, and the time five o'clock—*i.e.*, just dark. The flames shot up above the second floors of the houses. The French firemen, of course, tried to put out burning benzoline with water. Number two was in Oxford-street earlier in the afternoon, and from a spectacular point of view not nearly so exciting. But it amused the crowd, and showed what could be done in the way of enlivening our streets. A really malicious machine would have selected a congested part of the Strand or a narrow street in the City to burn in, as then there would have been at least an off-chance of setting fire to something and a fair certainty of frightening someone into running under a horse's hoofs. A gentleman has been fined for obstruction in the City with a motorcar. It was left in charge of a man for 20 minutes, but no one knew how to move it so as to let the traffic pass.

Induction Telegraphy.—The following is a letter from Mr. J. F. Young, of Llanelly, to the *Western Mail*, which we give as it stands: "Seeing your report of Mr. Preece's above experiment in to-day's paper reminded me of a similar experiment made by Mr. MacLucas and myself 18 years ago. We constructed an original arrangement by which we could communicate with each other. Mr. Lucas was living in Vaughan-street and I in Stepney-street. This we did without wires, and it so far succeeded that we could not only converse with each other, but we could hear each other's watches tick, and other sounds, such as people walking about the room, piano-playing, etc. Referring to what Mr. Preece said about induction, it may interest some of your readers that although the post office was two doors away from my dwelling, messages sent by the postal authorities could be easily read in my house. This was also due to induction. The postal authorities should take this hint, and prevent, if possible, such an occurrence." Even at the end of 1878 the telephone and microphone were quite new discoveries, and everyone was much interested in trying experiments.

The Channel Islands.—There is a paper in Guernsey called *Le Bailliage* which appears to change its mind whether it shall print in French or English about three times a column. To us inhabitants of the larger island, who for the last 400 years or so have given up speaking the language of our conquerors, it looks strange. But that is not the point. What is, is that *Le Bailliage* has published a long article from a correspondent urging the adoption of electric lighting. In Jersey it has been adopted "in principle"; but unless the Guernsey people are altered, that will hardly be an argument in its favour unless they could get their lamps alight before Jersey. The interesting point, however, and one to be borne in mind in preparing schemes, is under what regulations will the lighting be carried out. The extension of an English Act to the Channel Islands depends upon a technical formality which may or may not have been complied with. And even if the English rules hold, nothing is clearer than the fact that the local legislature can make any additional or even conflicting ones that it chooses. And if they do not agree, both must be complied with. Even the National Telephone Company cannot do exactly as it chooses in Guernsey.

Affixed to the Freehold.—Those who have read their leading cases will remember that even when Elwes *v.* Mawe was argued there was already question of the limits of a landlord's right to confiscate another man's engine on the plea that it is affixed to the freehold. But the matter is not settled yet. In the Court of Appeal on Saturday, before the Lord Chief Justice and Lords Justices Lindley and A. L. Smith, judgment was given in an appeal, Hobson *v.* Gorringe, from a decision of Mr. Justice Kekewich. The question involved was as to the right of the vendor, under a hire and purchase agreement of a gas-engine which he had allowed the purchaser to affix to his land, to recover possession thereof, on the failure of the purchaser to pay the stipulated instalments, as against a mortgagee in possession of the land. Mr. Justice Kekewich decided in favour of the defendant, the mortgagee in possession, and their Lordships, holding that as a fixture the gas-engine had ceased to be a chattel and had become a part of the freehold, affirmed this decision, and dismissed the appeal with costs. As there would be some difficulty in passing a gas-engine as a trade fixture, which by custom "as to which the memory of man runneth not to the contrary" had been always removable, the matter is worth the attention of all leaseholders hesitating between setting up a supply installation for themselves or taking current from the mains.

Electrolytic Work.—According to a review of the progress of electro-chemistry which has appeared in the *Elektrotechnischer Anzeiger*, hydrogen is manufactured electrolytically at the Leopoldshall works, compressed, and sold in steel cylinders in the usual way. *L'Electricien* has suggested that gas produced in this way might be used for gas-engines. There seems to be a regardlessness of expense about the proposition. The electric production of ozone does not seem to have made very much practical progress, although there have been a number of arrangements for that purpose brought out. The reduction of phosphorus by means of the electric furnace is stated to have made considerable advance during the past year. The phosphorus manufacture is, however, a very close business. Lately, Siemens and Halske, at Vienna, are stated to have succeeded in producing commercially by electrolytic methods antimony of very great purity. As to carbon there has, of course, been any amount of work done in the electric furnace, but the processes take place at such an exceedingly high temperature, and under circumstances in which exact measurement is so difficult, that it is usually impossible to say whether the effect is purely a heat reaction or whether electrolytic action has anything to do with it. It may be added that by treating in this way a mixture of powdered rock crystal and powdered carbon, not only the nearly colourless crystals of silicon carbide have been obtained, but also black crystals of silicon. A commercial use, however, has yet to be found for the latter.

The Davy-Faraday Laboratory.—Magnificence, in the Aristotelian meaning of the word, is by no means an obvious virtue, and there are abundant examples to show that it is easier to become a millionaire than to spend the acquired wealth in a really well-seeming manner. Dr. Mond, whose munificent gift to the Royal Institution was opened on Tuesday by the Prince of

Digitized by Google

Wales, of course, knows the crying need for research in pure chemistry and physics; but it would be well if some of the public benefactors who do not could be brought to see the advantage of departing from the common lines. We have already briefly described the new laboratory. Of the opening there is little to say. Dr. Mond made an interesting speech, to which the Prince of Wales returned a graceful reply, remarking on the fact that Dr. Mond had given to the new research laboratory the names of Davy and Faraday instead of his own. (There are larger works than any laboratory to perpetuate the name of Mond), and with the formal opening this country was able to advance the unique claim of possessing the only public laboratory in the world solely devoted to research in pure science. Of course, almost everyone was there that could be, and among others noticed were the Duke of Teck, Earl Percy, Lord Halsbury, Lord Playfair, Lord Ashbourne, Lord Knutsford, Lord Rothschild, Lord Kelvin, Lord Rayleigh, Lord Belhaven and Stenton, Sir Frederick Abel, Sir John Lubbock, Sir Henry Roscoe, Sir George Stokes, Sir James Blyth, Sir John Brunner, Sir Douglas Galton, Sir John Donnelly, Sir Benjamin Baker, Sir Frederick Bramwell, Dr. Huggins, Dr. Anderson, Dr. Hopkinson, Mr. W. H. Preece, Mr. Alexander Siemens. Mr. W. Crookes, and Mr. J. W. Swan. A series of experiments with liquid air were afterwards exhibited by Prof. Dewar.

The Telephone and Competition.—We have no means of ascertaining by experiment the effect of competition on the telephone in England. Nor will looking abroad help, for foreigners and Englishmen are not alike in all their ways. If we may say so, however, without offending them, there is not so very much difference between American men of business and our own as to prevent us looking across the Atlantic to see what is thought there on the subject. It is a country of "pools" and trusts, and they know all about monopolies there. Mr. Fred de Land, of *Electrical Engineering*, however, is definitely of opinion that competition in the telephone service is decidedly no good to the competing company. He has prepared a list of 24 towns where competition has been tried and failed—few of them very big ones, however. But except that he makes no reference to the effect of the liability to competition in keeping the Bell Company up to the mark, Mr. de Land may speak in his own words without further comment: "At first thought it appears perfectly feasible to make a competing telephone exchange profitable property, yielding good returns on the investment, and during the first few months nearly all competing exchanges flourish in a financial sense. For the unhealthy public sympathy stimulated for selfish ends enables town councils to grant franchises containing very liberal provisions, while the interest taken by many citizens ensures a large number of subscribers from the start. But though opened under the most favourable auspices, yet the records show that gradually one competing exchange after another suspends operations, and the plant is sold for what it will bring—often for old junk—unless the franchise is a peculiarly liberal one. The cause is easily found. The closed exchanges at Waukesha, at Topeka, at Fort Smith, at Selma, and at twenty other points all tell the same tale: 'Inability to secure an income from low rates that would warrant the expenditure necessary to secure the talent requisite to maintain and operate the plant in a manner that would ensure prompt and efficient telephone service.' This truthful and official statement is the whole story in a sentence. Nowhere was any legal action taken by the Bell Company, though in everyone of these exchanges apparatus was used that no doubt infringed patent rights owned or controlled by the Bell interests. But everywhere the Bell service formed the standard by which the new service was measured, and the expectations that a telephone service far superior to the Bell would be supplied at half the rates formerly charged were never realised. And when the quality of the service continued to depreciate, one after another of the subscribers refused to continue renting the new instruments, and the end soon came. Then the doors were closed, the plant sold for what it would bring, usually about one-fifth or one-tenth of its cost, and the original investment proved a total loss."

Liquid Oxygen.—We are indebted to the authors for a copy of Prof. Fleming and Prof. Dewar's paper on the dielectric constants of liquid oxygen and air which was read last week before the Royal Society. The authors in their experiments used a small condenser (capacity ·001 microfarad) made of 17 aluminium plates, kept apart by fragments of glass at the corners of the plates. This condenser was charged in liquid oxygen and in air, and afterwards discharged a given number of times in succession into a larger condenser for measurement. The reduction of the observations taken in this way presents some points of interest, but cannot be summarised here. As to possible leakage, it is known that liquid oxygen is a very perfect insulator, and it was also found that at the low temperature of just evaporated oxygen or air the ordinary leakage of an air condenser was immensely reduced. The construction of the condenser made it necessary to determine whether the specific inductive capacity of glass is changed at -182 centigrade, and hence we have incidentally the interesting result determined that the dielectric constant of crown glass is reduced by 21 per cent., of paraffined paper 28 per cent., but of mica only about 3 per cent. by cooling to that temperature. Further work in this direction is to be undertaken. As a result of measurements made with the condenser described above, the authors find the dielectric constant for liquid oxygen at -182 centigrade and standard pressure to be 1·49. There is a small uncertainty depending on the variation of the constant for gaseous oxygen or air as the temperature falls to -182, but it is practically certain that this would only affect the third decimal place. From similar experiments in liquid air all that can be said is that K comes out slightly higher, as during the experiments, of course, the nitrogen was evaporating away, leaving the mixture at the end practically oxygen only. The value 1·49 is very low, which is in accordance with the general rule that a high resistance in a dielectric goes with a low constant, and *vice versâ* (Nature cannot suit all). Profs. Dewar and Fleming have just recently determined the magnetic permeability (p) of liquid oxygen at 1·00287. Now, according to the electromagnetic theory of light, Kp should equal the square of the refractive index for exceedingly long waves of the luminiferous medium. The refractive index of liquid oxygen has been determined by Profs. Liveing and Dewar for several lines in the visible spectrum; but extrapolation according to a not very well-established law is necessary to obtain the limiting value for the infinite wave. The result, however, comes out right within 1 per cent. It may further be added that on Prof. Dewar's determination of the density of liquid oxygen as 1·14 and the permeability given above, the magnetic susceptibility of oxygen in the liquid state is nearly twice that of an equal mass of the gas, from which it is inferred that magnetic susceptibility is not merely a property of the molecule *per se*, but is a function of the state of aggregation.

RAILWAY BLOCK SIGNALLING.

BY J. PIGG.

(Concluded from page 693.)

Electrical methods have also been suggested for this purpose. Some of these involved the use of a bell fixed on the engine in any convenient position. This bell was to be operated by a battery, also carried on the engine, the circuit being closed by an obstruction placed by the side of the line, which was operated by simple means in conjunction with the signal to be indicated. This arrangement was not reliable on account of the difficulty experienced in maintaining batteries in a state of efficiency under the conditions of their use, and also on account of the vibrations and shocks to which the apparatus was subject.

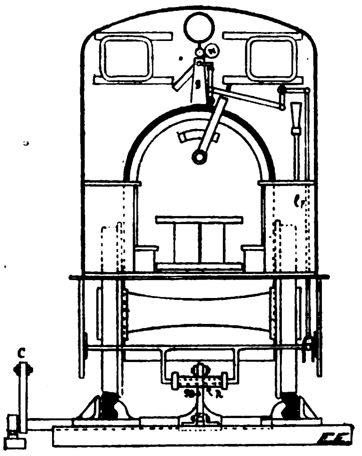

Fig. 102.

Other arrangements involved the use of a large bell, fixed in proximity to the line at a suitable height, which was intended to ring continuously whilst the signal was "on," and which could be put out of operation when not required by the use of a small peg switch. Such arrangements are of little use for the purpose intended; the difficulty of conveying sounds from the outside to the inside of the cab of an engine in rapid motion are immense, and can only be appreciated after experience.

Suggestions have also been made for repeating the position of the signal arm directly on the engine by mechanical means, worked in conjunction with the signal. One of these methods is shown by Figs. 102 and 103. The apparatus on the engine for indicating the positions of signals consisted of a small fac-simile of the ordinary outdoor signals. This was fixed in the cab of the engine, as shown. A counterbalance, W, was fixed to the arm so that when not otherwise supported the latter took up the "on" position. To the frame of the engine was pivoted a metallic rectangle, R, arranged to turn on its upper side as an axis. A rod, bifurcated at its lower end to engage with pins, *p*, on the rectangle, R, passed then to *s*, and supported the arm in the "off" position under normal conditions. Movement of the rectangle in either direction caused the support to be withdrawn from the arm of *s*, and it at once took up the "on" position by the action of the counterbalance. As will be noticed from Fig. 102, the arm could

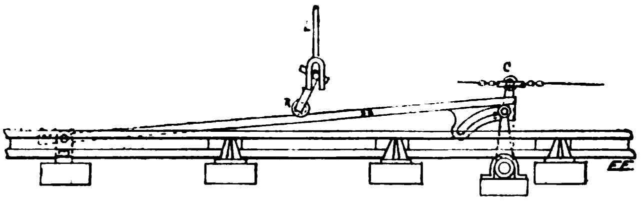

Fig. 103.

only be replaced in the "off" position by the direct action of the driver.

The great difficulty in connection with the design of apparatus for this purpose is the violent shock experienced when used on trains travelling at a high rate of speed. In order to minimise the shock, the swinging rectangle, R, was operated by sliding over the inclined bar, B (Fig. 103), which was fixed in the centre of the 4ft. way, and one end of which was raised or lowered as the signal was "on" or "off." When the signal arm was "off" it was, of course, intended that the bar, B, should be in such a position as would prevent its operating upon the swinging rectangle, R.

The fixing of such a means of operating an indicator on the engine requires considerable care if placed in the 4ft.

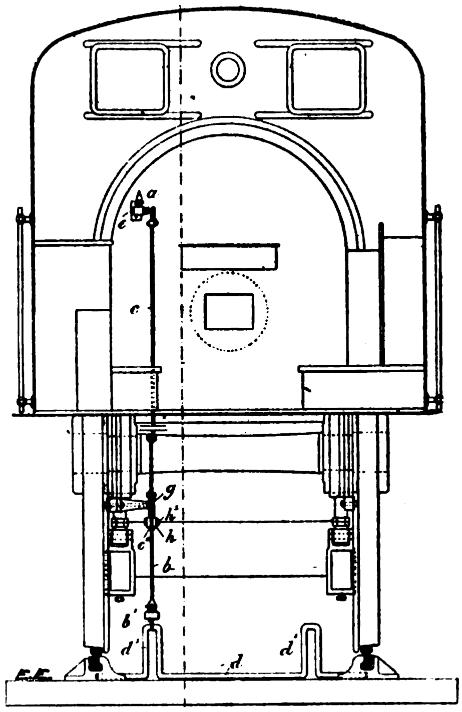

Fig. 104.

way, on account of the small amount of space available. The bar, B, when inclined for use, must project above the rail level; since the space between the rail is often filled up at level crossings the swinging rectangle must necessarily be set high enough to miss all such points. On the other hand, the bar must not be of such a height as to come in contact with the engine firebox, or any of the

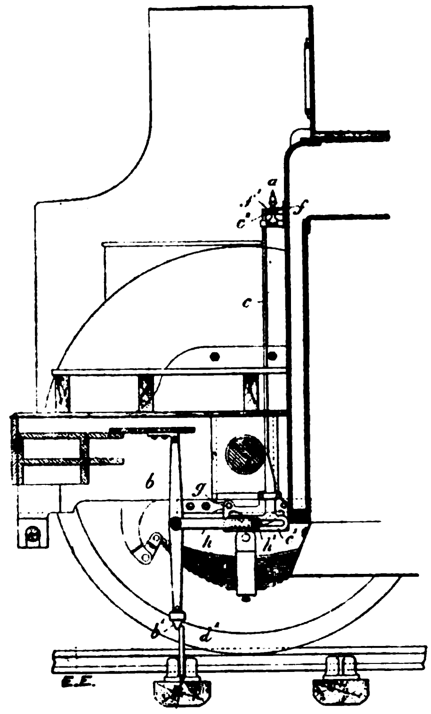

Fig. 105.

mechanism. Of course, it is possible to place such apparatus on the outside of the rails, but as engines do not always run engine first, it would be necessary to provide bars on both sides of each line of rails, or as an alternative provide attachments on each side of the engine.

A similar apparatus, patented by Messrs. Raven and Baister, of Darlington, is at present under trial on the North-Eastern Railway Company's lines. This arrangement

Digitized by Google

is shown by Figs. 104 and 105. The main principle is the operation of a special alarm on the engine, when the latter is approaching or passing a signal at danger. In this form, however, the alarm takes the form of a special whistle, which may be operated by steam or compressed air. The valve controlling admission of steam or air to the whistle is operated by the movement of the pendulum levers, *b*, when the latter come in contact with the raised obstructions. The lever, L, which is connected to the pendulum levers carries a pin which works in the straight slot, C^1, formed on the lower end of the rod, C, and also works in the curved slot formed on the fixed plate, *g*. Movement of the pendulum, *b*, causes the pin to rise in the fixed curve slot and raises C^1 and C, and opens the valve. It will be interesting to note the progress made in this development of automatic signalling, as, from the remarks made, the necessity for some such method is increasing. One of the greatest advantages arising from the use of such methods as those just described is due to the fact that they are in continual use, and, therefore, require no special arrangements to be made, and involve no additional operations on the part of any person concerned, to contribute towards the results desired.

Closely connected with this part of the subject is the question of repeating the positions of the mechanical signals in the cabins from which they are operated. The relative importance of the "on" and "off" indications has already been referred to. It only remains to point out that confining repetition to "distant" signals which are out of sight of the signalman is not consistent. The general rule is to repeat a signal which, even under normal conditions, is not visible to the signalman; and as "distant" signals are more frequently out of sight than any other, repetition is confined almost solely to this class of signal. Bearing in mind the real reason for repetition, it follows that any signal which may, under any circumstances, be out of sight of the signalman should be similarly treated. Very slight consideration is necessary to show the advisability of repeating all signals: during fog or snowstorms, distant signals, which under normal conditions are in plain sight, are quite invisible, as also are "advance" and "home" signals in particularly bad cases. As fogmen depend entirely upon the position of the signal arm for their guidance, it becomes of double importance that the signalman should have an accurate knowledge of their positions under these circumstances. For these and similar reasons, the increased use of repeaters of the positions of the mechanical signal arms seems desirable; and, as already pointed out, the repetition should be that of the arm itself, and not that of some point on apparatus more or less intimately connected with the arm.

Another point of great importance may be shortly referred to. This is the need for an uniform system. At present nearly every railway company's system differs from those of other companies, in either the regulations or the apparatus employed, or both. For this diversity of method or apparatus no really valid reasons can be alleged. The handling of railway traffic is practically the same wherever carried on, and the fact that block working, wherever used, is, in its essential characteristic—the enforcement of a space limit—uniform, is proof that uniformity of means to the end is merely a matter of arrangement. The end in view in all cases is exactly the same, and there is no reason to suppose that, generally, any one of the ways taken is speedier or smoother than the others. On the other hand, the advantages accruing from uniformity of code and apparatus would be considerable, and would put into the hands of railway companies powers which, under certain conditions, would be of the greatest importance, but which they do not yet appear to appreciate. Unfortunately, the amount of capital already invested in existing apparatus precludes the idea of a speedy reformation in this respect.

It may be thought that in giving so much attention to non-electrical methods, such as traffic arrangements and the mechanical signalling of trains, the writer has, to use a familiar colloquialism, "got off the rails." The term "block system" is too frequently used to indicate the electrical portion of the apparatus only. It cannot, however, be too strongly emphasised that the signalling which acts in *notification* of the movements of the trains, and only indirectly controls those movements, and that through another medium, is not the *whole* of the "block system." The term "block system," as the writer understands it, has a much broader significance, and consists in the preservation of a space limit between the successive trains, the means used to effect this desirable end being of importance only in proportion to the degree of perfection attained in producing that effect. The recognition of the necessity for a space limit is as old as railways themselves, and the methods of the present period are simply developments, rendered necessary by continual increase of traffic, along a line which has been rigidly marked out by a continual process of trial and error. In just the same way that the weakest link must be taken into account in gauging the strength of a chain, the whole of the apparatus connected with the working of traffic must be passed under review, before its combined efficiency can be fully estimated. No part can stand alone. Careful traffic arrangement is necessary to ensure that smooth and speedy working which is the first essential of all successful work. Electrical signalling is necessary for the preliminary arrangements required to marshal traffic in the order of its importance, to facilitate its passage with safety, and to notify its progress. Mechanical signalling is the executive of both.

MALTA ELECTRICITY SUPPLY.

The electricity supply works which have been undertaken by the Government of Malta commenced supplying current on December 1, 1896. They are interesting to engineers and members of local authorities in that the Government have not only provided machinery and mains for supplying private consumers, but have dispensed at the outset with gas lighting in the public streets and squares, for which they have substituted incandescence and arc lamps. The electricity works are equipped with machinery capable of giving a total output of 375 kilowatts, and of this the public lighting alone requires 124 kilowatts. So with private consumers, among whom are the Governor's palace and several of the War Department buildings, the works may be considered to have started with a paying load.

When contemplating taking up electric lighting the Government consulted Mr. W. H. Preece, C.B., F.R.S., and he, assisted by his son, Mr. A. H. Preece, drew up the scheme upon which tenders were invited. Of the tenders sent in that of the Brush Electrical Engineering Company was found to be the most advantageous for the whole of the work, and was accordingly accepted. The distribution of electricity is effected by low-tension alternating currents. Transformers fed by high-tension feeders running from the generating station to various points in the towns supply this low-tension system. This arrangement was adopted, in the first place, because it gives absolute safety to the users of the current, and, secondly, because it is possible to send the current through long feeders with but a small loss of power.

The area supplied at Malta is very scattered, the longest feeder being that to the Three Cities, a distance of 5,000 yards from the generating station to the first chamber. The towns of Valetta and Floriana being intersected throughout with subways, advantage was taken to lay the cables in them as far as possible. The generating station is situated on the Marina adjoining the custom house, and comprises an engine-room, 109ft. by 26ft., and a boiler and condenser room 109ft. by 25ft. Excellent coal-stores and water-tanks are also provided, and there is ample room for extensions in the present building. The work of arranging the building has been in the hands of Mr. Gatt, C.E., the Government engineer. The following detailed description of the works may be of interest:

Boilers.—Steam is supplied to the first instalment of plant from three Babcock and Wilcox water-tube boilers, each capable of evaporating 6,000lb. of water per hour at a working pressure of 150lb. per square inch. The heating surface of each is 1,827 square feet, and the grate area 33½ square feet. The drums are 48in. in diameter by 23ft. 7in. long, and are each provided with two safety-valves, one non-return steam-valve, one steam stop valve,

Digitized by Google

duplicate feed and check valves, and all the latest improvements in water-gauges, etc. A steam soot-cleaning apparatus is fitted to each boiler, by means of which sooty deposits are blown off the tubes. A ladder and gangway across the top of the boiler is provided, and the brickwork fronts are finished off with buff and white glazed bricks. The firing is at present done by hand.

Steam and Exhaust Pipes.—The main steam-pipe, which is of wrought iron, 6in. diameter, is in the ring form, with valves so arranged that any portion of the ring may be easily isolated without interfering with the working of the engines. Copper expansion bends are employed where necessary. All the valves used are of the parallel slide type. Water separators are provided in the main steam-ring, as well as on each engine, which are drained by Geipel's patent steam-traps. The exhaust-piping, which is of cast iron, ranges from 12in. diameter downwards, is arranged to either open into the condenser or direct to atmosphere, as may be desired. There is an automatic relief valve on the pipe which opens the exhaust to the atmosphere in the event of stoppage of the condensing plant, and there is also a valve for shutting off the condenser when required. All the steam-piping is covered with magnesia sectional non-conducting covering.

Feeding Arrangements.—There is one duplex feed pump, 6in. by 4in. by 6in. stroke, and two injectors (one spare), each capable of delivering 3,000 gallons of water per hour. They are arranged to supply the boilers direct from the town mains or from a galvanised wrought-iron tank, the latter being heated by the exhaust steam from the feed pump. The feed pipes, which are of galvanised wrought iron, are also on the ring system, with suitable valves for isolating any section, and this piping is also covered with magnesia sectional non-conducting material.

Condensing Plant.—The exhaust steam is condensed by a Ledward patent ejector condenser capable of dealing with 600 i.h.p. The cooling-water, which is obtained from the sea, is supplied by two centrifugal pumps, each capable of delivering 35,000 gallons of water per hour, one being coupled direct to the shaft of the Brush 6in. by 5in. vertical engine, the other being driven by means of belting from an alternate-current motor. The pumps are fitted with gun-metal discs and manganese bronze spindles, and each has an air-ejector for charging with water before starting up. A Mordey-Victoria transformer, 2,000 to 100 volts, supplies current to the motor, and there is a switchboard with ammeter and high and low tension switches and fuses for controlling it. The cooling-water is taken from a deep sump into which the sea-water flows, and the discharge is also to the sea. The condensing-water pipes are all 7in. in diameter, and of cast iron. A non-return valve and strainer are fitted to the suction, and suitable sluice-valves are placed where required.

Main Engines.—There are five main engines, three being of 166 i.h.p., and having cylinders 11½in. by 20in. by 12in. stroke, and running at 231 revolutions per minute; one of 84 i.h.p., with cylinder 8½in. by 15in. by 8½in. stroke, and running at 273 revolutions per minute; and one of 40 i.h.p., with cylinder 7½in. by 12½in. by 7in. stroke, and running at 300 revolutions per minute. The high-pressure cylinders are provided with piston-valves and the low-pressure with ordinary slide-valves. Steam is controlled by highly sensitive flywheel governors, and Hackworth gear is provided for varying the low-pressure cut-off whilst running. Raworth patent flexible couplings are used for coupling the engines direct to their respective alternators.

Alternators.—There are five alternators of the well-known Mordey-Victoria type. Three of them have an output of 100 kilowatts each, and the other two 50 and 25 kilowatts respectively. The armatures are stationary, as usual in this type, while the field magnets revolve. They generate current at a pressure of 2,000 volts. These alternators work in parallel with each other irrespective of size. The lubrication is automatic, being effected by small pumps which keep up a constant circulation of oil.

Exciting Plant.—The exciters, four in number, consist of two compound-wound Brush-Falcon two-pole dynamos, each having an output of 12,000 watts and coupled direct to Brush compound tandem engines 6in. by 10in. by 8in. stroke, upon one bedplate; and two small exciters are coupled directly to the 50 and 25 kilowatt alternator shafts, so that the day-load plants have each their own exciter. The 12-kilowatt exciters are each capable of exciting all the alternators running at one time, so that ample provision is made as regards safety and meeting both full and day load requirements economically.

Switchboard. — The main switchboard consists of the following separate slate panels: two for exciters, one synchroniser, five alternators, and six circuits, mounted together in a handsome polished teak frame and standing in one corner of the engine-room upon a raised platform. Two sets of omnibus bars are arranged at the back of the board so that any alternator can be put either singly or in parallel on either set of omnibus bars. The high-tension switches throughout are of the Brush quick-action trigger type, with mechanical make and releasing gear, and the high-tension fuses are of the Bate's pattern enclosed in porcelain handles. The low-tension switches are of the Brush chopper type. Suitable measuring instruments are provided on each panel, and the whole station is regulated by the rheostats which control the exciters. Each alternator is also provided with a resistance for compensating the change in resistance in the field circuits due to temperature variations. There are two small panels (placed underneath the 50 and 25 kilowatt alternator panels) containing instruments, switches and fuses, and regulating resistances for the two small direct-coupled exciters. Ample provision has been made on the board for extensions.

Crane.—The engine-room is spanned by a 10-ton travelling crane, with hoisting, cross travelling, and longitudinal travelling motions, all worked by hand ropes from the floor level. For light loads up to five tons the return block may be removed and the single chain used, the free end being provided with a five-ton swivel hook.

Distribution.—The current is carried from the generating station on the Marina to Valetta, Floriana, and Three Cities by means of concentric high-tension feeders, supplied by the British Insulated Wire Company. These are insulated with specially treated paper, lead covered and armoured and laid direct in the ground, or drawn through the numerous subways which exist throughout Valetta and Floriana. These feeders have a section of ·1 square inch as far as the Three Cities—a distance of 5,000 yards—·065 to Valetta, and ·035 to Floriana, and terminate at the principal sub-chambers. From thence high-tension distributors, insulated and protected in a similar way to the feeders, but varying in size from $^7/_{14}$ to $^7/_{20}$ in size, are taken to the sub-chambers, which are placed at convenient centres for distribution. Special high-tension isolating switches, enclosed in cast-iron boxes, are fixed at convenient points, and Geipel patent high-tension joint-boxes are used for jointing; the joints being mechanical are easily made, and may be inspected by removing the cover. Each high-tension feeder contains specially insulated pilot wires, and these are connected through highly insulated plugs to an electrostatic voltmeter on the main switchboard, thus enabling the station attendant to readily ascertain the pressure at the feeding points. The low-tension distributing mains consist of ·180, ·154, and ·077 square inch concentric cables insulated with specially prepared paper, lead covered, and armoured with steel, similar to the high-tension feeders. The house service connections are made with vulcanised rubber concentric cable drawn through galvanised wrought-iron pipes. The joints are made with Geipel patent joint-boxes, and the cable terminates in the Brush Company's specially designed lock-up cast-iron switch fuse-box fixed on the consumer's premises.

Transformers.—These are placed in sub-chambers cut out of the solid rock, or in War Department or public buildings. At present there are 40 transformers in use, varying from the 18-kilowatt size down to two-kilowatt. They are of the Mordey-Victoria type enclosed in cast-iron watertight cases, and provided with earthed shields between the primary and secondary coils. Current is transformed from 2,000 volts primary to 210 or 105 volts on the secondary, and, besides the primary switches and fuses contained in the transformer-case, switches are also provided in cast-iron boxes and inserted between the high-pressure supply and the transformer. Gabled top joint-boxes connect the high-

Digitized by Google

pressure mains to the transformers, and each box is provided with connectors for three transformers. Low-tension switch fuses and gunmetal omnibus bars convey the current from the low-pressure side to the circuits.

Public Arc Lighting.—The first instalment consists of 60 arc lamps, 45 of which are placed round the Grand Harbour and the remainder in the Palace-square and Strada Reale. All with the exception of two suspended from brackets are fitted into frames mounted upon cast-iron posts designed and made by the Brush Company at their Falcon Works. The lamps are of the Brush-Vienna 15-ampere alternate-current type arranged to burn 16 hours without retrimming. The above lamps are worked off a separate main, the conductors consisting of concentric cables insulated with vulcanised indiarubber, taped and braided and drawn into galvanised iron pipes. These mains are connected to small transformers which transform from 2,000 to 35 volts, the latter being specially designed to fit the lamp-post bases. Switches are provided to each lamp, and impedance coils are not required with this design of transformer. The cable runs from post to post and connects into specially designed terminals on the transformer. Thus all jointing is avoided and the cables may be quickly disconnected for testing or other purposes. Having each its own transformer, the lamps have therefore been provided each with an independent supply; any one can be turned on and off without in any way interfering with the supply to the remainder, or the whole may be switched on and off by the main switch.

Public Incandescence Street-Lighting.—Gas has been superseded throughout the whole of the streets of Valetta, Floriana, and the Three Cities by 770 32-c.p. incandescent lamps, either fitted into globe fittings with reflectors and attached to brackets, or where practicable fixed into the existing gas lanterns. These lamps are grouped in sections, and are worked off separate circuits, the conductors consisting of single cable, insulated with vulcanised indiarubber, taped and braided and laid upon insulators in the subways, and lead-covered twin vulcanised rubber cables laid in chases out of the solid rock where subways do not exist. In all cases the conductor is led up to the lamp through wrought-iron tubing fixed to the wall of the buildings, suitable fuses being inserted in watertight cast-iron boxes immediately underneath the lamp bracket. The various sections are supplied by transformers from sub-chambers specially provided for this part of the work. The distributing circuits conveying the low-pressure current to the lamps are taken from specially designed fuseboards mounted in cast-iron watertight cases. There are 16 brackets fitted to eight of the arc lamp-posts; these lamps are controlled by special switches, one operation putting in either the arcs or incandescence lamps as desired. The voltage of these incandescent lamps is 37, current being taken from the arc lamp transformers; the others are run at 100 and 103 volts.

General.—The whole of this important work has been supplied and erected by the Brush Company, while the general supervision has been entrusted by the Government to their consulting engineers, Mr. W. H. Preece, C.B., F.R.S., and Mr. A. H. Preece (who have been assisted by Mr. Marcus Chambers), and Mr. L. Gatt, the Government engineer at Malta. The general design and equipment of the works has been in charge of the Brush Company's contract department, under the control of Mr. W. Geipel, M.I.E.E., their superintending engineer, assisted by Mr. A. Mahood as resident engineer.

ON THE MANUFACTURE OF ALKALI AND BLEACH BY CHEMICAL AND ELECTROLYTICAL METHODS.*

BY BERTRAM BLOUNT, F.I.C., F.C.S., A.M.I.C.E.

(Concluded from page 665.)

A good word may be said for the use of mercury as an intermediate electrode and carrier of the products of electrolysis, in that it removes the need for a porous septum, and appears in practice, as in theory, to undergo no sensible loss or depreciation. Again, the anode is a standing obstacle. In almost all cases carbon is used, the particular form of that substance known as retort carbon being preferred. But even this very dense and refractory form of carbon is not wholly unaffected, and anodes made therefrom can only be considered as semi-permanent portions of the plant. There are, it is to be feared, no reliable data as to the life when in constant work of an electrolytic cell for the production of alkali and bleach. One must be content with qualitative statements. Nevertheless, it is well to recognise that it is not sufficient in computing the cost of an electrolytic process to reckon a capital expenditure, and to calculate on that the usual charges for interest and depreciation; a portion of the plant—viz., the diaphragms and anodes—should have a specially high rate of depreciation charged upon them, if, indeed, they might not rather be reckoned as part of the current expenditure, just as so much oil and waste would be.

At this stage of the paper, it appears not without value to transcribe certain calculations of cost of decomposing chlorides of the alkali metals electrolytically made by the well-known German electro-chemist, Dr. Borchers, and published recently in the *Zeitschrift für Elektrochemie*. He takes in the first place the cost of an electrical horse-power for the year, working day and night, at £4 when water power is available, and at £8. 15s. to £20 when coal has to be used. This corresponds with about 0·09d. and 0·24d. to 0·55d. per horse-power hour. It is probable that the cost of water power is here underestimated, and in any case it is not of primary importance in this district. The lower value for steam power may be accepted as a basis for calculation. Each electrical horse-power year, working with theoretical current efficiency but with a voltage of four volts (of which more anon), will decompose 3·5 tons of salt, having a value of about £2. 15s., and will produce 2·4 tons of caustic soda, worth £19, and rather over two tons of chlorine, which, as chloride of lime, is worth £35. The production of the latter material involves the consumption of 3·2 tons of lime, costing £2. 8s. Therefore from raw materials costing in all £5. 3s., and by the expenditure of power costing £8. 15s., products can be obtained having a market value of £54. An outlay of £13. 18s. to gain £40. 2s. is certainly tempting to the speculator. Making a similar comparison for some of the best-known processes proposed or put in practice in this country, values are obtained which, if not quite so attractive, at least offer a large enough margin for profit. Thus the Castner-Kellner process is credited by its devisers with a current efficiency of 88 to 90 per cent., so that assuming it can be worked at the same pressure as that chosen above (four volts), and taking the same buying and selling prices for the raw materials, and the products, chloride of lime and caustic soda, the expenditure will be £13. 5s. and the net profit £35. In the case of the Hargreaves-Bird process the preference of the patentees is for the manufacture of sodium carbonate rather than for that of caustic soda, and the estimates have to be modified accordingly. The current efficiency claimed is 80 per cent., and the pressure said to be required is 3·4 volts. Accepting these, an expenditure for raw materials and power of £13. 12s. yields a profit on the sale of the finished products (soda ash and bleach) of £39. 9s.

Others could no doubt be quoted giving on paper profits almost equally seductive. That such profits have hitherto proved hard to realise is due to the causes already indicated in an earlier part of this paper—viz., the high cost of the plant per unit of output and its considerable deterioration in use. Another cause may be touched on here. It must not be supposed that both chief products of electrolysis, caustic soda and chlorine, separate neatly and completely from the electrolyte in which they have been formed. Their combination, with the production of salts of various acids containing chlorine and oxygen, is apt to occur if the diaphragm be in any degree too porous, or if electrolysis be pushed so far that the liquid in the cathode compartment is even moderately rich in caustic soda. The inconvenience of allowing the liquid in the anode compartment to remain saturated with chlorine can scarcely be avoided, as the only practicable means of prevention—viz., keeping the electrolyte hot—is not to be thought of on other grounds altogether. When once saturation has occurred, however, the further quantity of chlorine evolved escapes spontaneously, and can be sent direct to the bleaching-powder chambers. But with the caustic soda a definite method of recovery is needful. According to the practice generally adopted in most processes, brine is circulated through the anode and cathode compartments independently, and fresh salt added as the strength of the liquor declines.

It may be taken that the most concentrated solution of caustic soda that can be profitably prepared in an electrolytic cell contains not more than 10 per cent. of the solid substance NaOH. With this is associated a large quantity of undecomposed salt, and the recovery of the latter is a necessary concomitant of the isolation of the former. Fortunately, the majority of sodium salts are insoluble in a concentrated solution of caustic soda, whence it happens that on boiling down a weak solution, separation of sodium chloride takes place progressively, and the separated salt can be fished out. There should be no serious difficulty in ultimately preparing caustic

* Paper read before the Northern Society of Electrical Engineers, December 7, 1896.

Digitized by Google

soda containing no greater quantity of foreign salts than does the best grade of caustic soda now put on the market—viz., that known as "77 per cent.," which is approximately pure NaOH. It is true that a considerable quantity of caustic soda will cling to the salts fished out, but this is only a source of loss in so far as it represents a certain amount of marketable material locked up in the process, and necessitates the addition of a small sum in the reckoning of interest on the whole stock. The caustic soda held in this way is not lost, but returns with the recovered salt to the cathode compartments. Processes such as the Castner-Kellner, using mercury as an intermediate electrode, have the advantage of obtaining caustic soda in solution free from salt, and the necessity for separation does not arise.

I have said nothing as to the production from fused salt of chlorine and sodium (and caustic soda from the latter by the action of water) because the mechanical difficulties of constructing an apparatus capable of withstanding the attack of sodium chloride at a red heat have hitherto proved of the most formidable kind, and although gallantly encountered both in this country and abroad have, as far as I know, not yet been overcome. It is enough to say here that any process of the sort will always be handicapped by two circumstances—(1) the necessity for supplying energy in some form to keep the electrolyte fused, and (2) the waste occasioned by the need for expending energy sufficient to win sodium itself instead of caustic soda, that balance of energy being wasted as heat when the sodium is brought into contact with water for the production of caustic.

Any review of the subject of the electrolytic production of alkali and bleach would be imperfect without a section devoted to the consideration of the merits of the plan of manufacturing caustic potash in place of caustic soda. Suppose it be conceded to those who deny that the formation of caustic soda electrolytically is likely to be profitable, that the prospects of success are not altogether assured, it may at least be possible to contend that a better fate attends the manufacture of caustic potash. Happening as it does that potassium is less widely and abundantly distributed in the earth's crust than is sodium, and that certain compounds of potassium cannot be industrially replaced by sodium, it follows that the price of potassium salts is higher than that of corresponding sodium salts, and is likely to continue so. Gunpowder is still a primary necessity of civilisation, or, perhaps, one should say, a standing need of peoples not yet initiated in the mysterious charms of smokeless explosives, and its manufacture is carried out on a large scale. Again, it is clear that a period of national rejoicing cannot be celebrated in a convincing manner without the aid of the artist in pyrotechny. To what sorry plight would both be reduced if denied the use of potassium nitrate and chlorate? In all seriousness there are many considerable manufactures—of which the preparation of soft soap and of oxalic acid may be mentioned—in which the use of potash, as distinct from soda, is a *sine quâ non*. How with a valuable raw material, such as potassium chloride, the cost of the energy and labour impressed upon it is a smaller fraction of the whole cost of the finished product than is that of the energy and labour spent upon a cheaper material—*e.g.*, sodium chloride. Losses of the raw material at any stage of its conversion consequently have a greater monetary significance, and a process operating cleanly and in a manner economical of the material handled will have an advantage which may outweigh any extra expenditure of energy. An estimate similar to those already quoted is available for the case in which potassium chloride instead of sodium chloride is electrolysed. Using the same data as before and assuming a theoretical current efficiency and a voltage of four volts, one electrical horse-power year would produce from 4·4 tons of potassium chloride and 3·2 tons of lime, 3·3 tons of KOH and 5·2 tons of chloride of lime. The cost of the power is £8. 15s., that of the potassium chloride at £7 per ton is £31, and that of lime £2. 8s., while the value of the products, reckoning caustic potash at £26 per ton, and chloride of lime at £6. 15s., is £86 and £35 respectively, representing a gain of £79 on an expenditure of £42. Of this expenditure the fraction which has to be incurred in buying raw materials by any process whatever is fourth-fifths, so that it is obvious at a glance that economy of raw material is of greater importance than in cheapness of handling. Translating these figures into something which is not beyond practical attainment—*i.e.*, assuming a current efficiency of 80 per cent., and using, as before, a voltage of four volts, an expenditure for raw materials and power of £35 would yield products representing a gain in value of £62. Of the expenditure, the fraction representing the cost of the raw materials is three-fourths, so that the position is almost as favourable as when the theoretical current efficiency is assumed.

Perhaps the most promising of all processes for preparing by electrolysis one of the products of the alkali trade is that for the manufacture of potassium chlorate. The apparent simplicity of the requisite reactions is most enticing. On electrolysing a solution of potassium chloride, caustic potash and chlorine are to be expected as the first products. If then no attempt be made to separate these products, but, on the contrary, the cell be provided with a good agitator, they will unite to form potassium hypochlorite if the solution be cold, and potassium chlorate if it be hot, according to the equation

$$6KOH + 6Cl = KClO_3 + 5KCl + 3H_2O,$$

five-sixths of the total potassium concerned in the reaction reverting to the condition of chloride. It must not be supposed that this reversion represents an avoidable waste; the chlorine which, for clearness of argument, may be regarded as liberated in the first stage of the electrolysis, is fully represented by oxygen in the ultimate product—potassium chlorate. In existing chemical processes the reaction between chlorine and an alkaline substance is carried out with lime instead of potash. and potassium chlorate is prepared by double decomposition with potassium chloride. Therefore, under these conditions, five-sixths of the chlorine is actually run away as calcium chloride—another example of the typical defect of most chemical processes—viz., the production of a large quantity of almost worthless by-product. It is difficult to say how far the manufacture of potassium chlorate by electrolytic means is carried on at the present time. Somewhat florid accounts occasionally reach us from the Continent and the United States, but thoroughly reliable information cannot be readily obtained. The manufacture has either failed to attract attention in this country, or possibly is being quietly pursued with a profit which would shrink if competing makers were aware of its successful working.

There are certain general considerations on which it may not be superfluous to insist in summing up the present position of the manufacture of alkali and bleach by chemical methods and by electrolysis. In the first place, it is customary and necessary to state the current efficiency of a process—that is, the output of the desired product as compared with that calculated from the ampere-hours. This is desirable, because the efficiency of the cell in keeping separate the products of electrolysis and of allowing of their isolation in a marketable form is thus ascertained, irrespective of all questions of internal resistance. But the efficiency thus stated is not the energy efficiency of the cell. A cell with a given current efficiency may be working at a pressure of three, four, five, or six volts, and the energy efficiency of the last will be just half that of the first, in spite of an identical current efficiency. The total number of heat units represented by the conversion of a given raw material into given products under known conditions can be calculated from existing thermo-chemical data with a fair degree of precision; the total number of units of electrical energy passing with a known current at a known voltage can be stated with accuracy; the number of units of electrical quantity concerned with the fulfilment of a given reaction is also known; the minimum voltage which will accomplish the decomposition can therefore be calculated fairly closely. Thus when sodium chloride in solution is converted into gaseous chlorine and caustic soda in solution, about 53 cal. are required for one gramme equivalent of NaCl. The smallest pressure at which electrolysis can be effected is therefore 2·3 volts. But the lowest voltage yet claimed for any process producing caustic soda and chlorine is four volts, whence we see that an electrolytic method needing this voltage and having a current efficiency of 80 per cent. has an energy efficiency of only 46 per cent. I do not say that full efficiency can be readily attained, but I do say without hesitation that it is above all things requisite to keep the calculated limit steadily before us both in judging or comparing processes and in seeking to devise improvements on such methods as exist. It is well to realise—and a considerable amount of iteration in enforcing it may consequently be pardoned—that there is a margin of some 50 per cent. at the disposal of the electro-chemist intent on improving extant processes for the industrial decomposition of common salt. This possibility has been overlooked or intentionally ignored by those concerned with the exploitation of particular processes and not unnaturally anxious to put the most favourable construction possible on the performance of their pet cell, but the attitude of mind thus induced is about as reasonable as that of the copper smelter who prefers the old and inaccurate Cornish dry assay to exact modern methods of analysis because the former deals lightly with the imperfections of the smelting process, not to mention his own technical shortcomings.

A precise quantitative comparison of the merits of the chemical and electrolytical methods of preparing alkali and bleach is obviously impossible at the present time; were it possible, every maker would be using one or the other, and the *raison d'être* of this paper wouid disappear. But it is practicable to sum up the weak and strong points of the two processes in a qualitative sense. The electrolytic process is direct, cleanly, economical of labour, free from worthless by-products. *Per contra*, its units of plant are small, troublesome, costly, and quickly deteriorated by use. The chemical process can provide a large output with comparatively few units of plant, of, on the whole, simple construction and of large size; repairs, though heavy, are not numerous, nor have they to be applied to a vast number of small apparatus. On the other hand, much arduous and fairly skilled labour is requisite, and by-products valueless or of negative value are invariable concomitants.

BOUND VOLUMES.

Vol. XVII. of new series of "The Electrical Engineer" *can be had bound in blue cloth, gilt lettered, price 8s. 6d. Subscribers can have their own copies bound for 2s. 6d., or covers or binding can be obtained, price 2s.*

FREE WIRING.

One objection that a struggling tradesman has to introducing the electric light is that the gas fittings already installed and paid for become useless. He has to pay a lump sum to a contractor for wiring his premises, for his fittings, and his lamps. The cost of installing the electric light, so far as his business books are concerned, is the value of the gas fittings discarded in addition to his payment to the contractor. Many men find it inconvenient to make such payments in a lump sum, while they would for many reasons be glad to change their system of lighting. In order to meet this difficulty some corporations and companies have arranged a system of free wiring, increasing the charge per unit of electrical energy consumed in order to recoup the initial outlay and interest thereon. We are rather disposed to agree with a system of free wiring, providing the charge for the same is not too one-sided. It is impossible to discuss a large number of special cases, but we may take as an average a small business premises consuming 35 to 40 units a year with, say, 20 16-c.p. lamps. The revenue from such a customer would at the highest consumption be only between 10s. and 11s. per 16-c.p. lamp per annum. Take the cost of wiring at a pound per lamp, or a total of £20. If, now, the corporation or company charge ½d. or ¾d. per unit extra, the revenue will be 1s. 8d. or 2s. 6d. per lamp; or in the one case 8⅓ per cent. on the outlay, in the other case 12½ per cent. on the outlay. Corporations can easily borrow money at 3 per cent., so that business of this kind would amply repay them. But is such a return just to the consumer? We think not, and should expect to see corporations at any rate putting a limit of time upon the extra charge per unit. If they got an 8 per cent. return upon the expenditure, a part of that return should be used to pay interest upon the capital borrowed, and the remainder used as a sinking fund to repay the capital. When such repayment was completed the customer ought no longer to be charged the extra amount. A system such as we have sketched out would be just to both parties. The customer would be benefited in that his payments for installing would be spread over a time, rather than being paid in the lump. The corporation would reap a large reward in that the output of the station would thereby be increased, and the larger the output the less the total cost. Further, in this particular a corporation is in a better position than a company, in that it can get its money cheaper; and properly managed, its expenses ought to be less, hence the extra charge would be as low as possible.

LIVERPOOL OVERHEAD RAILWAY.

The company owning the above railway is to be congratulated on the successful working of their system of electric traction and on the fact that they own the most remunerative electric railway in the kingdom. This is all the more gratifying when the nature of the traffic is considered. As our readers know, the line runs the full length of the Liverpool docks, with extensions to the suburbs at either end.

Digitized by Google

These extensions will provide for a certain number of travellers on their way to and from home, but the bulk of the traffic is due to the docks themselves. The dock-labourer class is the largest customer, and the fares are fixed to suit the pockets of this class. Thus a penny fare will carry one from the centre of the line at the landing stage to either end or to any intermediate station. A twopenny fare is charged for travelling the full length of the line. This is over seven miles long, and the fact that profit is made by carrying passengers at little more than a farthing per mile reflects great credit on the management of the company and on their able engineer, Mr. S. B. Cottrell. The southern extension of this line was opened to the public on Monday last. The private inspection and the opening ceremony took place on the previous Saturday, and was attended by an influential gathering. The details of the difficulties to be overcome in this additional portion of the line and of the construction of the tunnels were given in Mr. Cottrell's paper before the British Association this year and printed in our issue of October 16. The extension links Liverpool to the districts of Dingle, St. Michael's, Prince's Park, Sefton Park, and Aigburth, and will be of great service to the residents of these suburbs. The station at the end of the extension is underground, and is lighted by arc lamps placed two in series on a 110-volt circuit, supplied by a motor generator from the power circuit. Sir W. B. Forwood, the chairman of the company, in proposing "Success to the Extension" after the lunch which was provided after the inspection of the line, said "that the electricity supplied from their own generating stations not only provided the motive power but the lighting, heating, and automatic signalling, and added that the great economy of its use had been a revelation to the directors. He believed that they would before long see electricity much more generally used by great railway systems, and that its use would greatly increase the efficiency of the lines and also greatly add to the returns to the shareholders." A five minutes' service will be given throughout the day, and there will also be an express service during the busy hours of the morning.

GAS.

It may interest some readers to know, says the *Contract Journal*, that 203 local authorities in Great Britain and Ireland own their gasworks. Of these, 160 are in England and Wales, 36 in Scotland, and seven in Ireland. Besides these, there are 437 private companies, of which two are in Scotland, nine in Ireland, the rest in England and Wales. The authorised capital of companies is £55,443,940; of local authorities, £28,966,927. Of these authorised amounts, the companies have paid-up capital amounting to £45,195,416, and the authorities have borrowed £25,624,326, showing a total capital spent £70,819,742. The receipts of the companies amount to £12,982,956, of the authorities £6,478,191, with respective expenditures of £9,491,344 and £4,881,944. The total coal used amounts to 11,937,446 tons, from which 121,421,752,691 cubic feet of gas is made, of which 111,443,701,941 cubic feet were sold during the year ending March 25, 1896. There were at that time 23,857 miles of mains, supplying 2,659,771 consumers' premises and 526,888 public lamps.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

BRISTOL TRAMWAYS.

SIR,—With reference to the editorial in your issue of the 18th inst. on the Bristol tramways, I would point out, as a fundamental difference between the Bristol tramways and the Dublin tramways, that in Dublin the line extends some eight miles away from the power-house and a further extension had to be considered, whereas in Bristol none of the lines proposed or contemplated extend from the proposed power station such a distance.

It has never been done or contended that the electricity at Dublin was as economically supplied to the cars as at Bristol; the Dublin system was designed purely to meet the conditions prescribed by the Board of Trade.—Yours, etc., H. F. PARSHALL.

London, E.C., December 18, 1896.

WHOM TO CREDIT?

SIR,—With reference to the article on the "Storage Battery at the Manchester Corporation Electric Light Works," which appeared in your issue of the 27th ultimo, it was mentioned that the battery was of the Chloride Company's well-known "R" type. It might interest some of your readers to know that this type of battery has only the negatives made according to the "Laurent-Cély" process, or chloride process, whereas the positives are made according to my patent of May, 1895, which involves a great improvement in the mechanical construction of Planté plates with composite grids. As it was only by the peculiar construction in question that the high discharge rates were made possible, I was surprised at my name being omitted in connection therewith by the author of your article.—Yours, etc., JOHN. RHODIN.

47, Victoria-buildings, Manchester, December 22, 1896.

[We do not acknowledge any remissions on our part in the description of this battery. It is absolutely impossible to credit the designer of every detail in every piece of work; if that is to be done, we shall have to find out the first designer of brass-headed nails, octagonal-headed screws, and so on. The battery described was that known to the trade as the "R" type of the Chloride Company. We have to credit the Chloride Company with the work, and cannot go behind their back.—ED. *E. E.*]

REVIEWS.

The Commercial Organisation of Factories. By J. SLATER LEWIS. E. and F. N. Spon.

The author in his preface laments the want of some system of accounts common to the factories throughout the country. Hence, as every firm has its own methods, there is no recognised system for a student to learn. The system of accounts in the book before us is put forward as one which might be generally adopted, and the author has spared no trouble in making the same clear to the reader. The organisation of the factory is even more important, and the hints as to the interdependent work of all the officials are most valuable. Nothing conduces more to the prosperity of a firm than a well-organised staff working concordantly together, but even such a staff without a good system of accounts cannot assure the financial success of the undertaking. The author reviews the division of labour in the management of a manu-

Digitized by Google

facturer's business, and shows how essential it is that every man employed should be an expert in his individual work. This applies specially to the principal himself, who usually has the direction of the staff, and the idea that blustering about from one department to another is the correct way to control a large establishment is absurd. The coolness and self-possession recommended by the author must, however, be accompanied by a firm hand, and all decisions must be prompt and final.

Chapter VIII. deals with suppliers' orders and invoices, and contains many truisms with regard to the purchase of goods by tender. The acceptance of the lowest tender is advised in all cases, except when the strongest reasons exist for a departure from the custom. In this, however, so much depends on the character of the apparatus tendered for, and in engineering matters it frequently happens that the lowest-priced article is the dearest in the long run. The chapter on the drawing office is full of detail. We should, however, liked to have seen the question of the responsibility of the individual draughtsman, and also as to the final inspection of working drawings, taken up more fully. The practice of storing standard drawings in a fireproof safe is to be commended, but, failing this, the author advises that copies of the standard be given to a responsible person to take home. Here we differ strongly, and consider that neither standard drawings nor copies should ever be let out of the office or workshops. The question of estimating is so closely allied to that of accurate prime costing that the two must be considered together. Thus, in the book before us the cross references between the two chapters dealing with these subjects are very numerous. One difficulty in estimating lies in the fact that a good part of the cost of the finished article is that of establishment charges. These charges are fairly constant in amount, and hence the amount to be borne by each machine turned out varies very largely with the quantity of work in hand. Thus in a large firm, while the establishment charges become most burdensome at periods of slackness to vary the estimated prices for new work to meet those charges will serious handicap the firm in obtaining new orders. The author goes thoroughly into a system of book-keeping for these establishment charges, but admits that the results obtained are not sufficiently firm to warrant the clerical labours involved. It frequently happens that where a large firm competes with smaller houses there are certain articles produced by both which cannot bear their due proportion of the establishment charges of the large firm. Thus any rigid rule fails, and the special branch has to be fostered by a lowering of charges. The author strongly advocates the use of curves of prices both as a means of adjusting the values of various sizes, and also for ready reference. The irregular curves given, of different manufacturers' prices for low-tension dynamos show how much such a method is required. The author opens his chapter on pupils as follows: "It is the practice in many engineering establishments to take pupils for a term of years at premiums ranging from a small sum to a thousand pounds. This in itself is a perfectly legitimate practice, but with some firms these premiums constitute the bulk of their revenue. Such firms should be described as pupil farmers and not as engineers." The course for pupils is detailed and the difficulty of ensuring discipline amongst premium pupils is referred to. The author's plan for turning out good engineers is from this cause often made futile. As the volume consists of some 540 pages, we have hardly touched the fringe of the subject. In these pages the author has given a very large number of different forms to be filled in either by the engineering staff or accountant. The only objection to the number of these is the fact that all works managers and foremen have their time fully taken up, and cannot as a rule undertake more clerical work. Hence too large a number of forms are apt to defeat the object in view of carrying work through to time, and at the same time keeping a record for the accounts department. Still, the author has devoted great labour and forethought to the preparation of the book, and many of these forms are likely to be adopted. If there is one point more than another needing amendment we think that it is the fact that approximate figures are not given. Thus we should like to get some idea from the volume as to the relative cost of labour and standing charges in engineering works; also some figures as to general values to allow for depreciation on machine tools would be useful. That exact values cannot be given we know, but students gather a good deal from a statement of approximate values. On the whole we can recommend the book to all engineers interested in the financial standing of factories.

OPENING OF THE CHESTER ELECTRICITY WORKS.

The formal inauguration of the Chester electricity supply took place on Thursday, 17th inst. We gave a full description of the generating station, it will be remembered, in our last week's issue. A number of prominent officials, townsmen, and others were present, including, of course, the Mayor and Mayoress (Mr. and Mrs. B. C. Roberts), Prof. Kennedy, Mr. Thos. Parker, Mr. T. Browne, and Mr. I. Matthews Jones, the city surveyor.

The MAYOR, in his opening speech, congratulated the citizens of Chester upon having the installation at last complete. Touching upon the history of the undertaking, his Worship remarked that having obtained tenders for the installation, the Corporation, as business men, would have nothing to do with the acceptance of any one of the competitive schemes submitted, but determined to place the matter in the hands of the greatest authority in this country and the greatest living scientist—Lord Kelvin. Lord Kelvin drew up an exhaustive report, in which he strongly recommended the Corporation to adopt that of Messrs. Thos. Parker and Co., Limited. This advice was taken, as was also the suggestion of the same authority that Prof. Kennedy should be appointed to superintend the carrying out of the scheme. In concluding his speech, the Mayor introduced Prof. Kennedy, who then gave a popular explanation of the means by which the electricity supply was effected.

The Mayoress was then called upon to switch on the current, which was accomplished by simply bringing pressure to bear on a gold bracelet, presented by Mr. Thos. Parker. The switching on of the light was hailed by loud applause.

The MAYOR then declared the installation open, and also moved a vote of thanks to the consulting engineer (Prof. Kennedy) for his very able services to the Corporation.

Councillor C. J. JONES (deputy chairman of the Electric Lighting Committee) seconded the motion.

Prof. KENNEDY briefly replied.

A vote of thanks was also accorded to Messrs. Thos. Parker and Co., Limited, the contractors; Messrs. Clarke and Thursfield, the resident engineers on behalf of Prof. Kennedy and the contractors respectively; Messrs. J. H. Davies and Sons, the architects; Mr. Helms, the clerk of the works; and the various sub-contractors.

In the evening the Mayor's official banquet was held at the town hall, advantage being taken to make it commemorative of the introduction of the electric light into the city as well. The Council-chamber, in which the banquet took place, was beautifully illuminated for the occasion by means of the new illuminant. Mr. Rooper, of Stafford, the contractor for the wiring of the town hall and public market—whose name we inadvertently gave as Rupert in our last issue—was responsible for the special lighting arrangements.

In the speech-making subsequent to the banquet various mention was made of the electric lighting scheme which had only a few hours previously been formally inaugurated, and success to the undertaking was proposed by the Mayor, and heartily responded to.

Electric Machinery for Bridges.—The Chicago Rock Island and Pacific Railroad Company's new bridge across the Mississippi from Davenport, Iowa, to Rock Island, Illinois, is about completed. The new bridge, which replaces an old single-track structure built in 1872, is a double-track railroad and highway, with a total length of 1,850ft., including a draw span of 366ft. operated by electric power. The estimated cost of the bridge is about £100,000.

HOW TO INCREASE THE WORKING EFFICIENCY OF RAILWAY MOTORS.*

BY WM. BAXTER, JUN.

The first workers in the electric railway field did not have as easy a task in the matter of designing motors as the engineers of the present time. Then electricity was endeavouring to obtain a foothold, so that it was necessary to meet the existing conditions and develop machines that would operate successfully under them, but in the course of a few years electricity obtained such mastery over the field that the designers were able to make such changes in the conditions as they found necessary to facilitate their work.

The old horse cars ran on 30in. wheels, and the under side of the body was not over 12in. above the centre of the axle, and in this space the motors must be placed. The speed of these cars was not over six miles per hour, and, while greater velocity was desired, anything over 14 or 15 miles would have been regarded as inadmissible. On account of these restrictions, the difficulty of designing a single-reduction motor was more than those engaged in the work could overcome, hence the double-reduction machines were resorted to.

As soon as the popularity of electricity became demonstrated, engineers began to study the subject with a view to devising a single-reduction motor of reasonable weight and size and capable of running at a velocity not greater than that of the double-reduction motors. As the problem was a difficult one, they did not meet with immediate success. In the meantime electricity was forging ahead so fast that it soon became evident that a single-reduction motor would be accepted, even if it were a great deal heavier and larger than the machines in use, and even if it ran at a much higher velocity, providing it would reduce the cost of repairs, and this it was very evident it would do by greatly reducing the wear of the gearing, which at that time was a formidable expense. Taking this view of the case, no doubt, the larger corporations brought out single-reduction motors, which from an engineering point were but little short of failures Their weight ranged from 3,000lb. to 3,500lb., and their size was such that they could not be used with safety on cars provided with 30in. wheels; and the speed was increased from about 14 to 20 or 22 miles per hour. Not only were the wheels increased from 30in. to 33in., but the car body was raised from 2in. to 3in. higher above the axle, and therefore the distance from the under side of the car to the track was increased from 27in. to about 31in. Notwithstanding the increase in size and weight, the cross-section of the field was so small that the torque was very much less for the same current than with the double-reduction machines.

By a series of steps the design has been improved, and as a result the modern motors are of a greatly reduced size and weight, in some cases weighing less than 1,500lb., but the size of car wheels still remains the same, and is indeed necessary, owing to the fact that the gears on the axle are larger than could be safely used with smaller wheels. The current consumption has not been reduced to any appreciable extent, saving in this direction having been sacrificed apparently to obtain reduction in weight. Some of the engineers engaged in this field justify this course by saying that current is about the cheapest thing around an electric railway plant, and that a few amperes more or less make very little difference. If this is sound reasoning, one must naturally wonder why so much money is spent in expensive compound and triple expansion engines, whose only advantage is that they reduce the cost of the output.

It is evident that a reduction in the current consumption is of the greatest importance, for it not only reduces the running expenses but also the first cost of the plant. If a saving of 20 per cent. in the average current consumption per car can be effected, the station and line capacity can be reduced to that extent, and the cost of this part of the plant would be no greater for a 100-car road than it now is for 80 cars.

Engineers who have never had experience in designing railway apparatus are very apt to believe that if the efficiency of the motors is high, any such saving as 20 per cent. is impossible; but this not the case, and it will be shown that it is not in the following paragraphs.

Some time ago a brief description of one of the latest motors brought out by the General Electric Company appeared in the columns of the *Electrical World.* Curves were given showing the horizontal effort, the speed, and the efficiency, and the latter was shown to be nearly as high as 83 per cent., with a current of 40 amperes to the car, and not lower than 74 per cent. within the ordinary working range. This efficiency is certainly very good, for it must be remembered that it includes the loss due to the friction of the gears and all other parts; but a study of the horizontal effort curve will show that the increase with increasing currents is not as great as it might be. As an illustration, take the efforts at 20, 40, and 80 amperes, which are, as near as can be judged from the curve 180, 350lb. and 1,380lb. respectively. Now, as the frictional loss is a greater percentage of the lower efforts than of the higher, the difference in the torques would not be as great as these figures, but would probably be 200, 600, and 1,500. If the field remained constant the torque would rise in direct proportion with the current, and owing to the reduced frictional loss the horizontal effort at 40 amperes would be more than double that of 20—that is, more than 360lb., probably 380lb. As at the low rate of magnetisation that must prevail with such a small current the greater part of the magnetising force is impressed upon the air-gap, the increase in the flux density should be nearly proportional to the increase in current, and therefore the effort at 40 amperes should be not far from four times as great as at 20. At 80 amperes the effort is about 1,380lb., which is not as great an increase in proportion as that between 180 and 550, but this is the natural result of the greater magnetic density. These figures indicate that the cross-section of the field is not as great as it should be to obtain the necessary flux with a low magnetising force, and that the deficiency in this direction is made up by an increase in the ampere-turns. It is believed by some that this principle of proportioning is the correct one, and in defence of it they point out the fact that if the cross-section is increased and the magnetising force is reduced the effect will be to cause the speed to drop too much when the current is increased, and they contend that it is better to use a little more current and keep up the velocity. If the difference in velocity were as great as the difference in current, and if all this difference could be made available, the argument would be a good one, but the gain in speed is effected at a very heavy current expenditure, and on this account motors having a large field cross-section and a sufficient number of turns on the armature to cut down the velocity with respect to the current, will run the car at very nearly the same speed against a given resistance, owing to the fact that the necessary effort can be obtained with less current—therefore the working velocity will not be reduced very much, but the current will. Furthermore, as the large-field motors can develop a greater torque with excessive currents, the rate of acceleration in starting will be greater, and time will be saved in this way. Adding to this the fact that running speed does not help much to increase the velocity through crowded streets, and that going down grade the fast-running cars cannot gain much as the velocity is such that the current is cut down to a point where the effect of it is slight, it must be evident that for the general run of city and suburban roads increased motor speed is of very little advantage in the way of enabling the cars to make better time from end to end of the road, and that its real effect is to considerably increase the current consumption.

Purely theoretical reasoning is seldom as convincing as an actual demonstration based upon practical results, therefore the writer may be pardoned for presenting in the following the operation of motors of his own design in which the principles above referred to were adopted.

The curves, 1, 2, and 3, in Fig. 1 show the horizontal effort, speed, and efficiency respectively of a car equipment of two motors. The dotted curves, 4, 5, and 6, give the corresponding data for the G. E.-1,000 motors just considered. The table gives the data of Fig. 1 more accurately than it can be obtained from the latter, and in addition to this the

* From the *Electrical World* (New York).

Digitized by Google

electrical and effective horse-power. The field cross-section of these motors ranges from 695 square centimetres in the armature core to over 800 in the largest parts of the field proper. The air-gap area is about 1,100 square centimetres; length of magnetic circuit, 48cm.; turns on field, 200; turns on 1,015 equal 507 in series; air-gap, 6·4mm.

A comparison of Curves 3 and 6 will show that the difference in the efficiencies of the two types of motors is very slight, and that where the current runs from about 57 to 70 amperes the dotted curve is the higher. The difference in the horizontal effort curves, however, is very great. At 20, 40, and 80 amperes the figures are: 215lb., 765lb., and 2,480lb. for the solid line and 180lb., 550lb., and 1,380lb. for the dotted. The increase in the effort of the dotted line between 20 and 40 amperes is in about the ratio of 3 to 1 and for the solid line about 3·5 to 1. Between 40 and 80 amperes it is about 2·7 to 1 in the former case and 3·25 to 1 in the latter. In the dotted line curve the increase between 40 and 80 amperes is about 90 per cent. of what it is between 20 and 40, but in the solid curve it is 93 per cent. From this we can see that for the first doubling of the current the increase in horizontal effort is less in proportion in the dotted curve than in the solid one, and that in the second doubling it is still less. This shows that the magnetisation is higher for a given current with the motors represented by the dotted curve than it is in those represented by the solid line.

is due to the fact that the small cross-section fields with high magnetising force soon become magnetised to a point where the permeability is so low that the increase in magnetising force due to increase in current produces only a small change in the flux. On the other hand, the large field cross-section, with the same current, is magnetised to a lower density, owing to the reduced number of ampere-turns. This is clearly shown in Fig. 3, which gives in Curve 9 the density in the air-gap, and in Curve 10, that through the armature core.

Although the velocities with equal currents are widely different with the two types of motors, when the relation between speed and horizontal effort is looked into it will be found that the difference is very much less. This is shown in Fig. 2, in which Curve 7 gives the speeds corresponding to different efforts, for the large field-motors, and Curve 8 the same for the small-field. Here we see that with a horizontal effort of 400lb. the speed of the two motors is 14·6 and 16·8, but the current consumption is about 27 amperes for the slow-speed and 37 for the high. The difference in speed is about 15 per cent., and to obtain this the current is increased about 37 per cent. With higher horizontal efforts the difference between speed and current becomes still greater. At an effort of 2,000lb. the speeds are about 7·2 and 9·6, while the currents are about 70 and 105 amperes respectively. The increase in speed is about 33·5 per cent. and the increase in current about 50 per cent.

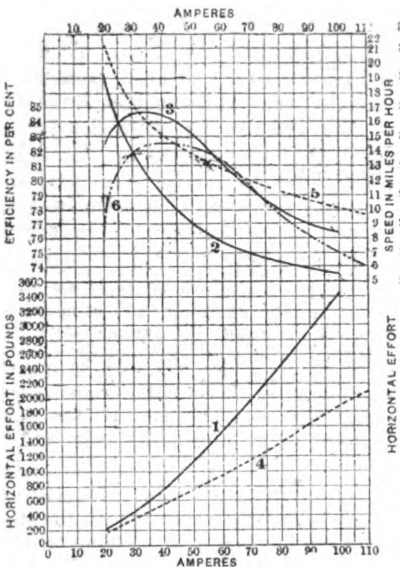

Fig. 1.

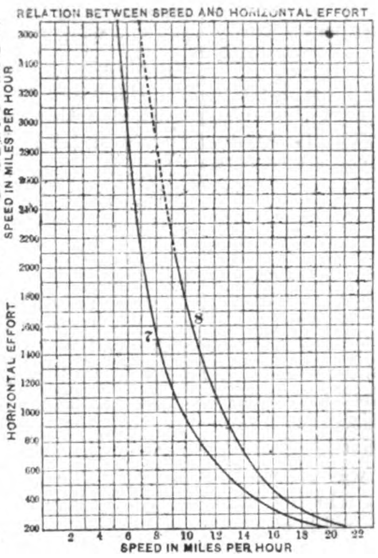

Fig. 2.

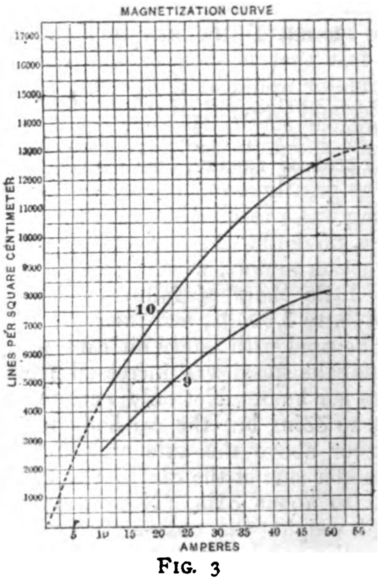

Fig. 3

The difference in the efficiency of the two motors is the natural result of the greater field cross-section. In the solid curve the maximum is reached between 30 and 35 amperes, and in the other at about 45. The explanation of this is that the proportion of the torque that is neutralised by the friction is very nearly the same in both cases, but as the large-field motors give a higher torque with the same current this proportion becomes a smaller percentage of the power developed in the case of the latter motors, hence the point of maximum efficiency is carried back to a lower current. The change in the relation of the efficiencies for currents between 60 and 70 amperes is not so easily accounted for, except upon the assumption that mistakes were made in the tests, in either or both cases, an occurrence that is possible even under the most favourable conditions. Beyond the 70-ampere point the efficiency of the solid line curve diverges rapidly from the other, which shows that the large field section increases the efficiency with large currents, a natural consequence of the lower magnetic density.

An examination of the speed curves 2 and 5 will show that with equal currents the large field cross-section runs very much slower, and the difference increases rapidly as the current increases. Thus, with 20 amperes the speeds are about 19·2 and 21·3 miles, which is a difference of close to 9 per cent., but at 60 amperes the velocities become 7·85 and 12·8 miles, the difference between which is about 37 per cent. This increased reduction in speed

From the foregoing it must be evident that to reduce the field cross-section so as to obtain higher velocity with larger efforts is not a wise course to pursue, since the increase is obtained only by the expenditure of an unreasonable amount of energy. If high-speed motors are desired, as for interurban roads, the best way to make them is with a low magnetising force and a sufficiently small number of armature-turns to obtain the required velocity with a field of as large cross-section as can be obtained conveniently. Such construction will give higher efficiency at all speeds for the same reasons that it does in generators and stationary motors. What the points here brought out show more clearly than anything else is that it is not advantageous to use motors that are designed to give a comparatively high speed when working against a high resistance for city and suburban roads. With such a construction the maximum effort is very much lower than that of motors which will slow down more, therefore the current required to start will be greater and more time will be lost in getting under headway, as the rate of acceleration will be slower.

High-speed motors, even if made with large field cross-section, are not the best for roads where there is much stopping to be done. Steam-railway men long ago found out that very little could be gained in the running time of local trains by using high-speed locomotives, because the time lost in making stops is very nearly the same in any case, and the runs are so short that the benefit of the

Digitized by Google

greater velocity cannot be utilised to any great extent. This is equally true of electric roads where frequent stops are made, and it is demonstrated practically by the record of the old double-reduction motors, which would run on a level track at about 14 miles per hour, or at about two-thirds of the speed of modern cars, but with all this difference, the average running time was very little lower than at present.

Motors that would give a speed of 15 miles with 25 amperes and an horizontal effort of 3,000lb. with less than 100 would make practically as good time as the motors now used, and would reduce the current consumption by 15 to 20 per cent.

TABLE OF CURRENT, HORIZONTAL EFFORT, SPEED, POWER, AND EFFICIENCY.

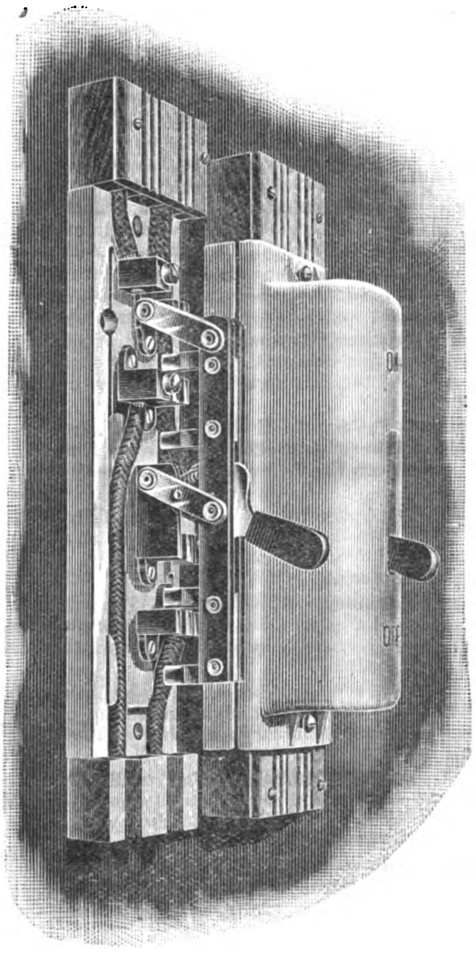
A NEW DOUBLE-POLE SWITCH.

The accompanying illustration represents a new double-pole switch brought out by Messrs. Dorman and Smith, electrical engineers, Salford, to replace the ordinary circular type of double-pole switch on 200-volt circuits. The illustration shows



a switch to carry a 15-ampere current at 200 volts. It is claimed for it that it gives a quick quadruple break and is easily wired and erected. The base and cover are of porcelain, and it is of very high insulation. It fits neatly to casing, and has a visible "on" and "off" position. It is also claimed to be suitable for arc light circuits and perfect as a small main switch.

COMPANIES' MEETINGS AND REPORTS.

MANCHESTER EDISON-SWAN COMPANY.

An extraordinary general meeting of this Company was held on December 21 for the purpose of confirming a resolution passed a month ago in favour of the amalgamation of the Company with the Edison and Swan United Electric Light Company, Limited, on terms that have been already reported.

Mr. V. K. Armitage, chairman of the Company, who presided, said that as all present were familiar with the position of matters, it was unnecessary to add anything to what he said at the former meeting, except, perhaps, that of the £30,000 that they had to take up in debentures of the United Company, as one of the conditions of amalgamation, applications had already been received for £22,000 worth. If the resolutions adopted at the previous meeting were confirmed, the Company would go into liquidation, with Mr. J. E. Sharples and Mr. H. C. Gover as liquidators, and the Manchester Edison-Swan Company would cease to exist.

The resolutions were then formally proposed, seconded, and passed.

On the motion of **Mr. F. B. Ross**, seconded by **Mr. W. T. James Fawcus**, and supported by **Mr. I. C. Waterhouse**, the thanks of the meeting were accorded to Mr. Armitage for his services as chairman of the directorate, and for the able manner in which he had assisted in carrying through the amalgamation negotiations.

Mr. Armitage, in reply, said he had been chairman of the Board from the beginning, and as his fellow-directors had always been pleasant men to work with, the duties had been of a very agreeable character.

ELMORE'S WIRE MANUFACTURING COMPANY, LIMITED.

A general meeting of the shareholders of the Elmore's Wire Manufacturing Company, Limited, was held on December 21 at the Great Northern Hotel, Leeds. Mr. J. J. Atkinson presided.

The **Chairman** said the notice convening the meeting informed them that it was not intended to do more than to adjourn it until they could produce the audited accounts to December 31, which was necessary to enable them to properly consider the proposal made to them to amalgamate with Elmore's Patent Copper Depositing Company, Limited. He did not wish to say more on this subject than had already been stated by the chairman of the Copper Company in his speech to a large meeting of their shareholders in London on the 12th inst. The chairman of the Copper Company on the same occasion pointed out that they had, in conjunction with the Wire Company, acquired and worked out at the Leeds works a method, which is carefully patented, whereby the rate of manufacture was increased enormously. Where an order had previously taken a fortnight to execute it would be executed in under 48 hours, at a fraction of the cost, and he was far from wishing it to be understood that even that marvellous expedition was the limit attainable. If he mistook not, it meant, the chairman of the Copper Company had said, at least a great extension of their business, a very rapid turnover of their capital, large profits, and possibly a revenue of royalties. The new process was being first introduced at their works, and they were very gratified by the success which was attending its operation. The output from the mine had begun to come forward, and the sales for the same proved the reality of the benefit they were to receive from the contract in question, and they wished before meeting the shareholders again to obtain their share of the full output of the mine and to give them the results in absolute figures. The whole of those benefits had been acquired without the expenditure of a penny of their own capital, which could not fail to be satisfactory to them.

Mr. Atkinson was re-elected a director of the Company.

On the motion of the **Chairman,** seconded by **Mr. F. E. Elmore,** the meeting was adjourned until further notice, which it was stated would be issued as early as possible in the New Year.

CONTRACTS FOR ELECTRICAL SUPPLIES.

CONTRACTS OPEN.

Arlon (Brussels).—Tenders will be received on January 7 at Arlon, rue de la Station 36, for an electric generating station building at the Marbehan railway station.

Elberfeld.—Among other miscellaneous stores, tenders will be received at Elberfeld on December 30 for the supply of electric light carbons for the Prussian State Railway.

Saint-Yvon (France).—Tenders will be wanted on January 31 for an electric lighting installation (to replace 1,500 gas lights) at the lunatic asylum at Saint-Yvon, in the Seine Inferieure. Application to the asylum authorities.

Breslau.—Tenders will be received on January 12 for the supply of porcelain insulators, telegraphic wire, etc., for the Prussian State Railways. Particulars are obtainable for 50pfg. (6d.). The address is Gartenstrasse 106, Breslau.

Hull.—The Corporation invite tenders for a lease of the tramways authorised to be constructed by the Tramways Orders Confirmation (No. 1) Act, 1896. Tenders to be delivered by February 1, endorsed "Tramway Tender," at the office of Mr. R. Hill Dawe, town clerk, Town Hall, Hull, from whom all particulars and conditions of tender may be obtained.

Digitized by Google

Brussels.—Tenders will be considered on January 8 by the Provincial Government for installing the electric light at the Office of Roads and Bridges. Particulars are obtainable at Brussels, rue des Augustins 17, and it is noted that tenders should be sent in on the 4th.

Karlsruhe.—Tenders will be received on January 2 next for an electric lighting installation for the railway station and pier at Constance for the Grand Ducal Railway Authorities. Particulars are obtainable for 10 marks (10s.) from the Generaldirektion, (Centralbureau) Grossh. Badischen Staatseisenbahnen, Karlsruhe Germany.

Harrogate.—The Town Council are prepared to receive tenders for wiring the Municipal Offices, Victoria Baths Market Hall, and Public Library; also for electrical fittings for the same. Specifications and forms of tender can be obtained at the office of the Electrical Engineer, Montpellier-gardens. Tenders must be delivered on or before January 1, 1897.

Leeds.—The Corporation require tenders for erection of a tramway depôt, including car and engine sheds, workshops, etc. The area to be covered is about 12,000 square yards. Quantities can be had at the City Engineer's Office, Municipal Buildings, on payment of £3. 3s., which will be returned on receipt of a bona fide tender. Tenders, properly endorsed, to be delivered at the Town Clerk's Office, Town Hall, by 10 a.m. on 31st inst.

Dover.—Tenders are required by the Town Council for the construction of about three miles of the Corporation tramways—single line with passing places—including a concrete road bed, the laying of rails, tie-bars, etc., and paving with granite setts, for the Town Council. Forms of tender, specifications, and bills of quantities may be obtained on payment of £3. 3s., returnable on receipt of a bona fide tender, and conditions and plans inspected at the Borough Engineer's Office, Town Hall, on and after 28th inst. Tenders to be sent in to Mr. E. Wollaston Knocker, town clerk, Town Clerk's Office, Castle-hill House, Dover, by 2 p.m. on January 12.

Dover.—The Town Council also invite tenders for the supply and delivery of steel girder rails, fishplates, fishbolts, tie-bars, points, crossings, and other accessories for about three miles of the Corporation tramways. Forms of tender, specifications, and bills of quantities may be obtained on payment of £3. 3s. (returnable on receipt of a bona fide tender), and conditions and plans inspected at the Borough Engineer's Office, Town Hall, on and after 28th inst. Tenders to be sent in to Mr. E. Wollaston Knocker, town clerk, Town Clerk's Office, Castle-hill House, Dover, by 2 p.m. on January 12.

Colwyn Bay.—The Urban District Council invite plans, particulars, and estimates, etc., for a scheme of electric lighting for their district, the powers for which they obtained last session. To the author of the scheme considered the best a premium of £30 will be paid, and in the event of the work being carried out such premium must be considered as part payment of the engineer's commission. To the author of the scheme considered second best a premium of £20 will be paid. Further information will be received on personal application to Mr. Wm. Jones, A.M.I C.E., the Council's surveyor. The schemes must be sent in not later than January 12, 1897. Further particulars are contained in an advertisement in another part of the paper.

Montevideo.—We have received information from the Foreign Office that the Uruguayan Government are calling for tenders for working the electric light system in the town of Montevideo, in accordance with Art. 25 of the law of liquidation of the Banco Nacional. The principal conditions are that the renting company shall take over the payment of all the private debts of the concern, which, on September 30, 1895, were as follows: Banco Hipotecario del Uruguay, mortgage in cedulas on the central station in Calle Yerbal, 63,865dol.; mortgage on the central station in Arroyo Seco, 71,411dol.; Ernesto Tornquist, for machinery, 29,332dol To carry out the public lighting at a price 5 per cent. below that actually paid for the first five years, and 10 per cent. discount for the second five years. The rental to be for 10 years. The renter to take over the debts of the concern. The renter to purchase 400 shares at present in private hands. Tenders to be presented on January 15, 1897, at 2 p m. A guarantee of 10,000dol. to be given. Tenders are to be sent in sealed envelopes to the Ministry of Finance, and will be opened in the presence of the interested parties.

RESULTS OF TENDERS.

Breslau.—The tenders on December 14 of seven firms for the supply of telegraph posts (about 32ft.) to the State Railway at Breslau varied from 7·50 marks (7s. 6d.) to 5 marks (5s.).

Dundee.—The Directors of the Royal Infirmary having agreed to light the new nurses' home at the infirmary by electricity, have accepted the tender of £100 sent in by Messrs. Lowdon Bros, Tay-street.

Darmstadt.—In the contracts for railway stores during 1897 for the Main and Neckar Railway on December 10 the contract for sulphate of copper was not tendered for, and the tenders for telegraphic paper varied from 10pfg. to 8½pfg.

Portsmouth.—The Town Council have accepted the joint tender of Messrs. Yates and Thom and S. Z. de Ferranti, Limited, for the supply of new plant at the electric light works. The amount of tender, after deducting 5 per cent. off the sum quoted for the engine, which was agreed to, was £8,448. 17s. 6d.

Shoreditch.—The Vestry have received the following tenders for the supply of wiring materials. Accepted tenders:—Henley's, 27, Martin's-lane, E.C., wires and cables; British Insulated Wire Company, Prescot, wires and cables; General Electric Company, 69, Queen Victoria-street, E.C., instruments, tools and sundries; J. Williamson and Son, 92, Queen Victoria-street, E.C., switches, etc. Also tendered: Drake and Gorham, 66, Victoria-street, S.W.; Edison and Swan, 36, Queen-street, Cheapside; Fowler, Lancaster, and Co., Graham-street, Birmingham; Francis and Spilsbury, 20, Bucklersbury; India Rubber and Gutta Percha Company, 106, Cannon-street, E.C.; Johnson and Phillips, 14, Union-court, E.C.; Lyel and Co, 56, Victoria-street, S.W.; Paterson and Cooper, 68, Victoria-street; Siemens Bros., 12, Queen Anne's-gate; Lancashire Electric Company, Kingsland-green; International Electric Company, 55, Red Cross-street, E.C.; Telegraph Manufacturing Company, Helsby, Warrington; Verity's, 31, King-street, Covent Garden.

London.—The County Council have received the following tenders for lighting the Whitefriars fire-engine station with electricity, £50 being included in each case for contingencies:

Private Wire and Telephone Installation Company (accepted)	£368	16	0
Brush Electric Engineering Company, Limited	375	0	0
Drake and Gorham	415	0	6
Russell and Russell	444	0	0
R. F. Barrett Lennard	463	2	6
Crompton and Co., Limited	480	0	0
F. A. Glover and Co.	489	0	0

BUSINESS NOTES.

Western and Brazilian Telegraph Company.—For the past week the receipts were £2,636.

Fort William.—The new post office, for which a site has now been found, is to be lighted throughout by electricity.

Howth.—A public meeting has been held in support of the Clontarf and Hill of Howth electric tramway which it is proposed to construct.

Witham.—Mr. J. Aloysius Kuner, who has recently taken possession of the Crown Inn, has had an electric light installation erected on his premises.

Uruguay.—In entering into contracts for works in Uruguay it is well to remember that at present there seems to be something very like a revolution going on there.

Mangotsfield.—The Parish Council have appointed a committee to meet the Bristol Tramways Company respecting the proposed extension into the district of Staple Hill.

Morley.—The Town Council have resolved to apply to the Board of Trade for a provisional order to supply electricity within the borough for lighting, power, and heating.

Kensington.—The question as to the advisability of opposing the City and West-end Railway scheme has been referred by the Vestry to the Law and Parliamentary Committee.

Electrical Traffic Syndicate, Limited.—This Company has been registered, with a capital of £1,000 in £1 shares, to develop and further the use of electricity in connection with traction.

Anglo-Portuguese Telephone Company.—Coupon No. 18 of the first mortgage and No. 13 of the second mortgage debentures will be paid, less income tax, by Parr's Bank on and after 1st prox.

National Telephone Company.—The transfer books of the 3½ per cent. debenture stock will be closed till the 31st inst. for the preparation of the warrants for the half-year's interest due January 1.

Warrington.—The Special Electric Lighting Sub-Committee of the Town Council have instructed the town clerk to make application to the Board of Trade for power to supply the town with electric light.

Killarney.—Dr. Griffin reported at the meeting at the District Lunatic Asylum that the electric current was now supplied and the asylum lighted by it. The current had been steady, and the light quite satisfactory.

Electrical Machinery.—At the second ordinary general meeting of Messrs. R. and J. Pullman, the Chairman stated that they were about to introduce electricity in connection with the manufacture of some of their products.

Berlin.—Electric tow boats are about to be placed on the River Spree, where for a distance of eight miles the ordinary barges cannot use sails owing to a large number of low bridges. The trolley system will be used.

Liverpool Overhead Railway.—The traffic receipts of this railway for the week ended December 20 amounted to £1,116, as compared with £1,080 in the corresponding week of the previous year, being an increase of £36.

Tunbridge Wells.—Mr. H. L. P. Boot, the borough electrical engineer, delivered a lecture last week entitled "The Electric Light in Tunbridge Wells." The lecture was given under the auspices of the Tradesmen's Association.

Bristol Tramways and Carriage Company, Limited.—The traffic returns for the week ended December 18 were £1,859. 4s. 8d., compared with £1 780 16s. 7d. for the corresponding period of last year, being an increase of £78. 8s. 1d.

Croydon.—The Corporation have decided, on the advice of Prof. Kennedy, to provide a cooling tank for the condensing plant at the electric lighting station, in lieu of conveying water direct to the condensing plant, as originally intended.

Digitized by Google

Bedford.—A deputation from Reigate Town Council visited the electric light works last week and were shown over the public buildings and town by Alderman Richards.

New Book—An illustrated book has just come from the press giving in popular language an account of the progress of electric traction. Its title is "Electric Tramways and Railways Popularly Explained," and the author is Mr. H. Scholey.

Dangerous Trades.—Acting under Section 8 (1) of the Factory and Workshop Act, 1891, the Home Secretary has certified that the process of vulcanising indiarubber by means of bisulphide of carbon, and the processes incidental thereto, are dangerous or injurious to health.

Electric Lighting of Trains.—A successful experiment has been made in lighting the London, Chatham, and Dover Railway Company's boat express trains with electric light, the current for which is generated by the train's motion. The light is to be used in the new corridor trains.

New Year Number.—We have received a copy of an established monthly magazine called *Mothers and Daughters*, with which is given away a bound supplement containing a complete story "True till Death." The book is published at the low price of a penny from *Great Thoughts* office.

City and South London Railway.—The returns for the week ended December 20 were £1,082, compared with £1 013 for the corresponding period of last year, being an increase of £69. The total receipts for the half-year 1896 were £24,103, compared with £22,553 last year, being an increase of £1,550.

Farnworth.—At the District Council meeting a resolution in favour of applying to the Board of Trade for a provisional order for the supply of electric energy for all public and private purposes as specified in Section 3 of the Electric Lighting Act, 1882, within the Council's area, was formally adopted.

Warminster.—Having considered a letter from the Board of Trade with reference to the existing electric light cable, the General Purposes Committee recommended at the Urban District Council meeting that it should be removed by disconnecting it near Mr. Mark Hill's yard. This was agreed to.

Walsall.—A slight accident occurred last week on the electric system of the South Staffordshire Tramways between Walsall and Darlaston. Two cars—a passenger car and a special freight car—collided with each other. The driver of one of the cars sustained a slight injury to his ankle, but no one else was hurt.

Bedminster.—At the Parish Council meeting, Mr. Enwright proposed, "That this Council regrets the decision of the Bristol Town Council with reference to the tramways extension, and considers it a distinct violation of their pledge." Six voted for and six against the motion, the chairman refusing to vote.

Brighton.—The *Sussex Daily News* has an interesting little article on electric lighting at Brighton, showing that on December 19 there were 1,357 private customers—a net increase of 300. Electricity for motive power is also on the increase, and the lighting of the street lamps is being extended very rapidly.

Makin, Smith, and Co., Limited.—This Company has been registered, with a capital of £1,000 in £1 shares, to carry on the business of an electric light company, and of electricians. mechanical engineers, and suppliers of electricity; as electrical apparatus manufacturers, etc. Registered office: 19, Ramsden-street, Huddersfield, Yorkshire.

Electric Ploughs.—In reference to the experiments in electric ploughing that have been made in Germany, it may be stated that the German Agricultural Society are offering a prize for improvement in steam ploughs "or ploughs operated by power other than from animals." The conditions are given fully in the *Elektrotechnische Zeitschrift* of November 12.

York.—Tenders for the electric lighting of the city were opened by the Streets and Buildings Committee of the Corporation at their meeting, and were ordered to be submitted to Prof. Kennedy. It is stated that the tenders were less numerous than they have been on previous occasions, and that none of the firms have tendered for the working on a term of years.

Morecambe.—The Lighting and Water Supply Committee reported at the District Council meeting that they had received a letter from Messrs. Hargreaves and Co., London, agents to Mr. Tilly, respecting application for a provisional order for the electric light undertaking. It was decided that the agents be instructed to proceed with the printing and depositing the provisional order. This report was adopted.

Commercial Changes.—By an arrangement between the Epstein Electric Accumulator Company, Limited, and Mr. L Epstein, the latter, in order that he may devote more time to other business, and especially to electric traction. has resigned his position as managing director of the Epstein Electric Accumulator Company, Limited, retaining his seat on the Board and acting as consulting engineer to the company.

Newcastle.—The Queen's Commemoration New Infirmary Fund Committee have accepted the offer of Mr. H. Engel to issue and place on sale 100,000 tickets of admission at the ordinary price of 1s. each, and available at any time, and on any one day during the run of the electrical exhibition, and if these were sold by the time the exhibition was opened he would give a donation of £1,000 from the funds of the exhibition.

New Traffic Syndicate, Limited.—This is the title of a company which has been registered, with a capital of £12,000 in £1 shares, to promote the interests of the movement or industry of placing motor vans, motor wagons, and all kinds of mechanically-propelled vehicles on the common roads, and to carry on the business of electricians, cycle, motor, and carriage manufacturers, etc. Registered office: 6, Old Jewry, E.C.

Radcliffe.—At the meeting of the District Council the Chairman of the Electric Lighting Committee reported that as a result of a visit to the Nelson electricity works he believed it was quite possible for an electric lighting installation to be self supporting in Radcliffe. It was resolved that application should be made to the Board of Trade for an extension of time for the carrying out of lighting in the compulsory area.

Limehouse—The District Board have agreed to consent to the application of the County of London and Brush Provincial Electric Lighting Company, Limited, for a provisional order under the Electric Lighting Acts, 1882 and 1888, in the form submitted by the company, in respect of the district of the Board, subject to the omission therefrom of Sub-clauses 2 and 3 of Clause 55 relating to the purchase of the undertaking by the Board.

Belfast.—At the meeting of the Electric Committee the engineer reported matters of detail in connection with the working of the department and the new plant recently erected, and received instructions in these matters. The question of the site for the proposed station was again under consideration as the site selected was held to be necessary for the requirements of another committee, and the town clerk was instructed to report on the matter at next meeting.

Hampstead.—At the meeting of the Vestry a long discussion took place on the proposal of the Finance, Lighting and Works Committees to transfer the insurance of one of the alternators in the central electric lighting station and some of the public buildings from the Norwich Union Fire Office to the Fine Art and General Insurance Company, the proposal being agreed to by a very large majority. It was stated that a very considerable saving will be effected by the transfer.

Telephone Workers' Conference—An adjourned conference of telephone workers from various parts of England took place on Sunday afternoon at Leeds. Certain proposals were formulated, and these will be forwarded to the headquarters of the Gasworkers' and General Labourers' Union in London, the officials of which will bring them before the directors of the National Telephone Company. After receiving a reply from the company another conference will be called, if necessary, to consider the matter.

Birkenshaw.—At the meeting of the District Council it was decided to invite the Gomersal District Council to meet the Birkenshaw Council and discuss the question of formulating a scheme of electric lighting for the two districts. The matter had been discussed previously by the Finance Committee, who recommended that this course should be taken. The Chairman (Mr. B. Crowther) stated that the committee were in favour of promoting a scheme on their own account if Gomersal would not join them.

Dover.—At the meeting of the Managing Committee the Tramway Sub-Committee recommended that the tenders for the lines be invited in three contracts—one for the rails and other metal works, the second for the permanent way, and the third for the electrical equipment. In connection with the third they recommended that Mr. Sellon's services should be retained. and his remuneration should be 5 per cent. on that portion of the tramway's expenses. The minutes were approved and the tenders ordered to be invited.

Fyvie—A meeting of villagers has been held for the purpose of considering as to the lighting of the village, and whether that should be done by means of gas lamps or electric lights. There was a good attendance. A committee was appointed, consisting of Mr. Mackie, Lewes; Mr. Stephen, Ashgrove; and Mr. Ogg, to make all necessary arrangements in getting an estimate of the expense, not only of gas lamps, but also of the electric light, as water power could be obtained. The committee will report to another public meeting.

The Giant's Causeway Electric Tramway.—Some correspondence has passed between Mr. Jas. Boyle, J.P., Ballymachrea, Portrush, and the Board of Trade with regard to the system of traction employed on the Portrush and Giant's Causeway tramway. In reply to Mr. Boyle, Mr. F. J. Hopwood, of the Board of Trade Railway Department, says he is directed by the Board of Trade to inform Mr. Boyle that they do not appear to have any authority to compel the company to stop the electric working of the line, which was authorised by a special Act of Parliament.

Stapleton.—At the meeting of the Urban District Council a deputation from the directorate of the Bristol Tramways Company attended for the purpose of interviewing the Council upon the question of the proposed extension of the electric tramways through the parish of Stapleton to Staple Hill. The deputation consisted of Mr. George White (chairman of the board of directors), Messrs. S White (secretary), H. G. Doggett (solicitor), and G. T. Edwards (engineer). After discussion of the various points in the company's proposed Bill, a resolution was passed consenting to the Bill.

Kingston—Councillor Collings has been reappointed chairman of the Lighting Committee. The Chairman reported at the Town Council meeting that an arrangement had been arrived at with the consulting engineer, Mr. A. H. Preece, in regard to his relations with the committee. The committee recommended that the arrangement be agreed to, and also that the Corporation seal be affixed to an agreement with the Surbiton Urban District Council as to the discontinuance of supplying electricity at the assembly rooms in the event of the Council themselves being in a position to do so. This was agreed to.

Newmarket.—At an adjourned meeting of the Urban District Council the Surveyor submitted his estimate of the sums proposed

Digitized by Google

to be spent in connection with the electric lighting provisional order applied for by the Council as follows: engine and boiler house plant, £5,000; buildings, chimney, and foundations, £2,200; mains, £2,500; provisional order, £300—total, £10,000. After discussion, it was decided to add £500 for the purchase of land for the works, and the clerk was instructed to deposit the necessary documents with the Board of Trade, including a statement that the proposed expenditure would be £10,500.

Cromer.—Mr. Broadhurst asked at the Town Council meeting if it was to be understood that the Council had abandoned its intention of protecting itself in the matter of the electric light. The Chairman replied that when the cost of a provisional order was named the matter was dropped. Mr. Broadhurst said he did not propose to argue the subject. He only wished the Council to realise the importance of the step that it had taken, and for the members to be prepared to stand by the responsibility of the action. He was sure that they would regret the decision one day. However it was open for the subject to be brought up again.

Lisburn.—A special meeting of the Street Committee has been held to consider the advisability of engaging a competent electrical engineer to report as to whether electric lighting plant could be erected for the purpose of lighting the town by electricity. Mr. G. B. Wilkins (chairman) presided. The matter having been carefully considered, and several engineers having offered their services, it was unanimously resolved that Mr. E. S. Dashwood, electrical engineer to Messrs. William Coates and Son, Belfast, be appointed consulting electrical engineer to the Town Commissioners, and to report fully on the best system for lighting the town.

Diary.—We have received a copy of the *Indian and Eastern Engineer* diary for 1897. This book contains a lot of particular information relating to Indian postage, shipping, railways. The abstract of customs tariffs for India, Siam, Corea, Japan, Ceylon, England, etc., will be found very useful. The information relating to railways and tramways, not only in the Indian peninsula, but the Far East generally, is very full and very valuable. The useful tables of Oriental weight are repeated, but we still miss what is much wanted—viz., tables of the coins of China, Persia, and the Malay peninsula. In all other respects this diary ranks among the best that are published.

Another Electric Railway.—A railway is projected which will connect High Beech with Moorgate-street and work in conjunction with the Great Northern and City Railway. For about four miles the line will be constructed in two parallel tunnels, and the remainder will be in the open. The tunnels, as in the case of the Great Northern and City, will be 16ft. in diameter, and at an average depth of about 40ft. The Act authorises the use of both steam and electric locomotives. The Great Northern and City is at present restricted to electricity, although the Bill it will present to Parliament in 1897 will provide for steam as well. It is expected than an active commencement will be made on the work of construction early in the New Year.

Proposed Amalgamation.—The stockholders of the Commercial Cable and the Postal Telegraph Cable Companies met on December 22 to vote on a proposition to exchange the stock of the Postal Company (15,000,000dol.) dollar for dollar, for new 4 per cent. gold bonds of the Commercial Cable Company, part of an issue of 20,000,000dol., of which 5,000,000dol. will remain in the treasury. The Postal Company paid its first dividend at the rate of 1 per cent. quarterly in April, 1896. The Commercial Company has paid 7 cent. annually since 1891, and last week declared an extra dividend of 1 per cent. The two organisations have been working together on an agreement which expires this year, and it was decided to make the union a permanent one.

Middlesbrough.—A proposal was made at the meeting of the Streets Committee for fixing incandescent lights to all the burners except the chandeliers. Councillor Carter thought they should let the matter stand over, as next year they might be going in for the electric light. Councillor Keay expressed a similar opinion, and moved as an amendment that the matter stand over for 12 months. Mr. Carter seconded, but the amendment was lost and the motion was adopted. The question of granting permission to the Imperial Tramway Company to extend the tramways in the town and adopt the overhead electric trolley of traction was again considered. It was ultimately agreed that the chairman and town clerk formulate questions for reply by the tramway company.

Turin Exhibition.—In reference to the international electrical exhibition to be held in Turin in 1898, the Executive Committee and the Special Commission, of which Prof. Galileo Ferraris is president, invite exhibits from all parts of the world. The exhibition will embrace the following classes: (1) apparatus for teaching electrotechnics; (2) materials for conduction of electricity; (3) instruments for electric and magnetic measurements; (4) telegraphs and telephones; (5) signalling apparatus and safety appliances on railways, lighting and heating of carriages; (6) dynamos and motors; (7) mechanical appliances and electric traction; (8) electric lighting; (9) electro-chemistry and electro metallurgy; (10) miscellaneous; (11) apparatus of historic interest.

Watford.—At a meeting of the Urban District Council it was reported that at a meeting of the Electric Lighting Committee a letter from Mr. Hawtayne was read, stating that he had had several interviews with Messrs. Shone and Ault on the subject of the proposed combined electric lighting and sewerage works for Watford, and as a result a rough general plan of the buildings had been prepared by them and was being forwarded, adding that there would be a few minor alterations to be made, and he should be glad to meet the committee at an early date to discuss the matter with them. The committee were invited to inspect the plan when received, and, if necessary, the clerk was authorised to arrange a meeting with Mr. Hawtayne. Ultimately it was decided that a committee of the whole Council should consider the scheme.

Epsom.—At the Urban District Council meeting the Lighting Committee presented a draft memorial to the Board of Trade applying for a provisional order giving the Council power to introduce the electric light in Epsom for public and private purposes. Mr. Langlands enquired what the cost would be. In the first instance they were informed that it was to be £25. That amount had been incurred, and in addition another £50. Mr. Beams said he understood the initial cost would be £200. Mr. Jay asked if it would be a valuable property when they had obtained the order. The Chairman said as far as he understood the matter it would. If they decided not to make use of the powers conferred upon them by the order, they could turn them over to a company. He moved that the memorial be sealed and signed. This was seconded by Mr. Beams, and carried.

Wolverhampton.—The following resolution was adopted at the Town Council meeting: "That subject to an agreement being entered into between the Dudley and Wolverhampton Tramways Company, Limited, and the Corporation, containing the same terms and conditions as the existing agreement, with the addition of a condition requiring that the company shall not on Sundays load or unload their cars, or permit or suffer the same to be loaded or unloaded, or permit or suffer their engines or cars to stand upon any portion of their line to the northward of George-street, in this borough, the Council do grant their consent to the use of steam on the Dudley and Wolverhampton tramways (so far as the same lie within this borough), from November 14, 1896, until November 14, 1897, unless in the meantime such consent be withdrawn in pursuance of the terms of the proposed agreement."

The Electrical Company.—We have received from the Electrical Company, Charing Cross-road, a tastefully got-up little pamphlet, entitled "A Glimpse into the Factory of our E.C. Incandescent lamps" From the numerous illustrations (they are German—not English) the amount of the work of lamp-making that gets done by women would appear to be pretty considerable. Of course, they do not blow glass or fire it, and it would seem that they are not wholly to be trusted for packing, but otherwise they seem to have it very much their own way all over the place. With this the Electrical Company send us the radiography (Röntgen ray) apparatus price-list. They adopt platino-cyanide of barium for the screen and make a T-shaped tube with two anodes and a cathode where the three arms meet, but in the instructions for use there is a direction which is equivalent to saying "use one anode if it works better."

Ardrossan.—The new installation of electric light at the harbour was turned on on Friday evening last by Mrs. Hugh Hogarth in presence of a large gathering of local ladies and gentlemen. Mr. Craig, harbour manager, who presided, explained that electric light was first introduced at the harbour in September, 1892, but the installation at that time was confined to the Eglinton Dock and Montgomerie Pier Station. The new installation embraced the old dock. The installation of 20 lamps had been increased to 43 altogether of 3,000 c.p. each. In the old system, when one light went out, all the others went out too, but under the new system when one light went out it did not affect the others. In the old lamps the carbons only burned for about 12 hours, or perhaps less; the new carbons burned for 20 hours. The improvements in the new installation would be extended to the old one as soon as possible. The dynamos were driven by two separate engines, steam being supplied from the boilers connected with the hydraulic engines. The extension had been carried out by a competent staff, under the direction of Mr. Stevenson, electrical engineer for the Caledonian Railway Company.

Leeds.—For the purpose of considering the best means of providing a new central tramway depôt a special meeting of a sub-committee of the Tramways Committee has been held. The city engineer submitted for approval plans for car and engine sheds on Kirkstall-road, shed for repairs, and other new buildings in connection with the working of the tramways of the city. The area over which the proposed premises are to be built is about 3½ acres. There is to be accommodation for 150 cars, including 50 electric cars and 24 locomotives. According to the plans, there are also to be repairing sheds for cars and for locomotives, and workshops for joiners, mechanics, blacksmiths, painters, and other workmen. The meeting decided that the city engineer should complete the plans for the new depôt, and invite tenders to be sent in at such date as would enable them to be laid before the committee at its next meeting, and if approved of submitted to the City Council at its January meeting. It was agreed to hold the meeting of the committee to consider the tenders on the last day of the year. The question of central offices for the tramway business was considered, but it was decided not to build any offices at this depôt.

Portsmouth.—The Electric Light Committee recommended the Town Council at the last meeting to accept the joint tender of Messrs. Yates and Thom and S. Z. de Ferranti, Limited, subject to a deduction of 5 per cent. off the sum quoted for the engine, which had been agreed to, also that a joint contract be entered into by the two firms for the supply of the whole of the plant. The amount of the tender, after allowing for the deduction, was £8,448 17s. 6d. Mr. Evans asked why the work was not tendered for. Mr. Dittman asked how much the engine would cost. In reply, Alderman Ellis said the cost of the engine was £5,000 odd. No one could tender for the work but Ferranti's. Mr. Dittman said that other firms than Yates and Thom could tender for the engine, and tenders ought to have been asked for. Mr. Dummer thought that

Digitized by Google

tenders should have been invited. There was much more discussion, during which Sir John Baker said it would be very unwise not to support the committee's recommendation. He suggested, however, as a safeguard, that the excellent Electric Lighting Committee and the trebly excellent chairman should allow it to be known that in future two or three good firms should be asked to send in prices. The recommendation of the committee was carried

Glasgow.—Mr. D. M. Stevenson asked at the meeting of the Corporation whether there was anything to prevent the gas and electric lighting services being made separate departments under the existing Acts of Parliament. Mr. Monro replied that he was not aware that there was anything to prevent the two departments being separated. The Corporation Tramways Committee, at a meeting last week, considered an offer to equip the cars with a new motor. The motor proposed is on the oil principle, and is the joint patent, it is stated, of Mr. George Johnstone and Sir William Arrol. The offer is to equip every tramway route in Glasgow with cars driven by mechanical traction, and to run these for a period of seven years at a cost to the tramway department not exceeding what it at present pays for horse haulage. At the end of the seven years the promoters undertake to hand over to the Corporation, as a free gift, the whole of the cars, with their motors, in good working condition, and free of any charge for royalties. It is calculated that horse haulage costs £100,000 per annum. The patentees are prepared at their own expense to furnish within four months motorcars for any route in the city, on the condition that, should the Corporation decide, after two months' trial, that the cars are unsuitable, they shall be withdrawn, and the community held in no way responsible for the expenditure incurred. After discussion, the committee decided to give all reasonable facilities to the inventors.

Jamaica.—The application lately made by the Jamaica Street Car Company, Limited, under the Tramways Law, 1895. for a license to establish tramways in Kingston and its environs having been refused by the Governor in Privy Council, parties willing to undertake the establishment and working of a system of rapid transit within the above district are again invited to forward applications for a license therefor, under the provisions of the above-mentioned law and the rules made thereunder. Applications must be addressed to the Clerk of the Privy Council, in Kingston, Jamaica, and should be enclosed in sealed envelopes, endorsed "Application for Tramway License." It has been decided by the Governor that he will not fix, under Section 6 of the Tramways Law, 1895, an earlier day than April 15 next for bringing any such application before the Privy Council for consideration; but on receipt of the first application the Governor will fix April 15, or the earliest possible subsequent day, for bringing it, and all other applications, if any, which may then be ripe for consideration, before the Privy Council, as provided by the above-mentioned section. Copies of the Tramways Law, 1895, and of the rules made thereunder by the Governor in Privy Council, and maps of Kingston and the surrounding parts of the parish of St. Andrew, may be seen in London at the office of the Crown Agents for the Colonies; in New York at the office of Messrs. Gilliespie Bros and Co., 4, Stone-street; and in Kingston, Jamaica, at the office of the Colonial Secretary.

Moss Side.—At an ordinary meeting of the Urban District Council it was reported that at a special meeting of the Council held on the 17th inst. an agreement with the Manchester Corporation with reference to the electric lighting order was approved. The main provisions of the agreement were that the Corporation should take a transfer of the order and become the undertakers to supply the Moss Side district with electric lighting for a term of 15 years, refunding to the Council the cost of obtaining the order and of the transfer deed, on condition that the charges in the Moss Side district were in all respects the same as those made within the city; that the Council could repurchase the undertaking within six months after the term of 15 years, or any subsequent fifth year; and that within two years preceding any purchase period no expenditure exceeding £100 on capital account should be incurred without the approval of the Moss Side Council, except in case of emergency, with a special provision in that event; and that the Corporation should not mortgage the Moss Side general district rate nor the Moss Side portion of the undertaking. The Chairman, in moving the adoption of the minutes of the special meeting, said what had been done was of great importance to the district. He thought that the ratepayers would cordially approve of the agreement with the Manchester Corporation for the electric lighting of the district, especially in regard to the clause giving the Council the power of taking over the undertaking, if they were in a position to do so, at the end of 15 years. The proposal of the chairman was seconded, and the minutes were unanimously approved.

The Postal Telegraph Staff.—A meeting of members of the London branch of the Postal Telegraph Clerks' Association was held last week. Mr. A. S. Nicholson occupied the chair, and, in opening the business, said they were met to crystallise the sentiment of dissatisfaction and discontent which existed amongst the members of the staff with regard to the arrangements for holidays next year, by which a large number were obliged to take their annual leave during January, February, November, or December. They would also be asked to press upon the Government the necessity for the early issue of the report of Lord Tweedmouth's Committee Their staff was obliged to keep in good health for the serious character of the work which they had to perform; but it was impossible to get the advantage necessary from a holiday in the winter months. The only way of effecting an alteration would be to increase the staff, which meant more money expended; but with an increase of staff they might be able to get rid also of the "long and short duties," which was one of their grievances. There was a profit handed to the Treasury of more than £3,000,000 a year, and he considered that to pay over £3,000,000 ought to satisfy the Government, and the surplus above that should go in aid of the working of the Department. Such an allowance would enable the Department to relieve the pressure, and so remove the grievances under which the Department laboured. There were 3,000 members of the staff who were waiting anxiously for the report of Lord Tweedmouth's Committee, and he thought they had shown great forbearance in the matter. A resolution asking the Postmaster-General to introduce for 1897 a more satisfactory arrangement of the periods of annual leave was passed unanimously, and the form of a memorial in which the resolution was embodied to be presented to the Duke of Norfolk as Postmaster-General was agreed to. The second resolution pressed for the early publication of the report of Lord Tweedmouth's Committee, and the meeting closed with a vote of thanks to the chairman.

Cardiff.—At the meeting of the Tramways Committee held yesterday week the question of the purchase of the tramways, which at the last meeting of the Council was referred back to the committee for further consideration, was again discussed A report was submitted by the town clerk as to the dates and terms of purchase and the exact position of the Corporation in relation to that of the tramway company. Alderman Carey put the following question: Supposing we agreed to buy the tramlines within a few weeks, can we buy at 30 per cent.? The Town Clerk answered in the affirmative. Mr. Waring: And the rolling-stock as well? The Clerk: That is so. Alderman Carey: Will the 30 per cent. apply to the plant as well as to the lines? The Town Clerk: Yes. Ultimately, the following resolution, proposed by Mr. Lloyd Thomas, was carried with three dissentients: "After considering the report of the town clerk this committee desires to recommend the purchase of the tramway lines and depôts for £61,000, the lines to be leased to the Corporation for a term of 15 years at a rental of 5½ per cent.; that the existing lines be made equal to new; that the cost of repairs be met by the company; that the fares be not raised; that the lines be doubled where necessary and convenient; that electrical, mechanical, or other traction be used when called upon by the Corporation, and that all extensions of the newly constructed lines be renewed on the same basis" A meeting of the Joint Parliamentary and Tramways Committee has also been held. It will be remembered that at the last meeting of the Council they referred back the recommendation made by the Joint Tramways and Parliamentary Committees to the effect that leave be not given to the Cardiff and Penarth Electric Tramway Syndicate to apply for a provisional order. At the Council meeting the town clerk read a letter from Mr. Ivor Vachell, solicitor to the Penarth Electric Railway Syndicate, offering, if the Joint Committee thought well, to meet them to talk the matter over. Eventually, on the motion of Councillor Crossman, seconded by Councillor Tucker, it was resolved to adjourn the meeting for the exclusive purpose of receiving a deputation from the syndicate should they wish to appear.

Hull.—A letter has been received by the Electric Lighting Committee from the secretary of the North-Eastern Railway Company stating that the directors had under consideration the question of lighting their station hotel at Hull by electricity, and he was desired by them to enquire at what price per Board of Trade unit the Corporation would be prepared to supply electric current for the purpose. The number of lights to be provided was estimated to be equal to 700 16-candle lamps or their equivalent in larger or smaller lamps. After some discussion it was resolved that the engineer report on the subject. The committee have confirmed the minutes of the sub-committee, which stated that having considered the letter from the Electric Lighting Extension Syndicate, Limited, it was moved and carried that the letter and draft terms proposed by the syndicate for erecting penny-in-the-slot meters lie on the table for six months. Now, that on the third time of asking the Council has by a majority of 29 passed the scheme it twice previously rejected, it is expected that the work for the extensions will be proceeded with rapidly. The question of the sub-stations has been left in the hands of Mr. Skinner, Mr. Millington, and the electrical engineer to select suitable sites, and a resolution was proposed at the meeting of the Electric Lighting Committee to the effect that the engineer should prepare plans and specifications for the proposed extension scheme. A long discussion took place on a proposition that Mr. Hammond be engaged as consulting engineer to assist Mr. Barnard, at a remuneration of 500 guineas, and ultimately it was decided to write to Mr. Hammond on the subject. The matter has been going on so long that it may be well to briefly remind our readers that the accepted scheme is one for giving the new area a continuous-current supply on the three-wire system at 440 volts between the outers, and derived from a transforming station fed by a high-tension feeder (2 000 volts) from the central station, leaving the old 220 three-wire system intact. An amendment to make the new scheme include East Hull was ruled out of order. The idea of the majority of the Council as opposed to the committee, though not definitely formulated, appeared to be either to have an entirely separate generating station for the extensions or, alternatively, to make such alterations in the existing work as would enable it to carry 440 instead of 220 volts. A special meeting of the Electric Lighting Committee has since been held, when it was decided to apply for power to borrow £10,000 to extend the electric light to East Hull.

Reading.—At a special meeting of the Corporation the Tramways Committee reported that they had received a letter from Mr. J. Clifton Robinson, managing director of the Imperial Tramways

Digitized by Google

Company, Limited, dated December 7, in the following terms: "Referring to our application 14th ult. and to the Finance Committee's recommendation, adopted by the Council on the 3rd inst., the directors desire to say that having regard to the general feeling of the Council as indicated during the discussion of the report, they are prepared to submit the following to your committee as an alternative proposition: The company will agree to sell at once to the Corporation the whole of their undertaking under the provisions of the compulsory purchase clause of the General Tramways Act, 1870, and in the event of such sale being effected the company would be prepared to take a lease of the lines on terms and conditions to be arranged, the Corporation assenting to the carrying out of the company's order, subject to any modification of the extensions, set forth in the plans and sections, as may be mutually agreed upon. There are other points which will arise in discussion, and I shall be pleased to meet your committee for this purpose." It was resolved that the town clerk should inform the Reading Tramways Company, Limited, through their secretary, that the letter submitted did not indicate a sufficiently clear basis upon which the Council could proceed to negotiate with the company. The committee considered generally the course which should be taken on the subject of tramways in the borough, and resolved that in the opinion of the committee the Council should determine without delay the general question whether the existing tramways or any future tramways within the borough should be in the hands of the Corporation, the method of working such tramways, whether by electric traction or otherwise, and if they should determine that the tramways should be in the hands of the Corporation, and that electric traction should be used, the expediency of acquiring the undertaking of the Reading Electric Supply Company, Limited; and that in connection with this subject the Council should consider the question of the probability of their constructing at some future time light railways under the provisions of the Light Railways Act, 1896, and of the same being worked by electric traction. The Council, after a long discussion, decided to adhere to their previous determination not to consent to the proposed new provisional order of the Reading Tramways Company, Limited, and that they were not prepared to give such consent upon any terms during the ensuing session of Parliament.

PROVISIONAL PATENTS, 1896.

DECEMBER 14.

28562. **Improvements in electric motors for driving engines.** Isaac Tillman Dyer and Otto Bruno Reichelt, 89, Chancery-lane, London.

28573. **Improved method of and means for extinguishing the "arc" formed in large high-pressure electrical circuit interrupters or switches.** Leonard Andrews, 166, Fleet-street, London.

28575. **Improvements in and in connection with glasses, globes, chimneys, and the like for use with gas, oil, and electric light.** William Sharp, 68, Melody-road, East-hill, Wandsworth, London.

28578. **Improvements in the bonding of rails used for electrical railways or tramways.** Rookes Evelyn Bell Crompton, 55, Chancery-lane, London.

28609. **Improved electric device for showing the relation of oxygen and nitrogen in mines.** Leo Cohn, 111, Hatton-garden, London. (Complete specification.)

28610. **Improvements in electric signalling apparatus for firedamps.** Leo Cohn, 111, Hatton-garden, London. (Complete specification.)

28612. **Improvements in or relating to telephonic systems, and in apparatus employed therein.** Alfred Julius Boult, 111, Hatton-garden, London. (La Société Anonyme de Téléphone Privée, Belgium.)

DECEMBER 15.

28663. **Improvements in the method of and means for protecting electric or other lamps when placed in dangerous positions especially from explosive vapours or the like.** William Robert Harrison and Percy Tom Runton, 8, Quality court, Chancery-lane, London.

28678. **Certain improvements in pendants for gas, electric, oil, and other lights.** Harry Hateley, 128, Colmore-row, Birmingham.

28688. **Improvements in incandescence electric lampholders.** Gustav Byng, 73, St. Stephen's-road, Upton Park, London.

28704. **New and improved switches for electric currents** William Robert Rawlings and John Joseph Rawlings, 82, Gloucester-road, South Kensington, London.

28723. **Improvement in secondary batteries for electricity.** Johannes Schuil, 20, Gladsmuir-road, Whitehall-park, London.

28725. **Improvements in or connected with prepayment meters for gas or other fluid and electricity.** Wesley Webber, 4, South-street, Finsbury, London.

28736. **Improvements in direct-current dynamo-electric generators.** Reginald Belfield, 322, High Holborn, London. (Benjamin G. Lamme, United States.)

28761. **An improved electrical brake for vehicles.** Edwin Grosz, 18, Southampton-buildings, Chancery-lane, London. (Complete specification.)

28764. **Improvements in apparatus for use in electrolysis, more especially intended for use in the electrolysis of zinc chloride.** Ferdinand Hurter and the United Alkali Company, Limited, 47, Lincoln's-inn fields, London.

DECEMBER 16.

28845. **Improvements in electrical apparatus for firing ordnance.** Francis Weldon, 2, Lancaster-place, Strand, London.

28851. **Improvements in electrical make-and-breaks.** Henry Harington Leigh, 22, Southampton-buildings, Chancery-lane, London (Charles Milde, Sons, and Co., France.)

28884. **A system of electric distribution for combined lighting and traction plants.** Alexander Bewicke Blackburn and Wilfrid L. Spence, 47, Lincoln's-inn fields, London.

SPECIFICATIONS PUBLISHED.

1895.

23137. **Manufacture or production electrolytically of coatings composed of oxides of the earth metals.** Langhans.

1896.

135. **Method for the adjustment of carbons in electric arc lamps.** Fabris.

1401. **Electrical gas-reaction apparatus.** Naville, Guye, and Guye.

1574 **Electricity meters.** Siemens Bros. and Co., Limited, and Nebel.

1782. **Apparatus for testing magnetic quality.** Ewing.

2106. **Lightning dischargers for electrical installations.** Siemens Bros. and Co, Limited. (Siemens and Halske.)

2161. **Apparatus for conveying electric current from overhead conductors to motors on tramcars or like vehicles.** Dawson.

7254. **Electric igniting devices for gas-burners.** Krieger.

19822. **Automatic circuit breakers.** The British Thomson-Houston Company, Limited (Hewlett.)

20984. **Electric brakes.** The British Thomson-Houston Company, Limited. (Macdonald.)

21614. **Cut-outs and similar devices for electric circuits** Von Wurstemberger.

22127. **Electric locomotives.** Lake. (Warfield.)

23393. **Portable telephone apparatus.** Kandt. (Töpffer and Schädel.)
